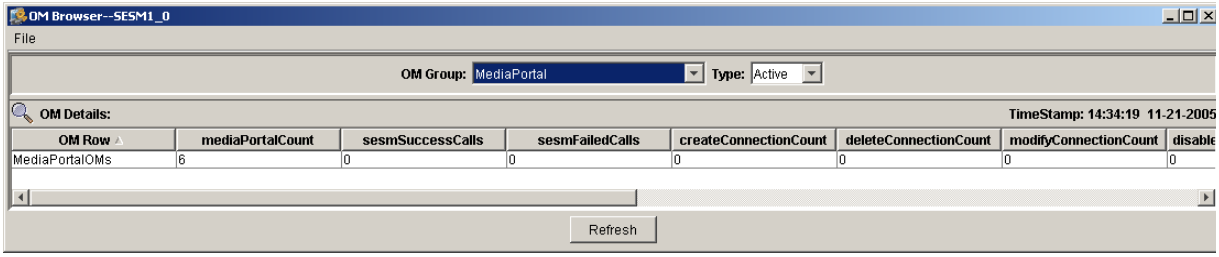
Table 2: OM Group Media Portal - New OM Registers

Register Name	Type	Description
sesmSuccessCalls	Counter	The number of calls that were successfully setup using any available BCP on this Session Manager in the last collection period.
sesmFailedCalls	Counter	The number of failed attempts to setup a call on any available BCP on this Session Manager in the last collection period.
mediaPortalCount	Usage	The number of BCPs configured to support this Session Manager from the Management Console. This counter will be updated when BCPs are added or removed via the Management Console.

Figure 6: Example GUI snapshot of MediaPortal OM Group



157.3.1.2 Media Portal Instances

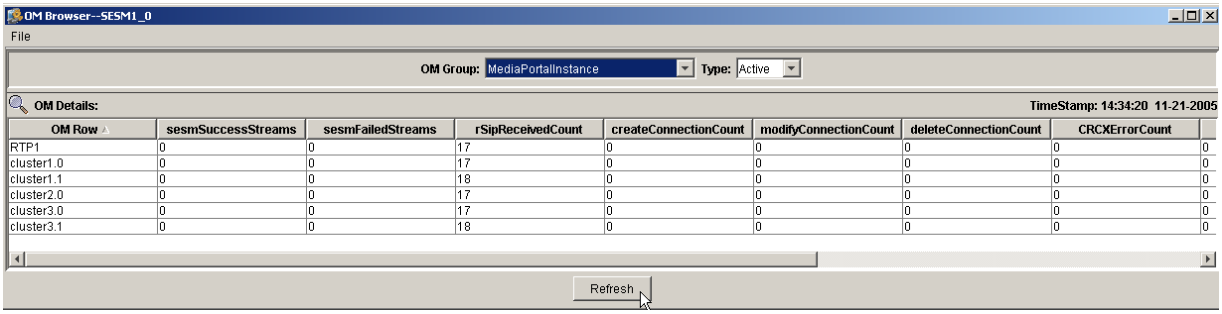
For OM Registers that are per-BCP, a new OM Group (“MediaPortalInstance”) is introduced. The OM Registers defined for this OM Group are described in Table 3: OM Group Media Portal Instance - New OM Registers. For each BCP configured to support this Session Manager, an OM Row is created. For CPX8216-T, the OM Row name is the NE-name. For BladeCenter-T, the OM Row name will be a label of the following form: <MediaPortalClusterName>.<ServiceID> (e.g. “MCP1.0”, “MCP1.7”, …). An example using BladeCenter-T is shown in Figure 7: Example GUI snapshot of MediaPortalInstance OM Group. The OM Row for a BCP is not

added to the OM Group until the BCP registers with the Session Manager (sends a RSIP message). If a BCPs' configuration is removed via the Management Console, its operational measurements for the current OTP are lost. The OM Row is not removed when the BCP deregisters with the Session Manager.

Table 3: OM Group Media Portal Instance - New OM Registers

Register Name	Type	Description
sesmSuccessStreams	Counter	The number of stream setups that were successfully processed by this media portal.
sesmFailedStreams	Counter	The number of stream setups that were not successfully processed by this media portal.

Figure 7: Example GUI snapshot of MediaPortalInstance OM Group

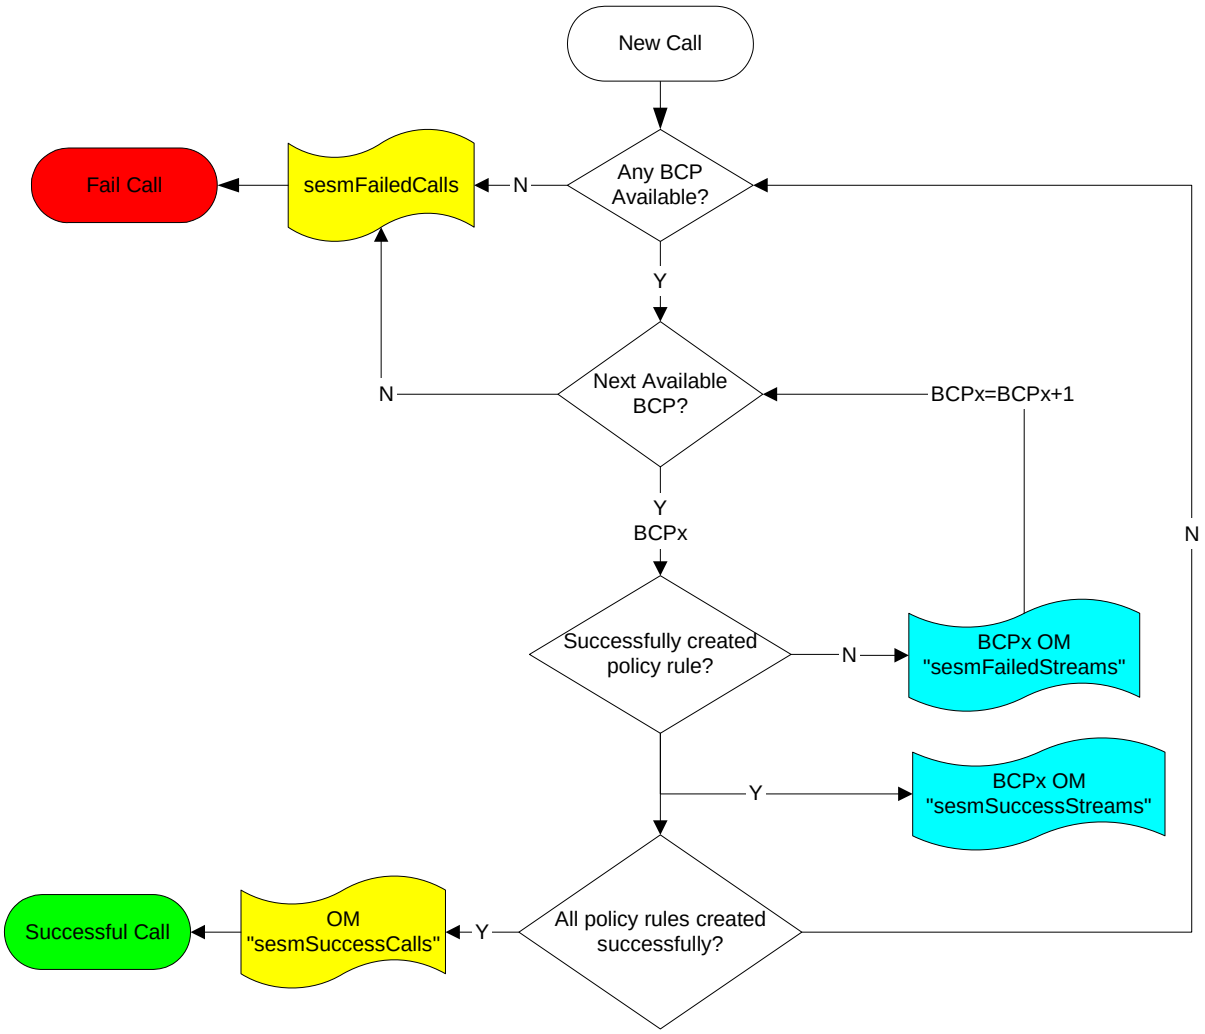


157.3.1.3 Session Manager Call Processing

The following diagram shows the flow for pegging the requested call related OMs on the Session Manager and the requested per-BCP OMs for that Session Manager. The new OMs are:

- Session Manager failed calls (sesmFailedCalls)
- Session Manager successful calls (sesmSuccessCalls)
- BCP failed streams (sesmFailedStreams)
- BCP successful streams (sesmSuccessStreams)

Figure 8: Session Manager "Call" OM Generation Logic



157.3.1.4 Session Manager Failed Calls

The Session Manager Failed Calls OM (“sesmFailedCalls”) represents the number of failed attempts to setup a call on any available BCPs on this Session Server in the last collection period. Unlike the GWC, media streams for a single call can be distributed over multiple BCPs. As Figure 8: Session Manager "Call" OM Generation Logic8 shows, for each new call, if a BCP is required for the call, the Session Manager will check to see if there are any BCPs available (registered with this Session Manager). If not, then the “sesmFailedCalls” OM Register is pegged. If there is a BCP available, the Session Manager will then attempt to create a policy rule for each media request for the call (e.g. audio, video, data). If there is a failure on one BCP, the Session Manager will attempt to use the next available BCP. If the Session Manager exhausts its pool of available BCPs before creating all the policy rules needed for the call, then the “sesmFailedCalls” OM Register is pegged.

157.3.1.5 Session Manager Successful Calls

The Session Manager Successful Calls OM (“sesmSuccessCalls”) represents the number of calls that were successfully setup using any available BCPs on this Session Manager in the last collection period. For a single call, unlike the GWC, media streams can be distributed over multiple BCPs. Figure 8: Session Manager "Call" OM Generation Logic illustrates the logic used in pegging this OM Register. This OM Register is incremented only if the Session Manager successfully creates a policy rule for each media. Note that it is possible for there to be a failure to create a policy rule for a media stream; however, the Session Manager will attempt to create it on the next available BCP (if not already exhausted its pool of BCPs).

157.3.1.6 BCP Failed Streams

The BCP Failed Streams OM (“sesmFailedStreams”) represents the number of stream setup requests that were not successfully processed per BCP. Unlike the GWC, the BCP does not have a notion of a call, but of ports and streams as shown in Figure 4: BCP Media Streams. As the figure shows, there are six ports allocated to the call for three media streams. A failure to allocate a port on the BCP or a failure to join the two ports via a policy rule in order to establish a media stream increments this OM register by one. This OM register is pegged per media stream and not per call as illustrated in Figure 8: Session Manager "Call" OM Generation Logic.

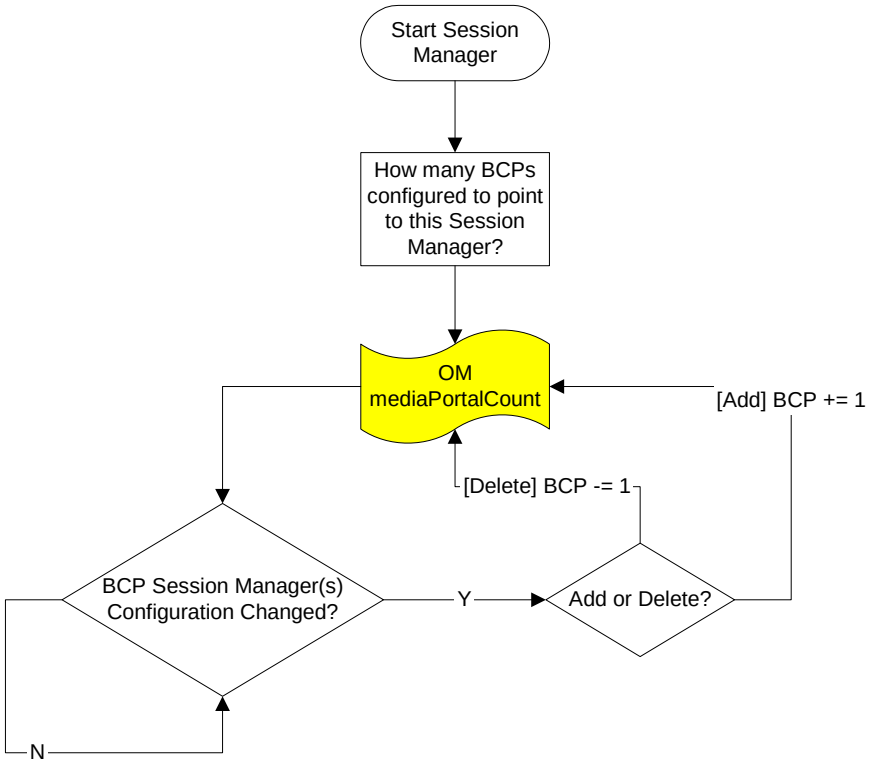
157.3.1.7 BCP Successful Streams

The BCP Successful Streams OM (“sesmSuccessStreams”) represents the number of media stream setup requests that were successfully processed per BCP. A media stream is considered successfully setup when the BCP establishes a logical connection via a policy rule between the two endpoints at which point the BCP Successful Streams is incremented by one. This OM register is pegged per media stream and not per call as illustrated in Figure 8: Session Manager "Call" OM Generation Logic.

157.3.2 Session Manager Configured BCPs

The following diagram shows the flow for pegging the mediaPortalCount OM Register on the Session Manager indicating the number of configured BCPs for this instance of the Session Manager. This register is only updated when a BCP configuration is either added or removed via the Management Console. If no BCP configurations exist, this register value is set to zero. A Session Manager only counts the BCPs that are associated with it via the “Session Manager(s)” data in the BCP configuration from the Management Console.

Figure 9: Session Server Configured BCPs OM Generation Logic



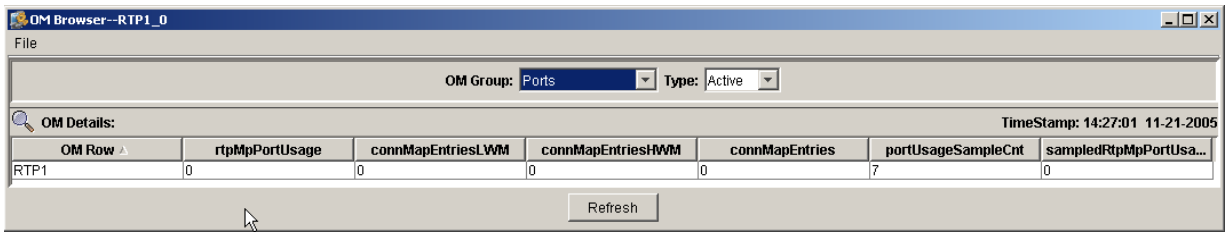
157.3.3 BCP OMs

Due to the large number of registers already existing in the MPCP OM Group, a new OM Group, named “Ports” has been created. There are four new OM Registers added to the OM Group “Ports” defined inTable 4: OM Group Ports - New OM Registers . Figure 6 shows the new OM Registers in the OM Browser GUI. The pre-existing OM Registers “rtpMpPortUsage” and “connMapEntries” has been moved out of the MPCP OM Group to the new Ports OM Group.

Table 4: OM Group Ports - New OM Registers

Register Name	Type	Description
sampledRtpMpPortUsage	Usage	Provides the summing of the in use ports every 100 seconds.
portUsageSampleCnt	Counter	The number of 100 second samples taken during this collection interval contributing to the averaged report.
connMapEntriesHWM	Usage	Highest number of simultaneous ports detected to be in use during this collection interval.
connMapEntriesLWM	Usage	Lowest number of simultaneous ports detected to be in use during this collection interval.

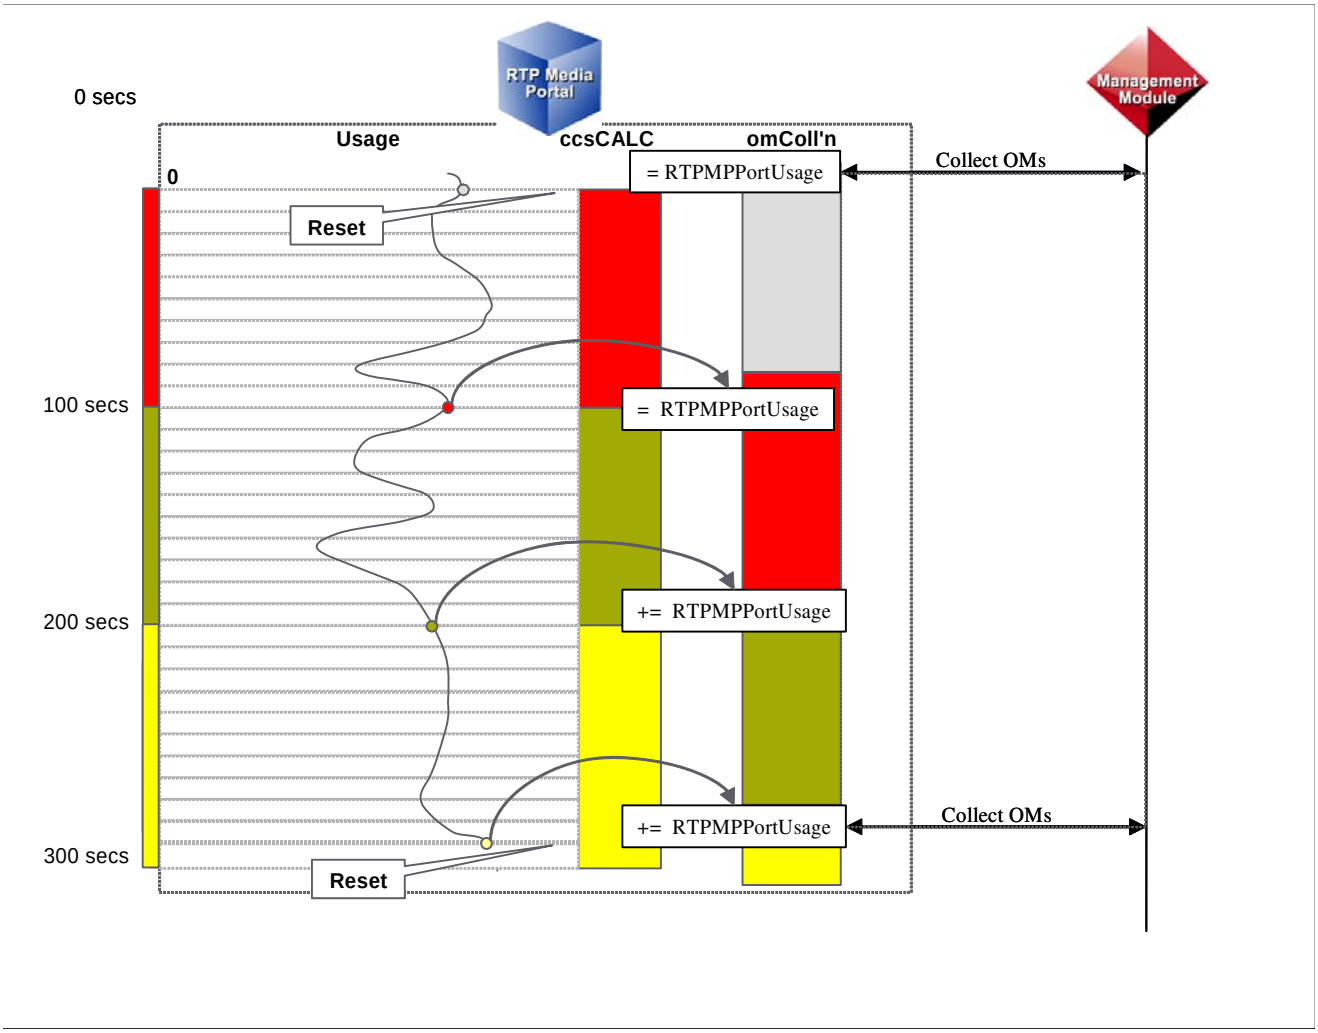
Figure 6:Example GUI snapshot of Ports OM Group



157.3.3.1 BCP Usage OM

The figure below illustrates the new sampledRtpMpPortUsage OM. This OM provides the summing of the in use ports every 100 seconds that gives a view of the CCS (hundred call seconds) of traffic. For example, in a five minute period, the BCP ports will be scanned three times (300 seconds/100 second scan). Each time there is a scan (every 100 seconds), and a port is in use, the count for that port is incremented. So for a five minute period, if a port is in use each time the scan occurs then a 3 is reported in the measurement. This measurement can then be plugged into traffic tables, like Erlang B, to compute the number of ports required for a given blocking probability. The number of 100 second reports sampled during the collection cycle will also be reported.

Figure 7 BCP: New "RTPMPPortUsage" OM



157.3.3.2 Port Usage Sample Count OM

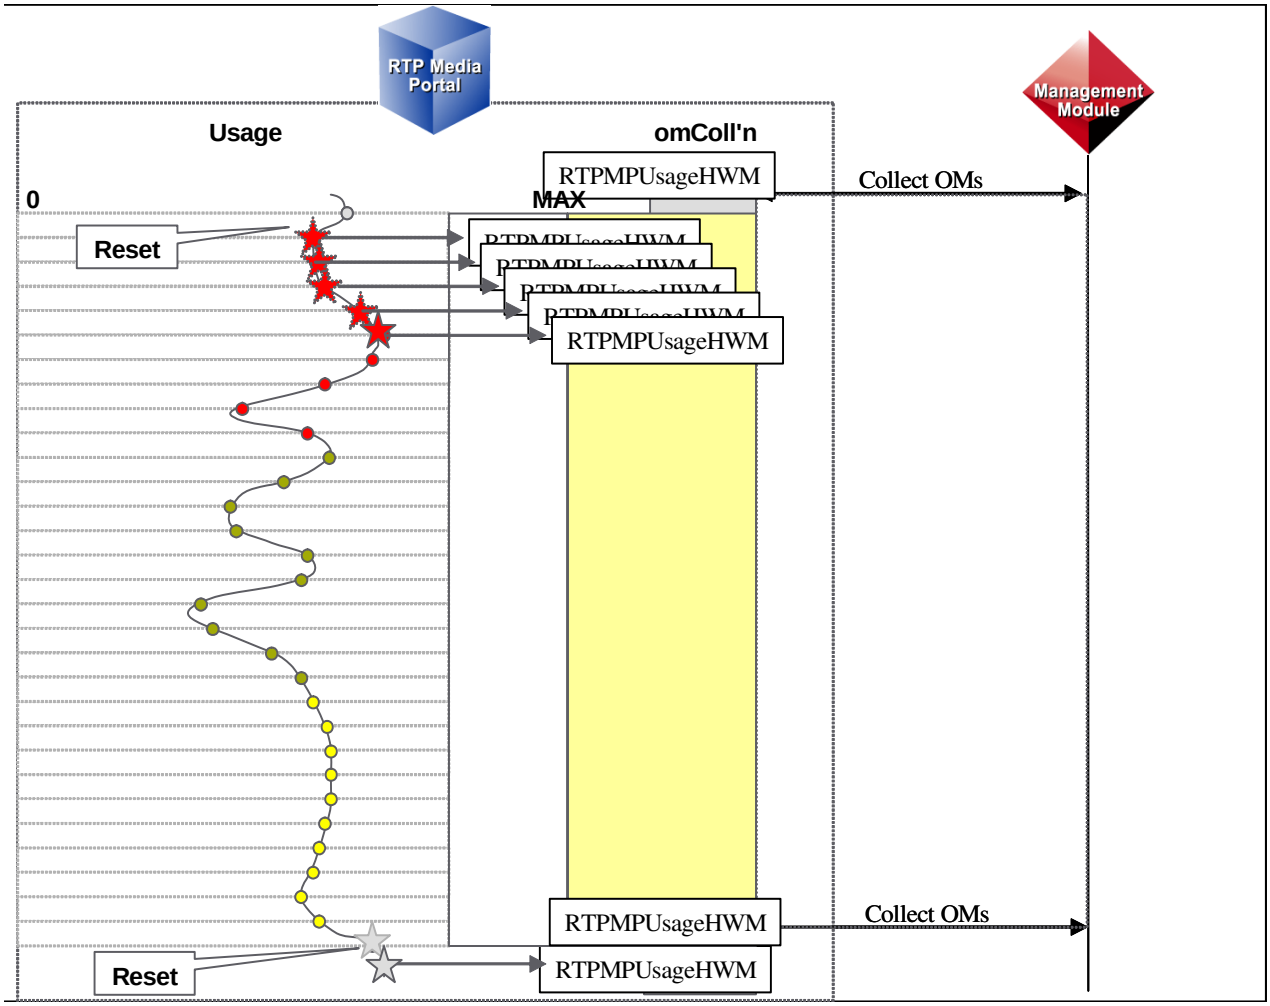
The Port Usage Sample Count OM (“portUsageSampleCnt”) represents the number of 100 second port usage samples taken during a collection cycle. For example, for a five minute collection cycle, the value should be 3. This value can be used to determine if the “sampledRtpMpPortUsage” OM Register should be thrown out or not when used with traffic tables. There is the possibility of a Java Garage Collection delaying a 100 second report.

157.3.3.3 BCP Usage High Water Mark OM

The figure below illustrates the new connMapEntriesHWM OM. This OM provides a high water mark of the ports in use on the BCP for a collection cycle. Each time a port is allocated, the number of ports in use is compared to the current value of the connMapEntriesHWM OM. If the current number of ports in use exceeds the value stored in the OM Register, then the OM

Register’s value is set to the current usage value. At the beginning of each collection cycle, the HWM register is reset to the current usage level.

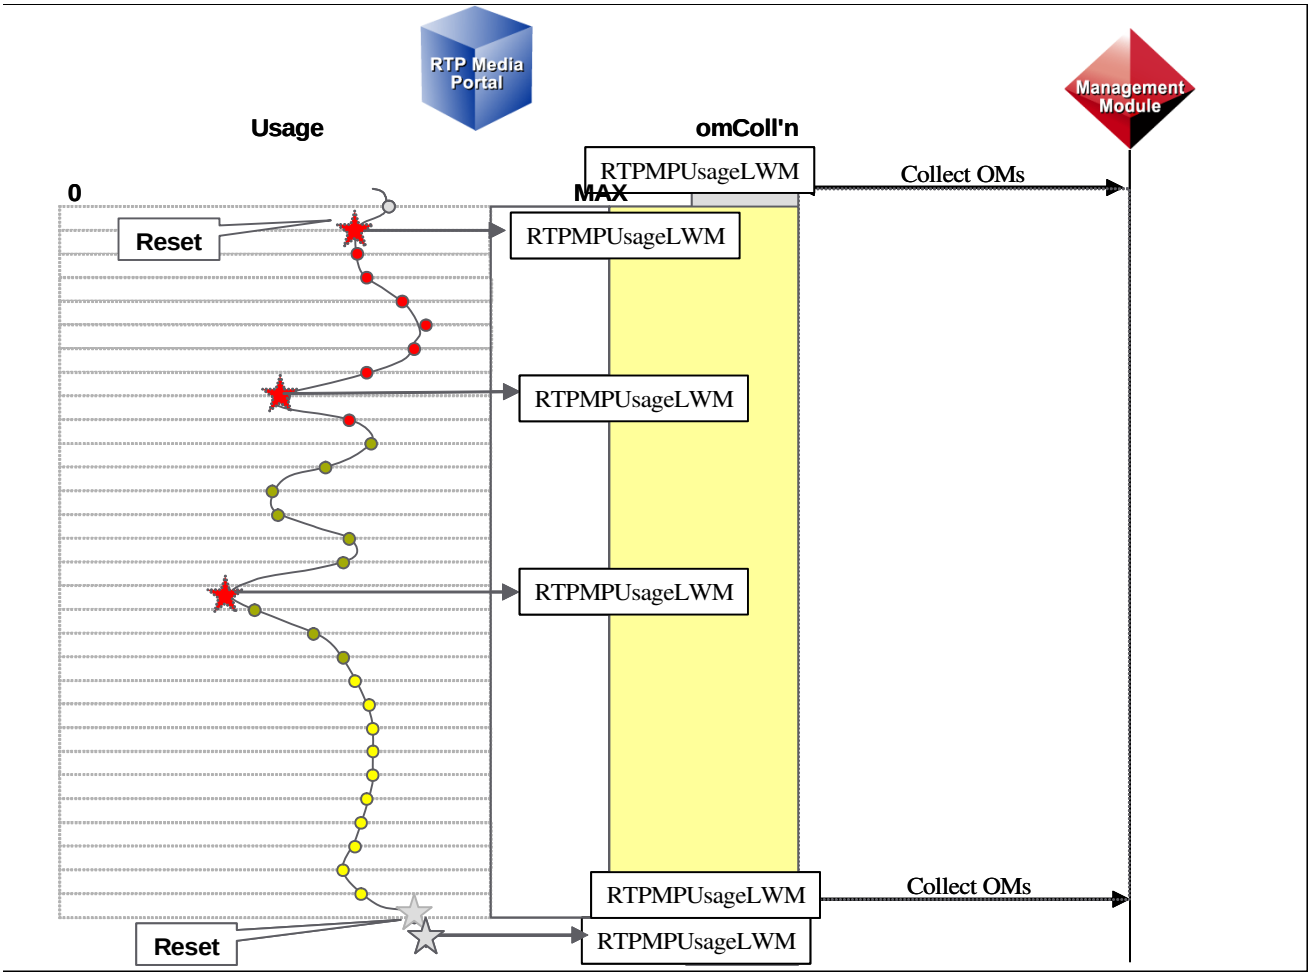
Figure 8: BCP: New "RTPMPUsageHWM" OM



157.3.3.4 BCP Usage Low Water Mark OM

The figure below illustrates the new connMapEntriesLWM OM. This OM provides a low water mark of the ports in use on the BCP for a collection cycle. At the beginning of each collection cycle, the LWM register is reset to the current usage level.

Figure 8: BCP: New "RTPMPUsageLWM" OM



157.4 Hardware Requirements or Dependencies

None

157.5 Software Requirements or Dependencies

None

157.6 Limitations and restrictions

If a BCPs configuration is removed via the Management Console, its operational measurements for the current OTP are lost.

The accuracy of reporting port usage every 100 seconds is at the mercy of the Java Garbage Collector.

157.7 Interactions

This feature will have negligible capacity and real time impact.

157.8 Glossary

Term	Description
Call	A communication context that involves two endpoints that are communicating using one or more forms of media.
Media Port	An entity repressenting one of the endpoints for a media stream..
Media Stream	A single media channel for conveyance of media (audio, video or data) between endpoints
OTP	Office Transfer Period.
Policy Rule	Refers to the internal connection between two proper connections on the BCP.

158: Functional Description (FN) A00012526

158.1 Feature name and Feature ID

A00012526 - TDM Call Recording Feature

158.2 Description

This feature provides trunk information in the ICM (Intelligent Call Management) protocol to facilitate call recording functionality in a TDM environment. It depends on feature A00012527: 'Provisioning of CS2K trunks on GW and Carrier basis' to access the trunk information.

158.2.1 Background

ICM is a SCAI (Switch-Computer Applications Interface) protocol.

SCAI specifies an architecture and an Open Systems Interconnection (OSI) application layer protocol suite for peer-to-peer data communication between host computer applications and switch applications, thereby enabling the functional integration of computer systems and telephony switching systems.[1]

Remote Operation Service Element (ROSE) is used to support the interactive communication between the switch and host application.

Currently, ICM services exist for the use of four types of customers.

- Automatic Call Distribution (ACD) customers
- Meridian Digital Centrex (MDC) customers
- Residential (RES) customers
- SL-100 Private Branch Exchange (PBX) customers

ICM uses the following Operation Classes.

- Class 1: Synchronous, reporting success or failure
- Class 2: Asynchronous, reporting success or failure
- Class 5: Asynchronous, outcome not reported

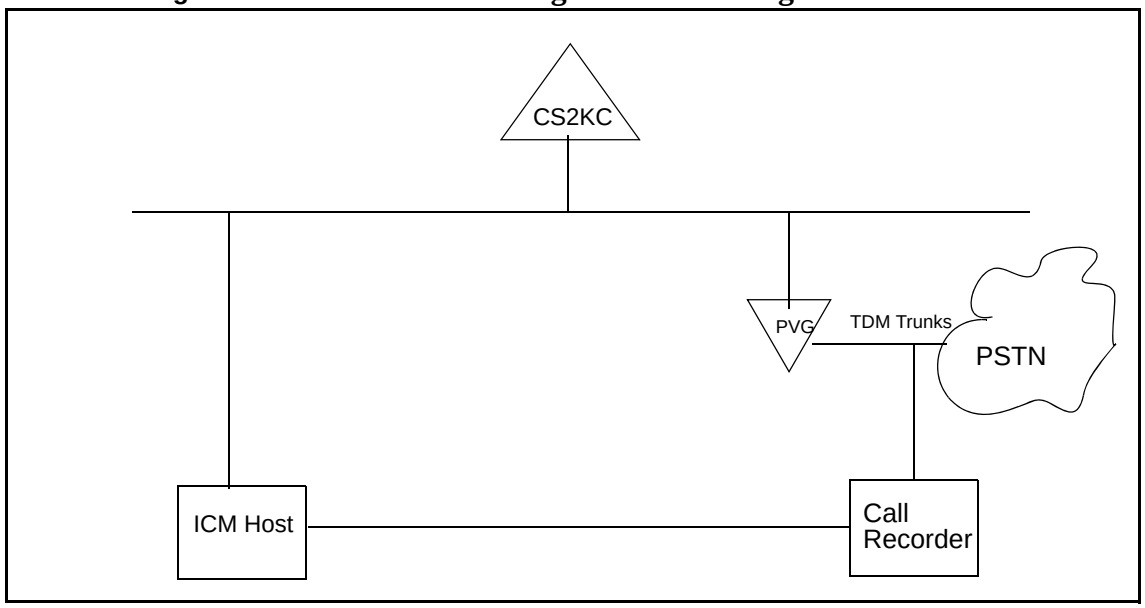
158.2.2 Functionality Overview

Call recording functionality for TDM trunks utilizes the ICM protocol and a call recording device which taps into the TDM trunk involved in the call. A high-level diagram is shown below.

[1]Taken from the ANSI SCAI Standard document: ANSI TI.626-1993

The CS2KC switch sends the ICM messages to the ICM Host (which is a Genesys CTI server for this case). The ICM Host will then relay required information to the Call Recorder, which will then start recording on the trunk.

Figure 1 TDM Call Recording Functional Diagram for CS2KC



To properly record calls and retrieve recorded calls, the system needs the following trunk information:

- PM Type
- PM Number
- Carrier Number
- Channel Number

This feature will provide this additional trunk information in the following ICM messages:

- dv_call_offered_U
- dv_call_queued_U

158.2.3 Feature Overview

To provide the trunk information in ICM messages, the following is required:

- SOC to control functionality
- SCAISSRV Table Control to subscribe for the trunk information
- ICM Enhancements including new SCAI protocol version SCAI19
- Call Processing and Error Handling
- New Log SCAI600

158.2.4 SOC

This feature will have a state controlled SOC, ICM00085.

— With the SOC turned on, the switch will attempt to send trunk information in the appropriate ICM messages. Reference the call processing section of this document for a complete description of the requirements to send trunk information.

— With the SOC turned off, the switch does not attempt to send trunk information in ICM.

Please reference the CN section of this document for more information.

158.2.5 Table SCAISSRV Subscription Changes

The following changes in the table SCAISSRV are required to provide subscription to the changed SCAI/ICM messages.

158.2.5.1 Subscription for ACD

A new default tuple ACDEVENT19$ will be created with the new parameter TRNKINFO in functions CALLQUED and CALLOFFR.

158.2.5.2 Subscription for Residential and Centrex lines

- A new default tuple RESEVENT19$ will be created with the new parameter TRNKINFO in function CALLOFFR.
- A new default tuple CTXEVENT19$ will be created with the new parameter TRNKINFO in function CALLOFFR.

Please reference the CN section of this document for more information on table SCAISSRV.

158.2.6 ICM Message Enhancements

This feature introduces a new parameter, **TRNKINFO,** in the following ICM call related messages.

- DV_Call_Queued_U
- DV_Call_Offered_U

The ASN.1 notations for the these messages are shown in the Appendix of this document.

The new parameter, TRNKINFO, is added with the following information:

- PM Type: string {PVG, GW}
- PM Number: integer {0-1023}
- Carrier Number: integer {1-168}
- Channel Number: integer {1-31}

The changes are included in a new SCAI protocol version, SCAI19, as described in the next section.

158.2.6.1 Application Logon SCAI Service Version

The dv-Appl-Logon message contains a parameter, Service Version, which uniquely identifies the version of messages which will be sent during the session. A new Service Version value will be created to uniquely identify the stream of messages which are new or changed during this software release. The new Service Version will be SCAI19.

This new Service Version (SCAI19) must be specified in the dv-Appl-Logon message for the host application to receive the enhanced messages. If a Service Version lower than SCAI19 is specified, the TRNKINFO parameter will not be contained in the above two SCAI messages sent to the Host.

The Service Version is upward compatible. This means all of the functionality enabled and provided with any of the previous Service Versions will be provided in SCAI19. Future DMS/CS2K/Cs2Kc software releases will provide additional ICM functionality but will continue to allow the specification of the SCAI19 Service Version. Therefore, applications written to use SCAI19 will not require rewriting to continue to work properly.

158.2.7 Call Processing and Error Handling

Throughout call processing, any time one of the two modified ICM messages is to be sent out, the switch will attempt to include the new TRNKINFO parameter. The following conditions must be met in order for this to occur:

1. SOC ICM00085 must be set to ON.
2. The SCAI Service Version is at least SCAI19.
3. An ICM switch-host session is established. A successful dv-Appl-Logon request was sent by the host computer.
4. The line which the host application is monitoring must be associated to the session via dv-DN-Associate.
5. For Centrex/Res lines the line option ECM with suboption CALL_EVENTS and SCAIRDIR must be set to ‘Y’.
6. The switch-host session is subscribed to the new default tuples, ACDEVENT19$, CTXEVENT19$ or RESEVENT19$.

For call which meet all of the above criteria, the trunk information will be sent if available. If the trunk information is not available then it cannot be sent and a new SCAI600 log is generated.

> ***Note:*** Nodal calls do not have a trunk involved in the call and therefore, have no trunk information. No log is generated for these calls.

For calls which do not meet the above criteria, the TRNKINFO parameter will not be sent. No log is generated.

Trunk information is obtained from tables created and altered by feature A00012527: Provisioning of CS2K trunks on GW and Carrier basis. The tables include GATWYINV and GWEPCARR. Please reference feature documentation for A00012527 for more information on these tables.

158.2.8 Log SCAI600

A new SCAI log, SCAI600, is created to indicate when a call should have sent the trunk information parameter, TRNKINFO, in the ICM message but was not able to because it was not available. The trunk information may not be available for a number of reasons including incorrect or missing datafill. The action is to check the datafill in table GATWYINV and GWEPCARR.

Please reference the FM section of this document for more information on this log.

158.3 Hardware Requirements or Dependencies

N/A

158.4 Software Requirements or Dependencies

If the trunk information is not available to the SCAI environment due to no manual entry of the SESM datafill in appropriate tables (look at activity A00012527: Provisioning of CS2K trunks on GW and carrier basis) the TRNKINFO parameter cannot be sent in the SCAI messages and log SCAI600 is generated.

158.5 Limitations and restrictions

New option TRNKINFO cannot be sent in ICM messages if no trunk information is available for the call.

158.6 Interactions

None of the existing interactions will be affected or changed by this activity. No new interactions will be introduced by this activity

158.7 Glossary

Term	Description
ACD	Automatic Call Distribution
ASN	Abstract Syntax Notation
CTI	Computer Telephone Integration
DN	Directory Number
ICM	Intelligent Call Management
MDC	Meridian Digital Centrex
RES	Residential Enhanced Services
SCAISSRV	Switch Computer Application Interface SCAI Service

158.8 Appendix: ASN.1 Notations for Modified ICM Messages

This sections shows the ASN.1 notations for the following modified ICM messages in SCAI19:

- DV_Call_Queued_U
- DV_Call_Offered_U

The new parameter, TRNKINFO, is added with the following information:

- Gateway Type: string {PVG, GW}
- Gateway Number: integer {0-1023}
- Carrier Number: integer {1-168}
- Channel Number: integer {1-31}

The parameters below which are ***italicized and bold*** are new to these messages.The letter ‘U’ in the message name indicates that the message is unconfirmed, i.e., this operation requires no outcome to be reported by the host. The letter ‘**C**’ at the end of the message’s name indicates that the message requires confirmation from the host.

158.8.1 DV_Call_Queued_U message

The switch sends this RO of Operation Class 5 to the host when a call to an ACD DN associated with the current session is received by the switch and placed in the Incoming Call Queue.

158.8.1.1 Changed DV_Call_Queued_U ASN.1 definition.

ASN.1 Encoding

```

158.8.1.2 DV_Call_Queued_U:Coded example.

An ACD call has been initiated from the OrigCallingNumber 6136217703 6134444444 and offered over a trunk to an ACD group with Primary DN 6136212111, for which no agent is available, the call is placed in the Incoming Call Queue and the switch sends DV-CALL-QUEUED-U to the host. No Return Result is required or received by the switch from the host.

158.8.2 DV_Call_Offered_U message

This section describes the DV-CALL-OFFERED-U message the switch uses to notify the host that a ICM Party has been selected for ACD. The party has been selected to handle an incoming call to one of the DNs belonging to the associated environment of the current switch-host session when the call is about to be offered to the ICM Party. This call comes in over a trunk.

158.8.2.1 Changed DV_Call_Offered_U ASN.1 definition.

ASN.1 Encoding

```
dv-CALL-OFFERED-U                   OPERATION

158.8.2.2 DV_Call_Offered_U: Coded example.

An ACD call is initiated from the OrigCallingNumber 6136217703 by dialing 6134444444 and is assigned a LocalCallID = 9. The call is offered over a trunk to an acd agent with posid 7707 of the acd group with primary DN 613621111.

The switch sends DV-CALL-OFFERED-U to the host. No Return Result is required or received by the switch from the host.

159: Functional Description (FN) A00012527

159.1 Feature name and Feature ID

A00012527 - Provisioning of CS2K trunks on GW and Carrier basis

159.2 Description

This activity allows mapping of trunk TID's on CS2K core based on GW and carrier, using CM tables GATWYINV and GWEPCARR.

Currently, provisioning of GWs and carriers for CS2000 trunking is done in the CS2K EM (SESM). Provisioning of trunk groups and individual trunk members is done in the CS2K CM. A trunk member in the CM is mapped to a channel on a carrier in SESM using a node and terminal number (TID). No GW or carrier information is currently available on the CM for trunks configured on gateways. Because of this data split, existing OA&M on the CM can only identify the TID of a trunk to the craftsperson by giving the physical circuit location. This has resulted in

1. a multi-step process for the craftsperson to locate a physical GW and pack (CM -> SESM -> GW element manager or physical hardware).
2. the inability to provide maintenance services on GW or carrier from the CM.
   - — post by GW or carrier in TTP
   - — OMs on a GW basis
   - — GW alarm

As part of this activity, changes will be made in the following areas:

- Support for PVG and GW profiles for table GATWYINV
- Introduction of new table GWEPCARR
- Modification of CktLoc command in MAPCI, TTP level to display Gateway and Carrier information.

This activity will support both North American and International loads.

Note 1: Automatic upload from SESM to GATWYINV and GWEPCARR tables in core is not supported as part of this activity. The craftsperson has to manually datafill the tables by looking into the SESM details.

159.2.1 GW Data - Table GATWYINV

Table GATWYINV is an existing table that houses the gateway related information. It currently allows only ABI GWs which are provisioned in parallel in the CM and SESM. This activity shall allow support for PVG and GW profiles in table GATWYINV.

Datafill each gateway in table GATWYINV prior to datafill in table GWEPCARR. Deleting of tuple in GATWYINV is not allowed if the Gateway type and number are being referenced in table GWEPCARR.

For details on what/how this is provisioned, refer to “12.5.2 Table GATWYINV Database Schema information” in the CN chapter of this book.

159.2.2 Carrier Data - Table GWEPCARR

Table GWEPCARR is a new table that shall hold the mapping from GW and carrier number to the TID range used by trunks on the carrier. The key to table GWEPCARR is the GW type and number and the carrier number. The number of channels on a carrier is restricted to 24 for North America and 31 for International. The table will also hold the carrier name information.

The internal representation of GWEPCARR shall be used to map GW and carrier group number to the TIDs used for that carrier. There shall also be a mapping from TID to GW and carrier.

Datafilling table GWEPCARR with a gateway, that does not exist in table GATWYINV, is not allowed.

For details on what/how this is provisioned, refer to “12.5.3 Table GWEPCARR Database Schema information” in the CN chapter of this book.

159.2.3 Trunk Test Position (TTP - CM)

At MAPCI, TTP level, the CktLoc command is not currently supported for GWC trunks. This component shall support GWC for CktLoc and shall display the gateway and carrier information for the trunk member currently being posted, if the TID to Carrier mapping exists in Table GWEPCARR.

If the posted trunk does not have TID to Carrier mapping in table GWEPCARR, then a message “CARRIER INFO NOT PRESENT IN TABLE GWEPCARR” would be displayed.

The CktLoc will not be supported for GWC audio nodes as part of this activity.

For details on what/how this is done, refer to the CN section of this feature.

159.3 Hardware Requirements or Dependencies

N/A

159.4 Software Requirements or Dependencies

This feature requires the Core load to be a succession load.

159.5 Limitations and restrictions

Craftsperson should provision the Gateway and carrier information in SESM. The same information must be manually datafilled in core as well.

160: Functional Description (FN) A00012528

160.1 Feature name and Feature ID

A00012528 - ICM Queue Expansion

160.2 Description

160.2.1 ICM Work queue

For every ICM link datafilled through Table SCAICOMS, one incoming and one outgoing ICM work queue is allocated. All messages coming from the host computer are queued by the transport into the incoming ICM work queue. Messages sent by the switch are queued by the ICM application into the outgoing ICM work queue. When the ICM work queue becomes full, the messages coming into it are lost. This scenario may arise during high traffic. This feature increases the ICM temporary queue size and hence enhances its capability to handle messages during high traffic. The ICM temporary queue size is being increased from 512 to 1024. Refer to Section 2.3 for further details on ICM temporary queue size increase.

160.2.2 Invoke ID

An Invoke ID is used each time an ICM message is sent or received. This Invoke ID remains in use until the message is responded to. Currently, the Invoke ID range is 0 - 1024. The messages originated by the switch to the Host will use Invoke IDs from 1023 down to 512 while the Host will use Invoke IDs from 0 up to 511. This feature also increases the Invoke ID range from 0 -1024 to 0 -3072 to support the increase of the ICM temporary queue. Refer to Section 2.4 for further details on Invoke ID expansion.

160.3 ICM Temporary Queue Expansion

Feature A59006731 introduced the concept of temporary work queues. This is an allocated pool of ten incoming/outgoing queues which is created at the time of datafilling the first ten links in Table SCAICOMS. As of now, the temporary work queues are capable of handling 512 messages. This pool of ten temporary incoming/outgoing queues will be available to any of the 351 links which experience high traffic. This pool of ten temporary queues is in addition to the SCAI Incoming/Outgoing work queue for each of the 351 links which is capable of handling up to 128 messages at a time. When the item count of an ICM Work queue (incoming or outgoing) reaches the threshold value of 128, a temporary queue (incoming or outgoing) from the allocated pool of ten temporary queues will be made available. So a total of 640 messages can be queued at a time. During high traffic, if the number of messages goes beyond 640, then the message is lost.

This activity increases the size of the ICM temporary queue to support 1024 messages at a time. This ensures that during high traffic conditions, message loss will be minimized to a large extent. The temporary queue size will be increased for both X.25 and TCP/IP links.

160.4 Invoke ID Expansion

Even with the increased size of the ICM message queue it will only be possible to queue a maximum of 512 messages without the expansion in the Invoke ID range. So this feature also increases the Invoke ID range from 0 -1024 to 0 - 3072 to support the increase of the ICM temporary queue. The messages originated by the switch to the host will use Invoke IDs from 3071 down to 1536 while the host will use Invoke IDs from 0 up to 1535.

The Invoke ID expansion will be controlled by the scai protocol version. For protocol version scai19 and above the Invoke ID range will be 0 - 3072. So the range of Invoke IDs for a session is determined at the time of session logon and by the scai protocol version. For session logons with scai protocol version less than scai19, the old range of Invoke IDs are retained.

The table below shows the Invoke ID range corresponding to the scai protocol version in the application logon message.

Table 1: Invoke ID range dependent on the Scai version

Affected ranges	Protocol version >= scai19	Protocol version < scai19
Invoke ID Range	0 to 3072	0 to 1024
Host to Switch Invoke ID range	0 to 1535	0 to 511
Switch to Host Invoke ID range	3071 to 1536	1023 to 512

161: Functional Description (FN) A00012538, A00012537, A00012539

161.1 Feature name and Feature ID

A00012538, A00012537, A00012539--SIP Lines Support - Part 2

161.2 Description

This activity, SIP Lines Support - Part 2, consists of 3 features:

- A00012538 - Additional Provisioning for SIP Lines
- A00012537 - SIP Lines - Data Sync Audit
- A00012539 - SIP Lines - Maintenance Enhancements

These features deal with meeting the Configuration and Provisioning requirements on CS2K SS for support of SIP Lines. It provides new OPI and OMI interfaces for configuration and provisioning. In addition new OPI methods are added for audit - which can be used by the clients to ensure that data on MCS is in sync with Data on other systems unknown to MCS.

The responsibility for audit and data correction is that of the client (SESM). The server provides mechanism to retrieve the data that exists on SS and use that for maintaining data consistency.

The requirements fall into the following work areas.

HUNT/MADN Group Provisioning

OPI methods for Data Audit

Version Service

Client Jars

Backward/ Forward compatibility

Number of simultaneous Endpoint postings

161.3 HUNT/ MADN Group Provisioning

The activity “A00009528 - Call Pickup” introduces a concept of grouping users on the Provisioning System. The group provisioning is generic and is associated with a group type. The group type defines what Call Processing Service the group is used for.

This feature requires addition on new group types such as MADN and Hunt Groups. Please refer to the “A00009528 - Call Pickup” FN for details.

The interfaces defined by the Call Pickup feature is leveraged for Group Provisioning. No additional methods are required for the same.

161.4 OPI methods for Data Audit

Several new methods are required to carry out the audit functionality for SIP Lines data on the client (SESM).

SIP Line Data Audit - SIP Line provisioning functionality was introduced as part of A00009043 SIP Lines Provisioning Support feature. Several new methods are required for auditing this data from the client.

The following methods are added to OPI web service.

1) public int getUserCountInSubDomain(String subDomainName) throws ProvisionException

Could be the root domain name. The output is the number of users in the actual domain specified.

2) public int getUserCountInDomain(String domainName) throws ProvisionException

Returns user count in the domain tree starting with the specified domain.

A new web service called “SIPLines” is added and the following methods will be exposed via this service.

1) public String[] getDomainsForVMG(String vmgName) throws ProvisionException

2) public String[] getVMGForDomain(String subDomainName) throws ProvisionException

This takes in the actual subdomain name.

3) public SipLineAuditData[] getSIPLineAuditDataByDomain(String domainName, int start, int stop) throws ProvisionException

Returns the users available in the actual domain specified.

The SIPLineAuditData object contains the following fields:

String endpointId
String vmg
String[] clientType
String userName (user@root domain only. Actual subdomain does not matter).
String dirNum

4) public SipLineAuditData[] getSIPLineAuditDataByDomainByVMG(String domainName, String vmgName, int start, int stop) throws ProvisionException

Returns the users available in the actual domain specified.

5) public String[] getUsersByRegistrationState(String domainName, boolean registered)

Returns the usernames in the actual domain specified.

This method returns the list of usernames in the domain specified that have any contacts registered if registered boolean is set to true.

It returns the list of users that are not registered at all if the registered boolean is set to false.

6) public String[] getUsersByRegistrationState(String domainName, boolean registrationState, String clientType)

Returns the usernames in the actual domain specified.

The client type is the name from the ClientType object that is returned by the getClientTypes() method.

Returns the same list as in the previous method, except that it is also filtered by the client Type. The client type check is done against the provisioned data and has no bearing to what client actually registered. (No way of knowing that).

Group Data Audit - Refer to the Call Pickup FN for APIs.

161.5 Version Service

A new web service “VersionService” will run on the SM and Prov Mgr.

Interface: VersionService

Method: getLoadVersion() returns Version

Version {

int majorReleaseNum

int minorReleaseNum

int maintenanceReleaseNum

}

This service would be used by OPI and OMI clients to handle versions for maintenance releases. Refer to Backward/ Forward Compatibility section for more details.

161.6 Client Jars

The client jar (built based on the wsdl) for SIPLines web service will be available in the “OPIClient.jar”.

The client jar (built based on the wsdl) for OMI services will be available in “OMIClient.jar”.

These jars will be available as part of the MCS load. The location of these jars for SESM loadbuild is TBD.

161.7 Backward/ Forward Compatibility

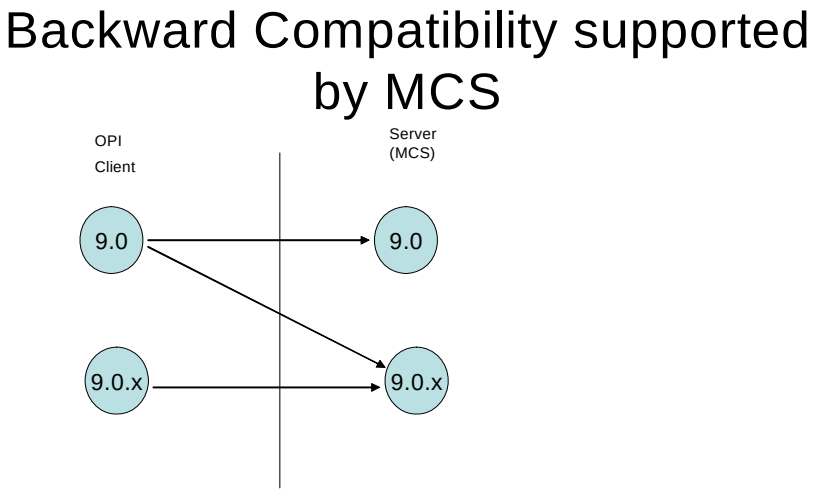
There are new OPI and OMI interfaces as part of this feature. Existing interfaces work as is and do not get affected.

OPI and OMI web services support backward compatibility for 1 release. This section describes SESM’s specific requirement for forward compatibility. The details are based on the fact that these features are delivered in a maintenance release for MCS09.

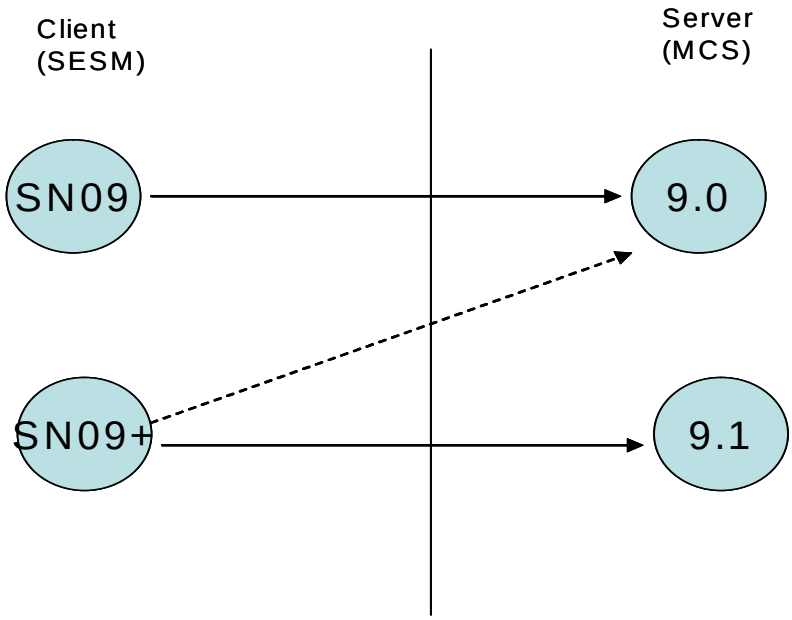
In the SIPLines solution, for provisioning and configuration using OPI and OMI services, MCS is a server and SESM works as a client. Since the client (SESM) would be upgraded prior to MCS (server), there is a risk that a forward release client talks to the older MCS09 load for the new functionality.

It is the client’s job to ensure that appropriate methods are called on the respective servers.

MCS Supported Backward Compatibility for major and minor releases:

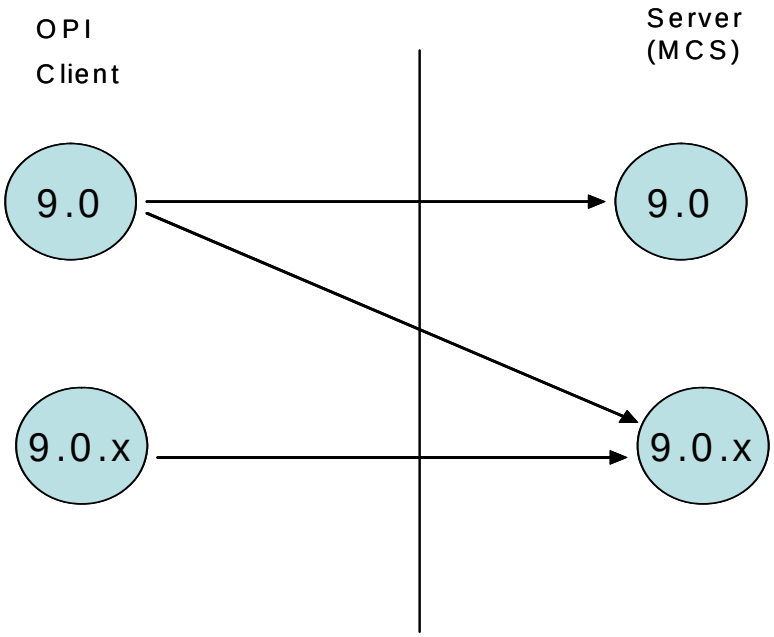


Forward Compatibility for major and minor releases:

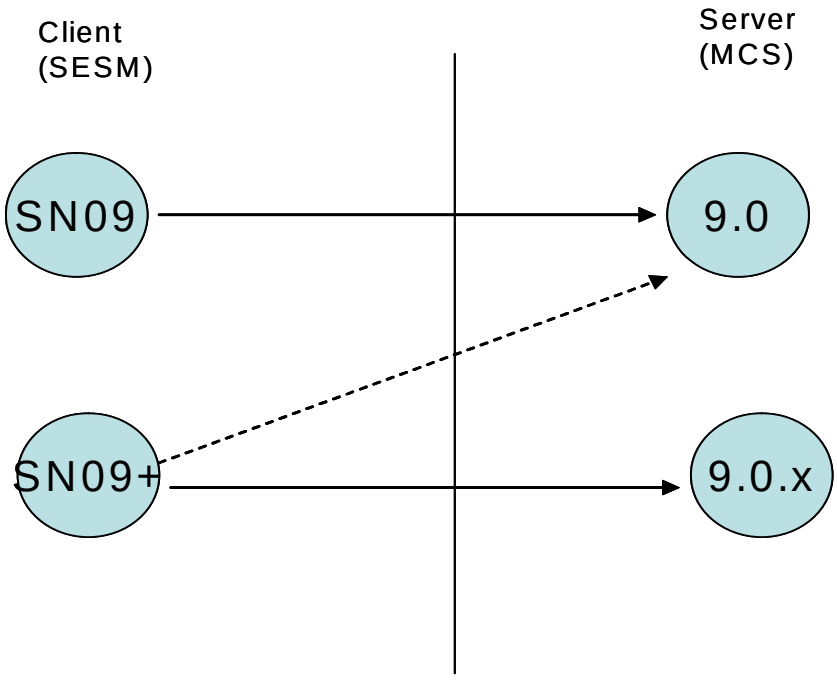


SESM would call the method getCurrentOPIVersion and based on the servers version, call the appropriate methods. The server would return the strings “9.0” and “9.1” respectively.

MCS Supported Backward Compatibility for maintenance releases:



Forward Compatibility for maintenance releases:



SESM would use VersionService to determine the MR number. Based on the MR number, SESM determines which methods to call. The server still expects the string “9.0” as the version number for any OPI method calls.

161.8 Number of simultaneous Endpoint posting

In the first release of SIP Lines on MCS (MCS 09) the number of endpoints which could be simultaneously posted from a single OMI login was limited to five. Since live monitoring of endpoint state must be done at the component which is aware of that state, endpoint state information is retrieved from the MCS Session Manager, which is responsible for Call Processing. This number was chosen as one which would not impact traffic rates on the Session Manager. However, it may be possible to increase the number without adversely affecting Call Processing. This feature will provide a mechanism to engineer the number of simultaneous endpoint posting per Session Manager via a configuration parameter against the System Manager.

161.9 Software Requirements or Dependencies

161.10 Limitations and restrictions

Interactions

A00009043 SIP Lines Provisioning Support

A00009528 Call Pickup

161.11 Glossary

Term	Description
Accounting Manager	CS2K MSM component which formats and stores billing records from the Session Manager. Turned off in MSM 9.0
AM	Accounting Manager
CPB	Call Processing Busy. Used to indicate that a SIP Line Subscriber is in the middle of a call.
Endpoint	Refers to a SIP Line Subscriber. In the context of SIP Lines, an endpoint does not actually refer to an IP port pair, but to a subscriber who may have registrations at multiple locations.
GCP	Gateway Control Protocol. Used for communication with GWCs
GWC	Gateway Controller. CS2K component to which Session Managers communicate for call processing
MCS	Multimedia Communication Server
MSM	Multimedia Session Manager
NCAS	Non Call Associated Signalling

Term	Description
NE	Network Element. A managed component of CS2K MSM. Includes Accounting Manager, Session Manager, and System Manager.
OAM	Operations, Accounting, and Management.
OID	Object Identifier. Unique ID used in the CS2K MSM database as a primary key.
OMI	Open Management Interface
Provisioning Manager	CS2K MSM component which manages CS2K MSM provisioning, including subscribers.
Session Manager	CS2K MSM component which manages SIP Sessions and call processing
SIP	Session Initiation Protocol
System Manager	CS2K MSM component which manages CS2K MSM configuration and maintenance.
VMG	Virtual Media Gateway. CS2K view of the CS2K MSM Session Manager.

162: Functional Description (FN) A00012569

162.1 Feature name and Feature ID

A00012569 - NI2 PRI/ ISUP UUI over SCAI

162.2 Description

162.2.1 User-to-User Service (UUI) Information Element (IE)

The PRI User-to-User Signalling (UUS) supplementary service enables a user to send/receive a limited amount of information to/from another user.This information is passed transparently without modification of content through the network over the signalling channel in association with the call.

UUS allows communication of ISDN users by transferring user-to-user information (UUI) during call establishment, call confirmation and/or call clearing phases of a call, within call control messages. Maximum 128 octets of user-to-user information can be transferred in each message. The UUI is already supported in Setup message for PRI NI2 GWC trunks.

This feature will support UUI for Setup Q931 messages i.e call establishment phase for

- DTCI and SPM peripherals for NI2 PRI trunk
- GWC, SPM and DTCI peripherals for NTNA PRI Trunks

UUS option will be enabled by datafilling in table LTDATA.

The UUI data from the setup will be tandemed to ISUP IAM (Initial address message) without any modification to the UUI data field. Similarly, UUI data from the ISUP IAM will be tandemed to PRI setup message without any modification to the UUI field.

162.2.2 UUI over SCAI

SCAI (Switch Computer Application Interface) is a messaging link provided by the CS2K to a host computer. The information carried across the X.25/TCP-IP link allows applications running on the CS2K to communicate with applications running on the host computer.

This feature will support delivery of UUI in the following SCAI messages:

- DV_Call_Received_C
- DV_Call_Queued_U
- DV_Call_Offered_U

In order to support UUI, the size of outgoing ICM messages will be increased from 256 bytes to 512 bytes. The support of UUI over the SCAI link will be supported only for SCAI19 and later service versions.

162.3 User-to-User Service (UUI) Information Element (IE)

162.3.1 Functional overview

In order to provide the User to User service on an NI2 PRI / NTNA PRI variant, two levels of requirements need to be met.

- There are 2 possibilities of UUS subscription, “Required” or “Preferred”. This feature will support only “Preferred” subscription.
- The second level is the request for a call. This is accomplished by the presence of a UUI IE in a received SETUP message.

The user to user data in any subsequent messages (Alert, Connect & Disconnect) is discarded.

This feature supports only the “Preferred UUS” option. The UUS is an existing option in table LTDATA.

User-to-User Service (UUS) starts with UUS option datafilled against a given LTID in table LTDATA. The UUS option is already available for tuples in table LTDATA. At present, it is enabled for NI-2 LTIDS on GWC. This feature enables UUS as an option for NI-2 LTIDs on SPM and XPM(DTCI). The Feature also supports UUS as an option for NTNA PRI LTIDs on SPM, XPM(DTCI) and GWC.

A call initiated with a Q.931 SETUP message having no UUI IE proceeds as non-UUS call.

This feature also supports mapping of UUI and UUS related messages for the following interworking:

- NI-2 PRI to/from NI-2 PRI
- NI-2 PRI to/from ANSI ISUP
- NTNA PRI to/from NTNA PRI
- NI-2 PRI to NTNA PRI

This feature will support UUS for NI-2 variant PRI and NTNA PRI100 variant on the following peripherals:

- A legacy XPM (DTCI)
- A SPM (DMSCP/MG4K)
- A GWC that hosts an H.248 trunk GW (PVG)

162.3.2 Delivery of UUS:

The Subscription of UUS has the following two possibilities:

- Preferred UUS
- Required UUS

162.3.2.1 Preferred UUS

Preferred UUS indicates that originating ISDN user can send a UUI IE in the Q.931 SETUP message to activate the service. If the UUI IE cannot be delivered to the far end user, due to a failure scenario the call continues without UUS active.

Preferred UUS subscription is obtained by datafilling table LTDATA with service option 'UUS' as shown in example below.

Preferred UUS will be supported by this feature.

Figure 1 External view of tuple in Table LTDATA with Preferred option

```
TABLE LTDATA
LTDKEY LTDRSLT
-----------------
ISDN 641 SERV SERV N N ALWAYS ALWAYS (UUS) $
```

162.3.2.2 Required UUS

REQUIRED UUS indicates that the originating ISDN user can send an UUI IE in the Q.931 SETUP message to activate the service. If the UUI IE cannot be delivered to the far end user due to a failure scenario, the call is cleared at the originating switch.

REQUIRED UUS will not be supported as part of this feature.

162.3.3 Message Protocols

162.3.3.1 ISDN UUI IE

The ISDN User to User Information Element structure is based upon the CCITT Recommendation Q.931 ISDN user-network interface layer 3 specification. The ISDN User to User Information Element structure will be as follows:

Table 1 User-user information element, coded #7E

Byte	8	7	6	5	4	3	2	1
1	0	1	1	1	1	1	1	0
		User-User Information Element Identifier						
2	Length of user-user contents							
3	Protocol Discriminator							
4	User Information							
:	:							
n	:							

- "n" can be a maximum of 131 bytes, which means up to 128 bytes of user information may be included.
- Protocol Discriminator is coded as 0 0 0 0 0 0 0 0 to indicate User Specific protocol.
- The User to User Information Element must be at least 3 bytes long in order for the UUS functionality to be invoked.
- The length of the UUI IE information is not regarded in the above 3 bytes limit check. Thus the presence of the first three bytes is mandatory for the UUI IE to be accepted.

162.3.3.2 User-to-User information parameter (UUI) on ISUP

The purpose of the User-to-user information parameter is to convey information between ISDN users. This information is not interpreted by the network, but rather is carried transparently and delivered to the remote user(s).

The format of the user-to-user information parameter is shown in the table below:

Table 2 User-user information parameter, coded #20

	8	7	6	5	4	3	2	1
1	User-user							
	0	0	1	0	0	0	0	0
	Information Parameter Identifier							
2	Length of user-user contents							
3	Protocol discriminator							
4etc	User information							

162.3.4 PRI to PRI/ISUP messaging

The UUS functionality is requested by including UUI IE in the SETUP message. When the originating CS2K receives the UUI IE in the SETUP message, table LTDATA static data will be checked. If Table LTDATA is NOT datafilled to support Preferred UUS, then the UUI IE will be stripped from the SETUP message and a STATUS message with Cause value of 50 “Requested Facility Not Subscribed” will be sent to the originator and the call will continue. If table LTDATA is datafilled to support Preferred UUS, then the ISDN UUI IE in the SETUP message will be carried across the network, the UUI IE will be mapped to the SETUP message for PRI to PRI calls and delivered to the ISDN end user.

The UUI data from the setup will be tandemed to ISUP IAM (Initial address message) without any modification to the UUI data field. Similarly, UUI data from the ISUP IAM will be tandemed to PRI setup message without any modification to the UUI field.

162.3.5 Preferred UUS Behavior

The Preferred UUS functionality will be requested by including UUI IE in the Q.931 SETUP message. When the Originator receives the UUI IE in the Q.931 SETUP message, Table LTDATA static data will be checked for subscription.

- **Preferred UUS Provisioning Phase**:

If table LTDATA is datafilled to support Preferred UUS, then the UUI IE in the Q.931 SETUP message will be carried across the network. The UUI IE will be mapped to the Q.931 SETUP message for PRI to PRI calls and/or PRI to ISUP calls, delivered to the end user.

- **Preferred UUS Call Request Phase:**

A call with specific parameters is requested by the calling party. If the (calling party) Originator sending the Q.931 setup message containing the UUI parameter, and if the Originator subscribes to the UUS service, then the UUI is mapped to SCP_X_Originate message. Otherwise the PM (DTCI, XPM, SPM) will send a Q.931 STATUS message to the Originator to indicate that the UUS facility was NOT subscribed. The Q.931 STATUS message with Cause value of 50 “Requested Facility Not Subscribed” will be sent to the originator and the call will continue without the UUI information.

Table 3 Error Scenario Handling

EVENT	ACTION BY SPCS/CS2K
UUS in Setup, but calling party has not subscribed to UUS option in LTDATA table.	Discard UUS; return STATus (cause #50) to calling party; continue call processing
UUS in SETUP cannot be further conveyed due to unsupported signaling. (Delivery of UUS is “Preferred”)	Discard UUS; continue call processing; return STATus (cause #69) to calling party.
User-User Information Element too long (excessive of 131 octets)	Discard UUS; continue call processing; Return STATus (cause #43) to sending party
UUS in CONNect,	Discard UUS; continue call processing;
UUS in DISConnect,	Discard UUS
UUS is present in an inappropriate clearing message (RELease)	Discard UUS; return RELease COMplete (cause #43) to sending party; continue call clearing
SETUP message length exceeds maximum supported number of octets	Discard UUS; continue call processing; return STATus (cause #43) to sending party

162.3.6 Information Element and Parameter Summary

A ‘X’ in Table 4 indicates that the IE, or parameter, can be included in the message identified in the column on the left. A blank entry indicates inclusion of the IE, or parameter, is invalid or not applicable.

Table 4 Information Element and Parameter Summary

Message	UUI IE	UUI Parm	Notes	UUI Supported
Setup (SETUP)	X		Call Request message	Yes
Alerting (ALERT)	X			No
Connect (CONNECT)	X		Call Confirmation message	No
Disconnect (DISC)	X		Call clearing message	No
Initial Address Message (IAM)		X	Call Request message	Yes
Address Complete Message (ACM)		X		Yes
Answer Message (ANM)		X	Call Confirmation message	Yes
Release (ISUP REL)		X	Call Clearing message	Yes

162.3.7 Hardware Requirements or Dependencies

None.

162.3.8 Limitations and restrictions

- The maximum length supported for the ISDN UUI IE is 131 bytes.
- The maximum length supported for the ISUP UUI Parameter is 131 bytes.
- The scope of this feature is limited to UUS enhancement for NI-2 PRI variant and NTNA PRI variant only.
- Only “Preferred” UUS option is supported by this feature.
- The protocol specifics outlined in this document reflect UUS for the Nortel North American PRI variant (NI-2 PRI and NTNA DMS PRI) only.
- The CS2K validates UUS subscription for ISDN PRI call originations only.
- When the CS2K receives a UUI IE in a message that does not support UUI, the CS2K sends a Q.931 STATUS message response.
- When the CS2K discards the UUI IE from a Q.931 message, indication of this is only communicated to the far end (FE) of the PRI. Indication that the UUI IE was discarded (a Q.931 STATUS message) is not propagated along adjacent PRI trunk connections.

162.4 UUI over SCAI

162.4.1 Description

The first PRI SETUP message (Initial Address message; IAM in the case of ISUP) sent from the originating switch can contain UUI (User to User Information) parameter. The UUI is used by the terminating switch as call related data.

This feature ensures that UUI arriving over the following trunks is delivered to the ICM environment.

1. NI2 PRI

2. NTNA PRI

3. ANSI ISUP

This activity will provide the UUI in ICM messages for the following agent types:

1. ACD agents
2. MDC agents
3. RES agents.

UUI IE from CS2K to the SCAI host will only be reflected in all the will be in every DV_Call_Queued_U, DV_Call_Offered_U and DV_Call_Received_C message.

162.4.2 Modified ICM Messages

This feature introduces a new parameter, namely **UUIPARM** in the following ICM call related messages.

- DV_Call_Queued_U
- DV_Call_Offered_U
- DV_Call_Received_C

The ASN.1 notations for the above mentioned three messages for ACD customer provided by this activity are shown in this section. The length fields are variable because the length depends on the variable contents. The tag values are taken from the Remote Operation Service Element (ROSE) protocol.

The maximum length of UUI supported by the new parameter is 128 bytes. The new parameter will show up in the above said messages on the basis of the appropriate subscription which will be discussed later.

The UUI is supported in the above-mentioned four messages for a SCAI-monitored terminator only.

- **SCAI19 Service Version**
  - — The ICM application Logon message contains a parameter; service Version, which is used to identify the stream of messages which will be allowed across the link. This service version is used as a method of protecting the integrity of host applications which choose not to upgrade their software to accept new message types after a switch has been upgraded to a new service version.
  - — The new service version SCAI19 needs to be added to the current list of SCAI service versions to receive modified messages with new parameter. The new service version is accepted at application logon processing time. The processing of individual messages which are introducing new encoding / decoding, adheres to the Service Version of ICM.

Note: *The parameters which are* ***italicized and bold*** *are new to these messages.The letter 'U' in the message name indicates that the message is unconfirmed, i.e., this operation requires no outcome to be reported by the host. The letter '****C****' at the end of the message's name indicates that the message requires confirmation from the host.*

162.4.2.1 DV_Call_Queued_U message

The switch sends this Remote Operation of Class 5 to the host when a call to an ACD DN associated with the current session is received by the switch and placed in the Incoming Call Queue.

162.4.2.1.1 Changed DV_Call_Queued_U ASN.1 definition.

162.4.2.1.2 DV_Call_Queued_U:Coded example.

An ACD call has been initiated from the OrigCallingNumber 6136217703 with UUI '01 02 03 04 05 06 07 08 09 0a', by dialing 6134444444 and assigned a LocalCallID = 13, and offered it to an ACD group with Primary DN 6136212111, for which no agent is available, the call is placed in the Incoming Call Queue and the switch sends DV-CALL-QUEUED-U to the host. No Return Result is required or received by the switch from the host.

162.4.2.3.2 DV_Call_Received_C: Coded example.

An ACD call has been initiated from the OrigCallingNumber 9192466001, with UUI in setup by dialing 9197224444 and assigns a LocalCallID = 4 to the call meant for ACD group with Primary DN of the ACD group =9194815200. The switch sends DV-CALL-RECEIVED-C message to the host which responds with either Return Result message or Return Error message.

INVOKE CS2K ===== > HOST

Hex Dump			Information Element	Comments
Tag	**Length**	**Content**

162.4.3 Size expansion of ICM messages

The size of outgoing ICM messages will be increased from the existing 256 bytes to 512 bytes. The increased size will be available for TCP/IP link set only. For X.25 link sets, the maximum available size will be 241 bytes.

If the size of a message with UUI parameter becomes greater than 241 bytes in X.25 link set, then the UUI will be discarded from the message and the message will be sent with the remaining parameters. In such scenarios, a SCAI LOG 304 will be generated indicating the removal of UUI.

Note: It is recommended to upgrade from X.25 to TCP/IP to get the full use of UUI over the SCAI link.

162.4.4 Subscription

The following changes in table SCAISSRV are required to provide subscription to receive ICM messages with the new parameter. Preconditions to be satisfied by a party in order to receive all the messages with new parameter are also given in this section.

162.4.4.1 Changes in table SCAISSRV

The changes in table SCAISSRV are made for the following SCAI messages:

- DV_Call_Received_C
- DV_Call_Queued_U
- DV_Call_Offered_U

An optional parameter UUIPARM is added to the existing parameters in the function CALLQUED, CALLOFFR and CALLRECDC which are present in the following categories: CTXEVENT, RESEVENT, ROUTING and ACDEVENT messages in table SCAISSRV.

During the software upgrade, the existing tuples of table SCAISSRV which are present in loads prior to the introduction of the aforementioned four tuples, would be modified by reformat procs during table transfer to reflect UUIPARM parameter in the functions CALLQUED, CALLOFFR and CALLRECDC as ‘N’.

Following are the sample tuples shown:

```
TABLE SCAISSRV
 SUBSERV SPROFILE
 ------------------------------------------------
 ACDEVENT15$ ACDEVENT (CALLQUED Y Y Y Y Y Y Y Y Y Y Y N)
 (CALLOFFR Y Y Y Y Y Y Y Y Y Y Y Y N)
 (CALLANSWR Y Y Y Y Y Y Y Y Y Y Y Y)
 (CALLREL Y Y Y Y Y Y) (AGTLGDIN Y Y Y) (AGTLGDOUT Y Y)
 (AGTREADY Y Y)
 (AGTNREADY Y Y N) (LOBEVENT Y Y Y) (EMKEVENT Y Y Y Y Y Y)
```

```
TABLE SCAISSRV
 SUBSERV SPROFILE
 ------------------------------------------------

ROUTING15$ ROUTING (CALLRECDC Y Y Y Y Y Y Y Y Y Y Y N)
(CALLREDIR Y Y Y) $
```

A new default tuple CTXEVENT19$ under category CTXEVENT will be created with the optional parameter UUIPARM of the function CALLOFFR set to Y. Prior to this, the latest default tuple in the category CTXEVENT is CTXEVENT13$.

A new default tuple RESEVENT19$ under category RESEVENT will be created with the optional parameter UUI of the function CALLOFFR set to Y. Prior to this, the latest default tuple in the category RESEVENT is RESEVENT13$.

A new default tuple ROUTING19$ under category ROUTING will be created with the optional parameter UUI of the function CALLRECDC set to Y. Prior to this, the latest default tuple in the category ROUTING is ROUTING15$.

A new default tuple ACDEVENT19$ under category ACDEVENT will be created with the optional parameter UUIPARM of the function CALLQUED, and CALLOFFR set to Y. Prior to this, the latest default tuple in the category ACDEVENT is ACDEVENT15$.

Table 5 SCAISSRV table changes

Category	Function	Added Parameters	New/Same
CTXEVENT	CALLOFFER / CALLANSWR	UUIPARM	Old function and new parameter
RESEVENT	CALLOFFER / CALLANSWR	UUIPARM	Old function and new parameter
ROUTING	CALLRECDC	UUIPARM	Old function and new parameter
ACDEVENT	CALLQUED / CALLOFFER / CALLANSWR	UUIPARM	Old function and new parameter

```
TABLE SCAISSRV
 SUBSERV SPROFILE
 ------------------------------------------------
 CTXEVENT19$ CTXEVENT (SETOFFHK Y Y Y)
 (CALLOFFR Y Y Y Y Y Y Y Y Y Y Y Y Y Y Y Y)
 (CALLANSWR Y Y Y Y Y Y Y Y Y Y Y Y Y Y Y) (CALLREL Y Y Y Y)
 (CALLNAME Y Y Y Y Y) $

TABLE SCAISSRV
 SUBSERV SPROFILE
 ------------------------------------------------
 RESEVENT19$ RESEVENT (SETOFFHK Y Y)
 (CALLOFFR Y Y Y Y Y Y Y Y Y Y Y Y Y Y Y)
 (CALLANSWR Y Y Y Y Y Y Y Y Y Y Y Y Y Y Y) (CALLREL Y Y Y)
 (CALLNAME Y Y Y Y Y) $

TABLE SCAISSRV
 SUBSERV SPROFILE
 ------------------------------------------------

 ROUTING19$ ROUTING (CALLRECDC Y Y Y Y Y Y Y Y Y Y Y Y)
 (CALLREDIR Y Y Y) $

TABLE SCAISSRV
 SUBSERV SPROFILE
 ------------------------------------------------
 ACDEVENT19$ ACDEVENT (CALLQUED Y Y Y Y Y Y Y Y Y Y Y Y)
 (CALLOFFR Y Y Y Y Y Y Y Y Y Y Y Y Y)
 (CALLANSWR Y Y Y Y Y Y Y Y Y Y Y Y)
 (CALLREL Y Y Y Y Y Y) (AGTLGDIN Y Y Y) (AGTLGDOUT Y Y)
 (AGTREADY Y Y)
 (AGTNREADY Y Y N) (LOBEVENT Y Y Y) (EMKEVENT Y Y Y Y Y Y)
```

162.4.4.2 Preconditions to receive the modified ICM messages.

- The state SOC ICM00083 should be ON.
- A party must be a ACD DN or ECM associated in order to get the modified messages.
- The Service Version should at least be SCAI19.
- The ICM session on which the DV_Call_Queued_U message is to be sent with the new parameter must subscribe to the ACDEVENT category and CALLQUED function. Also the parameter ***UUIPARM*** in the function CALLQUED must be set to ***Y***.
- The ICM session on which the DV_Call_Offered_U message is to be sent with the new parameter must subscribe to either ACDEVENT, CTXEVENT or RESEVENT category and CALLOFFR function. Also the parameter ***UUIPARM*** in the function CALLOFFR must be set to ***Y*** and ***UUIPARM*** in function CALLQUED and CALLRECDC must be set to N.
- The ICM session on which the DV_Call_Received_C message are to be sent with the new parameter must subscribe to the ROUTING category and CALLRECDC function. Also the parameter ***UUIPARM*** in the function CALLRECDC must be set to ***Y***.

162.4.5 Message Flow Scenarios

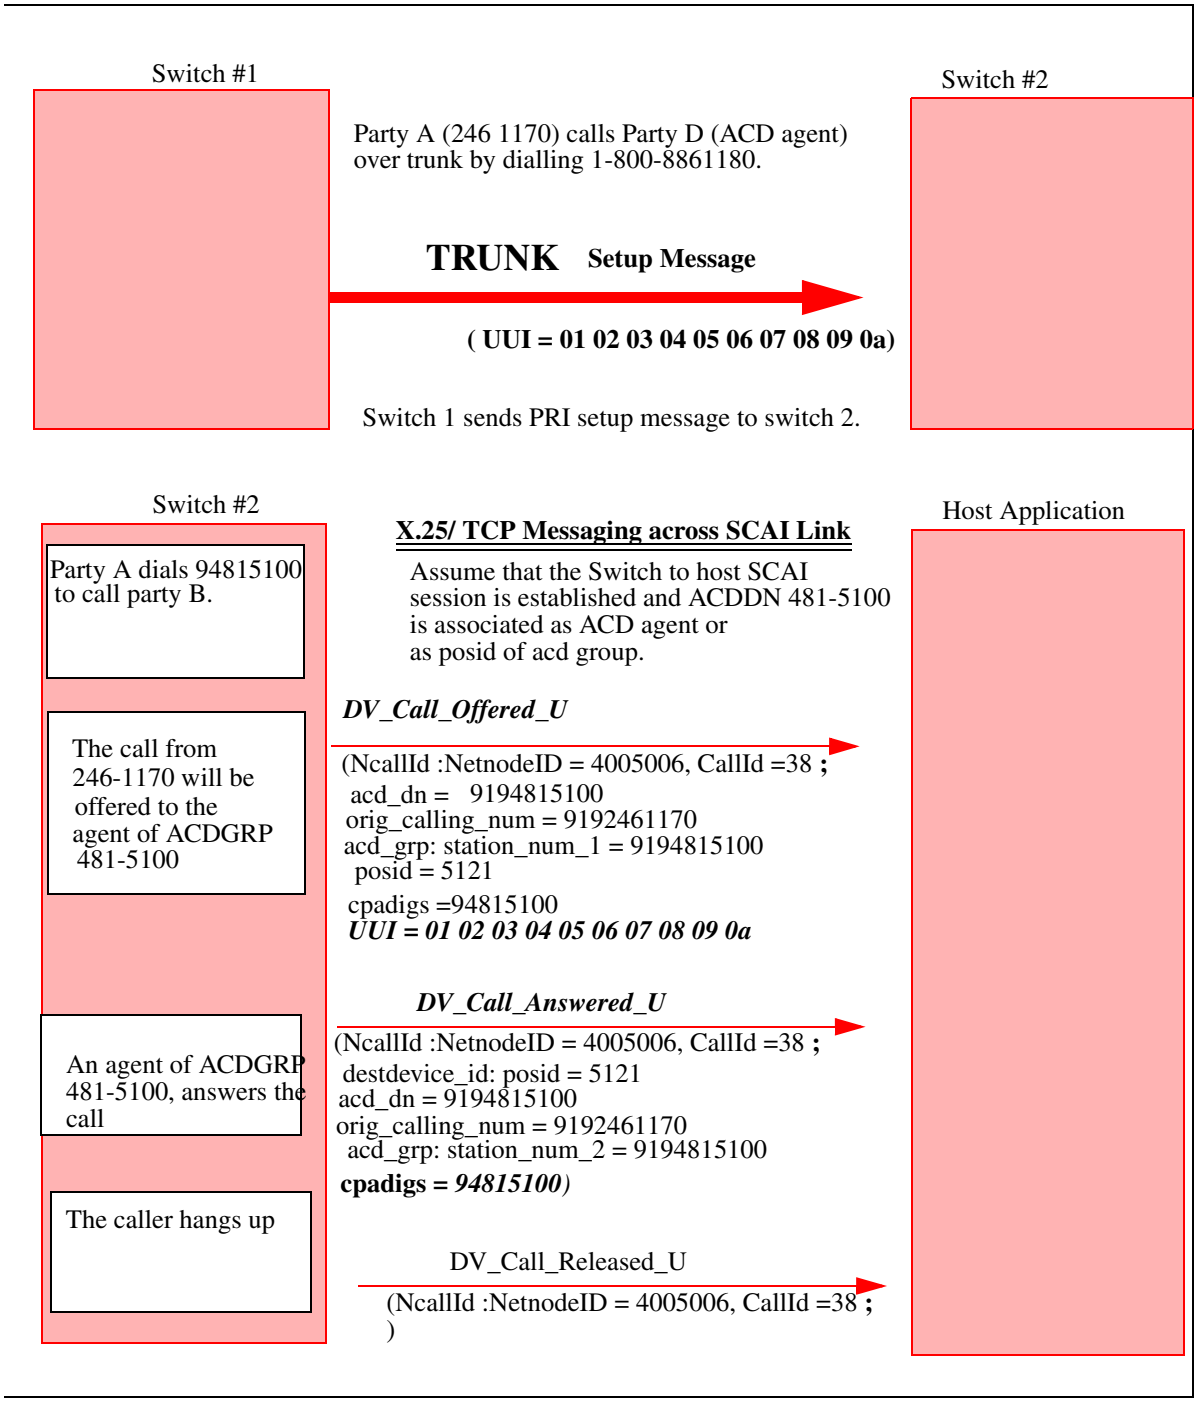
Consider some message flow scenarios to get better understanding of the feature. In all the scenarios mentioned below, assume the following, unless stated otherwise:

1. *Parties B, C and D are always ECM associated ACD/MDC/RES agents.*
2. *Parties B and C belong to same switch.*
3. *Party A is any agent that requires service from a call centre and may be on the same network or a different network.*
4. *All the preconditions mentioned in section Please refer to "161.4.4.2 Preconditions to receive the modified ICM messages." on page 1616. are satisfied by all the parties.*
5. *The modified messages are shown in bold and italics.*
6. *The messaging that remains the same may not been shown explicitly.*
7. *The term trunks mean any of the trunks mentioned in section Please refer to "161.4.1 Description" on page 1602..*
8. *In all the scenarios, the statement 'party A calls party B/D' is to be interpreted as 'party A dials to reach a call centre and the call terminates to agents B/D within that call centre'.*

162.4.5.1 Example 1: UUI IE in DV_Call_Offered_U

Party A (2461170) calls party B (ACD agent of ACDGRP 4815100, posid: 5121) over PRI/ISUP trunk and party B answers.

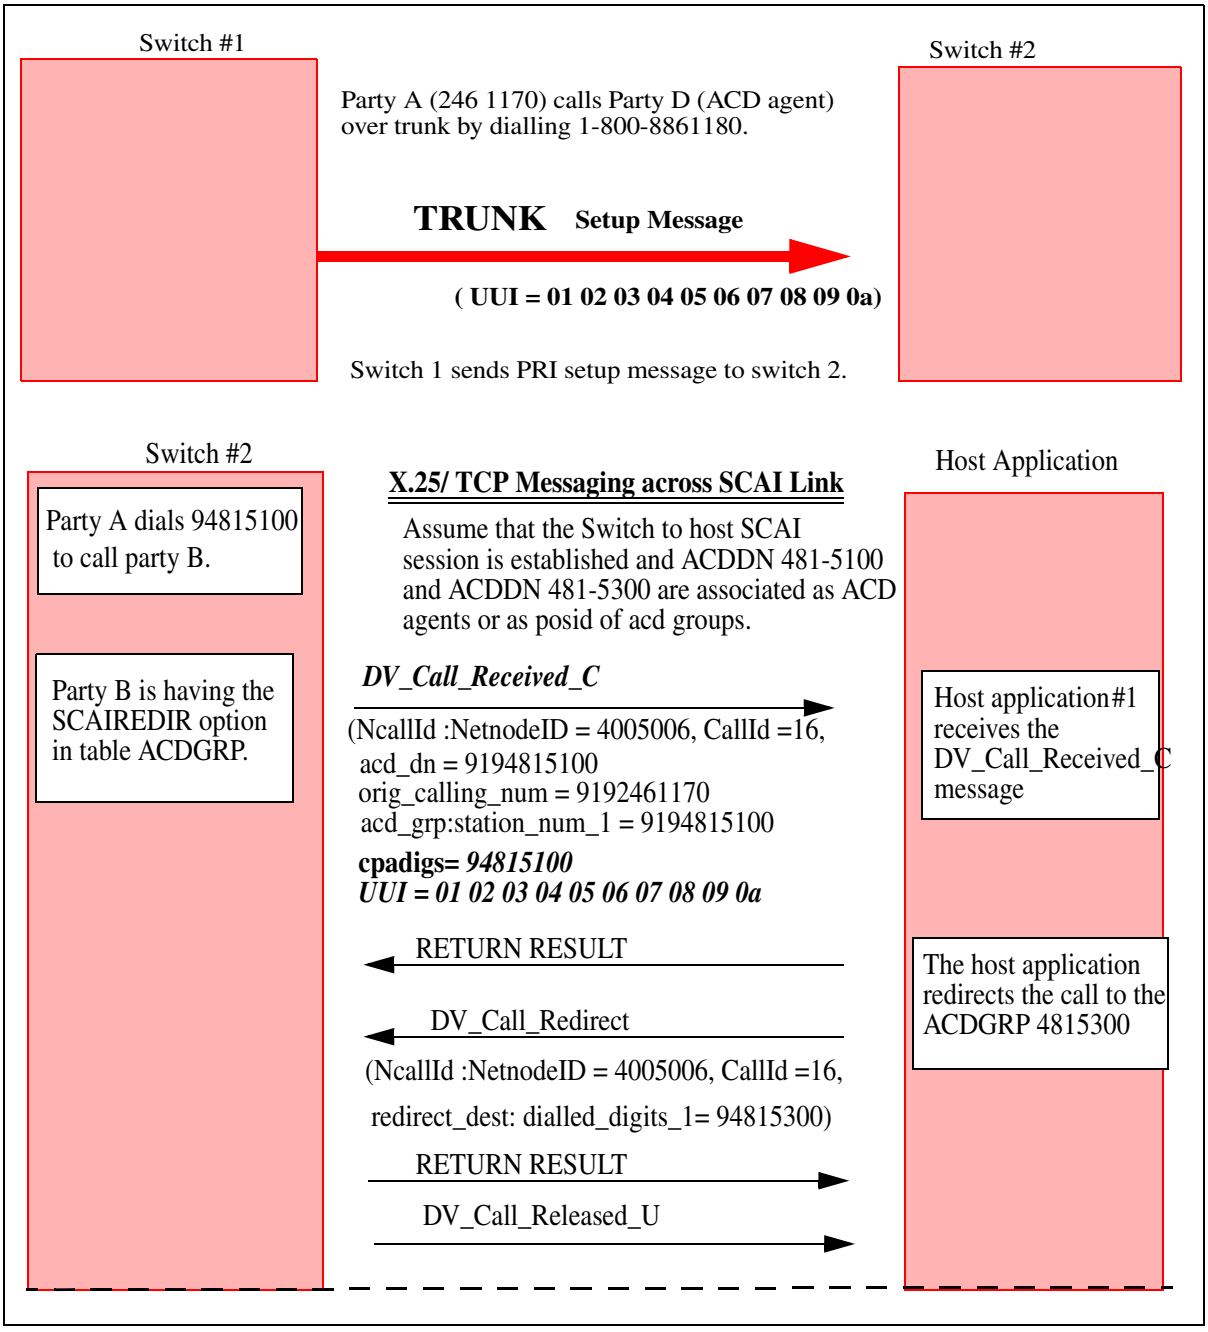
Figure 2 UUI in DV_Call_Offered_U



162.4.5.2 Example 2: UUI IE in DV_Call_Received_C message

Party A (2461170) calls party B (ACD agent of ACDGRP 4815100, posid: 5121) over PRI/ISUP trunk and party B answers.

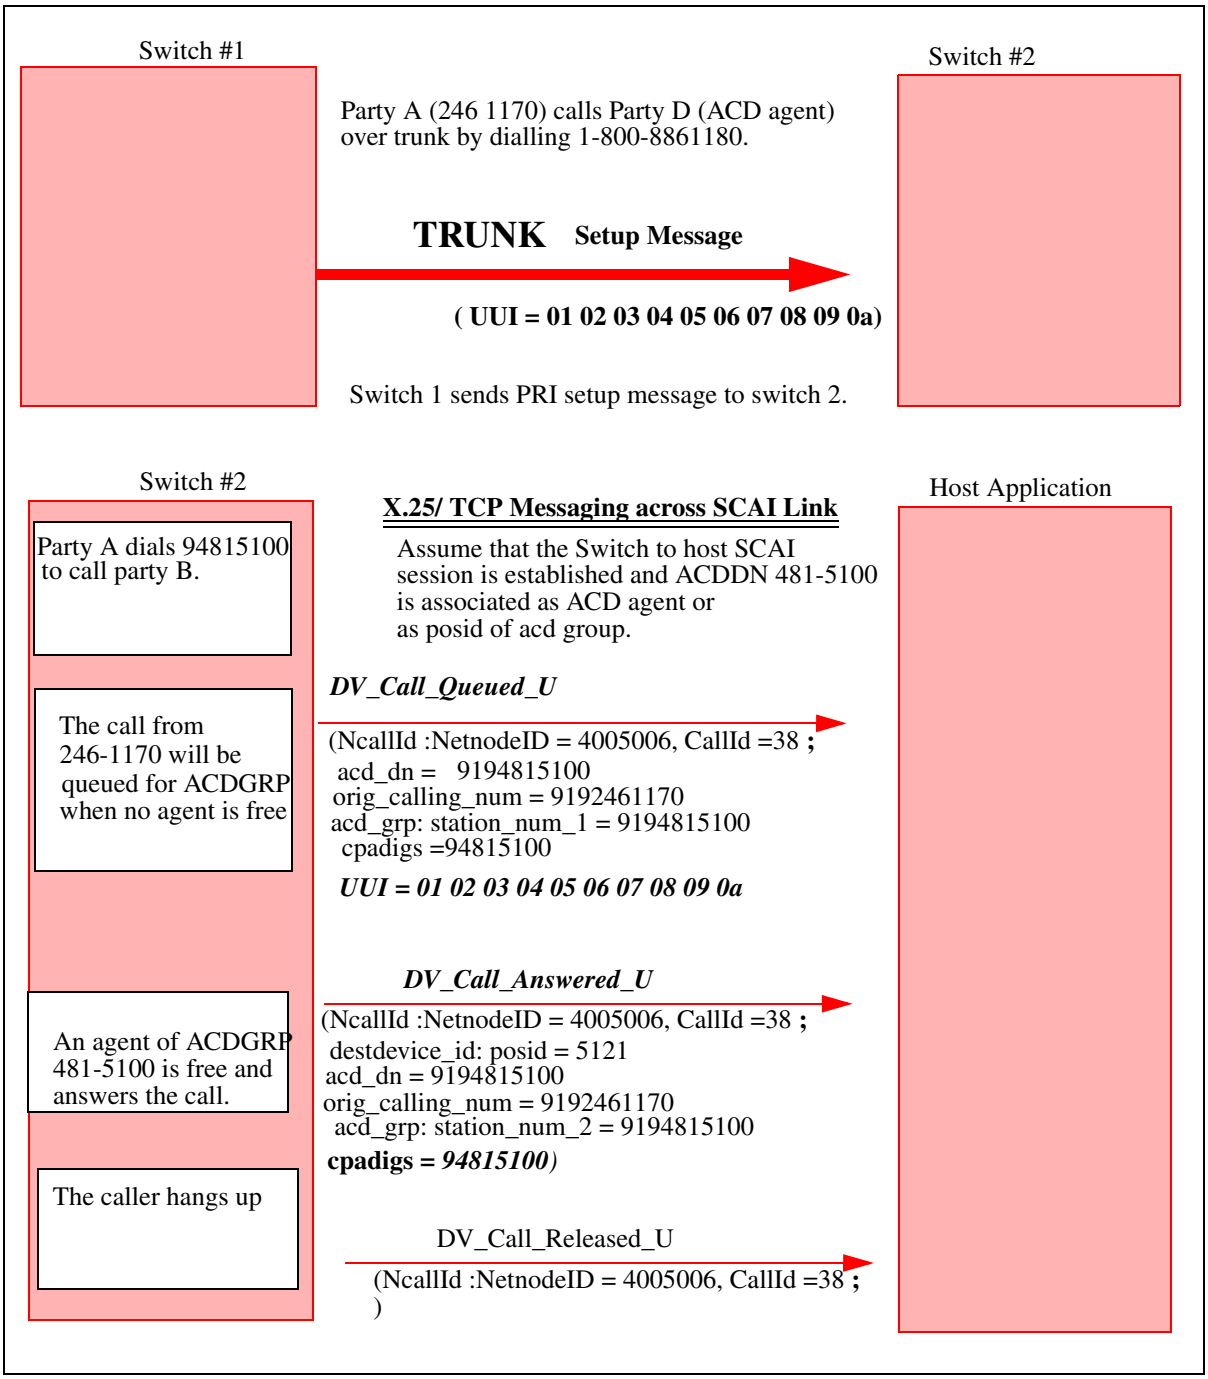
Figure 3 UUI in DV_Call_Received_C message



162.4.5.3 Example 3: UUI IE in DV_Call_Queued_U

Party A (2461170) calls party B (ACD agent of ACDGRP 4815100, posid: 5121) over ISUP/PRI and party B answers.

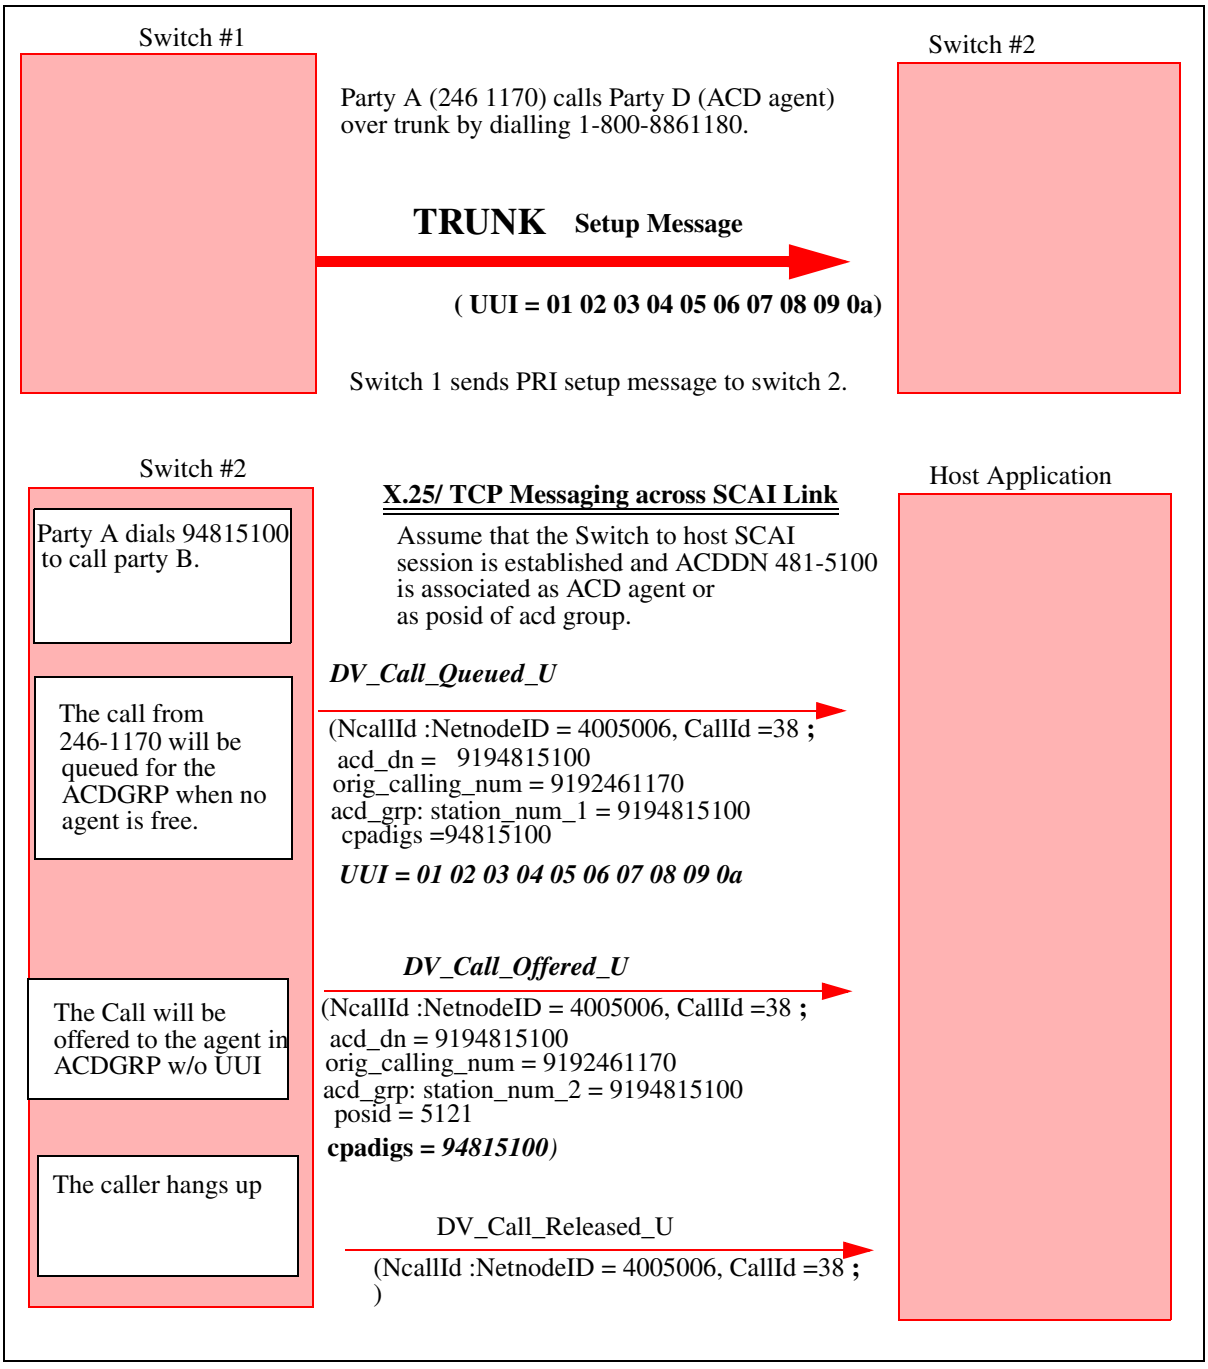
Figure 4 UUI in DV_Call_Queued_U



162.4.5.4 Example 4: UUI IE not in DV_Call_Offered_U

Party A (2461170) calls party B (ACD agent of ACDGRP 4815100, posid: 5121) over ISUP/PRI and party B answers.

Figure 5 UUI in DV_Call_Queued_U



162.4.6 SOC

The UUI IE data delivery to SCAI is controlled by state SOC ICM00083. The UUI IE data is delivered to the SCAI host only if the SOC is turned on and the sub service supporting UUI is subscribed.

In case a call over a ISUP/NI2 PRI trunk with UUI IE terminates on a SCAI monitored agent and the SOC ICM00083 is IDLE, the UUI shall not be delivered to the SCAI host even if the profile in SCAIPROF is subscribed to the subservice with support for UUI.

The SOC functionality shall be available in SN10 and SN09 Drop II shall have the functionality as an activatable patch. When CS2K with patch CFZ40 activated on SN09 upgrades to SN10 or higher release, the SOC Option ICM00083 will be automatically turned ON during ONP.

Note: The delivery of UUI IE over incoming NI-2 PRI or ANSI ISUP messages will not be SOC controlled.

162.4.7 Logs

If the total size of the outgoing ICM message with UUI exceeds the maximum supported size of outgoing ICM message then the UUI IE will be discarded and LOG SCAI 304 will be generated.

162.5 Hardware Requirements or Dependencies

Not Applicable

162.6 Software Requirements or Dependencies

Not Applicable

162.7 Limitations and restrictions

This feature does not ensure the correct UUI IE population for the protocol variants other than those specified

162.8 Interactions

Not Applicable

162.9 Applicable customer facing sections

162.9.1 Fault Management

162.9.1.1 Logs (LG)

SCAI 304: The snapshot of the log is given below:

RSNN10AG SCAI304 JAN14 22:30:56 5348 INFO UUIPARM DISCARDED
MESSAGE: DV-CALL-QUEUED-U

LINK ID : DNA: 000000000000000 PROTOCOL: 1 1 1 1
DEVICE : MPC: 0 LINK: 3
SCAI GROUP: SCAI_GRP1
LINKSET NAME: X25_LNK1

SCAI304 log limitation: There are certain scenarios in which the SCAI304 log will be generated with LINK ID, DEVICE ID and LINKSET NAME set as unavailable. This happens when the queue used to transmit the message to the SCAI host is decided at a later stage. That is, the queue information is available only at a later stage after the UUI parameter is discarded. The queue information is needed to get the LINK ID, DEVICE ID and LINKSET NAME details.

ISUP	ISDN User Part

163: Functional Description (FN) A00012570

163.1 Feature name and Feature ID

A00012570 - Disabling Non-secure Network Services in SSPFS

163.2 Description

When non-secure services within the operating system are not used, they should be disabled to close down any port(s) used by these services and reduce the exposures to security threats. Non-secure services such as ftp, tftp, telnet, SNMP and NFS may have secure equivalents. Therefore the use of the non-secure services can be disabled altogether when not in use. A configuration tool is required to selectively disable the non-secure services.

This activity provides some configuration tools to assist customers in configuring the server based on their security policy. Upon completion of the fresh system installation or upgrade, the customer (security administrator) has the possibility to apply the security policy on the server via a command line interface.

As part of this feature, non-secure network services not required by our product offerings (such as rpc in inetd.conf) will be disabled by default during initial system installation and upgrades.

This feature is targeted for all SSPFS platforms and profiles.

163.3 Hardware Requirements or Dependencies

Not applicable.

163.4 Software Requirements or Dependencies

Not applicable

163.5 Limitations and Restrictions

The following operating system services will be configurable/disabled by default on fresh install:

- List the RPC post IT.

This feature only provides configuration tools for services registered in the inetd.conf and the proftpd.conf files.

The configuration tools are only available to the root user.

Any services started under inittab, initd or the rpcd deamons are not affected.

163.6 Interactions

This feature interacts with any applications already deployed that makes use of the services listed above in section 2.5.

164: Functional Description (FN) A00012571

164.1 Feature name and Feature ID

A00012571 - CBM User Group Improvements

164.2 Description

This feature builds on two other CBM23 security features:

- A00012465 - CBM User Authorization Integration with a Nortel Central Security Server (Wireless application).
- A00012729 - CBM Application GID Migration.

A number of CBM maintenance commands require *root* (superuser) privileges. This is a security concern because it results in the wide distribution of the *root* password. This feature will eliminate the requirement to be the *root* user in order to do CBM maintenance procedures[1].

Currently there are only two authorization levels on the CBM: 1) the *root* user and 2) users belonging to the *maint* group. In this feature two new user groups will be created to eliminate the requirement for the *root* user and enable increased authorization granularity. The new groups are **emsadm** for system administration and **secadm** for security administration. While just these two groups will be added at this time, it will be possible to extend this feature in future releases and add additional groups.

The following table has a general summary of the CBM maintenance functions and the required authorization level. For more detail refer to later sections.

Table 1: Summary of Authorization Levels

Function	Root	emsadm	secadm	maint
Initial system installation	* *(1)*			
Application software install	*	*		
Software patching	*	*		
System upgrade	*			

[1]Initial installation of a CBM will still require the use of the root account (limitation imposed by Solaris).

Table 1: Summary of Authorization Levels

Function	Root	emsadm	secadm	maint
User Administration (create users, add users to groups, etc.)	*		*	
Application Configuration	*	*		*
Application State Change	*	*	*	*
view security logs	*		*	
Backup	*	*	*	*

This feature will extend the CBM maintenance MAP screens for user administration, including additional screens to:

- display list of groups and the users in a group
- display list of users and the groups they belong to
- create, change and remove users
- add/delete users to groups.

164.3 CBM User Shells

All CBM users regardless of their authorization levels will obtain a restricted shell after login to a CBM. The only exception to a restricted login shell is the root user.

A restricted shell will limit a user's ability to preform many system commands. A non-restricted shell is needed for administrative users to perform their functions. For users with administrative authorizations, they will able to obtain a non-restricted shell from a restricted login shell. For maintenance users who don't have administrative authorizations, they will be denied access to obtain a non-restricted shell.

The following shows how an emsadm user can obtain non-restricted shell access from the restricted login shell.

Figure 1 Get non-restricted shell from a restricted login shell

```
> ssh hems@47.135.214.81

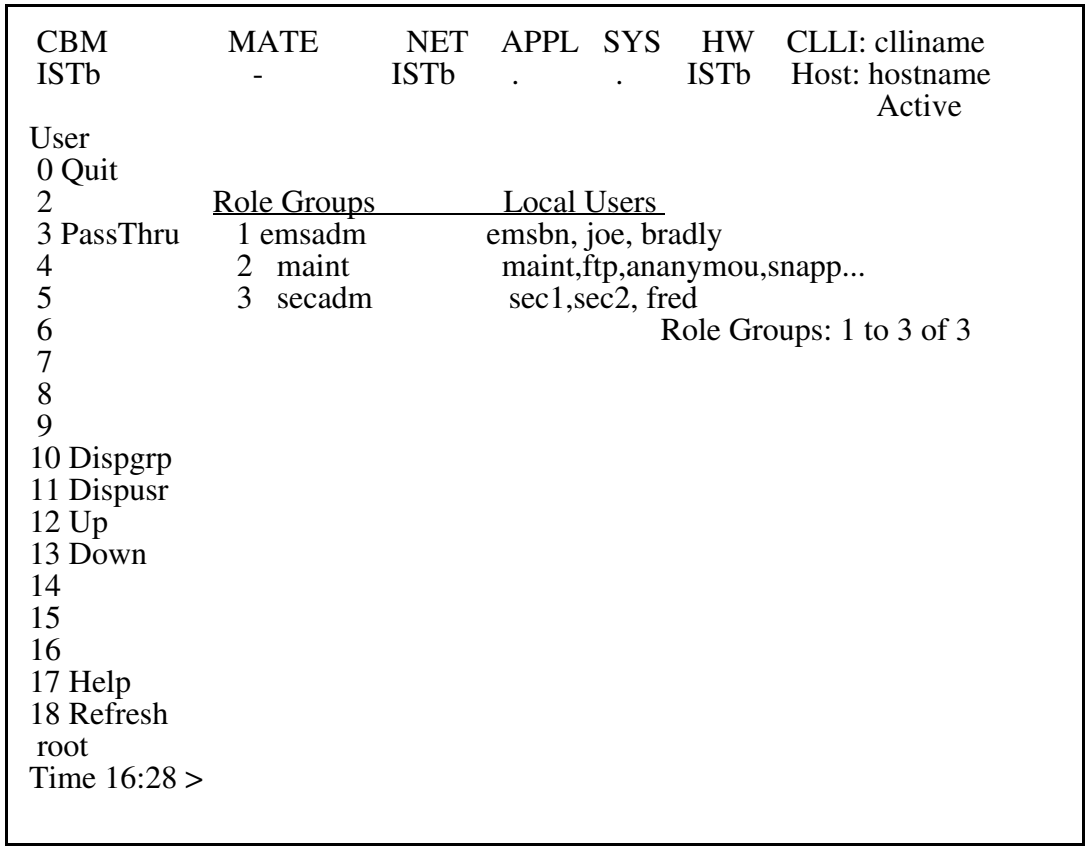
Note: The syntax of the above displayed logs is not finalized.

164.4 CBMMTC- User Menu Changes

The main menu for the user level of the CBMMTC will be changed to display all the Role groups and their users. From this menu “add”, “change” and delete will still be done as it was in previous releases. Some new commands have also been added to display more information about the role groups and users of the roles groups.

Figure 2 CBM user menu

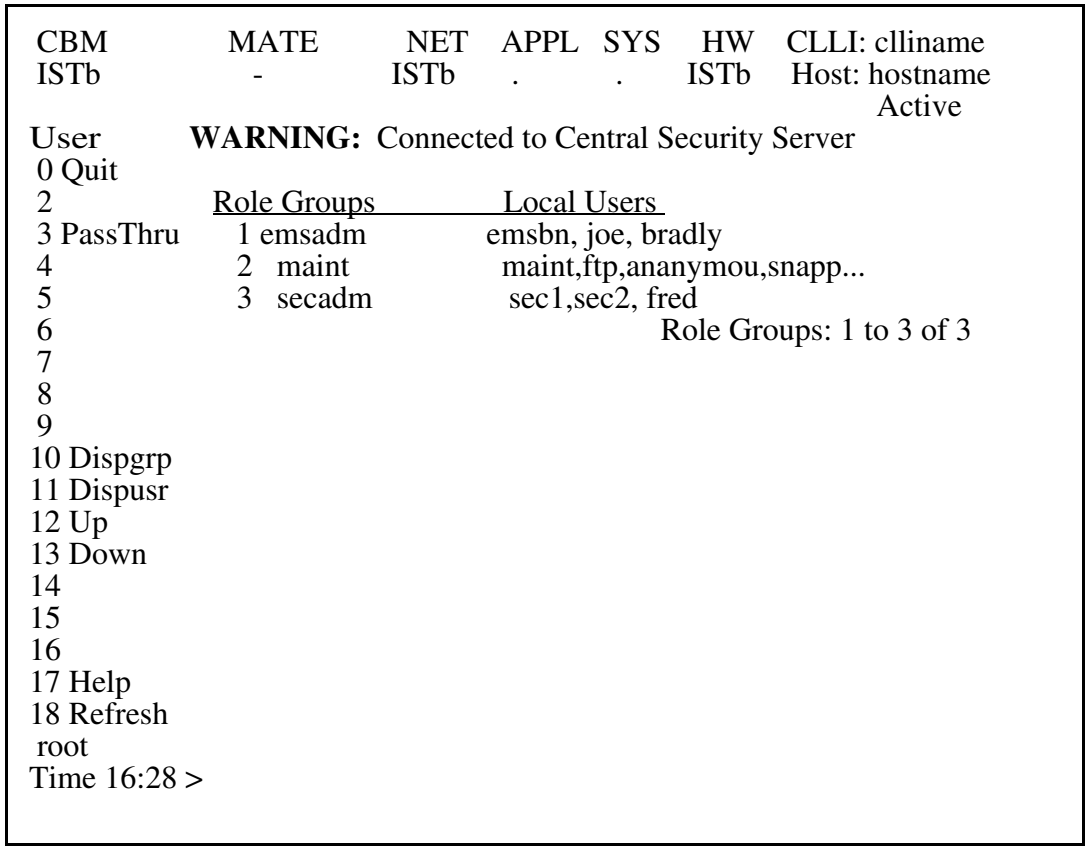


With this menu a user can be added, changed or deleted. To add a user to a group type: “add <username>”. If the user already exists locally or remotely, an error will be returned stating this. The user will be required to enter the main role group for the user as well as any other role groups the user is to belong to. To change the users information including password type “change <user>”. The user’s groups and/or password can now be changed. To remove the user from a group type: “delete <username>”. If the user does not exist, a error will be displayed. Only local user can be deleted from the RMI.

If a central security server is installed in the system a special warning will be displayed on the screen so that the user will know that any users create on the CBM are local to that CBM and will not appear on the Central security server.

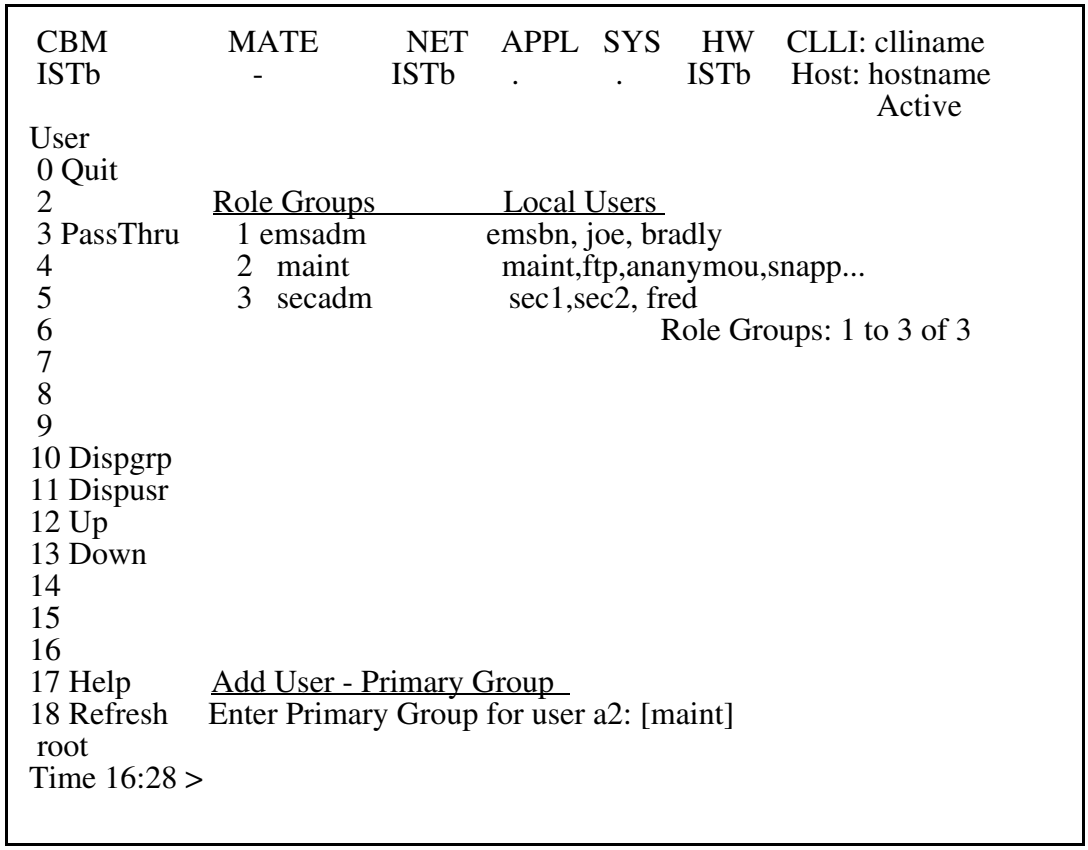
Also, any users that are created on the central security server will not appear on the local CBM menus. That is, remote users can not be viewed, added, changed or deleted. However, if a user is attempted to be created locally and it already exists on the central security server, the command will fail.

Figure 3 CBM user menu



The add and change options for users will display a new group of screens to allow the primary group, secondary groups and password for a new user to be added or changed. The following screens will be displayed for the add or change commands:

Figure 4 CBM "Add/Change" Primary Group prompt



At this prompt the user can either type a carriage return to accept the default which is "maint" in this case, as the user's primary group or type a different primary group. At this time the other choices are "secadm" and "emsadm".

The user will now be prompted to enter the secondary groups. The following screen will be displayed:

Figure 5 CBM "Add/Change" Secondary Groups prompt

```
CBM          MATE       NET   APPL  SYS   HW    CLLI: clliname
ISTb           -        ISTb   .     .    ISTb   Host: hostname
                                                      Active
User
 0 Quit
 2              Role Groups          Local Users
 3 PassThru      1 emsadm            emsbn, joe, bradly
 4               2  maint            maint,ftp,ananymou,snapp...
 5               3  secadm           sec1,sec2, fred
 6                                                Role Groups: 1 to 3 of 3

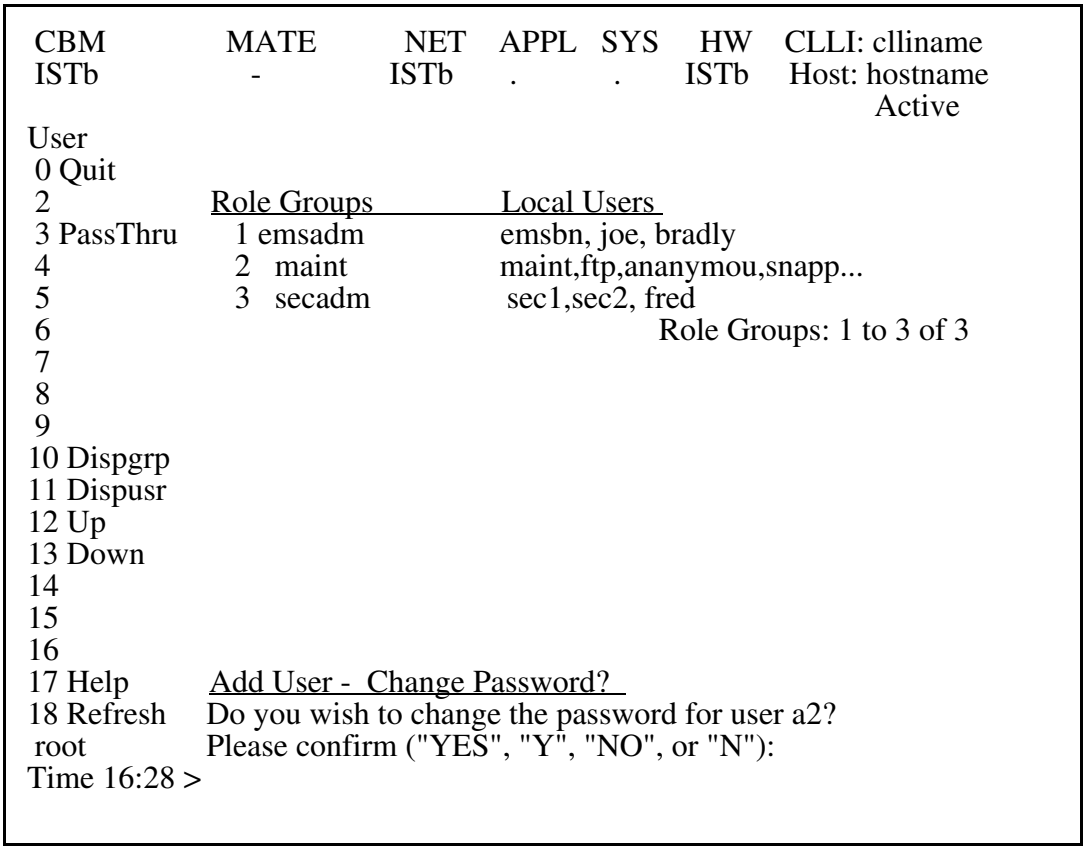
18 Refresh     Enter Secondary groups for user a2, type 'none' to remove: [none]
 root
Time 16:28 > secadm,emsadm
```

At this prompt the user can either type carriage return to accept the default which is "none" in this case or type one or more groups. The possible groups are "maint', "secadm" and/or "emsadm". The primary group can not be a part of this list. So in the above example since "maint" is the maint group the secondary groups can be none, secadm, emsadm of both secadm and emsadm. To add both type the names separated by a comma, as shown above.

The user will then be asked if he wants to change the password of the new user.

Figure 6 CBM "Add/Change" Password prompt



If you choose "y" you will then be prompted to enter the password for the user. If "n" is chosen then you will get the "command complete" and you will see the display change to add your user.

A security log is generated to capture the password change event. The password change security log will look as follows:

Aug 24 13:49:40 CBMDRY3 gen_security_log[20718]: class_security.ver02 EVENT.TYPE="USER_ACT_Security_Passwd" DOC="cbmmtc" STAT="Success" DST="CBMDRY3" DST.USR="root" SRC.OFFEND="47.129.112.179" HOST.TYPE="application" TTY="pts/1" MESSAGE=user A reset password for user B MID="SDM_MID_defn.security.0018"

Note: The syntax of the above displayed log is not finalized.

To display all users on the local CBM type either option 11 or “dispusr”. The display user command will give the following screen:

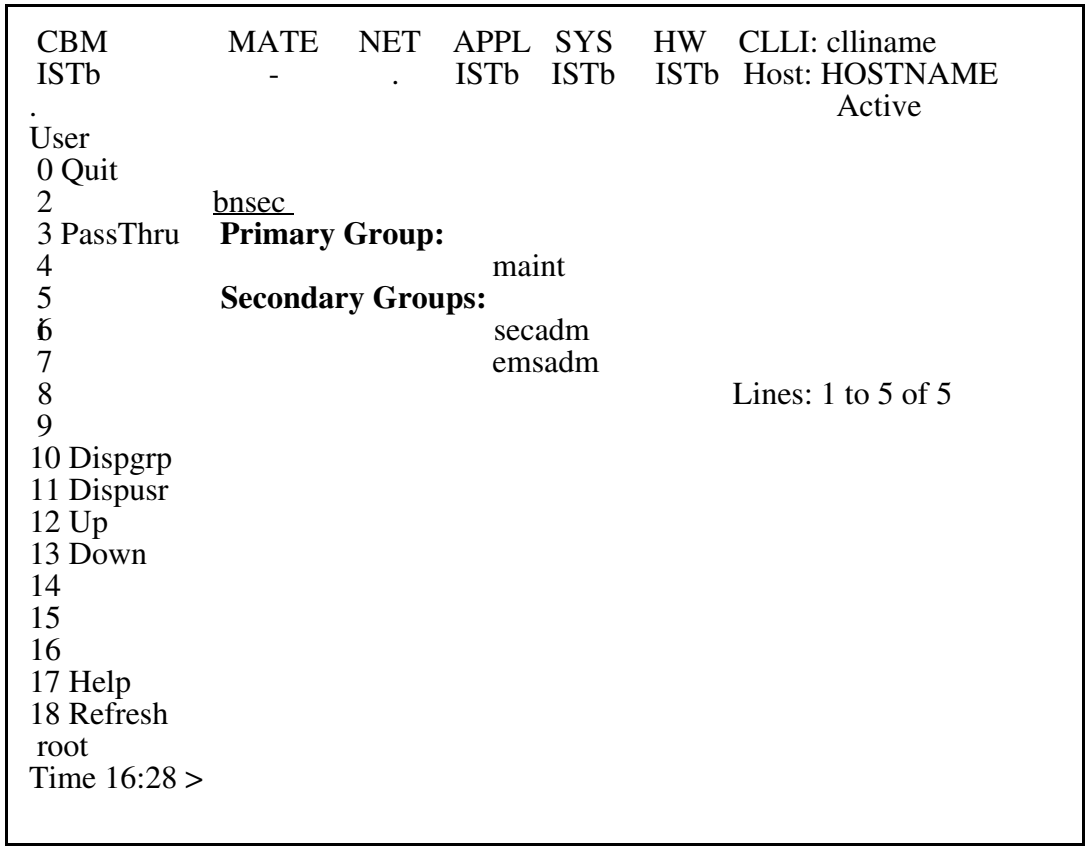
To display the information for a particular user type: 11 <username> or “dispusr <username>”. The display for a user will appear as:

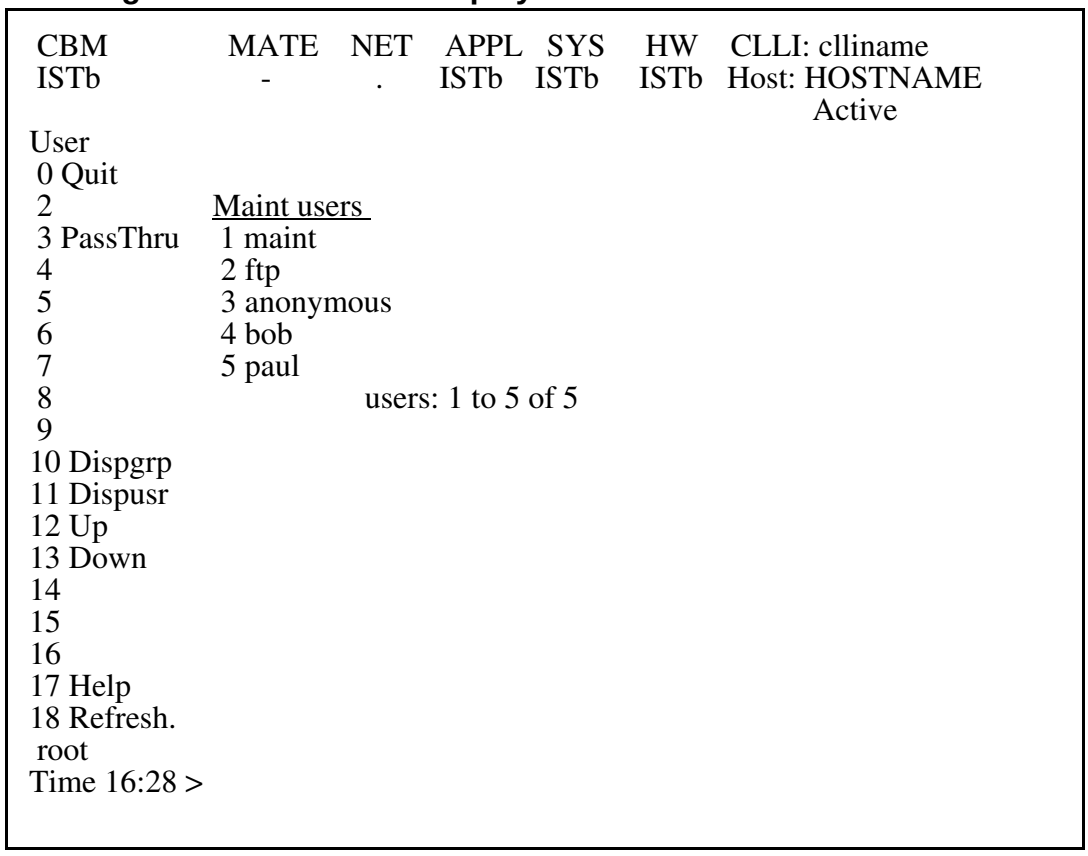
Figure 8 CBM user display menu



This menu differs from the SDM menu of this level slightly as it does not show the home directory or shell for the user. In this release we thought it was better not to allow the user to change these fields since it required more knowledge on the user’s behave.

The Group information can also be displayed. If option 10 or “dispgrp” is typed without parameters, all the groups with their users is type as in figure 3. If you type “11 maint” or “dispgrp maint” you will get the following screen:

Figure 9 CBM Maint display menu



The actions that a certain group can perform can also be displayed. This may be done by typing “10 <groupname> act” or “dispgrp <groupname> act”. The following is a display for maint:

164.5 CBM Commands Authorization

The following tables contain the commands authorizations for CBM tools (cbmmtc and billmtc) and some of the commands from SPFS CLI tool that are used on a CBM.

Note: When the new authorization level is “ALL”, it indicates that users in all groups (maint, emsadm and secadm) and the root user have access to that command.

Table 2: CBMMTC Command Authorization Summary

CBM Tool	Level	Commands	Description	Old auth. level	New auth. level
cbmmtc				root, maint	ALL

Table 2: CBMMTC Command Authorization Summary

CBM Tool	Level	Commands	Description	Old auth. level	New auth. level
	Mtc		Enter the maintenance level	root, maint	ALL
	Mtc>Net		Enter the Network connectivity status level.	root, maint	ALL
	Mtc>Net	Logs	Display the last event reported on each of the connectivity status indeicators.	root, maint	ALL
	Mtc>Net	QueryCBM	Query information about the CBM including Faults, status and mate faults.4	root, maint	ALL
	Mtc>Net>Core		Go to the Core level.	root, maint	ALL
	Mtc>Net>Core	Logs	Display the last Core communication event reported.	root, maint	ALL
	Mtc>Net>Core	QueryCBM	Query information about the CBM including Faults, status and mate faults.	root, maint	ALL
	Mtc>Net>NTP		Go to the NTP level.	root, maint	ALL
	Mtc>Net>NTP	Query	Display the details of an NTP server.	root, maint	ALL
	Mtc>Net>NTP	Logs	Display the last NTP event reported (if any).	root, maint	ALL
	Mtc>Net>NTP Note: The command is disabled in cbmmtc	Add	Add NTP server(s) and peer(s)	n/a	n/a
	Mtc>Net>NTP Note: The command is disabled in cbmmtc	Change	Change NTP server/peer.	n/a	n/a
	Mtc>Net>NTP Note: The command is disabled in cbmmtc	Delete	Delete NTP server(s) and peer(s)	n/a	n/a
	Mtc>Appl		Enter the software applications status level.	root, maint	ALL
	Mtc>Appl	logs	Display the last event reported (if any) on each of the application status indicators.	root, maint	ALL

Table 2: CBMMTC Command Authorization Summary

CBM Tool	Level	Commands	Description	Old auth. level	New auth. level
	Mtc>Appl	Bsy	Busy an application.	root, maint	ALL
	Mtc>Appl	RTS	Return an application to service.	root, maint	ALL
	Mtc>Appl	OffL	Offline an application.	root, maint	ALL
	Mtc>Sys		Enter the operating system software status level.	root, maint	ALL
	Mtc>Sys	Logs	Display the last event reported on each of the connectivity status indei-cators.	root, maint	ALL
	Mtc>Sys	QueryCBM	Query information about the CBM including Faults, status and mate faults.	root, maint	ALL
	Mtc>Sys> Note: The command is disabled in cbmmtc	Change	Change the alarm threshold for a system software status indicator.	n/a	n/a
	Mtc>Hw		Enter the hardware status level.	root, maint	ALL
	Mtc>Hw	logs	Display the last event reported (if any) on each of the hardware status indicators.	root, maint	ALL
	Mtc>Hw	QueryCBM	Query information about the CBM including Faults, status and mate faults.	root, maint	ALL
	Mtc	Quit	Quit the current level or exit the CBM maintenance interface.	root, maint	ALL
	Mtc	Help	Displays help for a single command or all valid	root, maint	ALL
	Mtc	Refresh	Refresh the current screen.	root, maint	ALL
	Admin		Enter the system administration level.	root, maint	ALL
	Admin>User		Enter the user administration level.	root, maint	ALL
	Admin>User>PassThru		Go to PassThru level.	root, maint	ALL

Table 2: CBMMTC Command Authorization Summary

CBM Tool	Level	Commands	Description	Old auth. level	New auth. level
	Admin>User>PassThru	**Change**	**Change a PassThru user.**	**root**	**root, secadm**
	Admin>User>PassThru	**Add**	**Add a new PassThru user.**	**root**	**root, secadm**
	Admin>User>PassThru	**Delete**	**Delete a PassThru user.**	**root**	**root, secadm**
	Admin>User	**Add**	**Add a new maintenance class user id.**	**root**	**root, secadm**
	Admin>User	**Delete**	**Delete a maintenance class user id.**	**root**	**root, secadm**
	Admin>User	**Change**	**Change the password for the user specified.**	**root**	**root, secadm**
	Admin>SWIM		Enter the software inventory management level.	root, maint	ALL
	Admin>SWIM>packages		Enter the software packages level.	root, maint	ALL
	Admin>SWIM>packages	**Apply**	**Apply package on this CBM.**	**root**	**root, emsadm**
	Admin>SWIM>packages	Select	Select a package.	root, maint	ALL
	Admin>SWIM>packages	**Remove**	**Remove software.**	**root**	**root, emsadm**
	Admin>SWIM>packages	Search	Search the list for the given text	root, maint	ALL
	Admin>SWIM>packages	Filter	Filter the list of software.	root, maint	ALL
	Admin>SWIM>Packages	View	Toggle between showing the software description and the software fileset name.	root, maint	ALL
	Admin>SWIM>Config		Enter the software configuration level.	root, maint	ALL
	Admin>SWIM>Config	Select	Selects a package.	root, maint	ALL
	Admin>SWIM>Config	**Config**	**Configure packages.**	**root**	**root, emsadm**

Table 2: CBMMTC Command Authorization Summary

CBM Tool	Level	Commands	Description	Old auth. level	New auth. level
	Admin>SWIM>Config	Search	Search the list for the given text.	root, maint	ALL
	Admin>SWIM>Config	Filter	Filter the list of software.	root, maint	ALL
	Admin>SWIM>Config	View	Toggle between showing the software description and the software fileset name.	root, maint	ALL
	Admin>SWIM>Options		Enter the options level.	root, maint	ALL
	Admin>SWIM>Options	**Change**	**Change default values for SWIM.**	**root**	**root, emsadm**
	Admin>SWIM>History		Enter the software history level.	root, maint	ALL
	Admin>SWIM>History	ViewLog	View the log for the given history entry.	root, maint	ALL
	Admin>SWIM>History	Search	Search the list for the given text.	root, maint	ALL
	Admin>SWIM>History	Filter	Filter the list of software.	root, maint	ALL
	Admin>SWIM>History	View	Toggle between showing the software description and the software fileset name.	root, maint	ALL

Wireless SBA billing application's BILLMTC is different than the Wireline version. The following is the authorization summary for Wireless SBA BILLMTC.

Note: The root user have access to all the commands under billmtc and it is not shown in the authorization levels in the following table.

Table 3: Wireless BILLMTC Command Authorization Summary

CBM Tool	Level	Commands	Description	Old auth. level	New auth. level
billmtc			Enter billing maintenance level.	maint	emsadm, maint
	billmtc	Quit	Quits the current level	maint	emsadm, maint

Table 3: Wireless BILLMTC Command Authorization Summary

CBM Tool	Level	Commands	Description	Old auth. level	New auth. level
	billmtc	Set	Sets context	maint	emsadm, maint
	billmtc	CONF-STRM	Enters CONFSTRM level	maint	emsadm, maint
	billmtc	APPL	Enters APPL level	maint	emsadm, maint
	billmtc	Query	Displays current state of streams	maint	emsadm, maint
	billmtc	Mib	Sets and gets MIB objects	maint	emsadm, maint
	billmtc	Dispal	Displays all current CBM alarms	maint	emsadm, maint
	billmtc	Displogs	Displays logs not yet sent to CM	maint	emsadm, maint
	billmtc	FILESYS	Enters FILESYS level	maint	emsadm, maint
	billmtc	SCHED-ULE	Enters SCHEDULE level	maint	emsadm, maint
	billmtc	Help	Available commands with syntax	maint	emsadm, maint
	billmtc	Refresh	Refreshes the screen	maint	emsadm, maint
	billmtc	Clli	Displays core CLLI	maint	emsadm, maint
	CONFSTRM	Quit	Quits the current level	maint	emsadm, maint
	CONFSTRM	Set	Sets context.	maint	emsadm, maint
	CONFSTRM	Add	Configures a new stream	maint	emsadm, maint
	CONFSTRM	Change	Changes an existing stream configu-ration	maint	emsadm, maint
	CONFSTRM	Delete	Deletes a stream	maint	emsadm, maint
	CONFSTRM	List	Lists configuration of a (or all) stream(s)	maint	emsadm, maint

Table 3: Wireless BILLMTC Command Authorization Summary

CBM Tool	Level	Commands	Description	Old auth. level	New auth. level
	CONFSTRM	CLEANUP	Configure the closedSent cleanup process	maint	emsadm, maint
	CONFSTRM> CLEANUP	Quit	Quits the current level	maint	emsadm, maint
	CONFSTRM> CLEANUP	Set	Sets context.	maint	emsadm, maint
	CONFSTRM> CLEANUP	Change	Change closedSent cleanup config	maint	emsadm, maint
	CONFSTRM> CLEANUP	List	List closedSent cleanup config	maint	emsadm, maint
	APPL	Quit	Quits the current level	maint	emsadm, maint

	billmtc	TOOLS	Enters TOOLS level	maint	emsadm, maint
	billmtc	Help	Available commands with syntax	maint	emsadm, maint
	billmtc	Refresh	Refreshes the screen	maint	emsadm, maint
	billmtc	Clli	Displays core CLLI	maint	emsadm, maint
	CONFSTRM	Quit	Quits the current level	maint	emsadm, maint
	CONFSTRM	Set	Sets context.	maint	emsadm, maint
	CONFSTRM	Add	Configures a new stream	maint	emsadm, maint
	CONFSTRM	Change	Changes an existing stream configu-ration	maint	emsadm, maint
	CONFSTRM	Delete	Deletes a stream	maint	emsadm, maint
	CONFSTRM	List	Lists configuration of a (or all) stream(s)	maint	emsadm, maint
	CONFSTRM	Act	Activates a filtered stream	maint	emsadm, maint
	CONFSTRM	Deact	Deactivates a filtered stream	maint	emsadm, maint
	CONFSTRM	Update	Updates a filtered stream’s criteria.	maint	emsadm, maint
	CONFSTRM	Start	Resume receiving records on a fil-tered stream.	maint	emsadm, maint
	CONFSTRM	Stop	Stop receiving records on a filtered stream.	maint	emsadm, maint

Table 4: Wireline BILLMTC Command Authorization Summary

CBM Tool	Level	Commands	Description	Old auth. level	New auth. level
	CONFSTRM	Help	Available commands with syntax	maint	emsadm, maint
	CONFSTRM	Refresh	Refreshes the screen	maint	emsadm, maint
	CONFSTRM	clli	Displays core CLLI	maint	emsadm, maint
	APPL	Quit	Quits the current level	maint	emsadm, maint
	APPL	Set	Command inapplicable	maint	emsadm, maint
	APPL	AFT	Enters AFT level	maint	emsadm, maint
	APPL	SFP	Enters SFP level	maint	emsadm, maint
	APPL	Help	Available commands with syntax	maint	emsadm, maint
	APPL	Refresh	Refreshes the screen	maint	emsadm, maint
	APPL	clli	Displays core CLLI	maint	emsadm, maint
	APPL>AFT	Quit	Quits the current level	maint	emsadm, maint
	APPL>AFT	Set	Command inapplicable	maint	emsadm, maint
	APPL>AFT	AFT-CONFG	Enters AFT Session configuration level	maint	emsadm, maint
	APPL>AFT	Query	Query info on file transfer lists for sessions	maint	emsadm, maint
	APPL>AFT	Setfile	Set an override file, delete a file from the list	maint	emsadm, maint
	APPL>AFT	Rsetfile	Reset a file from partial to pending	maint	emsadm, maint
	APPL>AFT	AFTRESND	Enters AFT resend level	maint	emsadm, maint
	APPL>AFT	Start	Start an AFT session that was stopped	maint	emsadm, maint

Table 4: Wireline BILLMTC Command Authorization Summary

CBM Tool	Level	Commands	Description	Old auth. level	New auth. level
	APPL>AFT	Stop	Stop an AFT session file transfer	maint	emsadm, maint
	APPL>AFT	Alarm	Query or cancel AFT session alarms	maint	emsadm, maint
	APPL>AFT	Help	Available commands with syntax	maint	emsadm, maint
	APPL>AFT	Refresh	Refreshes the screen	maint	emsadm, maint
	APPL>AFT	clli	Displays core CLLI	maint	emsadm, maint
	APPL>AFT>AFT-CONFG	Quit	Quits the current level	maint	emsadm, maint
	APPL>AFT>AFT-CONFG	Set	Sets context	maint	emsadm, maint
	APPL>AFT>AFT-CONFG	Add	Add AFT tuples to the MIB	maint	emsadm, maint
	APPL>AFT>AFT-CONFG	Delete	Delete AFT tuples from the MIB	maint	emsadm, maint
	APPL>AFT>AFT-CONFG	Change	Change number of retry attempts for a session	maint	emsadm, maint
	APPL>AFT>AFT-CONFG	List	List AFT tuples in the MIB	maint	emsadm, maint
	APPL>AFT>AFTRESND	Quit	Quits the current level	maint	emsadm, maint
	APPL>AFT>AFTRESND	Set	Sets context	maint	emsadm, maint
	APPL>AFT>AFTRESND	Listfile	Lists processed files	maint	emsadm, maint
	APPL>AFT>AFTRESND	Addfile	Add processed files to a session	maint	emsadm, maint
	APPL>SFP>	Quit	Quits the current level	maint	emsadm, maint
	APPL>SFP>	Set	Sets context	maint	emsadm, maint
	APPL>SFP>	Query	Queries the SFP status	maint	emsadm, maint

Table 4: Wireline BILLMTC Command Authorization Summary

CBM Tool	Level	Commands	Description	Old auth. level	New auth. level
	APPL>SFP>	**Act**	**Activates SFP**		**emsadm**
	APPL>SFP>	**Deact**	**De-activates SFP**		**emsadm**
	FILESYS	Quit	Quits the current level	maint	emsadm, maint
	FILESYS	Set	Sets context	maint	emsadm, maint
	FILESYS	Sendfile	Sends billing file(s) per stream to downstream	maint	emsadm, maint
	FILESYS	Listfile	Lists stored billing file(s) per stream	maint	emsadm, maint
	FILESYS	Closec	Closes currently open billing file(s) per stream	maint	emsadm, maint
	SCHEDULE	Quit	Quits the current level	maint	emsadm, maint
	SCHEDULE	Set	Sets Context	maint	emsadm, maint
	SCHEDULE	Add	Adds a tuple to the schedule	maint	emsadm, maint
	SCHEDULE	Change	Changes a tuple in the schedule	maint	emsadm, maint
	SCHEDULE	Delete	Deletes tuple(s) from the schedule	maint	emsadm, maint
	SCHEDULE	List	Lists tuple(s) in the schedule	maint	emsadm, maint
	SCHEDULE>RTB		**Enters RTB level**	**maint**	**maint**
	SCHEDULE>RTB	Set	Sets context	maint	emsadm, maint
	SCHEDULE>RTB	Rts	Returns RTB to service for a stream.	maint	emsadm, maint
	SCHEDULE>RTB	Bsy	Busies RTB for a stream.	maint	emsadm, maint
	SCHEDULE>RTB	Offl	Offlines RTB for a stream.	maint	emsadm, maint
	SCHEDULE>RTB	Query	Queries the state of RTB for a stream.	maint	emsadm, maint

Table 4: Wireline BILLMTC Command Authorization Summary

CBM Tool	Level	Commands	Description	Old auth. level	New auth. level
	SCHEDULE>RTB	IPTest	Tests the IP address used by RTB for a stream.	maint	emsadm, maint
	SCHEDULE>RTB	CONFRTB	Enters the RTB configuration level.	maint	emsadm, maint
	SCHED-ULE>RTB>CON-FRTB	Set	Set context	maint	emsadm, maint
	SCHED-ULE>RTB>CON-FRTB	Add	Adds RTB to a stream.	maint	emsadm, maint
	SCHED-ULE>RTB>CON-FRTB	Change	Changes the RTB configuration for a stream.	maint	emsadm, maint
	SCHED-ULE>RTB>CON-FRTB	Delete	Deletes RTB from a stream.	maint	emsadm, maint
	SCHED-ULE>RTB>CON-FRTB	Query	Query the RTB configured destina-tions.	maint	emsadm, maint
	SCHED-ULE>RTB>CON-FRTB	Autorec	Turns Autorecovery on or off for RTB.	maint	emsadm, maint
	SCHED-ULE>RTB>CON-FRTB	**LagTimer**	**Set the RTB Lag Timer**	**maint**	**maint**
	TOOLS	Quit	Quits the current level	maint	emsadm, maint
	TOOLS	Set	Sets Context	maint	emsadm, maint
	TOOLS	Amadump	Displays record information	maint	emsadm, maint

The following table lists the commands from SPFS CLI tool that are used on a CBM and supported by this feature.

Table 5: SPFS CLI Command Authorization Summary

CBM Tool	Level	Commands	Description	Old auth. level	New auth. level
cli	cli		Enter the system command line interface level.	root	root emsadm secadm
	cli>view		Enter the view level	root	root emsadm secadm
	cli>view	sspfs_soft	Display Software Installation Level Of SSPFS	root	root emsadm secadm
	cli>view	chk_ssfps	Check SSPFS Processes	root	root emsadm secadm
	cli>view	sw_conf	The software configuration of the system	root	root emsadm secadm
	cli>view	cpu_util	Overall CPU utilization	root	root emsadm secadm
	cli>view	cpu_util_proc	CPU utilization by process	root	root emsadm secadm
	cli>view	port_util	I/O port utilization	root	root emsadm secadm
	cli>view	disk-util	Filesystem utilization	root	root emsadm secadm
	cli>configure		Enter the configuration level	root	root emsadm secadm
	cli>configure>NTP configuration		Enter the NTP configuration level	root	root emsadm secadm
	cli>configure>NTP configuration	ntp_conf	Configure the NTP daemon	root	root emsadm
	cli>configure>NTP configuration	ntp_unconf	Unconfigure the NTP daemon	root	root emsadm

Table 5: SPFS CLI Command Authorization Summary

CBM Tool	Level	Commands	Description	Old auth. level	New auth. level
	cli>configure>NTP configuration	ntp_remove	Remove an NTP server	root	root emsadm
	cli>configure>NTP configuration	ntp_view	View ntp configuration information.	root	root emsadm
	cli>configure>OAMP Application Configuration		Enter OAMP Application Configuration level	root	root emsadm secadm
	cli>configure>OAMP Application Configuration	sdm_conf	Configure SDM IP Address	root	root emsadm
	cli>configure>OAMP Application Configuration	sdm_unconf	Unconfigure SDM IP Address	root	root emsadm
	cli>configure>OAMP Application Configuration	sdmuser_conf	Configure SDM User	root	root emsadm
	cli>configure>OAMP Application Configuration	sdmuser_unconf	Unconfigure SDM User	root	root emsadm
	cli>configure>OAMP Application Configuration	cmClli_rediscovery	Re-discovery the CM CLLI by SDM IP	root	root emsadm
	cli>configure>OAMP Application Configuration	cmClli_conf	Configure CM_CLLI Address	root	root emsadm
	cli>configure>OAMP Application Configuration	cmClli_unconf	Unconfigure CM_CLLI IP Address	root	root emsadm
	cli>configure>OAMP Application Configuration	cm_conf	Configure CM IP Address	root	root emsadm
	cli>configure>OAMP Application Configuration	cm_unconf	Unconfigure CM IP Address	root	root emsadm
	cli>configure>IP Configuration		Enter IP Configuration level	root	root emsadm secadm
	cli>configure>IP Configuration	config_router	Configure Default Router and Netmask	root	root emsadm

Table 5: SPFS CLI Command Authorization Summary

CBM Tool	Level	Commands	Description	Old auth. level	New auth. level
	cli>configure>IP Configuration	config_data	Configure System Data IP Addresses	root	root emsadm
	cli>configure>IP Configura-tion>ipsecike_config		enter ipsecike_config level	root	root emsadm
	cli>configure>IP Configura-tion>ipsecike_config >IPSec		enter IPSec configuration level	root	root emsadm
	cli>configure>IP Configura-tion>ipsecike_config >IPSec	**Add IPSec Entry**	**Add IPSec Entry**	**root**	**root**
	cli>configure>IP Configura-tion>ipsecike_config >IPSec	**Delete IPSec entry**	**Delete IPSec entry**	**root**	**root**
	cli>configure>IP Configura-tion>ipsecike_config >IPSec	List All IPSec entries	List All IPSec entries	root	root emsadm
	cli>configure>IP Configura-tion>ipsecike_config >IKE		enter IKE configuration level	root	root emsadm
	cli>configure>IP Configura-tion>ipsecike_config >IKE	**Add IKE Entry**	**Add IKE Entry**	**root**	**root**
	cli>configure>IP Configura-tion>ipsecike_config >IKE	**Delete IKE entry**	**Delete IKE entry**	**root**	**root**
	cli>configure>IP Configura-tion>ipsecike_config >IKE	List IKE entries	List IKE entries	root	root emsadm
	cli>IP Configura-tion>ipsecike_config >IKE	**Change**	**Change Preshared Key for IKE entry**	**root**	**root**

Table 5: SPFS CLI Command Authorization Summary

CBM Tool	Level	Commands	Description	Old auth. level	New auth. level
	cli>configure>Syslog Configuration		Enter Syslog Configuration level	root	root emsadm secadm
	cli>configure>Syslog Configuration	list_syslog	List a system's syslog configuration	root	root emsadm
	cli>configure>Syslog Configuration	add_syslog	Add a syslog configuration entry	root	root emsadm
	cli>configure>Syslog Configuration	del_syslog	Remove a syslog configuration entry	root	root emsadm
	cli>configure>Syslog Configuration	route_syslog_on	Route syslog to remote host	root	root emsadm
	cli>configure>Syslog Configuration	route_syslog_off	Turn off syslog re-direction to a remote host	root	root emsadm
	cli>configure>Security Services Configuration		Enter Security Services Configuration level	root	root emsadm secadm
	cli>configure>Security Services Configuration>Socks Configuration		Enter Socks Configuration level	root	root emsadm secadm
	cli>configure>Security Services Configuration>Socks Configuration	config_socks	Modify Socks Security Service	root	root emsadm
	cli>configure>Security Services Configuration>Socks Configuration	list_socks	List Socks Security Service	root	root emsadm secadm
	cli>configure>Security Services Configuration>IEMS Server Location Configuration		Enter IEMS Server Location Configuration level	root	root emsadm secadm
	cli>configure>Security Services Configuration>IEMS Server Location Configuration	iems_ip	Configure IEMS Server IP	root	root emsadm

Table 5: SPFS CLI Command Authorization Summary

CBM Tool	Level	Commands	Description	Old auth. level	New auth. level
	cli>configure>Security Services Configuration>PAM Configuration		Enter PAM Configuration level	root	root emsadm secadm
	cli>configure>Security Services Configuration>PAM ConfigurationCentral Security Client Configuration>		Enter Central Security Client Configuration level	root	root emsadm secadm
	cli>configure>Security Services Configuration>PAM ConfigurationCentral Security Client Configuration>	pam_orig	Use Default PAM Configuration	root	root emsadm
	cli>configure>Security Services Configuration>PAM ConfigurationCentral Security Client Configuration>	pam_radius	Use Security Server	root	root emsadm
	cli>configure>Security Services Configuration>PAM ConfigurationCentral Security Client Configuration>	saml_passwd_conf	Configure saml password	root	root emsadm
	cli>configure>Location Configuration		Enter Location Configuration level	root	root emsadm secadm
	cli>configure>Location Configuration	chg_tz	Change Timezone	root	root emsadm
	cli>configure>Location Configuration	sys_loc	System Location	root	root emsadm
	cli>configure>Succession Element Configuration		Enter Succession Element Configuration level	root	root emsadm secadm
	cli>configure>Succession Element Configuration	NPM Application	NPM Application Configuration	root	root emsadm

Table 5: SPFS CLI Command Authorization Summary

CBM Tool	Level	Commands	Description	Old auth. level	New auth. level
	cli>configure>Succession Element Configuration	PSE Application	PSE Application Configuration	root	root emsadm
	cli>Other		Enter Other Configuration level	root	root emsadm secadm
	cli>Other>log rotation		Enter Log rotation configuration level	root	root emsadm secadm
	cli>Other>Log Rotation	exec_rlog	Execute The Rotatelog Function	root	root emsadm secadm
	cli>Other>Log Rotation	view_rlog	View The Rotatelog Configuration File	root	root emsadm secadm
	cli>Other	capt_files	Capture Various SSPFS Files/Logs For Debugging Purposes	root	root emsadm
	cli>Other	sun_explorer	Execute the Sun Explorer Data Gathering Tool	root	root emsadm
	cli>Other	mount_image	Mount A Generic Iso Image To The SSPFS Unit	root	root emsadm
	cli>Other	umount_image	Un-Mount A Generic Iso Image From The SSPFS Unit	root	root emsadm

164.6 CBM NTP Procedures

Table 6: Authorization Summary - CBM NTP Customer Documentation

Operation/ Command	Current Action	New Action	Current auth. level	New auth. level	Note
Customer doc: NN10347-461 Core and Billing Manager 850: Application Installation and Upgrade Guide					
Upgrading the CBM850			root	root	This procedure include other procedures (listed in this table) that require root access.

Table 6: Authorization Summary - CBM NTP Customer Documentation

Operation/ Command	Current Action	New Action	Current auth. level	New auth. level	Note
Verifying the state of a cluster			root	root,	The following commands are executed: • ubmstat • ubmstat • CheckConfiguration • init 6 • cli, other, capt_files
Transferring and mounting an ISO image delivered through ESD onto an SSPFS-based server			root	root,	The following commands are executed: • df -k / • ftp <repository_server_ip> • ftp> ls • ftp> get <iso_image> • mv • gzip -d • tar -xvf • cd • mv • cli, other, mount_image This procedure is required only during an install and upgrade.

Table 6: Authorization Summary - CBM NTP Customer Documentation

Operation/ Command	Current Action	New Action	Current auth. level	New auth. level	Note
Upgrading SSPFS software			root	root	The following commands are executed: **Using CDROM:** • cd / • /cdrom/cdrom0/s0/pre_upgrade • /liveupgrade.ksh • cli, view, sspfs_soft **Using ESD:** • df -k /opt • cd /opt • ftp • ftp> get • cli, other, mount_image • /tmpmnt/pre_upgrade • cli, other, umount_image • mv • /liveupgrade.ksh
Performing a backup of oracle data on an SSPFS-based server			root	root	The following commands are executed: • servstop IEMS • /opt/nortel/iems/current/bin/purge-TempData.sh • servstart IEMS • mt -f /dev/rmt/0 rewind • /opt/nortel/sspfs/bks/bkdata • tar tvf /dev/rmt/0 • tar tvf /cdrom/*bkdata*/*.tar • cd / • eject cdrom • /etc/init.d/volmgt stop • /etc/init.d/volmgt stop **This procedure is not required for CBM.**

Table 6: Authorization Summary - CBM NTP Customer Documentation

Operation/ Command	Current Action	New Action	Current auth. level	New auth. level	Note
Performing a backup of file system on an SSPFS-based server		config-admin	root	root, emsadm	The following commands are executed: • mt -f /dev/rmt/0 rewind • /opt/nortel/sspfs/bks/bkfullsys • gtar -tvMf /dev/rmt/0 • gtar -tvMf /cdrom/*bkfullsys*/*.tar • cd / • eject cdrom **root only (These steps are not needed for this procedure unless error occurs when ejecting a CD:** • **/etc/init.d/volmgt stop** • **/etc/init.d/volmgt start**
Verifying group IDs and user IDs on an SSPFS-based server			maint, root	ALL	The following commands are executed: • cut -f1,3 -d':' /etc/group • cut -f1,3 -d':' /etc/passwd
Executing a fallback during an SSPFS-based server upgrade			root	root	The following commands are executed: • /SSPFS_Upgrade.fallback • udstat
Applying patches to a CBM		Config-admin	root	root, emsadm	The following commands are executed: • Calls “Configuring PSE on a CBM”. • Calls “Configuring NPM on an SSPFS server”. • Calls “Applying patches using the NPM”.

Table 6: Authorization Summary - CBM NTP Customer Documentation

Operation/ Command	Current Action	New Action	Current auth. level	New auth. level	Note
Removing patches from a CBM		Config-admin	root	root, emsadm	The following commands are executed: • Calls “Configuring PSE on a CBM”. • Calls “Configuring NPM on an SSPFS server”. • Calls “Removing patches using the NPM”.
Configuring PSE on a CBM		Config-admin	root	root, emsadm	The following commands are executed: • cli, configuration, Succession Element Configuration, PSE Application Configuration, Configure_PSE (Configure the Patching Server Element) • pse start
Configuring NPM on an SSPFS server		Config-admin	root	root, emsadm	The following commands are executed: • cli, configuration, Succession Element Configuration, NPM Application Configuration • servstart npm
Setting up local user accounts on an SSPFS-based server			root	root	The following commands are executed: • useradd -g succssn <userid> • passwd -r files <userid> • groups <userid> • usermod -g succssn -G <groupA,groupB,...> <userid>

Table 6: Authorization Summary - CBM NTP Customer Documentation

Operation/ Command	Current Action	New Action	Current auth. level	New auth. level	Note
Patching the inactive node of a cluster during an upgrade			root	root	The following commands are executed: • Follow procedure “Applying patches using the NPM” if NPM does not reside on CBM -> should not worry about in this case. • patchUpToDate - directory <directory_name> **Note: CBM upgrade will be performed by root users. This procedure is invoked during an upgrade, and therefore will be executed as root.**
Starting the PSE server application on an SSPFS-based server		Config-admin	root	root, emsadm	The following commands are executed: • pse start • pse status
Starting the NPM server application		Config-admin	root	root, emsadm	The following commands are executed: • servman query -status -group NPM • servstart NPM

Table 6: Authorization Summary - CBM NTP Customer Documentation

Operation/ Command	Current Action	New Action	Current auth. level	New auth. level	Note
Transferring patches to the NPM database manually			root	root	The following commands are executed: • ubmstat • mkdir /data/npm/tmp • chmod 777 /data/npm/tmp • find /cdrom -name '*.patch' > /data/npm/tmp/current.patchlist • cd /data/npm/tmp • mkdir /data/npm/patch_upgrade • chmod 777 /data/npm/patch_upgrade • cd /data/npm/patch_upgrade • ftp <ESD_server> • ls • chmod 777 * • servquery -status -group NPM • servstart NPM • npm • getpatch patchlist • cd / • eject cdrom • /etc/init.d/volmgt stop • /etc/init.d/volmgt start **Note: As it currently stands, this procedure will be executed by root. However, this procedure could be split into two procedure:** **1- Procedure one will create the patch directory structure and this will be required just once after a fresh install or upgrade (will be executed by root).** **2- Procedure two will provide the steps to transfer the patches to the NPM server. This is the procedure that will be often run by customers prior to patch apply. This procedure will be executed by emsadm.**

Table 6: Authorization Summary - CBM NTP Customer Documentation

Operation/ Command	Current Action	New Action	Current auth. level	New auth. level	Note
Applying patches using the NPM			root	root emsadm secadm	The following commands are executed: • npm (calling procedure “Accessing the Network Patch Manager CLUI” - calling npm commands). • The rest of the procedure called within this procedure requires invoking the GUI from outside the CBM.
Removing patches using the NPM			root	root emsadm secadm	The following commands are executed: • npm (calling procedure “Accessing the Network Patch Manager CLUI” - calling npm commands). • The rest of the procedure called within this procedure requires invoking the GUI from outside the CBM.
Deactivating patches using the NPM			root	root emsadm secadm	The following commands are executed: • npm (calling procedure “Accessing the Network Patch Manager CLUI”) • The rest of the procedure called within this procedure requires invoking the GUI from outside the CBM.

Table 6: Authorization Summary - CBM NTP Customer Documentation

Operation/ Command	Current Action	New Action	Current auth. level	New auth. level	Note
Performing a device audit using the NPM			root	root emsadm secadm	The following commands are executed: • npm (calling procedure “Accessing the Network Patch Manager CLUI”) • The rest of the procedure called within this procedure requires invoking the GUI from outside the CBM.
Defining NPM patching reports			root	root emsadm secadm	The following commands are executed: • npm (calling procedure “Accessing the Network Patch Manager CLUI”) • The rest of the procedure called within this procedure requires invoking the GUI from outside the CBM.
Accessing the Network Patch Manager CLUI			root	root emsadm secadm	The following commands are executed: • npm
Restarting a device using the NPM			root	root emsadm secadm	The following commands are executed: • npm (calling procedure “Accessing the Network Patch Manager CLUI”) • The rest of the procedure called within this procedure requires invoking the GUI from outside the CBM.

Table 6: Authorization Summary - CBM NTP Customer Documentation

Operation/ Command	Current Action	New Action	Current auth. level	New auth. level	Note
Launching CS 2000 Management Tools and NPM client applications			root	root emsadm secadm	The following commands are executed: • npm (calling procedure “Accessing the Network Patch Manager CLUI” • The rest of the procedure called within this procedure requires invoking the GUI from outside the CBM.
Confirming the upgrade on a cluster			root	root	The following commands are executed: • /SSPFS_Upgrade.accept • /SSPFS_Upgrade.fallback • OK boot • GetRunningClusterNodeNames • udstat

Table 6: Authorization Summary - CBM NTP Customer Documentation

Operation/ Command	Current Action	New Action	Current auth. level	New auth. level	Note
Cloning the image of one node in a cluster to the other node			root	root	The following commands are executed: • udstat • cli, view, • sspfs_soft • servquery -status all • servstart <app_name> • pse status • pse start • ptmctl status • cp • cd • ./ configure_s1isext.sh -replica disable • init 0 • OK banner • startb <Ethernet address> • OK boot net -image • finishb

Table 6: Authorization Summary - CBM NTP Customer Documentation

Operation/ Command	Current Action	New Action	Current auth. level	New auth. level	Note
Installing optional software on a CBM 850			root	root emsadm	The following commands are executed: • May need to create logical volumes depending on the application • init 6 (if logical volume created) • Insure that system is patch current (refer to patching procedures) • Perform system clone. DDMS: • makelv /cbmdata/00/osscomms 16 • chmod 755 /cbmdata/00/osscomms • chown maint:maint /cbmdata/00/osscomms • cbmmtc apply, source, select, apply • cbmmtc config, select, config • All the rest of the applications follow the same process. **If changing ownership/ permission of a logical volume is required for application apply, then a root user is required. Else an emsadm user can perform the procedure otherwise.**
Removing software packages from a CBM 850		Config-admin	root	root emsadm	The following commands are executed: • cbmmtc packages, select, remove
Viewing software transaction history and logs on the CBM 850			root, maint	ALL	The following commands are executed: • cbmmtc • history • ViewLog <#>

Table 6: Authorization Summary - CBM NTP Customer Documentation

Operation/ Command	Current Action	New Action	Current auth. level	New auth. level	Note
Using the Queryloads tool to display patches and packages applied on the CBM 850			root, maint	ALL	The following commands are executed: • queryloads
Customer Doc: NN10353-511 Core and Billing Manager 850 Configuration Management					
Configuring a virtual IP on an SSPFS-based server			root	root	The following commands are executed: • Cli, Configuration, IP Configuration,config_data. • shutdown • **boot** This procedure requires a reboot and therefore must be executed by root.
Configuring log delivery destinations			root, maint	ALL	The following commands are executed: • logroute
Modifying a log device using logroute			root, maint	ALL	The following commands are executed: • logroute
Deleting a device using logroute			root, maint	ALL	The following commands are executed: • logroute
Configuring log delivery for MDM/PPEM security and audit logs			root, maint	ALL	The following commands are executed: • logroute
Excluding MDM/PPEM audit and security logs from other log devices			root, maint	ALL	The following commands are executed: • logroute
Specifying the logs delivered from the CM to the core manager			root, maint	ALL	The following commands are executed: • logroute
Configuring log delivery global parameters			root, maint	ALL	The following commands are executed: • logroute

Table 6: Authorization Summary - CBM NTP Customer Documentation

Operation/ Command	Current Action	New Action	Current auth. level	New auth. level	Note
Configuring the GDD parameter using logroute			root, maint	ALL	The following commands are executed: • logroute
Configuring outbound connection security for OMDD			root	root	The following commands are executed: • cd ~maint • ls -lad .ssh • mkdir .ssh • chown maint:maint .ssh • chmod u+rwx .ssh • su maint • ssh -l maint <nn.nn.nn.nn>
Configuring core access for SBRM through the CBM 850		config-admin	root	root, emsadm	The following commands are executed: • cd /opt/nortel/bkresmgr/cbm/scripts • ./bkmgr_config.sh
Creating the backup user ID on the core for SBRM	N/A	N/A	N/A	N/A	This procedure is executed on the Core.
Commissioning or decommissioning Network Time Protocol (NTP)		Config-admin	root	root, emsadm	The following commands are executed: • Cli, configuration, NTP configuration • cbmmtc ntp
Adding or removing an NTP server or peer		Config-admin	root	root, emsadm	The following commands are executed: • Cli, configuration, NTP configuration • cbmmtc ntp
Installing the logreceiver tool on a client workstation			root, maint	ALL	The following commands are executed: ftp <CBM_IP_address> ftp> cd /swd/client ftp> binary ftp> get logreceiver ftp> bye

Table 6: Authorization Summary - CBM NTP Customer Documentation

Operation/ Command	Current Action	New Action	Current auth. level	New auth. level	Note
Installing the CMFT on a client workstation			root, maint	ALL	The following command is executed from the client workstation, connecting to the CBM as root: scp root@<coremanager_ip_address>:/sdm/scft/cmft.
Customer doc: NN10358-611 Core and Billing Manager 850 Security and Administration					
Performing a backup of oracle data on an SSPFS-based server			root	root	The following commands are executed: • servstop IEMS • /opt/nortel/iems/current/bin/purgeTempData.sh • servstart IEMS • mt -f /dev/rmt/0 rewind • /opt/nortel/sspfs/bks/bkdata • tar tvf /dev/rmt/0 • tar tvf /cdrom/*bkdata*/*.tar • cd / • eject cdrom • /etc/init.d/volmgt stop • /etc/init.d/volmgt stop **This procedure is not required for CBM.**

Table 6: Authorization Summary - CBM NTP Customer Documentation

Operation/ Command	Current Action	New Action	Current auth. level	New auth. level	Note
Performing a backup of file system on an SSPFS-based server		config-admin	root	root, emsadm	The following commands are executed: • mt -f /dev/rmt/0 rewind • /opt/nortel/sspfs/bks/bkfullsys • gtar -tvMf /dev/rmt/0 • gtar -tvMf /cdrom/*bkfullsys*/*.tar • cd / • eject cdrom **root only (These steps are not needed for this procedure unless error occurs when ejecting a CD:** • **/etc/init.d/volmgt stop** • **/etc/init.d/volmgt start**
Preparing a CD-RW or DVD-RW for use			root	root emsadm secadm	The following commands are executed: • cdrw -l • cdrw -b all • cdrw -l • cd / • eject cdrom **root only (These steps are not needed for this procedure unless error occurs when ejecting a CD:** • **/etc/init.d/volmgt stop** • **/etc/init.d/volmgt start**

Table 6: Authorization Summary - CBM NTP Customer Documentation

Operation/ Command	Current Action	New Action	Current auth. level	New auth. level	Note
Adding a file system using the makelv command		Config_admin	root	root emsadm	The following commands are executed: • makelv <file system name><file system size>
Increase the size of a file system on an SSPFS-based server			root	root	The following commands are executed: Single server CBM: • cli, View, disk_util • echo '/opt/nortel/sspfs/fs/meta.pl fs' 2048 / 5000 - p | dc • filesys grow -m <mount_point> -s <size>m CBM HA: • ubmstat • Udstat • Cli, view, disk_util • GrowClusteredFileSystem.ksh <mount_point> <size>m • init 6 • StopCluster
Migrating core manager user accounts to IEMS NOTE: The procedure shouldn't be in SN09 NTP since the feature wasn't available in SN09			root	root	The following commands are executed (duplicate commands are not displayed twice): • cd <directory path> • ls -IRa • exportLocalUser <directory path> <IEMS server domain name> • cat • sftp <IP address>, put • rm • Cbmmtc, admin, user, delete <userID> • mkdir • cp • chown • rm -rf

Table 6: Authorization Summary - CBM NTP Customer Documentation

Operation/ Command	Current Action	New Action	Current auth. level	New auth. level	Note
Adding or removing a program from the maintenance class users' access		config-admin	root	root, emsadm	The following commands are executed: • custprog -a <program name> • custprog -d <program name>
Connecting to the CM passthru			passthru	passthru	The following commands are executed: • telnet or ssh with passthru userid
Adding or removing a maintenance user		Security_admin	root	root, secadm	The following commands are executed: • cbmmtc, user, add <userID>, change <userID>, delete <userID>
Adding or removing a passthru user		Security_admin	root	root, secadm	The following commands are executed: • cbmmtc, pasthru, add, delete <userID>,
Setting up local user accounts on an SSPFS-based system			root	root	The following commands are executed: • useradd -g succssn <userid> • passwd -r files <userid> • groups <userid> • usermod -g succssn -G <groupA,groupB,...> <userid> **This procedure must be removed from the customer documentation (should use cbmmtc to setup users)**

Table 6: Authorization Summary - CBM NTP Customer Documentation

Operation/ Command	Current Action	New Action	Current auth. level	New auth. level	Note
Configuring an SSPFS-based central security client NOTE: The procedure shouldn't be in SN09 NTP since central security server is not supported on CBM in SN09.		Config_admin	root	root, emsadm	The following commands are executed: • userdel <userid> • Cli, Configuration, Security Services Configuration, IEMS Server Location Configuration, iems_ip, x, PAM Configuration, Central Security Client Configuration, pam_radius, x, saml_passwd_conf **Note: This procedure should be performed through cbmmtc with secadm access.**
Configuring IPSec and IKE on the CBM 850			root	root	This procedure calls procedure "Configuring IPSec and IKE on an SSPFS-based server" (no other commands invoked).
Transferring files as a core user using FTPProxy NOTE: The procedure is out of date since site cm is no longer available.			passthru	passthru	The following commands are executed: • ftp <cbm IP address> • ftp> site cm • ftp> get output
Starting an SCFT client session			root maint	ALL	The following commands are executed: Invoke procedures: • Displaying help for SCFT • Listing volumes on Core using SCFT • Removing a file from Core using SCFT • Transferring files from Core using SCFT • Transferring files to Core using SCFT

Table 6: Authorization Summary - CBM NTP Customer Documentation

Operation/ Command	Current Action	New Action	Current auth. level	New auth. level	Note
Transferring files from Core using SCFT			root maint	ALL	The following commands are executed: • ssh <user>@<cbm host> "scft <-b|-a> -s <reclen> -g /<volume>/<corefile>" > <localfile>
Transferring files to Core using SCFT			root maint	ALL	The following commands are executed: • ssh <user>@<host> "scft <-b|-a> -s <reclen> -p /<volume>/<corefile>" < <localfile>
Removing a file from Core using SCFT			root maint	ALL	The following commands are executed: • ssh <user>@<host>"scft -r /<volume>/<filename>"
Displaying help for SCFT			root maint	ALL	The following commands are executed: • ssh <user>@<cbm host> "scft -h"
Listing volumes on Core using SCFT			root	ALL	The following commands are executed: • ssh <user>@<host>"scft -1 /"
Configuring the time zone on an SSPFS-based server		Config_admin	root	root, emsadm	The following commands are executed: • Cli, Configuration, Location Configuration, chg_tz

Table 6: Authorization Summary - CBM NTP Customer Documentation

Operation/ Command	Current Action	New Action	Current auth. level	New auth. level	Note
Changing a user password on an SSPFS-based system			root	root	The following commands are executed: • passwd -r files <userid> **This procedure must be removed from the customer documentation (should use cbmmtc to change user password)**
Changing a passthru user password			passthru	passthru	No commands invoked. Just login to the system as a passthru user.
Setting the threshold for file system on an SSPFS-based server		Config_admin	root	root, emsadm	The following commands are executed: • filesys update -m <mount_point> -a <threshold>
Starting an application			root, maint	ALL	The following commands are executed: • Cbmmtc, appl, bsy/rts
Starting the application group			root, maint	ALL	The following commands are executed: • Cbmmtc, appl, bsy group/rts group
Stopping an application			root, maint	ALL	The following commands are executed: • Cbmmtc, appl, bsy
Stopping the application group			root, maint	ALL	The following commands are executed: • Cbmmtc, appl, bsy group
Stopping and restarting an application			root, maint	ALL	The following commands are executed: • Cbmmtc, appl, bsy, rts

Table 6: Authorization Summary - CBM NTP Customer Documentation

Operation/ Command	Current Action	New Action	Current auth. level	New auth. level	Note
Offlining an application			root, maint	ALL	The following commands are executed: • Cbmmtc, appl, bsy, offl
Offlining the application group			root, maint	ALL	The following commands are executed: • Cbmmtc, appl, bsy group, offl group
Displaying the CLLI from the command line			root, maint	ALL	The following commands are executed: • clli
Displaying the CLLI from BILL-MTC			root, maint	ALL	The following commands are executed: • billmtc, clli
Configuring IPSec and IKE on an SSPFS-based server			root	root	The following commands are executed: • Cli, Configuration, IP Configuration, ipsecike_config, IPSec Configuration, Add IPSec entry, x, Delete IPSec entry, x, List All IPSec entries, x, x, IKE Configuration, Add IKE entry, x, Delete IKE entry, List IKE entries, x, Change Preshared key for IKE entry
Customer doc: NN10361-711 Core and Billing Manager 850 Performance Management					
OMUI operations			root, maint	ALL	This document include only OMUI configuration procedures. These procedures are all allowed by maint users.
Customer doc: NN10355-111 Core and Billing Manager 850 Basics					

Table 6: Authorization Summary - CBM NTP Customer Documentation

Operation/ Command	Current Action	New Action	Current auth. level	New auth. level	Note
No procedures defined					This document provides a detailed description of the CBM and its applications.
Customer doc: NN10351-911.03.01_Core_and_Billing_Manager_850_Fault_Management (Note: all maint authorizations can run as root, emsadm and secadm)					
Clearing a CBM850 fault condition			root maint	ALL	The following commands are executed: • querycbm flt • cbmmtc, appl, bsy, rts
Clearing a CBM application Alarm			root maint	ALL	The following commands are executed: • querycbm flt • cbmmtc, appl, bsy, rts
Clearing a GDD logical volume size threshold violation			root (1) maint (2)	root (1) ALL (2)	This procedure describe two ways of fixing the problem: 1- Increase the size of the logical volume. 2- Decrease the number of days to keep the logs. The following commands are executed: 1) • cli, view, disk_util • echo '/opt/nortel/sspfs/fs/meta.pl fs' 2048 / 5000 - p | dc • filesys grow -m <mount_point> -s <size>m 2) • logroute
Clearing a major heartbeat alarm					No commands (HW check)
Replacing a failed power supply					No commands (HW check)

Table 6: Authorization Summary - CBM NTP Customer Documentation

Operation/ Command	Current Action	New Action	Current auth. level	New auth. level	Note
Replacing failed Ethernet Interface			root	root	The following commands are executed: • mapci;mtc;appl;sdmbil;post <stream_name> • bsy • cbmmtc, appl • bsy group • offl group • **shutdown system** • Replace hardware • cbmmtc, appl • bsy group • rts group
Accessing TCP and TCP-IN log devices from a remote location			root maint	ALL	The following commands are executed: • logreceiver <port_number> • logroute
Accessing the mate			root	ALL	The following commands are executed: • GetCurrentHostName • ping <mate hostname> **root only:** • **ssh root@ <mate hostname>**
Clearing Mate alarm			root	ALL	The following commands are executed: • Access the mate • cbmmtc
Displaying SBA log reports		accounting-manage	root maint	root maint emsadm	The following commands are executed: • billmtc • displogs **procedure indicates that root user is required, however I don't see the need for root user. The document must be changed.**

Operation/ Command	Current Action	New Action	Current auth. level	New auth. level	Note
Searching and viewing billing records		accounting-view	maint root	maint root emsadm	The following commands are executed: • billmtc, tools, amadump <stream-name>, AMADUMP>> dump <display_mode> [sum] [numout <numout_value>] [numsrch <numsearch_value>] [numblk <numblock_value>] [filter <filter_string> or <%filter_number>] [fname <file-name>] [btime <start_time>] [etime <end_time>] • listfile <stream-name>
Listing billing files		accounting-view	maint root	maint root emsadm	The following commands are executed: • billmtc, filesys, • listfile <stream_name> <optional_parameters>,
Listing billing streams		accounting-view	maint root	maint root emsadm	The following commands are executed: • billmtc, confstrm, • list {<stream_name> | ALL},
closing billing files		accounting-manage	maint root	maint root emsadm	The following commands are executed: • billmtc, filesys, • closec <stream_name>

Table 6: Authorization Summary - CBM NTP Customer Documentation

Operation/ Command	Current Action	New Action	Current auth. level	New auth. level	Note
Sending billing files from disk		accounting-manage	maint root	maint root emsadm	The following commands are executed: • billmtc, filesys, • sendfile <stream_name> [<optional_parameters>]

Note: When the new authorization level is “ALL”, it indicates that users in all groups (maint, emsadm and secadm) and the root user have access to that command.

164.7 Hardware Requirements or Dependencies

There are no hardware requirements for this feature.

164.8 Software Requirements or Dependencies

This feature builds on two other CBM23 security features:

- A00012465 - CBM User Authorization Integration with a Nortel Central Security Server (Wireless application).
- A00012729 - CBM Application GID Migration.

164.9 Limitations and restrictions

No user interface is provided to create additional authorization levels.

Only commands that are specified in this document will be supported by this feature. In the future, other applications or commands will be revised to use this authorization scheme.

Some commands do not check for authorizations, and therefore these commands would be accessible by all users.

164.10 Interactions

This feature will change the RMI for user creation.

164.11 Glossary

Term	Description
API	Application Program Interface
CBM	Core and Billing Manage
CNM	CDMA Network Manager
CLI	Command Line Interface
IEMS	Integrated Element Manager System
MS	Management System
MSAP	Management System Application
MSOS	Management System Operating System
NE	Network Element
NE/MS	NE or MS
PAM	Pluggable Authentication Modules
RBAC	Role Based Access Control
RMI	Resource Manager Interface
SBA	SuperNode Billing Application
SDM	Super Node Data Manager
SPFS	Succession Platform Foundation Software

165: Functional Description (FN) A00012622

165.1 Feature name and Feature ID

A00012622 - Platform HW Alarm Reporting

165.2 Description

This activity provides the capability for the MCS System Manager to monitor HP CC3310 servers, IBM blade servers, and the IBM BladeCenter chassis for hardware faults.

Alarms are generated for four kinds of hardware faults.

Power Supply. A minor alarm raised when any power supply operates outside of specifications or any voltage sensor reports a value outside of specifications.

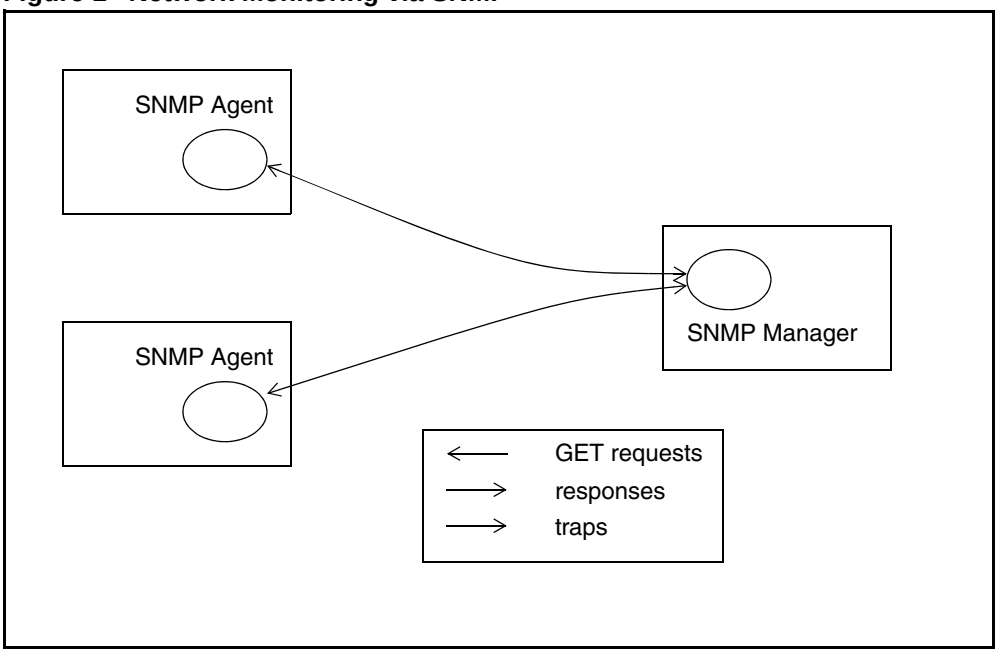
Cooling Device. A minor alarm is raised when any cooling device (fan or blower) operates outside of specifications.

Temperature. A minor alarm is raised when any temperature sensor exceeds its specified threshold.

Processor. A minor alarm is raised when a CPU failure is detected (available on the BC-T only).

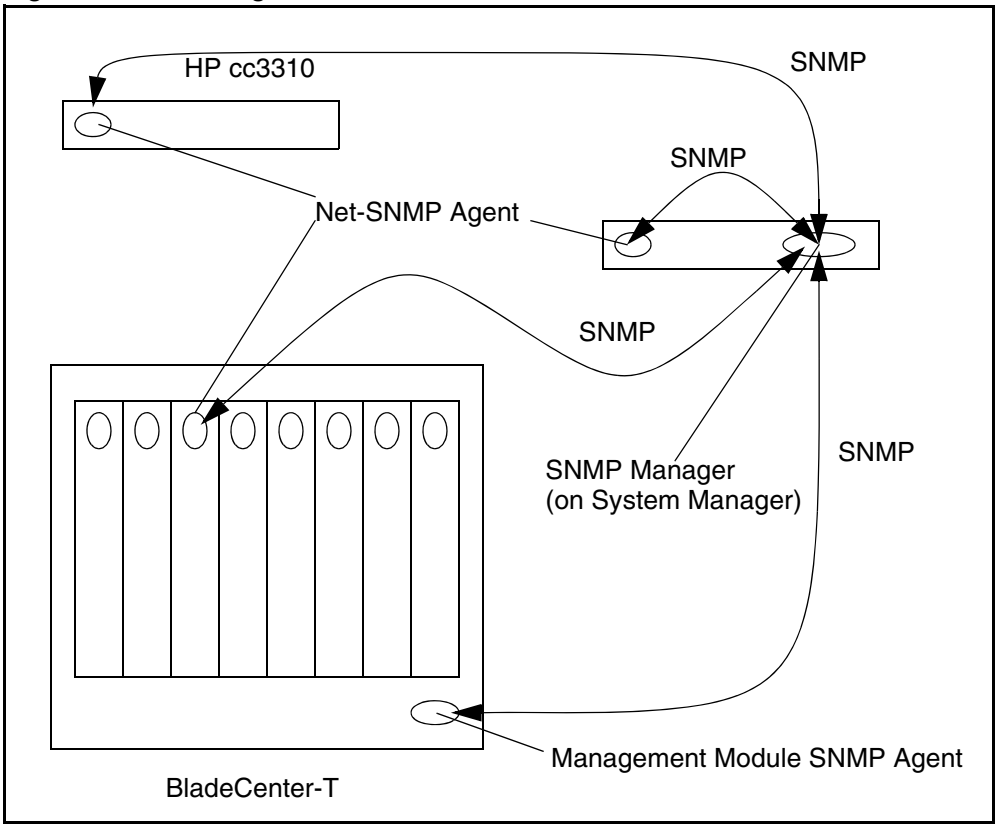
The System Manager monitors configured servers using the SNMP protocol. A high level depiction of the use of SNMP is shown in Figure 1. The SNMP protocol is exchanged between an SNMP Agent and an SNMP Manager. An SNMP agent is responsible for reporting the values of variables defined by one or more Management Information Base specification documents. An SNMP manager is an entity capable of requesting MIB variable values from SNMP Agents. An SNMP agent may also be configured to spontaneously report events to an SNMP Manager; these event reports are called *traps*.

Figure 1 Network Monitoring via SNMP



The SNMP protocol provides a mechanism enabling the SNMP Manager to cause an SNMP Agent to alter the values of some MIB variables. This mechanism, referred to as “SNMP Set”, justifies the term “management” in SNMP. This capability is disabled under MCS for security reasons. The MCS therefore *monitors* servers, but does not *manage* them.

Figure 2 Monitoring the CC3310 and BC-T

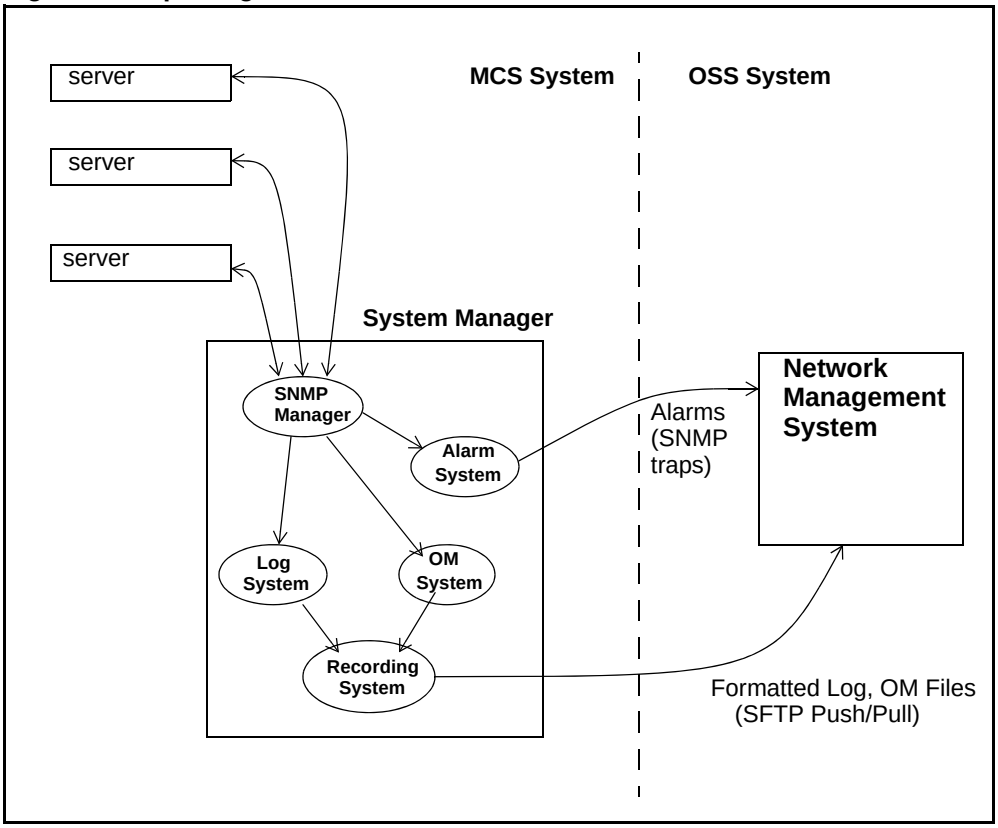


A more detailed view is shown in Figure 2. The open source Net-SNMP agent is installed on all MCS servers. Resource utilization measurements are available from these agents under the well known MIB-2 standard.

On the HP CC3310, hardware faults are reported through the Net-SNMP agent using the mapbase4 MIB provided by HP.

BladeCenter servers do not report their own hardware faults; this function is provided by an SNMP agent running in the BladeCenter Management Module using the mmblade MIB provided by IBM.

Figure 3 Reporting to the NMS



The general flow of network management information is shown in Figure 3. The System Manager polls SNMP agents running on monitored servers for the raw data from which to generate operational measurements. Some of these measurements are instrumented with configured alarm thresholds. The System Manager raises and clears alarms when these thresholds are crossed. Alarms are reported to registered parties as SNMP traps defined under the Nortel Reliable MIB. A log is generated whenever an alarm is raised or cleared.

Formatted logs and OMs are reported to the recording system on the System Manager which persists them in the local file system. Formatted record files are available via SFTP pull.

165.3 Hardware Requirements or Dependencies

The hardware fault reporting implemented under this activity is available only for the CC3310 and BC-T.

165.4 Software Requirements or Dependencies

The CC3310 implementation relies upon the dmi2snmp process supplied by HP and the SMUX capability of Net-SNMP.

165.5 Limitations and restrictions

Processor failure is reported only for the BC-T.

Monitoring must be started manually (from the System Management Console). Once started, the administrative state of the monitor is maintained over System Manager restarts so that monitoring will automatically resume.

165.6 Interactions

The Oracle SNMP agent must be configured not to use the well-known TCP port 199 for the SMUX protocol.

165.7 Glossary

Term	Description
BC-T	BladeCenter -Telco. A NEBS-compliant version of the IBM BladeCenter.
BIST	Built-In Self Test. A capability for equipment to test itself for defects by comparing self-administered known inputs to expected outputs.
DMI	Desktop Management Interface. A standard for remote computer maintenance.
DMTF	Distributed Management Task Force. The standards organization responsible for defining the Desktop Management Interface.
ITU	International Telecommunication Union
MIB	Management Information Base. A data structure and documentation describing the information accessible via SNMP
MM	Management Module. The BladeCenter management module.
PDU	Protocol Data Unit. A data packet formatted according to some particular protocol.
SMUX	SNMP Multiplexing. A standard for instructing an SNMP agent to delegate processing of a MIB subtree to another process.
SNMP	Simple Network Management Protocol. A standard networking protocol. UDP is unreliable, meaning that data may be lost, duplicated, or received out of order.

166: Functional Description (FN) A00012635

166.1 Feature name and Feature ID

A00012635 - Netra 240 146 GB Disk Drive Upgrade

166.2 Description

Due to the increasing foot print of data stored by the applications on SPFS, the servers are running out of available disk drive space. To resolve this disk space need, the field grade Netra 240 servers can be upgraded with 146 GB drives, replacing the existing two 72 GB drives. Although the existing servers can be manually upgraded today, this feature provides an automated upgrade utility to greatly reduce the complexity and interaction required by the personnel performing the disk drive upgrade.

166.2.1 Performing the 146GB Upgrade - High level view

Below is a high level description of the manual steps required to perform this procedure and then a session of the output when the automated utility is invoked. The automated process will log all steps below to the /var/adm/ messages file for ease of GNPS to debug any error or interruption in the field. Note, most of the user's time will be spent waiting for disk mirrors to synchronize.

Simplex unit or Cluster active unit high level description

1. Invoke the disk upgrade utility from cli. Provide a description of the action to be taken, warn user about implications of aborting procedure, and finally get user's confirmation to continue.
2. Perform Prechecks:

- System must be field grade N240 with existing 2 x 72 GB drives
- All mirrors must have full redundancy, in an 'Okay' state.
- Warn the user if the utility is not invoked from the console. Force confirmation if the console is not used for this upgrade.
- Check for the existence of the /Mtce InProgress file which indicates other significant SPFS maintenance is in progress such as a software upgrade or clone. If the file exists, do not continue.
- Set mtce in progress so other SPFS maintenance actions are aware of this activity in progress.

3. Obtain and persist metastat information.
4. Select first disk and remove it from the boot device list.

5. Detach submirrors for selected disk.
6. Clear metastat information for detached submirrors.
7. Remove selected disk device from meta database.
8. Unconfigure selected disk device (blue light on chassis is now lit indicating which disk should be removed).
9. Instruct user to remove old disk and insert new 146 GB disk drive.
10. Ensure 146 GB disk drive is inserted. Selected disk is now 146 GB disk drive.
11. Configure selected disk.
12. Format selected disk.
13. Meta initialize submirrors with selected disk.
14. Attach the submirrors one at a time, displaying synchronization status periodically.
15. Update boot device list with selected device.
16. Perform disk state checks again.
17. Repeat steps 4 - 15 for the other disk device.
18. Create a customer log indicating the upgrade is complete.
19. Instruct user to take a full system backup immediately.

Cluster Mate Unit Upgrade high level description

For an SPFS cluster only, upgrading the inactive node would be slightly more than the time it takes to perform a clone. These steps are manual and would consist of the following:

1. Put the inactive node at the ‘ok’ prompt.
2. Replace both 72 GB disks with the 146 GB disks.
3. Follow the existing documented procedure to perform a clone.

166.2.2 Example Session of a Successful 146 GB Upgrade

The following is an example of the commands the user would enter to invoke the 146 GB upgrade. Shown below are the messages displayed for a successful upgrade along with the expected input required by the user. Additionally, sample design logs are also displayed which would be used in the event an unexpected error occurred and additional support was needed.

spfs-server:/> cli

################################################################################
##
#####                        Hard Drive Upgrade Utility                    #####
################################################################################
##
This program is an automated utility which will assist with upgrading the disk drives in this
server to 146 GB disk drives. This procedure will disable the disk mirroring one disk at a time,
which means one of the redundant disks will be out of service or not fully capable of providing
service until this procedure is complete. If the other disk fails or is removed inadvertently, sig-
nificant recovery time should be expected.

It is highly recommended that this procedure be invoked from the system console. Due to the
length of time to synchronize the mirrors each time a disk is replaced, expect this procedure to
take at least 4 hours to complete. Any interruption to the automated utility (i.e. loss of connec-
tion, terminating the process) will require the user to manually complete the disk drive upgrade
or recover from the disk drive upgrade.

Lastly, a recent system and data backup should be available before continuing with this disk
drive upgrade procedure. These will be needed if an unexpected restore is required.
Do you want to continue? [no] y

166.2.3 Examples of Possible Error Messages

Below are examples of error messages that could occur during the upgrade.

New disk is not inserted even though it was confirmed.

The following message would be seen if the user confirmed the disk was changed but the disk was not inserted:

.
.
```
************************************************************
*         Checking that disk 0 is present                  *
************************************************************

"Error: Disk 0 is not detected.

** Warning ** Because of the failure above that occurred after disk 0
replacement, it must be replaced or reseated again.
If yould would like to replace or reseat the disk drive, enter 'yes' below.
Enter 'no' if you want to abort the upgrade procedure.
Do you want to retry this action?

************************************************************
*                       Removing disk 0                    *
*                * Manual Action Is Required For This Step *                *
```

```
*            **Warning** Removing the wrong disk will most likely          *
*                          result in extended service loss.                *
************************************************************************
```

Please replace disk 0 with the new 146 GB disk drive. The disk to be replaced is labeled "HDD 0" on the chassis. The blue removal lamp should be lit on the chassis, adjacent to the disk drive to be removed. Confirm below when the disk drive has been replaced.
Has the disk drive been replaced? [no] y
.

.Upgrade program is not invoked by the root user.

The following message would be seen if the user invoking the upgrade procedure is not root:

```

##
#####                        Hard Drive Upgrade Utility                  #####
##############################################################################
##
```

This program is an automated utility which will assist with upgrading the disk drives in this server to 146 GB disk drives. This procedure will disable the disk mirroring one disk at a time, which means one of the redundant disks will be out of service or not fully capable of providing service until this procedure is complete. If the other disk fails or is removed inadvertently, significant recovery time should be expected.

It is highly recommended that this procedure be invoked from the system console. Due to the length of time to synchronize the mirrors each time a disk is replaced, expect this procedure to take at least 4 hours to complete. Any interruption to the automated utility (i.e. loss of connection, terminating the process) will require the user to manually complete the disk drive upgrade or recover from the disk drive upgrade.

Lastly, a recent system and data backup should be available before continuing with this disk drive upgrade procedure. These will be needed if an unexpected restore is required.
Do you want to continue? [no] y

This program requires it to be invoked by the root user, exiting the program.

Disk drive upgrade utility exiting because of precheck failures.
Correct the failure(s) displayed above before retrying.

The current server does not have 72 GB disks currently installed.

The following message would be seen if the server didn't have the required 72 GB disk drives currently installed:

```
.#############################################################################
###
#####                        Hard Drive Upgrade Utility                  #####
#############################################################################
##
```

This program is an automated utility which will assist with upgrading the disk drives in this server to 146 GB disk drives. This procedure will disable the disk mirroring one disk at a time, which means one of the redundant disks will be out of service or not fully capable of providing service until this procedure is complete. If the other disk fails or is removed inadvertently, significant recovery time should be expected.

It is highly recommended that this procedure be invoked from the system console. Due to the length of time to synchronize the mirrors each time a disk is replaced, expect this procedure to take at least 4 hours to complete. Any interruption to the automated utility (i.e. loss of connection, terminating the process) will require the user to manually complete the disk drive upgrade or recover from the disk drive upgrade.

Lastly, a recent system and data backup should be available before continuing with this disk drive upgrade procedure. These will be needed if an unexpected restore is required.
Do you want to continue? [no] y

Error: Disk 0 size is 36 GB. This value is less than the minimum required disk size which is 72 GB.

Disk drive upgrade utility exiting because of precheck failures.
Correct the failure(s) displayed above before retrying.

166.2.4 146 GB Disk Drive Rollback to 72 GB disk drive

It is possible but not expected to rollback one or both of the 146 disk drives to the 72 GB drives.

Rolling back one of the 72 GB drives

The only for seeable reason why a 146 GB drive would have to be rolled back during the upgrade procedure is a disk failure. It is impossible to predict at what point a failure could occur. An automated recovery mechanism does not exist to recover from a disk failure during the upgrade.

The automated utility persists information about the upgrade to facilitate any manual recovery. One important piece of persisted information is the output of the meta data prior to beginning the upgrade, stored in file /var/tmp/

meta_backup. Other important persisted data is found in the /var/adm/ messages. This file will contain all of the messages from the upgrade utility when a change or modification is attempted by the utility. It contains success and failure messages which allows the user to observe the progression of the upgrade if their console session is not available.

By using the meta data prior to the upgrade and knowing at which point the upgrade failed, the user can attempt to manually finish the 146 GB upgrade or rollback to the 72 GB disk drive.

Example: New 146 GB disk drive fails right after insertion for disk 0 (i.e. configuration fails) and the on-site personnel doesn't have three new drives on hand so they want to back out. This utility may fail to configure the drive and the user chooses to abort the upgrade after the configuration failure.

The persisted meta data that shows the mirror and submirror mappings in file /var/tmp/meta_data looks like:

```
d11 -m d9 d10 1
d9 1 1 c1t0d0s4
d10 1 1 c1t1d0s4
d8 -m d6 d7 1
d6 1 1 c1t0d0s3
d7 1 1 c1t1d0s3
d5 -m d3 d4 1
d3 1 1 c1t0d0s0
d4 1 1 c1t1d0s0
d2 -m d0 d1 1
d0 1 1 c1t0d0s1
d1 1 1 c1t1d0s1
d100 -m d101 d102 1
d101 1 1 c1t0d0s5
d102 1 1 c1t1d0s5
```

Using the /var/adm/messages logs (or the users session), the following logs were found for the upgrade of disk 0:

```
Oct  3 13:15:30 nbound HD_Upgrade: Beginning the Hard Drive Upgrade Procedure
Oct  3 13:15:33 nbound HD_Upgrade: d11: submirror d9 is detached
Oct  3 13:15:36 nbound HD_Upgrade: d8: submirror d6 is detached
Oct  3 13:15:38 nbound HD_Upgrade: d5: submirror d3 is detached
Oct  3 13:15:40 nbound HD_Upgrade: d2: submirror d0 is detached
Oct  3 13:15:42 nbound HD_Upgrade: d100: submirror d101 is detached
Oct  3 13:15:47 nbound HD_Upgrade: d9: Concat/Stripe is cleared
Oct  3 13:15:49 nbound HD_Upgrade: d6: Concat/Stripe is cleared
```

```
Oct  3 13:15:52 nbound HD_Upgrade: d3: Concat/Stripe is cleared
Oct  3 13:15:54 nbound HD_Upgrade: d0: Concat/Stripe is cleared
Oct  3 13:15:56 nbound HD_Upgrade: d101: Concat/Stripe is cleared
Oct  3 13:16:01 nbound HD_Upgrade: Deleted device c1t0d0s7 from the Meta database.
Oct  3 13:16:05 nbound unix: /pci@1c,600000/scsi@2/sd@0,0 (sd0) offline
Oct  3 13:16:05 nbound HD_Upgrade: Unconfigured disk device c1::dsk/c1t0d0
Oct  3 13:16:09 nbound unix: DISK @ HDD0 has been removed.
Oct  3 13:16:17 nbound unix: DISK @ HDD0 has been inserted.
Oct  3 13:16:22 nbound HD_Upgrade: Disk 0 is present.
Oct  3 13:16:24 nbound HD_Upgrade: Failed to configure disk device c1::dsk/c1t0d0
```

The user would then have to manually recover/rollback to the 72 GB by doing the following (which is basically a reverse of what was done):

1. Replace the failed 146 GB drive with the original 72 GB drive.
2. Configure the disk: *cfgadm -c configure c1::dsk/c1t0d0*
3. Add the disk to the meta database: *metadb -af c1t0d0s7*
4. Initialize each of the submirrors that were cleared (from the logs above, message “d9: Concat/Stripe is cleared”) by using the meta data from above:
   a. *metainit d9 1 1 c1t0d0s4*
   b. *metainit d6 1 1 c1t0d0s3*
   c. *metainit d3 1 1 c1t0d0s0*
   d. *metainit d0 1 1 c1t0d0s1*
   e. *metainit d101 1 1 c1t0d0s5*
5. Attach the submirrors one at a time, waiting for each mirror to finish synchronization prior to starting the next one. The synchronization status can be checked by invoking ‘metastat <mirror>’.
   a. *metattach d11 d9*
   b. *metattach d8 d6*
   c. *metattach d5 d3*
   d. *metattach d2 d0*
   e. *metattach d100 d101*
6. Add the disk back to the boot list: *eeprom boot-device=”disk0:b disk1:b”*

Rolling back both 146 GB drives to 72 GB drives

It is unforeseeable why the 146 GB drives would be rolled back to the 72 GB drives. The following is the high level description of how to rollback the 146 GB drives to the original 72 GB drives after the upgrade.

Simplex:

7. Locate the latest full system backup taken with the 72 GB drives.
8. Put the unit at the ‘ok’ prompt.
9. Replace the 146 GB drives with the 72 GB drives that were removed from the system.
10. Follow the existing procedure for restoring from a full system backup for a simplex server, using the backup taken when the drives were 72 GB.
11. Restore the latest data backup using the existing procedure for a simplex server.

Cluster Rollback

1. Locate the latest full system backup taken with the 72 GB drives.
2. Put both units of the cluster at the ok prompt.
3. Replace the 146 GB drives in both units with the 72 GB drives that were removed from the units.
4. Follow the existing procedure for restoring from a full system backup for a cluster, using the backup taken when the drives were 72 GB.
5. Restore the latest data backup using the existing procedure for a cluster.

166.3 Hardware Requirements or Dependencies

The 146 GB disk drive upgrade utility is only supported on SPFS servers with two 72 GB drives.

166.4 Software Requirements or Dependencies

The 146 GB disk drive upgrade is performed after the server upgrade to SN09FF.

166.5 Limitations and restrictions

Limitations and restrictions include:

- A new full system backup is required to be taken after completion of the upgrade.
- If a remote backup server is in use, it must be re-installed with 146 GB drives after the target server is upgraded with 146GB drives.
- Synchronization of the mirrors must be performed one at a time. The amount of time it takes to fully synchronize one of the 146 GB drives is at least 2 hours.
- Interruption of the automated upgrade utility will require the user to either manually complete the upgrade or manually recover the server.

166.6 Interactions

Not applicable.

166.7 Glossary

Term	Description
New term	Definition

167: Functional Description (FN) A00012735

167.1 Feature name and Feature ID

A00012735 - Session Server Fault Handling Enhancements

167.2 Description

This activity extends the coverage of hardware faults handled by the Session Server NCGL Platform Manager software and thus increases the reliability of the Session Server platform. This activity involves the detection and reporting of hardware faults in the following areas:

- Power Supplies
- Fan Speeds
- System Temperature
- System Voltage
- Miscellaneous Hardware Elements

167.3 Hardware Requirements or Dependencies

The software of activity interacts with functions of the existing SAM XTS (HP CC3310) hardware of the Session Server platform. No new hardware is required.

167.4 Software Requirements or Dependencies

No new software or firmware dependencies are introduced by this activity.

167.5 NCGL Platform Web Pages

An Element Management web based interface is provided to perform the platform or application maintenance and monitoring of logs and alarms. The platform web interface resides under the Communication Server 2000 NCGL Platform Manager link on the Session Server EM web login page. This web interface can be accessed from either the Succession IEMS or a general web browser running on a client machine.

This activity introduces enhancements to the fault handling of the NCGL software within the NGSS platform. These enhancements include the monitoring and alarming of the various hardware resident sensors. These sensor monitors are displayed in a new Sensors page of the Succession Communication Server 2000 NCGL Platform Manager web pages. When mate connectivity exists, data for both units are shown on the Sensors page.

The sensors are categorized as either primary or secondary sensors. The primary sensors are always reported on the Sensors page while the value of a secondary sensor is only reported when the sensor is reporting a failure. In terms of alarms and customer logs, no such distinction between primary and secondary sensors applies - all sensors are treated the same.

The sensors are also categorized into the following sensor groups for purposes of sensor display, logging and alarming:

1. Power Supplies:

   There are two power supply modules, labelled “A” and “B”, per unit. Sensors report module presence and operational status. There is one primary and 2 secondary sensors per power supply module.

2. Fan Speed:

   There are 4 internal fan speed sensors and no secondary sensors per unit.

3. System Temperature:

   There are 4 primary temperature sensor plus 6 secondary sensors per unit.

4. System Voltage:

   There are 3 primary power line sensors plus 13 secondary sensors per unit.

5. Miscellaneous Hardware Elements:

   There are no primary sensors reported but up to 29 secondary sensors might be reported per unit.

The format of sensor information for a single unit of the new Sensors web page appears below in Table 1 on page 1724. Where applicable the units of the sensor readings appear in the Sensor Status column. In the cases of sensors with thresholds, the current value of the sensor plus associated thresholds are provided. Note that these thresholds are established in the hardware and this activity does not provide a method to change the threshold values. Where applicable the severity of the threshold (minor or major) is shown indicating that the exceeding the threshold will result in the assignment of the respective severity or higher.

The alarm severity column allows easier identification of the failed sensors and correlation with alarm indicators and customer log reports. A higher severity may appear in the alarm severity column in comparison to the minor threshold. This might happen if multiple sensors with the same replaceable component (FRU) are reporting failures. Please see the alarm subsection for more information.

If the secondary sensors report a failure indication, then the senors records will appear in the “<any other sensor failure reports>” fields. Reports for one or

more failed secondary sensors could appear on the Sensor page. If no secondary sensors report failures, then no additional records appear.

Table 1: Unit Sensor Format

Sensor Group		Sensor Status
Unit 0 Chassis Sensors		**Alarm:** <chassis alarm severity>
Fan Speed	80mm, Left	<current RPM plus thresholds>
	80mm, Right	<current RPM plus thresholds>
	40mm, Left:	<current RPM plus thresholds>
	40mm, Right	<current RPM plus thresholds>
System Temp	Baseboard	<status plus current degrees C>
	Processor 1	<status plus current degrees C>
	Processor 2	<status plus current degrees C>
	Front Panel	<status plus current degrees C>
	Other	<any other sensor failure reports>
System Voltage	3.3V	<current Volts plus hi/low thresholds>
	5V	<current Volts plus hi/low thresholds>
	12V	<current Volts plus hi/low thresholds>
	Other	<any other sensor failure reports>
Miscellaneous H/W Elements		<any other sensor failure reports>
Unit 0 Power Supply Module A		**Alarm:** <power supply A alarm severity>
Power Supply	A	<PS present and status> <any other sensor failure reports>
	Other	<any other sensor failure reports>
Unit 0 Power Supply Module B		**Alarm:** <power supply B alarm severity>
Power Supply	B	<PS present and status> <any other sensor failure reports>
	Other	<any other sensor failure reports>

The Sensors page provides the latest values of the last sensor sample. No history of sensor readings or failures is provided. The customer logs may be used to identify such a history.

Here is an example Sensor page display for a single unit

Sensor Group		Sensor Status
Unit 0 Chassis Sensors		**MAJOR**
Fan Speed	80mm,Left	Current = 4029.00 RPM Low Minor/Major = 1989.00/1836.00 RPM
	80mm,Right	Current = 3315.00 RPM Low Minor/Major = 1989.00/1836.00 RPM
	40mm,Left	Current = 9537.00 RPM Low Minor/Major = 3774.00/3264.00 RPM
	40mm,Right	Current = 8925.00 RPM Low Minor/Major = 3774.00/3264.00 RPM
System Temp	Baseboard	Current = 87.00 C Low Minor/Major = 10.00/5.00 C High Minor/Major = 60.00/65.00 C
	Processor1	Current = 33.00 C Low Minor/Major = 0.00/-10.00 C High Minor/Major = 75.00/80.00 C
	Processor2	Current = 32.00 C Low Minor/Major = 0.00/-10.00 C High Minor/Major = 75.00/80.00 C
	Front Panel	Current = 25.00 C Low Minor/Major = 10.00/5.00 C High Minor/Major = 40.00/45.00 C
	Other	OK
System Voltage	3.3V	Current = 3.41 volts Low Minor/Major = 3.08/2.99 volts High Minor/Major = 3.54/3.64 volts
	5V	Current = 5.01 volts Low Minor/Major = 4.68/4.52 volts High Minor/Major = 5.33/5.49 volts
	12V	Current = 16.03 volts Low Minor/Major = 11.16/10.79 volts High Minor/Major = 12.71/13.08 volts
	Other	OK
Miscellaneous H/W Elements		OK
Unit 0 Power Supply Module A		**MAJOR**
Power supply	A	presence detected
	Other	minor 22 performance lags; minor 23 performance lags;
Unit 0 Power Supply Module B		**minor**
Power supply	B	presence detected
	Other	minor 26 performance lags;

167.6 Alarms

This activity introduces new alarms for reporting faults due to:

1. Power Supply related failure
2. Fan Speed threshold exceeded
3. System Temperature threshold exceeded
4. System Voltage threshold exceeded
5. Miscellaneous hardware sensors reporting failure

The new alarms are associated with an field replaceable unit (FRU). There are two FRU types involved with the sensor monitoring:

1. the server chassis and contained baseboard
2. the power supply module

There are two power supply FRUs, A (left when viewed from rear) and B (right), per session server module.

For the new alarms:

1. An XTS382 alarm and log signifies the occurrence of a server chassis/ baseboard sensor alarm condition.
2. An XTS383 alarm and log signifies the occurrence of a power supply module alarm condition

For each unit, at any time at most one alarm should be raised for each FRU.

Once raised, the severity of an alarm might escalate if:

- the number of failed primary or secondary sensors in the group detecting failure increases or
- the nature of the sensor failure changes (e.g. both minor and major thresholds are crossed)

When raised these alarms may be viewed on the Alarms page of the NCGL Platform Manager web pages. Note that the Alarms page is refreshed approximately every 45 seconds.

The NCGL platform also supports the reporting of alarm events to an SNMP host target. These SNMP traps are typically configured to route to the Succession IEMS. Traps for the new alarms follow the same format, fields values and behavior as existing platform alarm traps. When raising an alarm, the SNMP traps are associated with the XTS382 and XTS383 identifiers. Once all sensor conditions associated with an FRU are cleared, the alarm is cleared and an XTS682 or XTS683 SNMP trap and customer log are generated.

Alarms are formatted and displayed as follows:

<Type> <ID> <Timestamp> <Host> <Severity> <Description>

167.6.1 Alarm Type

The alarm type specifies the alarm category for the given alarm. Each of the new alarms are associated with the Equipment Alarm type.

Table 2: Alarm Type Selection

Log Number	Elements	Type
XTS382/XTS682	Chassis/Baseboard Sensor	Equipment alarm
XTS383/XTS683	Power Supply Sensor	Equipment alarm

167.6.2 Alarm ID

The alarm ID specifies, in general terms, why the given alarm was raised. The alarm ID choices for the new alarms are:

1. Cooling system problem:
2. Processor Problem:
3. Threshold Crossed
4. Power Problem
5. Equipment Malfunction

For cases of multiple, diverse alarm conditions against the same FRU, the equipment malfunction identifier is used.

167.6.3 Alarm Timestamp

The alarm timestamp specifies the date and time when the given alarm was raised.

167.6.4 Alarm Host

The host field contains the Session Server host name from where alarm was raised.

167.6.5 Alarm Severity

The alarm severity specifies the seriousness of the given alarm.

The following alarm severities apply to the alarms introduced by this activity:

- Minor

  Indicates the detection of a non-service affecting fault condition and that corrective action should be taken in order to prevent a more serious fault.

- Major

  Indicates a service affecting condition has developed and a timely corrective action is required.

- Cleared

  Note that ‘cleared’ will not be seen on the Alarms Panel, since the Alarms Panel only shows alarms that are currently raised.

For severity selections of the new alarms of this activity please refer to table 1.

167.6.6 Alarm Description

The alarm description provides specific details about the given alarm. For the alarms introduced by this activity, the description field includes:

- location:

  For the power supply module alarms, this indicates either “A” (left when viewed from rear) or “B” (right when viewed from rear) for the applicable FRU.

- sensor counts:

  The number of sensor reporting failure for the FRU is also given.

Here are example fields from the Alarms Panel on the platform web pages:

Type: Equipment

ID: Threshold Crossed

Date: Monday December 12th 2005 04:17:46 AM

Host: NGSS0

Severity: Minor

Description: Chassis sensor alarm raised. 1 sensor is reporting a failure.

167.7 Customer Logs

The Session Server Element Manager provides a web page for viewing of customer logs. The customers log panel displays a historical view of customer logs that have been generated on the Session Server unit.

This activity adds new customer logs to the existing platform (XTS) logs. The new customer logs are associated with the types of field replaceable units where the hardware sensors reside.

The Session Server customer logs are generated using syslog. Here is the format for the new logs.

<time stamp> <host name> <process name> <Name> <Number> <Severity> <Event type> <Label> <Description>

The log description field follows the same format as the alarm description field described in “Alarm Description” on page 1728.

Here are the field values for these new customer logs.

Table 3: Fields of the New Logs

Name	Number	severity	Event Type	Label	Description
XTS	382	MINOR	FLT	Chassis Sensor Fault	Chassis sensor alarm raised. <#> sensor <is/are> reporting a failure.
XTS	382	MAJOR	FLT	Chassis Sensor Fault	Chassis sensor alarm raised. <#> sensor <is/are> reporting a failure.
XTS	682	CLEARED	INFO	Chassis Sensor Condition Cleared	Chassis sensor condition cleared.
XTS	383	MINOR	FLT	Power Supply Sensor Fault	Power supply alarm raised in module <A/B>. <#> sensor <is/are> reporting a failure.
XTS	383	MAJOR	FLT	Power Supply Sensor Fault	Power supply alarm raised in module <A/B>. <#> sensor <is/are> reporting a failure.

Table 3: Fields of the New Logs

Name	Number	severity	Event Type	Label	Description
XTS	683	CLEARED	INFO	Power Supply Sensor Condition Cleared	Power supply condition cleared in module <A/B>.

167.8 Limitations and restrictions

This activity does not introduce further limitations or restrictions to the NGSS platform. Please note that this activity addresses the failure monitoring documented in the FN section of A00004005. Please refer to A00004005 for other limitations and restrictions of the NGSS platform.

167.9 Interactions

A00012843 - IEMS support for MDM security Interface changes

168.2 Description

In SN09 MDM changes their security interface, MDM client is moving from a PAM Radius client to a PAM IS Client, so it will no longer require a Radius secret configuration in IEMS.

To support this change in MDM, IEMS requires the following design changes:

1. Remove the Radius Secret field from the MDM Mgr Addition wizard when adding a new SN09 or later MDM Element Manager. See Figure 1.

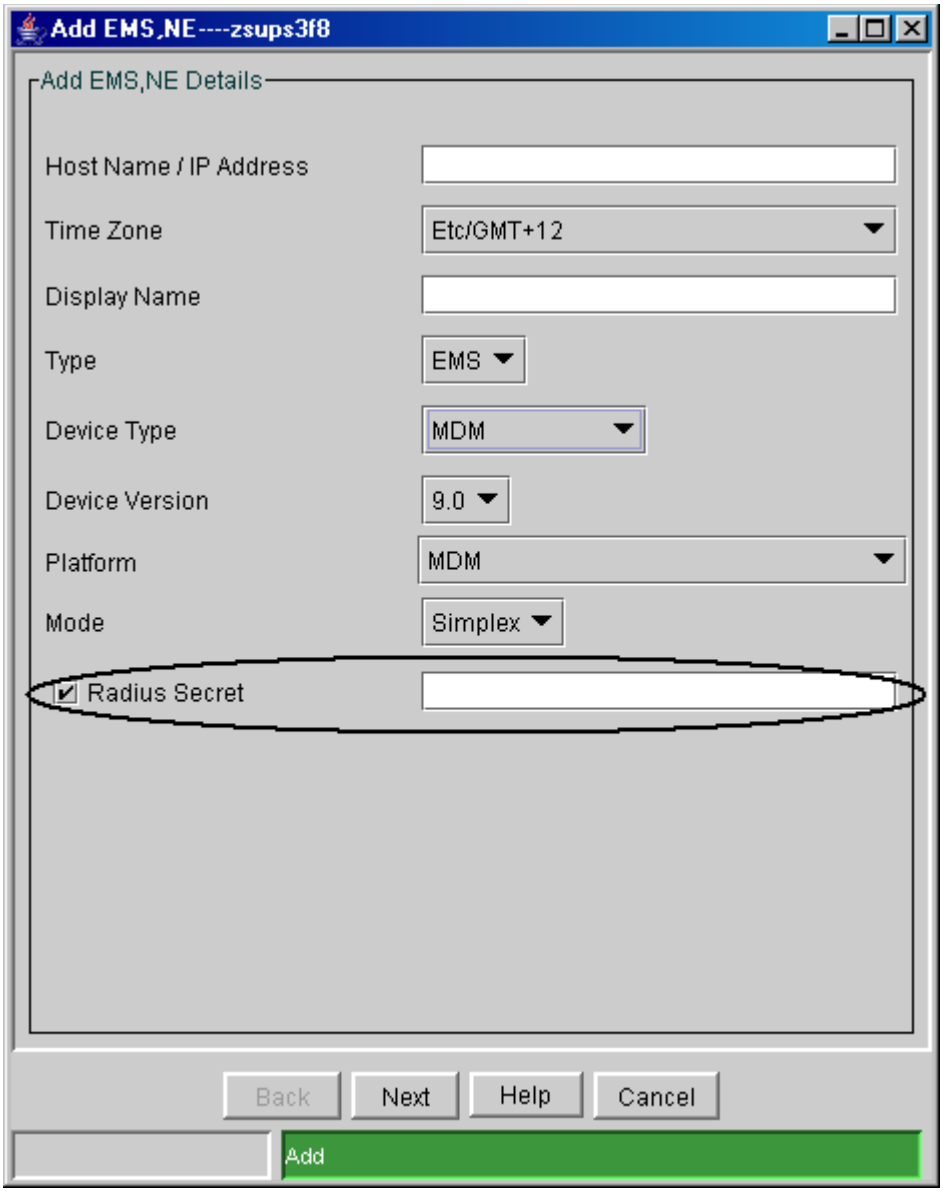

Figure 1 MDM Addition wizard

2. Disable the Update Radius Secret menu item from the MDM Element Manager's menu when it is a SN09 or later MDM Element Manager. See Figures 2 and 3.

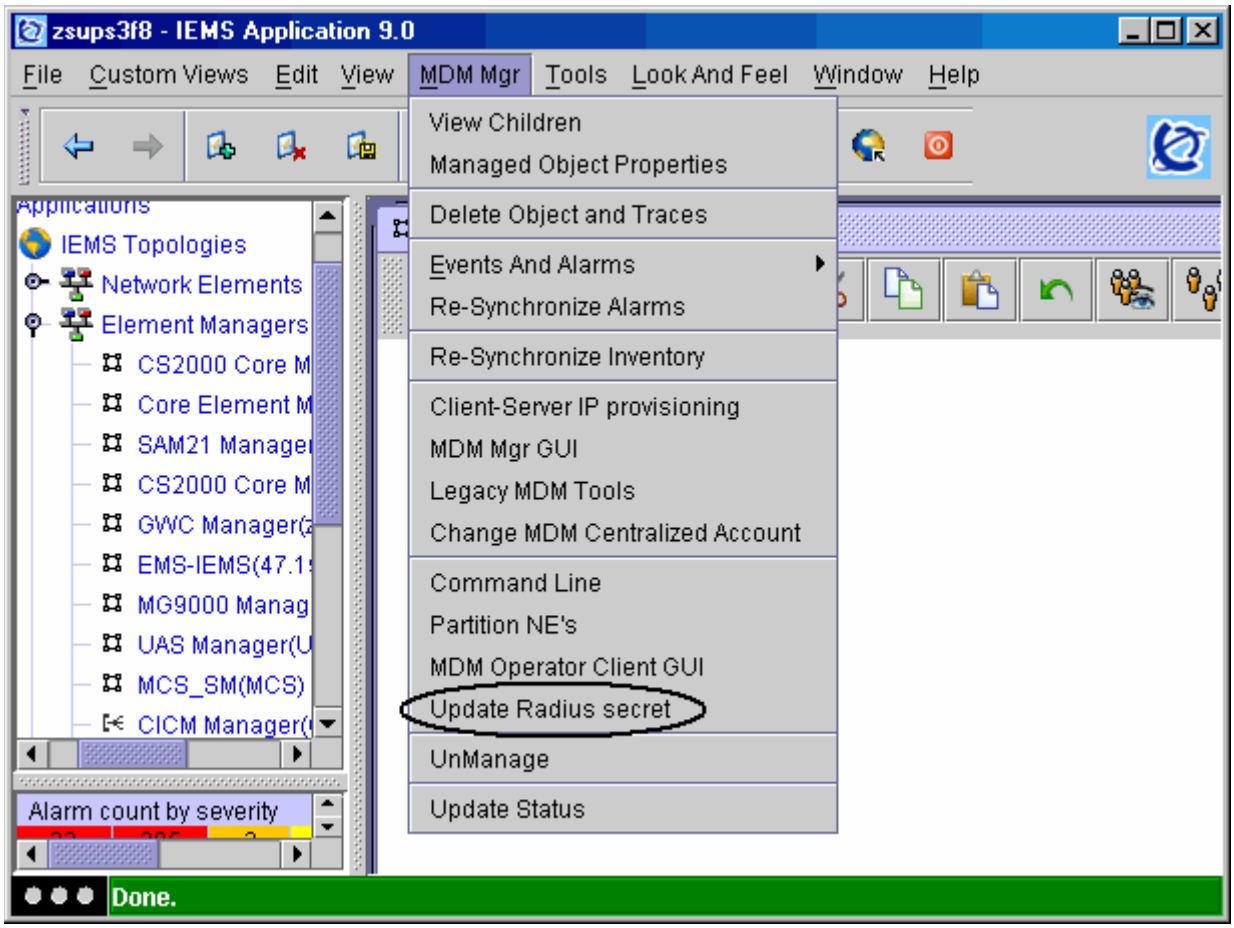

Figure 2 MDM Mgr Menu

Figure 3 MDM Mgr Right Click Popup Menu

52.1 Hardware Requirements or Dependencies

52.4 Interactions

There are no interactions between this feature and existing features.

52.5 Glossary

RADIUS - Remote Authentication Dial-In User Service

IEMS - Integrated Element Management System

GUI - Graphical User Interface

EM - Element Manager

NE - Network Element

CLI - Command Line Interface

PAM - Pluggable Authentication Module

169: Functional Description (FN) A00012889

169.1 Feature name and Feature ID

A00012889 - Passphrase Protected Keys for SSH

169.2 Description

The applications (SBA and OMDD) on the SDM/CBM, use either standard FTP (insecure) or OpenSSH SFTP (secure) to perform outbound file transfers to the downstream machine.

Currently, for secure outbound file transfer, only password-based authentication is supported.

This feature enhances the existing secure outbound file transfer functionality by introducing the key-based (public key) authentication.

The key-based authentication mechanism is provided as an additional option for the user. Hence, the user can select to use either the password-based or the key-based authentication while adding and changing the secure file transfer schedules in the SBA (billmtc) or OMDD (omui) user interface programs. The actual configuration details are documented in the configuration section.

When the user configures secure file transfer schedule with key-based authentication, the keypair (public/private key files) will be automatically generated with a random passphrase. The keypair will be stored under ~maint/ .ssh/ directory and the passphrase will be stored in the Private Data Manager in an encrypted format.

If there is a failure in generating the cryptographic keys, an info log SDM666 will be generated.
Ex:
SDM666 Oct 12 04:33:59 1234 NONE INFO Failed to generate cryptographic keys for user=maint, app_name=OMDD, index=ftd1

169.3 Hardware Requirements or Dependencies

No new hardware requirements or dependencies are introduced by this feature.

169.4 Software Requirements or Dependencies

The customer's downstream machine (OSS) should be running a SSH-2 server compatible with SFTP client of OpenSSH. The OpenSSH software should be installed on the SDM/CBM too.

169.5 Limitations and restrictions

- The initial host key acceptance of the downstream processor should be done manually before it can use the SSH protocol to transfer the files from SDM/CBM. Figure 1 shows an example of how to accept a host key manually. The .ssh/known_hosts file in maint user's home directory will be edited by SSH software to include the host key. After that, the applications (SBA/OMDD) can use SSH to send files to the downstream OSS as maint/root. This procedure must be performed for each downstream destination.
- Automatic dumping of the public key file on the remote system is NOT supported by this feature. All users have to manually dump the contents of the public key file into the user's authorization file on the remote system.

  Note: If the remote system is running OpenSSH server, the public key should be appended to .ssh/authorized_keys or .ssh/authorized_keys2 file of the user. Figure 2 shows an example of how to append the public key to .ssh/authorized_keys file of the user.
- The SSH-2 server running on the downstream OSS must be compatible with OpenSSH sftp client.
- The data transfers of AFT, RTB and sendtape applications are not secured.

Figure 1 Host key acceptance

On SDM/CBM

```

170: Functional Description (FN) A00012893

170.1 Feature name and Feature ID

A00012893 - BCP 7200 VLAN Tagging

170.2 Description

This feature provides support for IEEE 802.1Q VLAN-tagging on the BCP7200.

The introduction of IEEE 802.1Q VLAN-tagging on the BCP7200 simplifies the Service Network Interconnect of the BCP7200 by supporting direct interconnect into VLAN-tagged network topologies.

Simplification of BCP7200 Service Network Interconnect has transitive benefits in terms of:

- reduced cost: due the elimination of the need for specialized Interconnect Equipment containing advanced packet analysis functions.
- deployability: the BCP7200 can now be deployed directly into a broader array of networks (i.e. tagged and untagged topologies).
- simplification: the BCP7200 network interconnect no longer requires complex configuration of advanced functions on Service Network Interconnect Equipment.

170.3 Background

170.3.1 The Media Portal Component

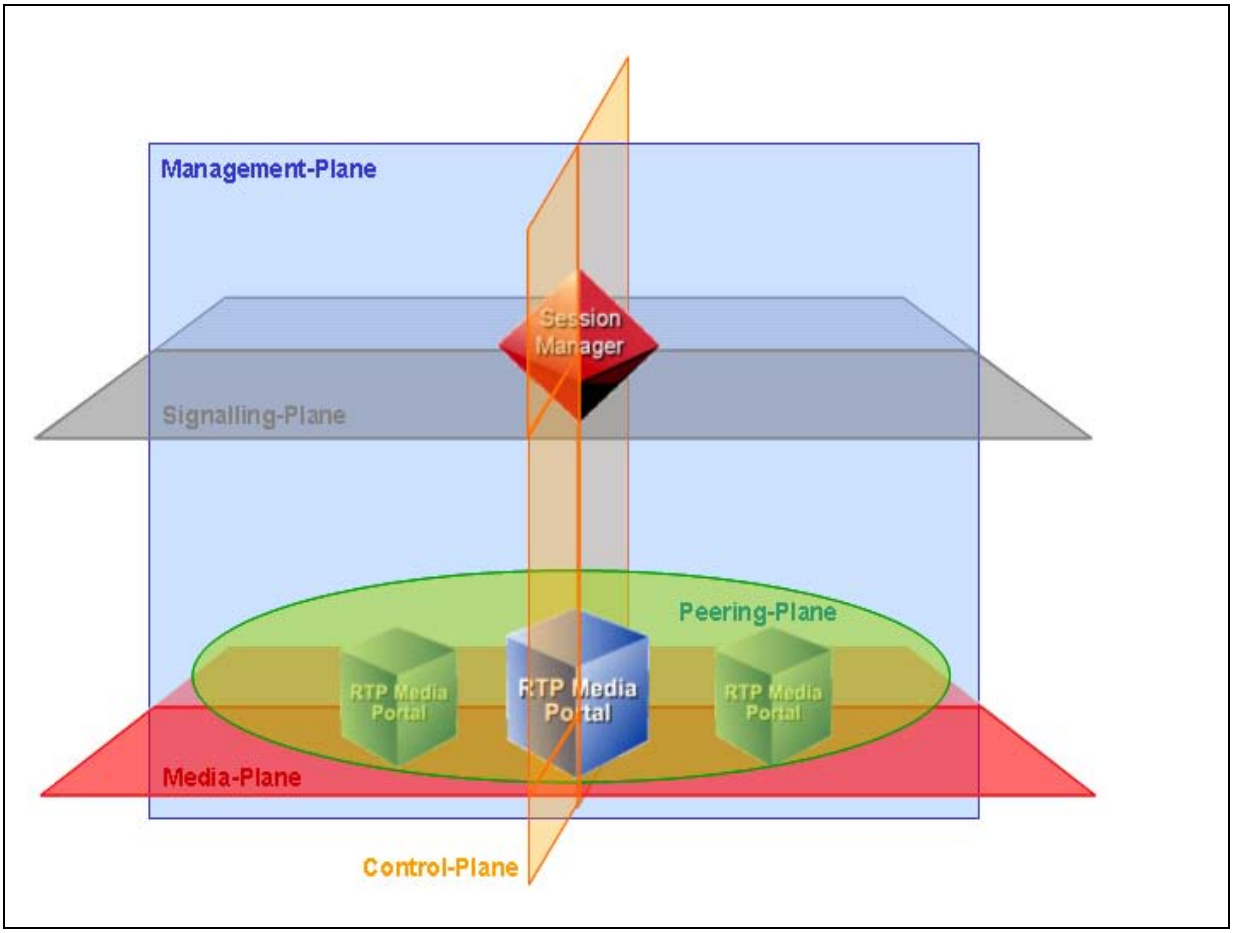
The Media Portal Component is the part of the Multimedia Communications Portfolio (MCP) whose primary function is to extend the reach of multimedia services so that they are accessible to obscured endpoints - devices residing behind a firewall (FW), or a Network Address Translation (NAT) and/or Network Address Port Translation (NAPT) device.

The Media Portal Component is also employed as a media NAPT point that shields internal Service Network components from external exposure - and is used to provide media anchoring and media pivot capabilities.

In order to provide these advanced media functions the Media Portal Component must reside in the following planes of operation (refer to “Media Portal Component - Presence in Service-planes.” on page 1741):

- the **Management-plane**, over which the Media Portal Component is deployed to a target platform – and over which command/control and telemetry can flow to aid in operation, administration, and maintenance.
- the **Control-plane**, through which a Call Server (e.g. a CS2000 Gateway Controller, GWC – or a MCS Session Manager) can utilize the Media Portal Control Protocol (MPCP) to control participation of the Media Portal Component in calls as required.
- the **Media-plane**, over which media streams converge on the Media Portal for relay to their associated endpoints.
- *and the **Peering-plane**, in which the Service Instances participating in a Fault Tolerant Service Cluster maintain synchrony (through heartbeat and Checkpointing mechanisms) and detect failures.* ***(this service-plane is only applicable to the BCP7200).***

Figure 1 Media Portal Component - Presence in Service-planes.



In addition to its logical presence in the service–planes, the Media Portal Component can be configured for physical presence in either one, or two separate, media networks. These two types of network topology are known as:

- **Single Network Topology**: in this topology the Media Portal Component is connected to a single network space in the Media-plane (refer to “Media Portal Component – Single Network Topology.” on page 1742). In this topology, the Service Network is protected by Access Control Lists (ACLs) on the routers. This topology occurs in Multimedia Communications System (MCS) deployments.
- **Dual Network Topology**: in this topology the Media Portal Component is connected into two separate Media-plane network spaces – and can relay media packets between the two (refer to “Media Portal Component – Dual Network Topology.” on page 1743). In this topology, the Service Network also benefits from an extra layer of protection in the Media-plane as a result of the Media Portal’s operation. This topology is used throughout Communications Server 2000 (CS2K) deployments.

Figure 2 Media Portal Component – Single Network Topology.

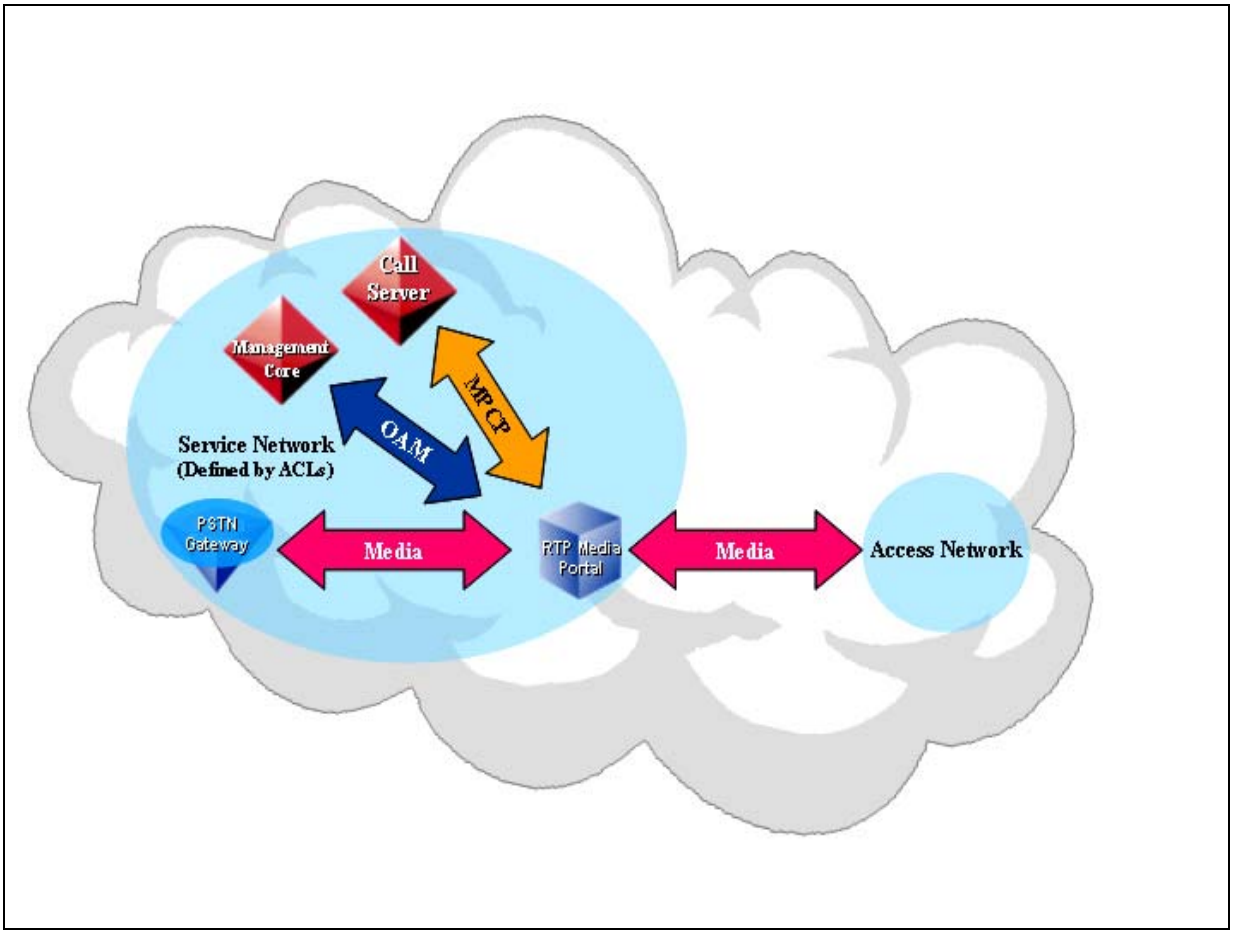


Figure 3 Media Portal Component – Dual Network Topology.

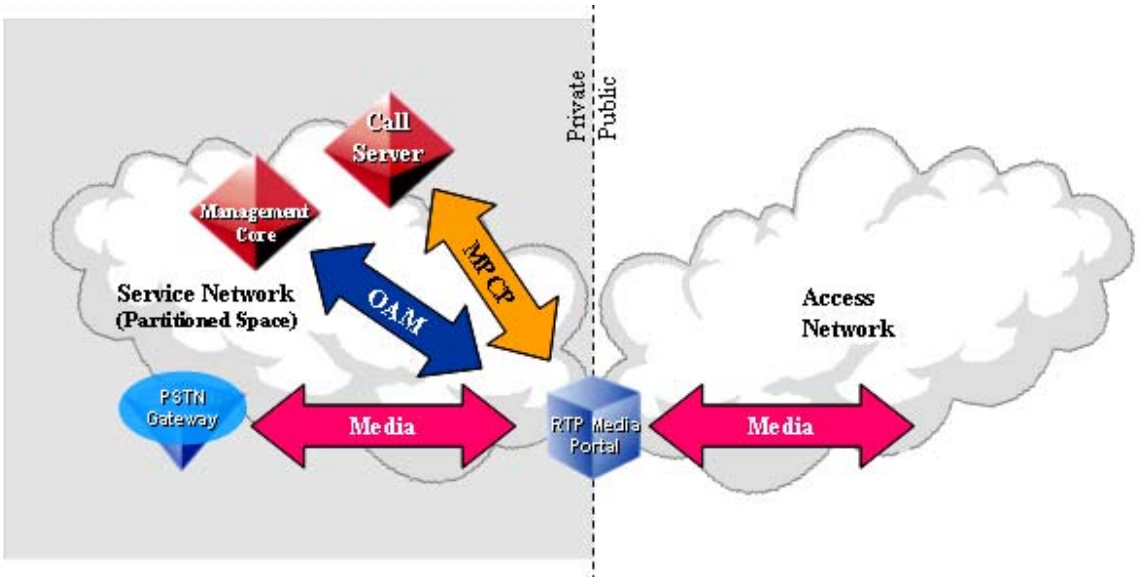
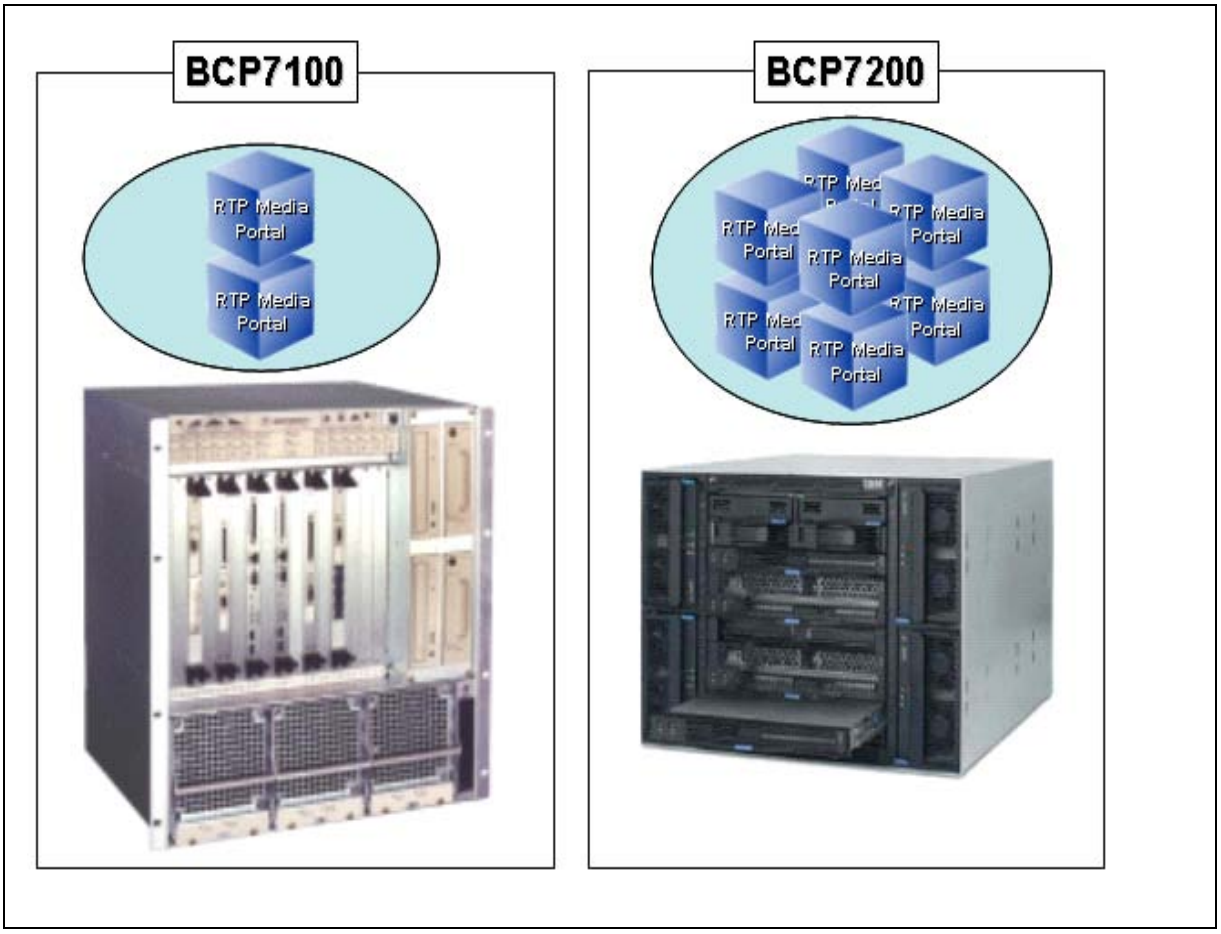


170.4 Border Control Point (BCP)

The Border Control Point (BCP) is the nomenclature used to identify particular packaging of the Media Portal Component (refer to “The Border Control Point (BCP) Family” on page 1744):

- The BCP7100 describes the original packaging of the Media Portal component onto the Motorola CPX8216T platform. The BCP7100 supports a maximum of two (2) simplex RTP Media Portal Service Instances.
- The newer BCP7200 is the packaging of the Media Portal Component onto the IBM BladeCenterT chassis. The BCP7200 supports a maximum of eight (8) simplex RTP Media Portal Service Instances (for “1+0” stand-alone configurations), and a maximum of seven (7) redundant RTP Media Portal Service Instances (for the maximum “7+1” Fault Tolerant Service Cluster configuration).

Figure 4 The Border Control Point (BCP) Family



While the physical packaging of these two platforms differs significantly, the basic operation of the RTP Media Portal Component software is the same on both platforms[1]. In fact, both platforms present a consistent logical view of the RTP Media Portal Service owing to its consistent presence in the Service-planes. It is at the point of Network Interconnect where the distinguishing architectural differences between the platforms is most visible. A summary of these differences (hardware/software, and physical/logical) are presented below (refer to "Border Control Point (BCP) Family – Service Network Connectivity" on page 1746):

- BCP7100: in this packaging a distributed hardware architecture is closely matched to a distributed RTP Media Portal Component software architecture (management and control functions reside on the Host Card,

[1]From a logical perspective, both BCP7100/BCP7200 support the same suite of functionality in the Management-plane (OAM), the Control-plane (MPCP), and the Media-plane (Address and Port Discovery, Anchor/Pivot, QoS Reporting, Asynchronous Event Reporting, …). Also, both BCP7100/7200 support single- or dual-network operation. ***Caveat: the BCP7200 provides "N+1" Fault Tolerance capabilities that are not available on the BCP7100.***

and media processing is performed separately across many distributed Media Blades). This close mapping between distributed hardware and software components makes for a simpler interconnect into the Service Network(s) since the physical links connect to hardware subcomponents that are dedicated to hosting specific software subcomponents (i.e. the physical links carry only the traffic of the hosted software subcomponent). As a result, the BCP7100 hardware platform is interconnected into the Service Network(s) using the available physical links (on the Host Card and the Media Blades) to establish presence in the Service-planes as follows:

- The Host Card utilizes an active/standby Network Interface Card (NIC) Teaming configuration to provide a redundant physical link through which the Media Portal can establish presence in both the Management- and Control-planes.
- Each Media Blade has two separate non-redundant physical links to establish presence in the Media-plane. If the Media-plane consists of a single-network space (i.e. Single Network Topology) then only one of these physical links (Net1) is connected to establish Media-plane presence. However; if the Media-plane consists of partitioned network spaces then each physical link on the Media Blades (Net1 and Net2) is connected into each network space.
- The Service Interconnect Equipment can then utilize simple functions (e.g. port-based VLAN) to classify the traffic flow for each physical link and drop it into the appropriate network space.

- BCP7200: in this packaging the Media Portal Component software architecture is no longer distributed, but has become a monolithic whole (the Host and Media Blade functions are melded together) that executes as a single logical instance on a non-distributed hardware platform (i.e. BladeServer). As well, the BCP7200 hardware architecture contains an integrated Ethernet Switch Module (ESM) that interconnects the BladeServers and the Service Network(s) together using Layer-2 link aggregation (for reliability and capacity requirements). As a result, the BCP7200 interconnect into the Service Network(s) is an aggregate flow of multi-netted traffic[1] (Management-, Control- , and Media-plane traffic are all intermixed on the ESM's external links). For some Service Network topologies, interconnect of this sort requires advanced functions in the Service Network Interconnect Equipment that can classify traffic flows (e.g. the subnet-based VLAN functions available on the Passport 8600, refer to "BCP7200 – Service Network Interconnect" on page 1747). This makes for a more complex Service Network Interconnect that relies on advanced functions to analyze all incoming/outgoing packets and to place them in the proper network space:

[1]Multi-netted traffic consists of flows that are comprised of frames belonging to multiple subnets.

- The BCP7200 Service Network Interconnect Point consists of up to six (6) separate physical links grouped together at Layer-2 into a Link Aggregation Group (which provides a single logical link with a total capacity of the constituent physical links).
- All traffic emitted/admitted from/to the BCP7200 is multi-netted traffic.
- The Service Network Interconnect Equipment cannot simply classify traffic according to physical link (since all traffic flows appear on all ESM external physical links). Therefore the Service Network Interconnect equipment must have advanced traffic processing functions if it is desired to separate the multi-netted traffic and drop it into the appropriate network space.

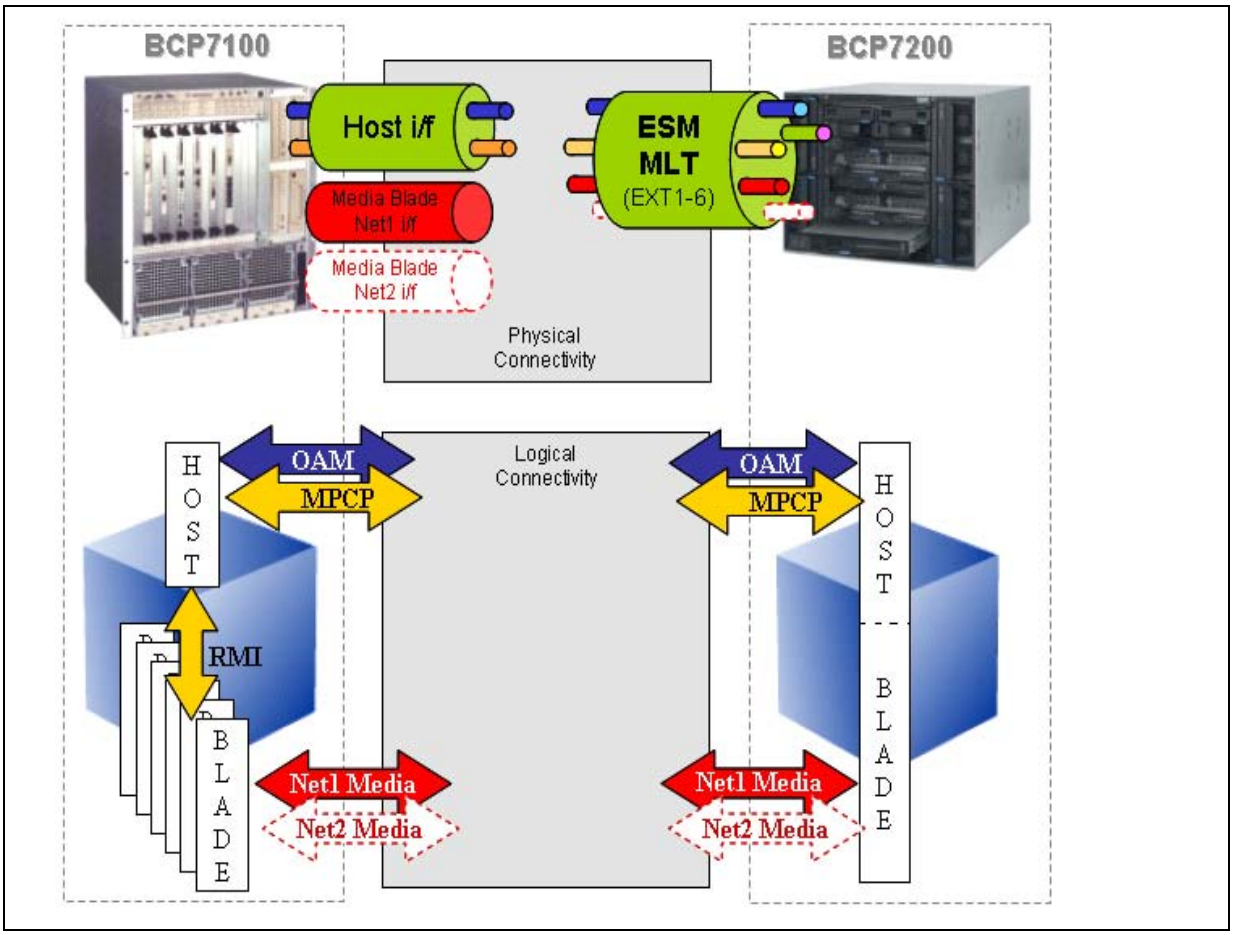

Figure 6 BCP7200 – Service Network Interconnect

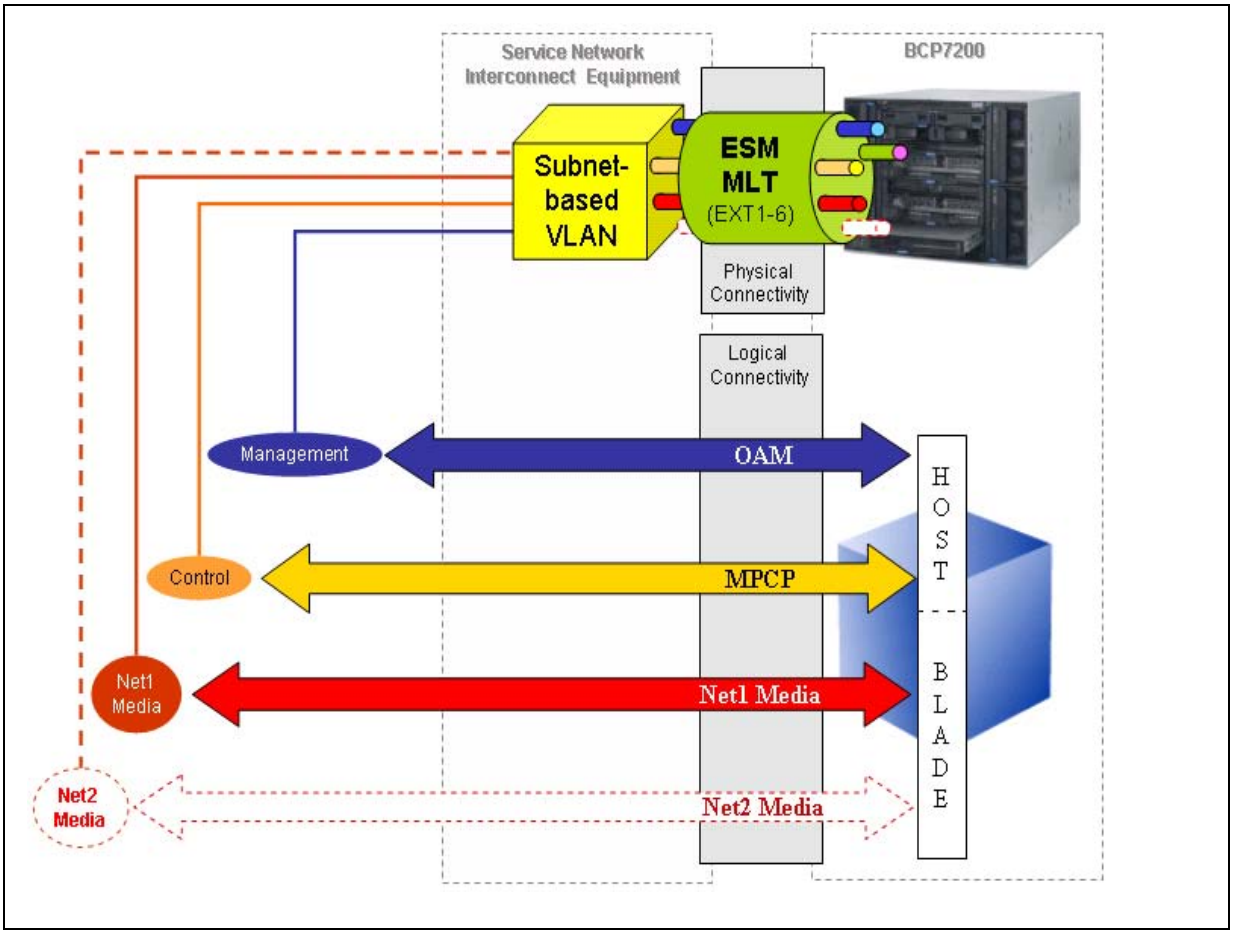


170.5 IEEE 802.1Q VLAN-tagging

170.6 IEEE 802.1Q Ethernet Frame

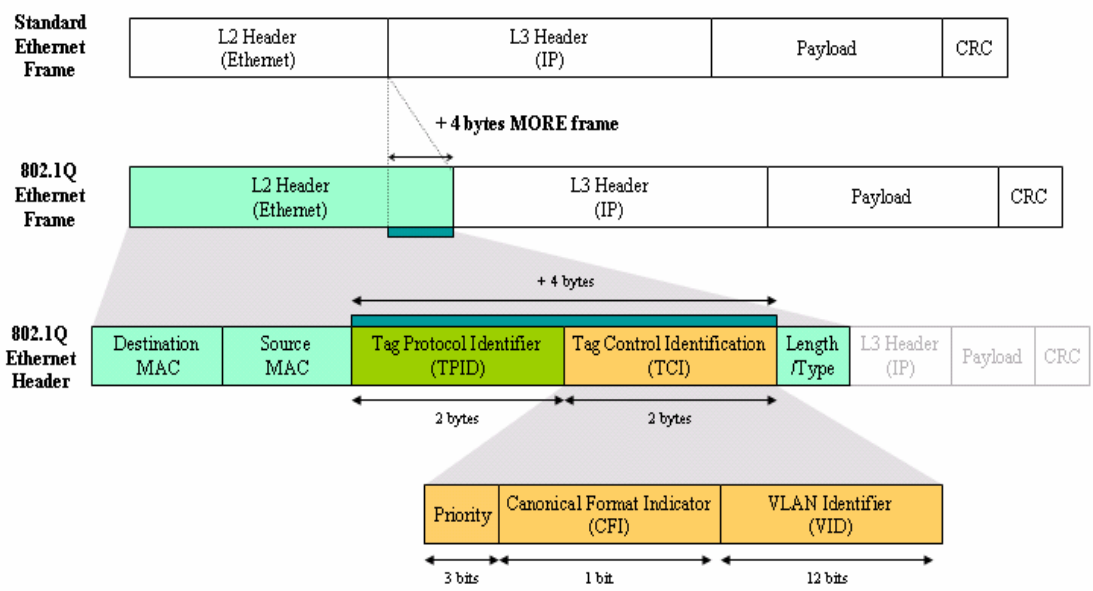
A summary of IEEE 802.1Q VLAN-tagging functionality is presented in this section, and a more comprehensive description can be found in the specification that can be found in "802.1Q™, IEEE Standards for Local and metropolitan area networks, Virtual Bridged Local Area Networks".

Originally, IEEE 802 Local Area Networks (LANs) were connected together with Media Access Control (MAC) Bridges that operated according to physical connectivity: all connected devices were implicitly part of the same broadcast domain (with routers providing network connectivity between broadcast domains).

As network topologies evolved into ever more complex structures to meet a growing array of requirements, the physical dependencies constraining broadcast domains became unwieldy and the concept of virtual broadcast domains came into being. The IEEE 802.1Q standard defines the operation of Virtual LAN (VLAN) Bridges that permit the definition, operation and administration of Virtual LAN topologies within a Bridged LAN infrastructure.

The key re-tooling that enables VLAN-tagging to occur is the extension of the Ethernet frame (Layer-2) by 4-bytes to accommodate the new tagging data structures placed in the L2 Header (refer to “802.1Q – Ethernet Frame Extensions” on page 1748 [1]). This feature enables the BCP7200 to be configured to support the new 802.1Q Ethernet Frame – including properly populating its VLAN Identifier (VID) field.

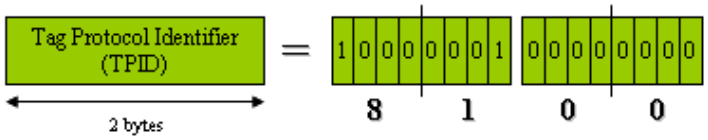
Figure 7 802.1Q – Ethernet Frame Extensions



The new fields that distinguish an 802.1Q Ethernet Frame from a Standard Ethernet Frame are (the italicized data structures are not explicitly addressed by this feature but are included for completeness):

- The 2-byte Tag Protocol Identifier (TPID):

[1]Expanding the Ethernet Frame size by 4-bytes implicitly requires other interconnecting network components (hardware and software) to be able to distinguish 802.1Q Ethernet Frames –AND- to be able to properly process such frames.



- The TPID has a defined value of 8100 in hex.
- When a frame has a TPID (also known as “EtherType”) equal to 8100, the frame carries the tag information for IEEE 802.1Q / 802.1P.

- The 2-byte Tag Control Identification (TCI) field:

  - The first three bits of the TCI define user priority.
    - These bits provide eight (2^3) priority levels.
    - IEEE 802.1P defines the operation for these 3 user priority bits.
  - The Canonical Format Indicator (CFI) is a single-bit flag that is always set to zero for Ethernet switches.
    - CFI is used for compatibility between Ethernet type network and Token Ring networks.
    - If a frame received at an Ethernet port has a CFI set to 1, then that frame should not be forwarded as CFI=1 indicates an untagged port.
  - **VLAN ID is the identification of the VLAN, which is basically used by the standard 802.1Q.**
    - 12 bits allow the identification of 4096 (2^12) VLANs.
    - VID of 0 is used to identify priority frames*, and a VID of 4095 (FFF) is reserved, so the maximum possible VLAN configurations are 4,094.

      ***NOTE:** A frame with a VID (VLAN Identifier) of null (0) is called a priority frame, meaning that only the priority level is significant and the default VID of the ingress port is used as the VID of the frame*

170.7 IEEE 802.1Q Terminology

Presented below is some common terminology used in reference to IEEE 802.1Q tagging functionality:

- o VLAN identifier (VID) - the 12-bit portion of the VLAN tag in the frame header that identifies an explicit VLAN.
- o Untagged frame - a frame that does not carry any VLAN tagging information in the frame header.
- o Tagged frame - a frame that carries VLAN tagging information in the header. This VLAN tagging information is a 32-bit field (VLAN tag) in the frame header that identifies the frame as belonging to a specific VLAN.
- o Port VLAN identifier (PVID) - a classification mechanism that associates a port with a specific VLAN. For example, a port with a PVID of 3 (PVID =3) assigns all untagged frames received on this port to VLAN 3.
- o Untagged member - a port that has been configured as an untagged member of a specific VLAN. When an untagged frame exits the switch through an untagged member port, the frame header remains unchanged. When a tagged frame exits the switch through an untagged member port, the tag is stripped and the tagged frame is changed to an untagged frame.
- o Tagged member - a port that has been configured as a tagged member of a specific VLAN. When an untagged frame exits the switch through a tagged member port, the frame header is modified to include the 32-bit tag associated with the PVID. When a tagged frame exits the switch through a tagged member port, the frame header remains unchanged (original VID remains).

NOTE: *If an 802.1Q VLAN-tagged frame is sent to a port that has VLAN-tagging disabled, then the frames are dropped at that ingress port.*

170.8 IEEE 802.1Q Frame Processing

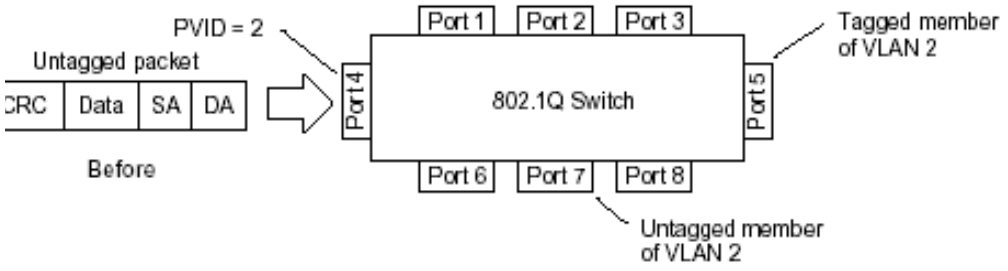
Each port on an IEEE 802.1Q-enabled switch can belong to one or more VLANs, and each VLAN can have any number of switch ports in its membership.

When configuring port-based VLANs, the switch ports are configured as tagged or untagged members of specific VLANs. Any port that belongs to multiple VLANs, however, must have VLAN tagging enabled. Any untagged frames (those with no VLAN specified) are classified with the sending port's PVID.

170.8.1 Untagged Frame Processing:

This example describes the processing of untagged frames (*Port 5 is configured as a tagged member of VLAN 2, and port 7 is configured as an untagged member of VLAN 2*):

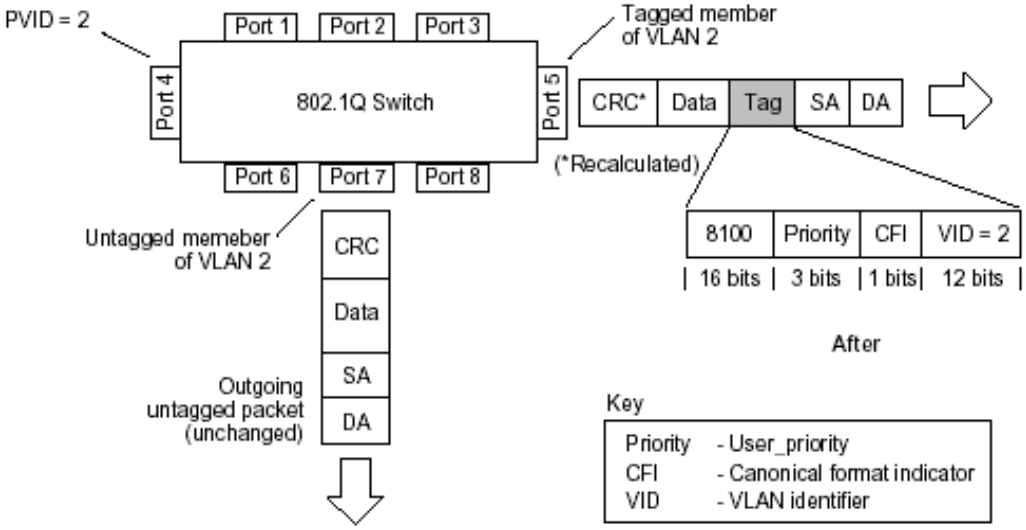
1. Untagged incoming frames arriving on Port 4 are assigned directly to VLAN 2 (port 4 has a PVID = 2).



2. The untagged frame traverses the logical broadcast domain in the 802.1Q Switch and is:

    a. marked (tagged) as it leaves the switch through port 5 (which is configured as a tagged member of VLAN 2).

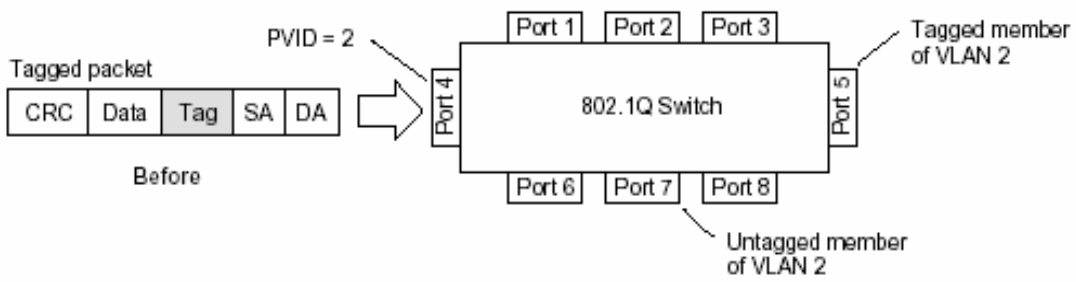
    b. unchanged as it leaves the switch through port 7 (which is configured as an untagged member of VLAN 2).



170.8.2 Tagged Frame Processing:

This example describes the processing of tagged frames (*Port 5 is configured as a tagged member of VLAN 2, and port 7 is configured as an untagged member of VLAN 2*):

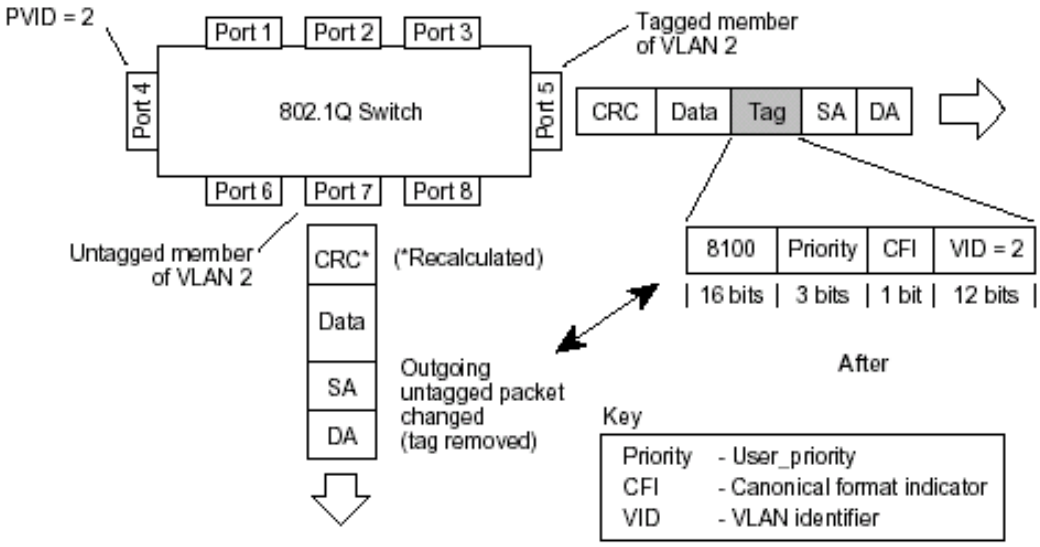
1. VLAN-tagged incoming frames arrive on Port 4 and (assuming the VLAN ID in the frame was “VLAN 2”) are relayed across VLAN 2.



2. The VLAN-tagged frame remains unchanged as it traverses the logical broadcast domain in the 802.1Q Switch and:

    a. remains unchanged as it leaves the switch through port 5 (which is configured as a tagged member of VLAN 2).

    b. Becomes untagged as it leaves the switch through port 7 (which is configured as an untagged member of VLAN 2).



170.9 Overview

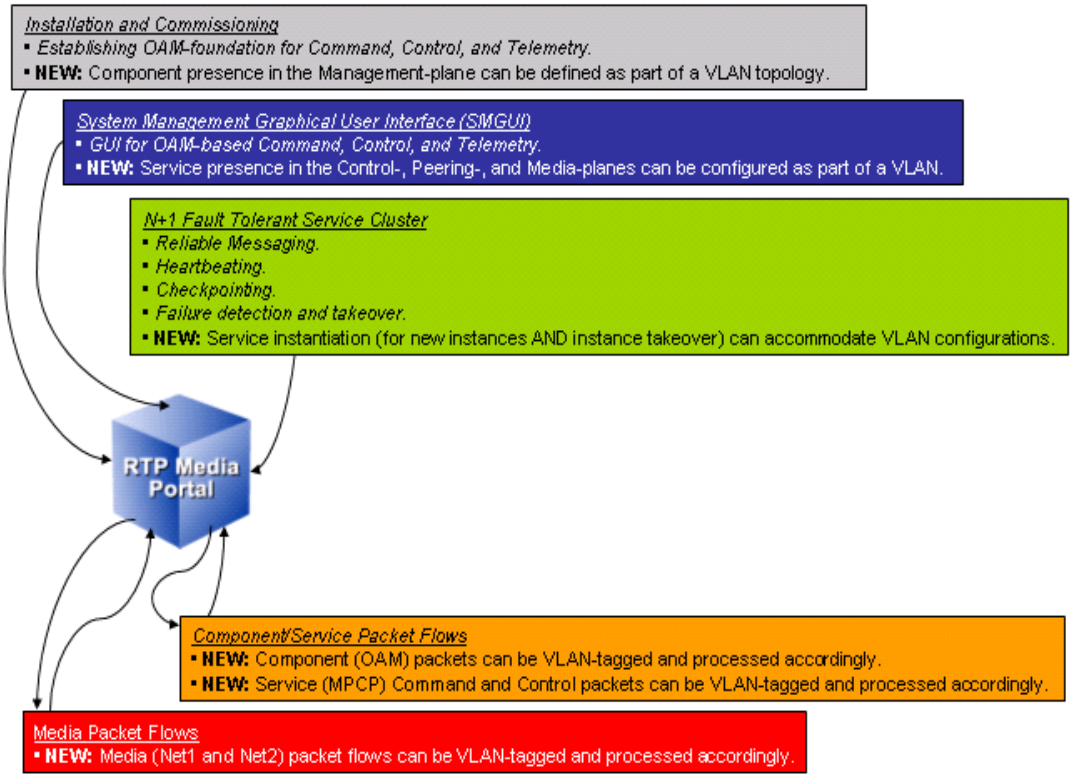
The BCP7200 is enhanced to provide IEEE 802.1Q VLAN-tagging functionality.

This is accomplished by providing means to configure and utilize the available IEEE 802.1Q capabilities that were previously dormant in the platform - NOT implementing IEE802.1Q itself since support for this was already available, but latent, in the underlying platform hardware and Operating System.

The scope of this feature encompasses the following areas (refer to “BCP7200 VLAN Tagging – Feature Overview” on page 1754):

- Installation and Commissioning Procedures (I&C): these procedures are enhanced to support configuration for logical- and physical-partitioning of VLAN-tagged traffic at the point of Service Network Interconnect, and to accommodate specification of the Management-plane (OAM) presence in a VLAN-tagged network topology.
- System Management Graphical User Interface (SMGUI): this interface is enhanced to provide the capability to specify VLAN membership for Control- and Media-plane points of presence. There are also changes made to Static Route datafill that permit association of Static Routes to VLANs.
- N+1 Fault Tolerant Cluster: the fault tolerance mechanisms are enhanced to accommodate service instantiation in VLAN topologies (for both the Control- and Media-planes).

Figure 8 BCP7200 VLAN Tagging – Feature Overview



170.9.1 Installation and Commissioning (I&C)

There are two Installation and Commissioning procedures utilized to prepare the BCP7200 to host the RTP Media Portal Component:

- the “MCP09 BCT RTP MP - I&C MOP” [2], which sets up the IBM BladeCenterT platform. This MOP is enhanced to include a description of how the Nortel Networks Layer-2/3 Gigabit Ethernet Switching Module (ESM) can be configured to support logical partitioning of traffic, and how it can be configured to achieve a degree of physical separation between the various types of traffic.
- and the “RTP Portal Installation MOP” [3], which installs and configures the Linux Operating System on each of the service nodes (an IBM HS20 BladeServer that will host a RTP Media Portal Service Instance). This procedure is enhanced to collect optional VLAN information for the IP-address configured on the BladeServer (used to properly establish presence in the Management-plane for VLAN-tagged network topologies).

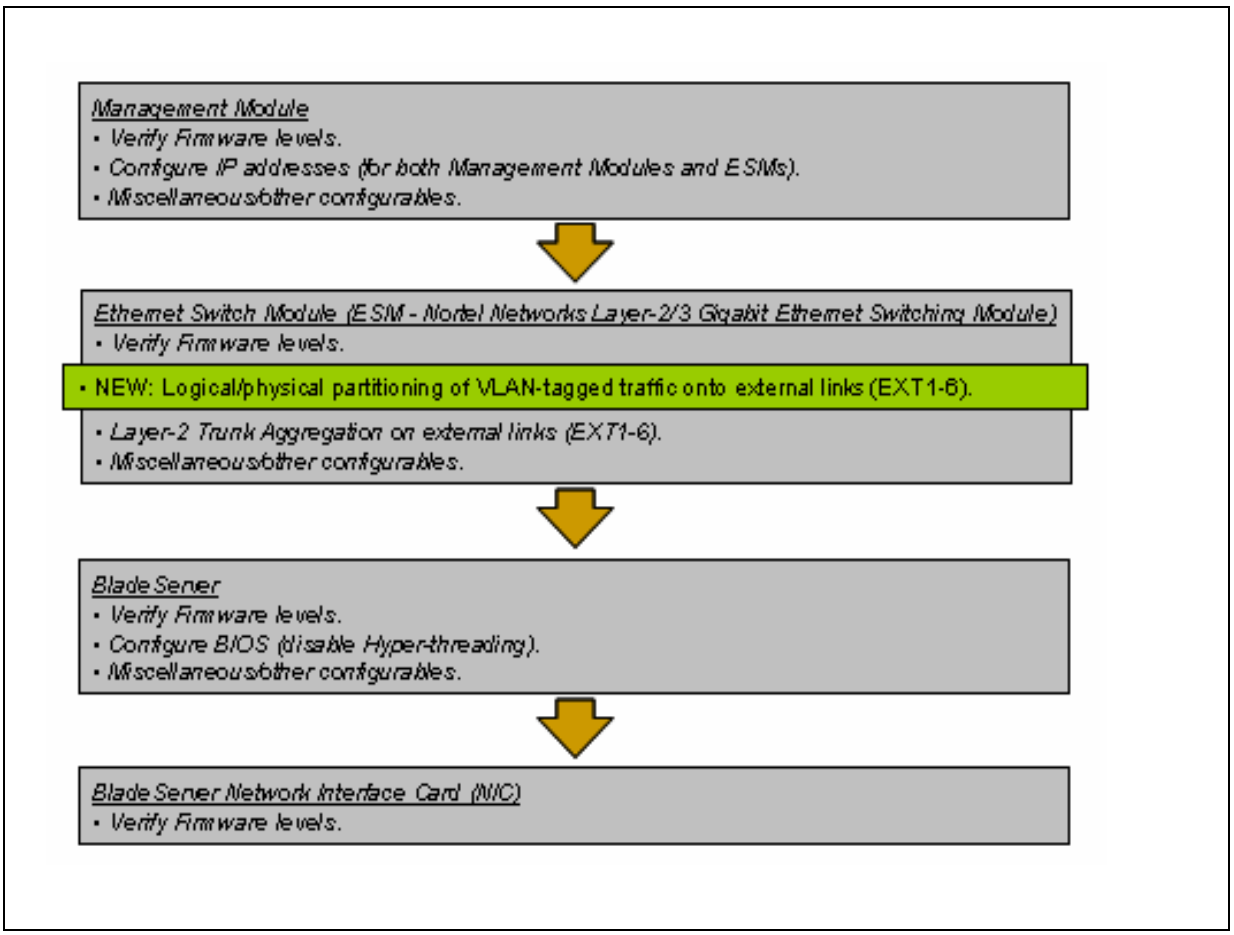
170.9.2 MCP09 BCT RTP MP - I&C MOP

170.9.3 Traffic Partitioning Overview

The “MCP09 BCT RTP MP - I&C MOP” [2] describes methods for ensuring that the subcomponents of the IBM BladeCenterT chassis are properly configured.

There is a new section added to this procedure that describes the methods that should be employed on the Nortel Networks Layer-2/3 Gigabit Ethernet Switching Module (ESM) to achieve the desired level of traffic partitioning for the various types of traffic traversing the network interconnect point between the BCP7200 and the Service Network (refer to ““MCP09 BCT RTP MP – I&C MOP” – Additions ” on page 1755).

Figure 9 “MCP09 BCT RTP MP – I&C MOP” – Additions

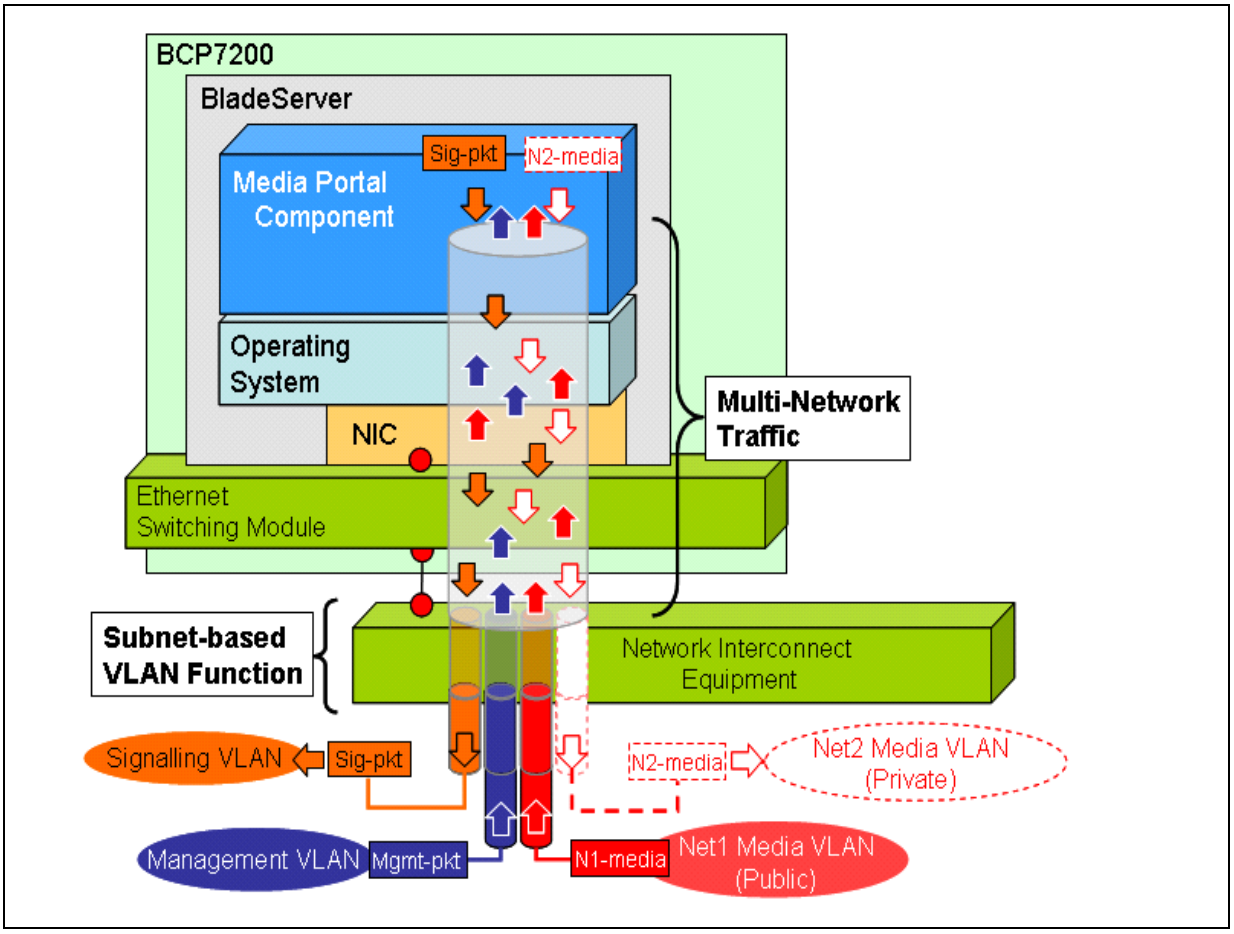


The Nortel Networks Layer-2/3 Gigabit Ethernet Switching Module (ESM) resides in-chassis and provides the switch fabric between the BladeServers (the service nodes that host the RTP Media Portal Service Instances) as well as

network interconnect to the Service Networks. As such, the ESM provides the point at which the BCP7200 interconnects into the Service Network.

Prior to the introduction of this feature the ESM could only be configured for non-tagged operation[1] (refer to “BCP7200 Service Network Interconnect – Multi-netted Flows ” on page 1756): all traffic was delivered as a multi-netted flow over the Layer-2 trunk connecting the BCP7200 to the Service Network. In certain configurations (typically for CS2K deployments) the multi-netted flow was later partitioned onto separate VLANs by some other network equipment outside of the BCP7200 (e.g. Network Interconnect Equipment providing Subnet-based VLAN functionality).

Figure 10 BCP7200 Service Network Interconnect – Multi-netted Flows



With the introduction of VLAN-tagging by this feature, it is now possible to configure the ESM to logically and/or physically partition the traffic flows

[1]When configured to operate in an untagged mode, the BCP7200 utilizes Standard Ethernet Frames for packet carriage.

delivered between the BCP7200 RTP Media Portal Service Instances and the Service Network (refer to “BCP7200 Service Network Interconnect – Logical Partitioning of Flows ” on page 1757, and “BCP7200 Service Network Interconnect – Physical Partitioning of Flows” on page 1758).

NOTE: *All configuration parameters will continue to default to the multi-netted configuration in order to preserve backwards compatability.*

Figure 11 BCP7200 Service Network Interconnect – Logical Partitioning of Flows

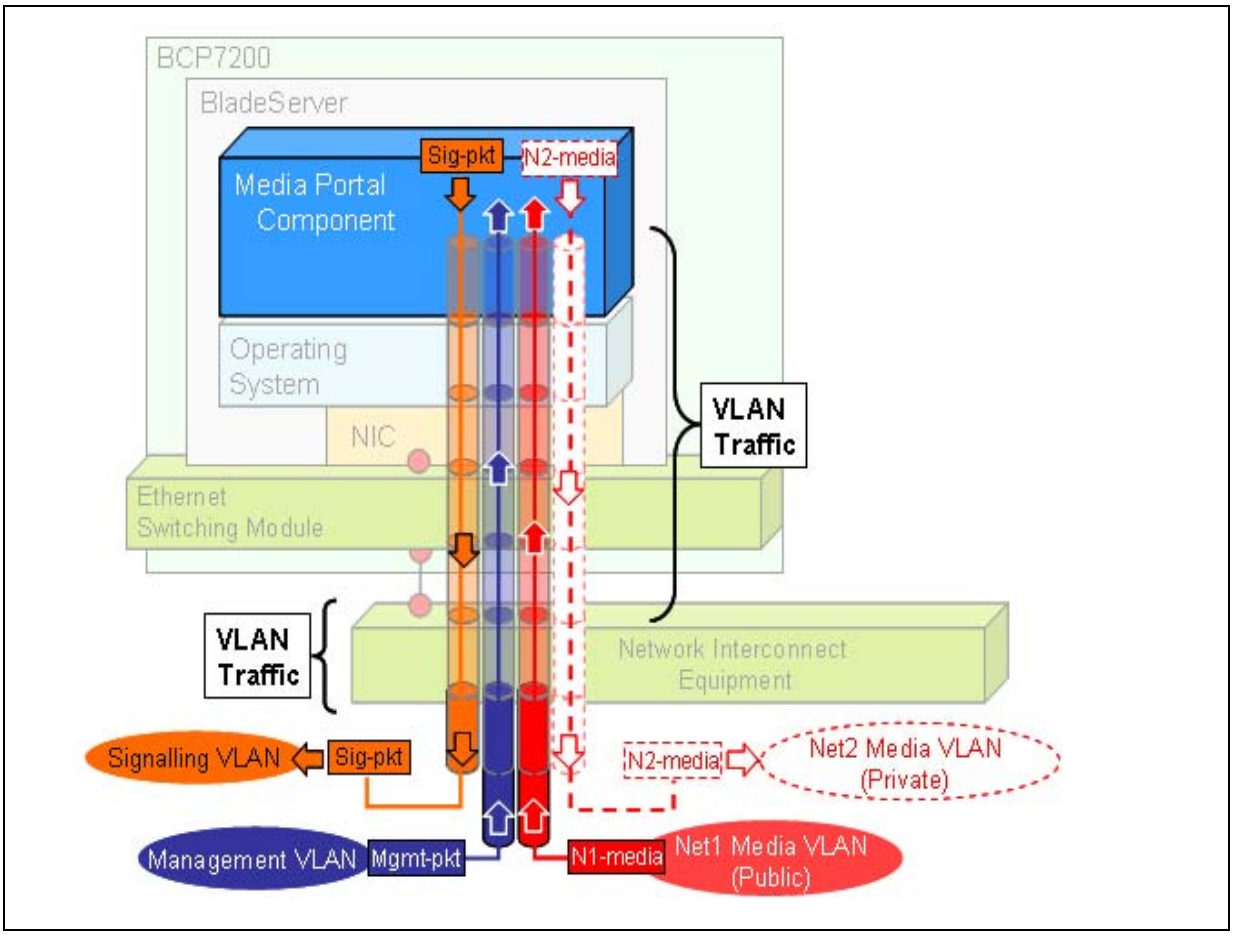


Figure 12 BCP7200 Service Network Interconnect – Physical Partitioning of Flows

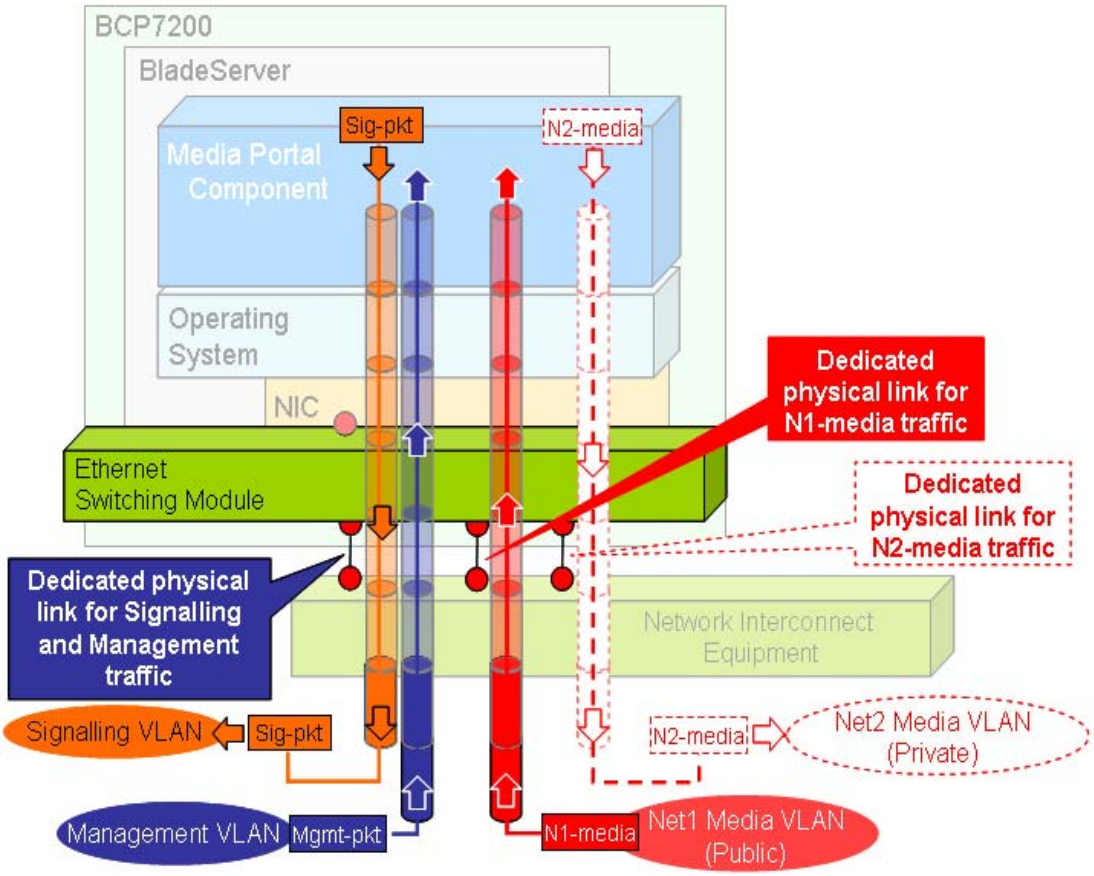


170.9.4 ESM Configuration for IEEE 802.1Q VLAN-tagging

The ESM supports IEEE 802.1Q VLAN-tagging.

The Alteon OS running in the ESM supports up to 128 VLANs per switch. Even though the maximum number of VLANs supported at any given time is 128, each can be identified with any number between 1 and 4095.

In order to properly interconnect and convey VLAN-tagged packets to their destination, the ESM must be configured to support the intended broadcast domains and to provide the desired degree of partitioning between those broadcast domains.

Each port on the ESM can belong to one or more VLANs, and each VLAN can have any number of ESM ports in its membership. Any port that belongs to multiple VLANs, however, must have VLAN tagging enabled. Any untagged frames (those with no VLAN specified) are classified with the sending port's PVID.

It is through the association of ESM ports to VLANs that logically and physically partitioned traffic is able to traverse the BCP7200 interconnect with the Service Network.

170.9.4.1 Multi-Network/Unpartitioned Flows (Default)

The ESM factory default configuration makes use of an internal VLAN configuration (all external ESM ports are untagged) where:

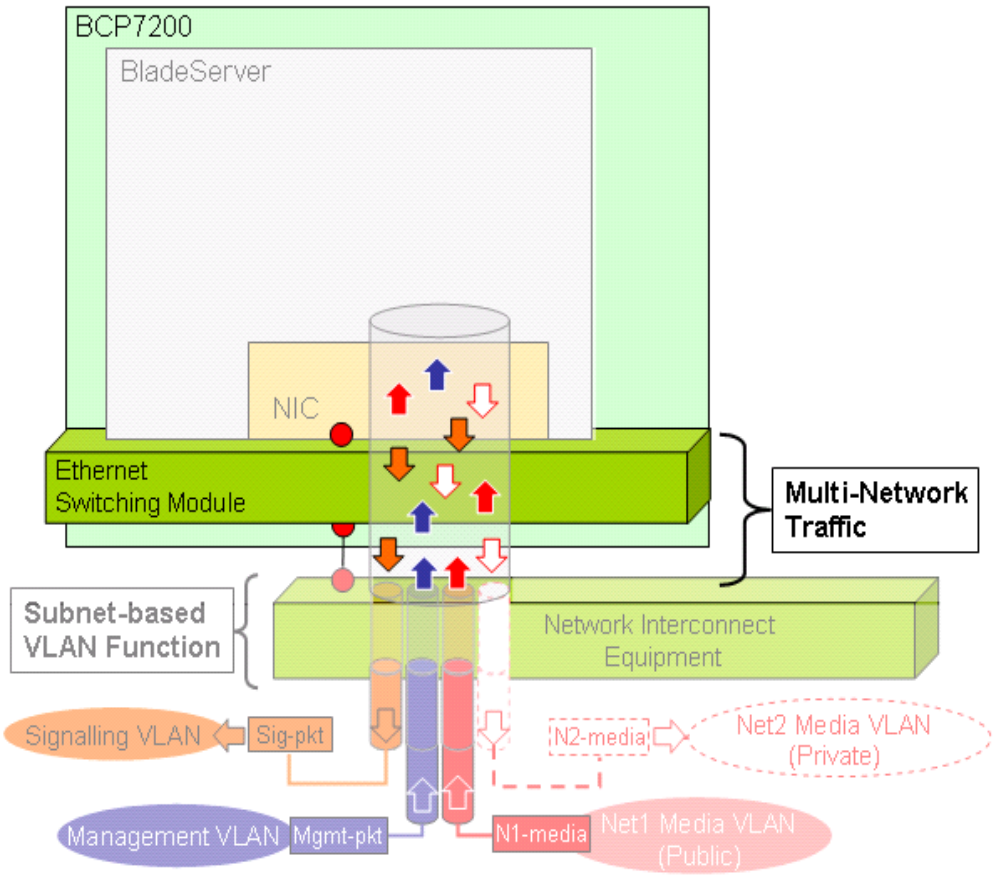
- VLAN 1 is the default service VLAN for connecting the external ports (EXT1-6) and the internal blade ports (INT1-8).
- VLAN 4095 is used by the out-of-band management network for chassis/ platform administration.

The factory default setting places all non-management ports (i.e. ports EXT1-6, and ports INT1-8) on the same VLAN initially - although each port's PVID is configurable to any VLAN number between 1 and 4094. Each port on the ESM is also configured with a default VLAN number, known as its PVID (default PVID = 1).

The factory default configuration for the ESM also has all external ports set as untagged members of VLAN 1.

This factory default ESM configuration enables theBCP7200 to handle multi-netted traffic (untagged) to flow across the Service Network interconnect (refer to "ESM – Configuration for Multi-Network Traffic (Default)" on page 1760).

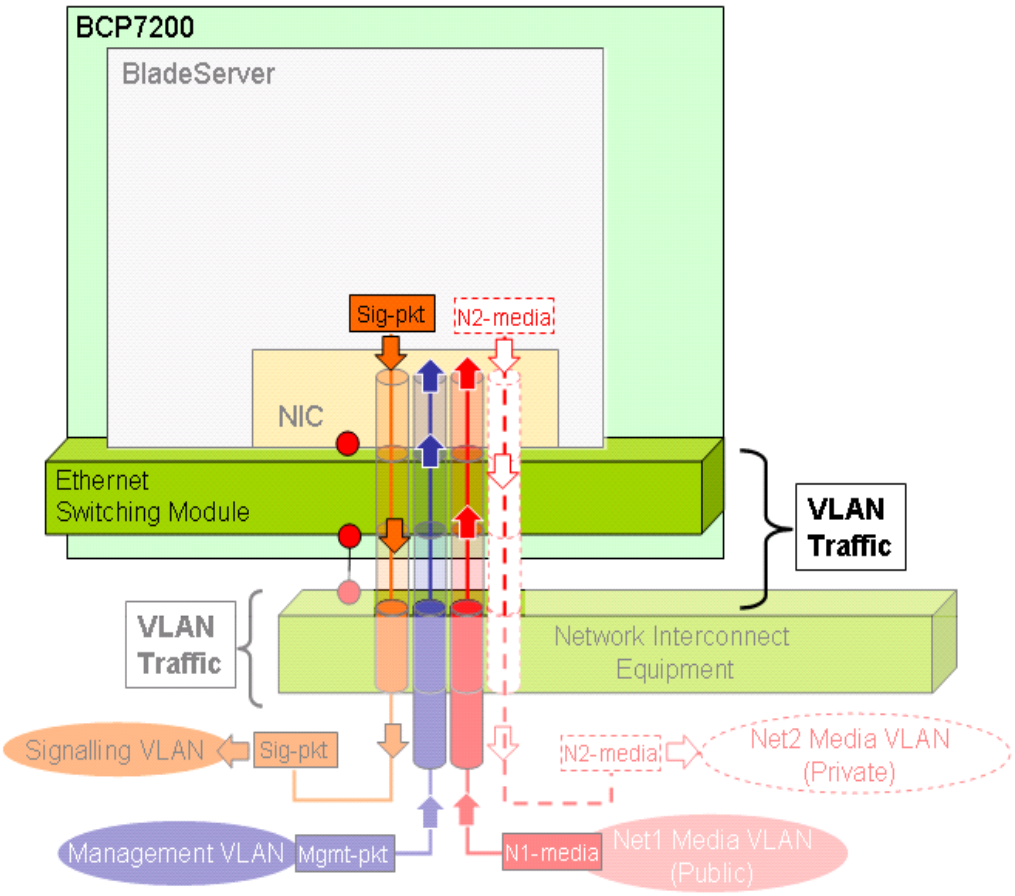
Figure 13 ESM – Configuration for Multi-Network Traffic (Default)



170.9.4.2 Logical Partitioning of Flows

Logical Partitioning of traffic flows between the BCP7200 and the Service Network (refer to “ESM – Configuration for Logical Partitioning of Traffic” on page 1761) is accomplished by configuring the ESM for membership in the desired Service Network VLANs – and by enabling VLAN tagging on the ESM service ports (EXT1-6, and INT1-8). This extends the logically partitioned Service Network VLANs to the service nodes (Blade Servers) that will eventually host a running Media Portal Service Instance.

Figure 14 ESM – Configuration for Logical Partitioning of Traffic



It is assumed in a VLAN-tagged network topology that only VLAN-tagged frames will traverse the Service Network Interconnect. However; the PVID associated with the EXT ports on the ESM can be set to a desired value to accommodate handling of untagged frames (should such be encountered).

When preparing for I&C of the BCP7200 into a VLAN-tagged network, it is important to understand the underlying topology. Of relevance to the logical partitioning of traffic are (refer to Table 3 VLAN Network Topology Information for Logical Separation3 on page 1762): the number of Service Network VLANs in which the BCP7200 must participate, and the specific Service-planes and network spaces that these VLANs occupy. It is the existing Service Network Topology into which the BCP7200 must interconnect (i.e. the presence of, and values for: x, y, z1and z2) that dictates how traffic is logically partitioned. This information is required in order to configure the proper interconnect between the ESM and the Service Network.

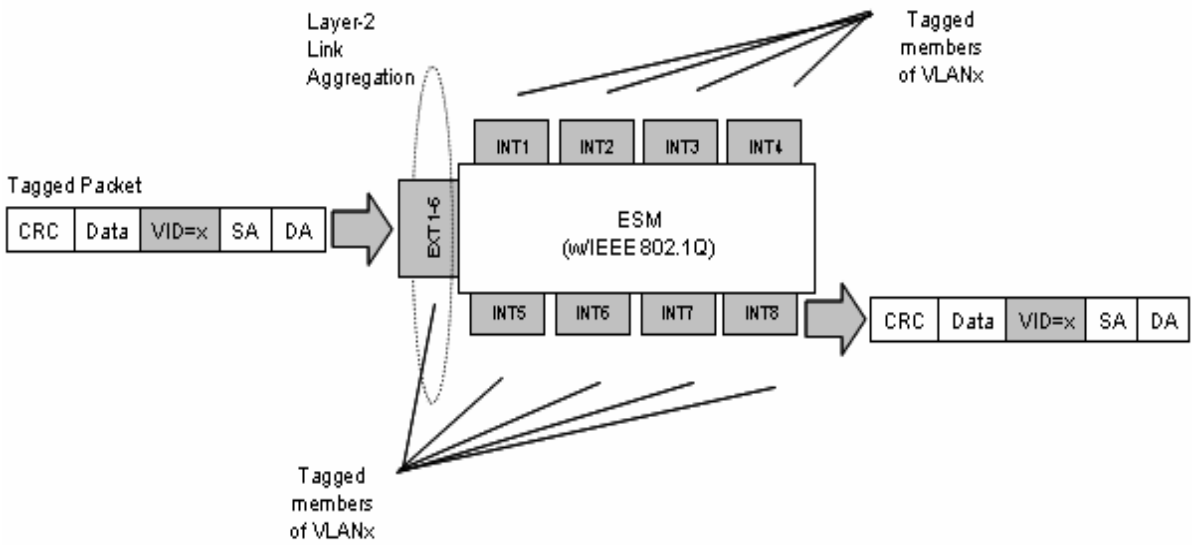
Table 3 VLAN Network Topology Information for Logical Separation

Service Plane / Network Space	VID
Management-Plane (OAM)	x
Control-Plane (MPCP)	y
Media-Plane (Net1 media)	z1
Media-Plane (Net2 media)	z2
Peering-Plane	*Not Applicable*

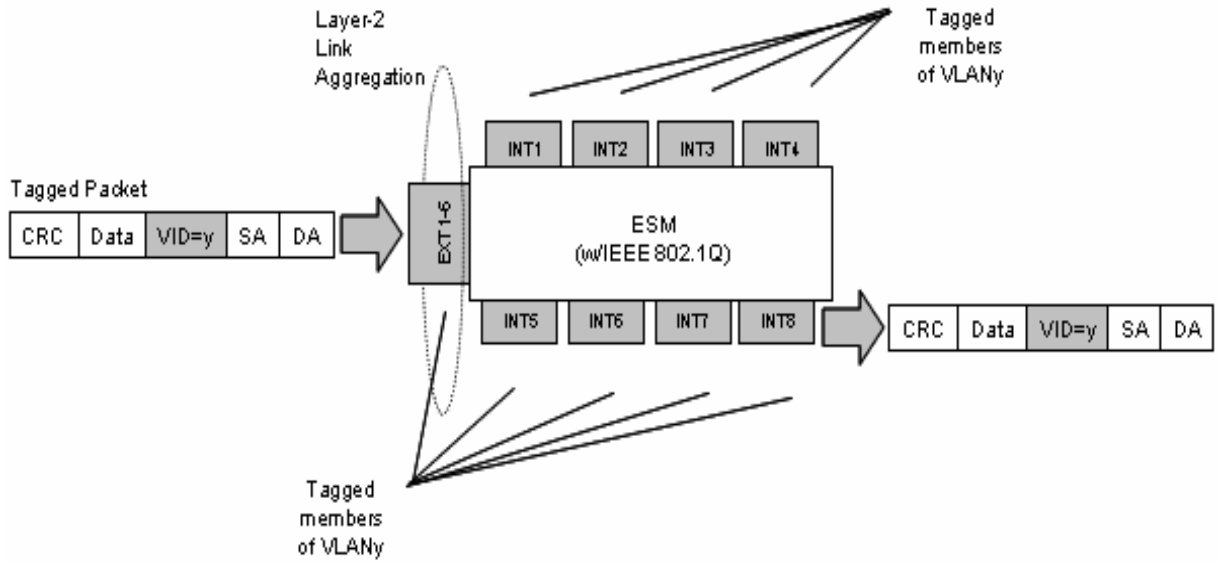
The Service Network's VIDs must be accounted for in both: the platform configuration during I&C (to provide an ESM configuration that supports proper interconnect and relay between the Service Network and the Blade Servers), and the service configuration in the SMGUI (to provide the RTP Media Portal Service with the topological knowledge required for participation in VLAN-tagged Service Networks).

The following permutations of VLAN-tagged network topologies are possible:

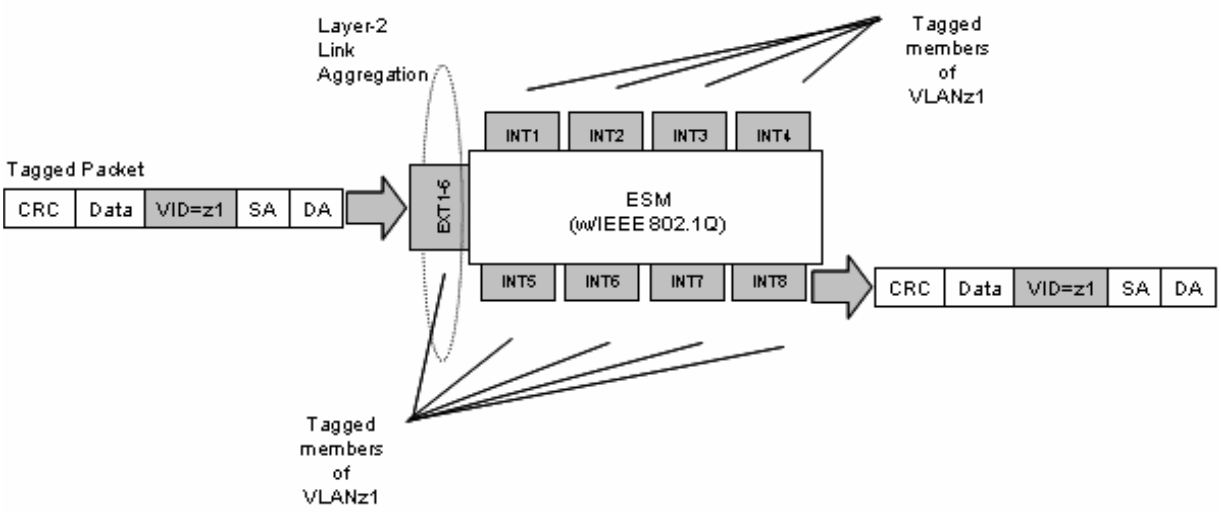
- **Unique VIDs (xyz1z2)** – there is a unique VID for each network space, and all ESM service ports (EXT1-6 and INT1-8) are configured for membership in each of these VLANs. Thus, service traffic can traverse the ESM switching fabric between the Service Network and the Service Node(s). For example:
  - OAM traffic (tagged with "VID=x") from the Service Network arrives at the ESM (on the Layer-2 trunk formed by ports EXT1-6) and traverses VLANx for delivery to the appropriate Service Node (e.g. INT8). Similar processing occurs for tagged frames originating on the Service Node and destined for the Service Network.

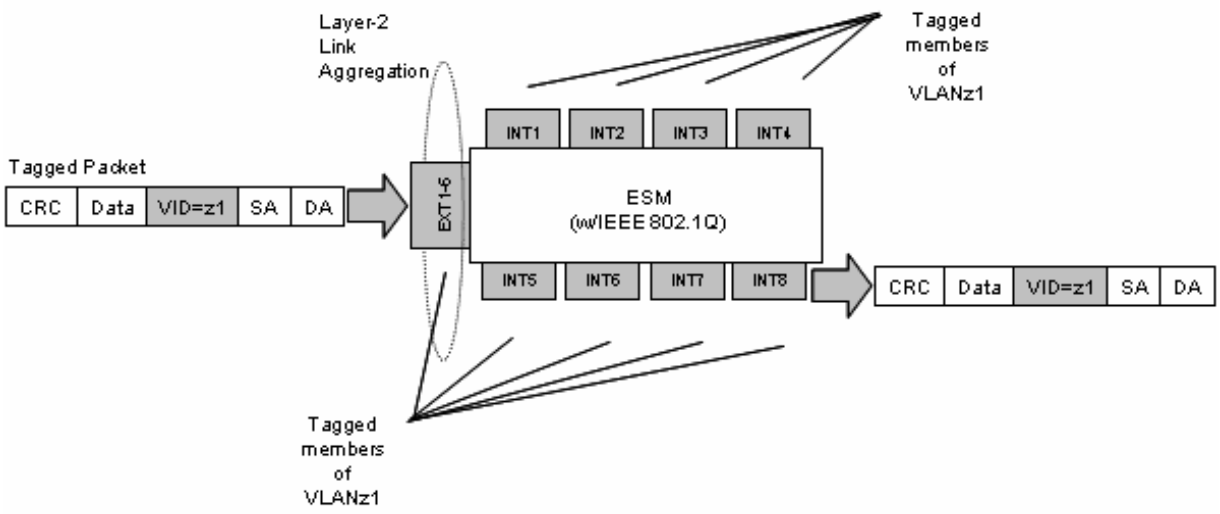


- MPCP traffic (tagged with "VID=y") from the Service Network arrives at the ESM (on the Layer-2 trunk formed by ports EXT1-6) and traverses VLANy for delivery to the appropriate Service Node (e.g. INT8). Similar processing occurs for tagged frames originating on the Service Node and destined for the Service Network.



- Media traffic (tagged with either "VID=z1" or "VID=z2") from the Service Network arrives at the ESM (on the Layer-2 trunk formed by ports EXT1-6) and traverses VLANz1/VLANz2 for delivery to the appropriate Service Node (e.g. INT8). Similar processing occurs for tagged frames originating on the Service Node and destined for the Service Network.





- **Shared VIDs (x=y, or x=z1, y=z1, etc.)** – some VIDs are common to multiple network spaces, and all ESM service ports (EXT1-6 and INT1-8) are configured for membership in each of the required VLANs. Thus, service traffic can traverse the ESM switching fabric between the Service Network and the Service Node(s).
- **Common VID (x=y=z1=z2)** – there is one single VID for all service plane traffic, and all ESM service ports (EXT1-6 and INT1-8) are configured as members of this VLAN. Thus, service traffic can traverse the ESM switching fabric between the Service Network and the Service Node(s).

NOTE: *This Common VID topology is similar to originally existing multi-netted traffic flows, except in this configuration the multi-netted traffic is delivered inside tagged frames.*

In order to configure the ESM to support such VLAN-tagged topologies, the following ESM commands are used:

- To add VLAN topology knowledge into the ESM:

    1. Access the ESM configuration menu for each Service Network VLAN:

       /cfg/l2/vlan <x>

       where:

       <x> = the Service Network VID.

    2. Add ESM ports to a specific VLAN:

       /cfg/l2/vlan <x>/add <port>

       where:

<x> = the Service Network VID.

<port> = the service port (EXT1-6, or INT1-8).

- To enable VLAN-tagging on ESM ports:

  /cfg/port <port>/tag e

  where:

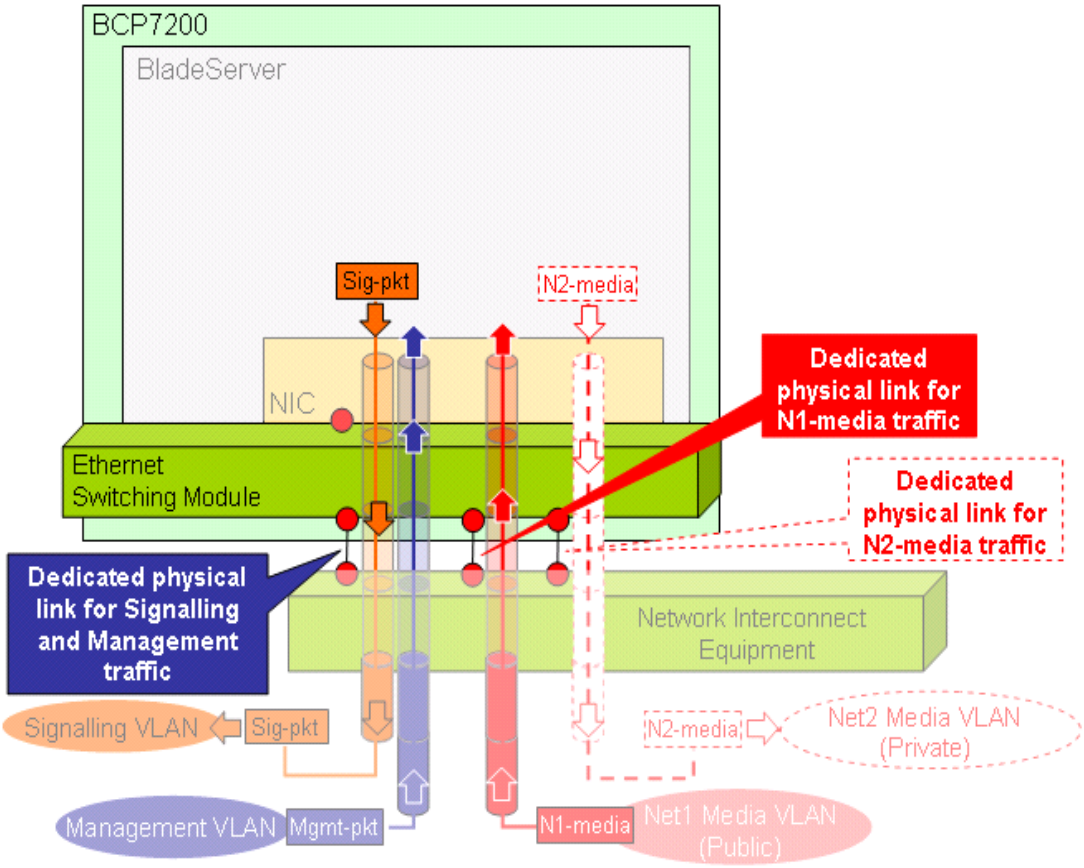
  <port> = the target service port (EXT1-6, or INT1-8).

170.9.4.3 Physical Partitioning of Flows

In addition to being able to support the logical partitioning of service flows, the ESM can also be configured to provide a degree of physical separation between flows at the Service Network Interconnect.

Physical partitioning is accomplished through the dedicated membership of certain external physical service ports (EXT1-6) to a specific VLAN(s). Once this association is made, only traffic from that specific VLAN(s) will traverse that physical link(s). Refer to “ESM – Configuration for Physical Partitioning of Traffic” on page 1766.

Figure 15 ESM – Configuration for Physical Partitioning of Traffic



Once again, when preparing for I&C of the BCP7200 into a network, it is important to understand the underlying topology. However; in addition to the information required to maintain the logical separation of traffic flows (the number of VLANs in which the BCP7200 must participate – and the specific Service-planes and network spaces that these VLANs occupy), the degree of physical separation must also be determined (refer to Table 4 VLAN Network Topology Information for Physical Separation). The additional External Service Port information is required in order to configure the proper physical/ logical interconnect between the ESM and the Service Network.

Table 4 VLAN Network Topology Information for Physical Separation

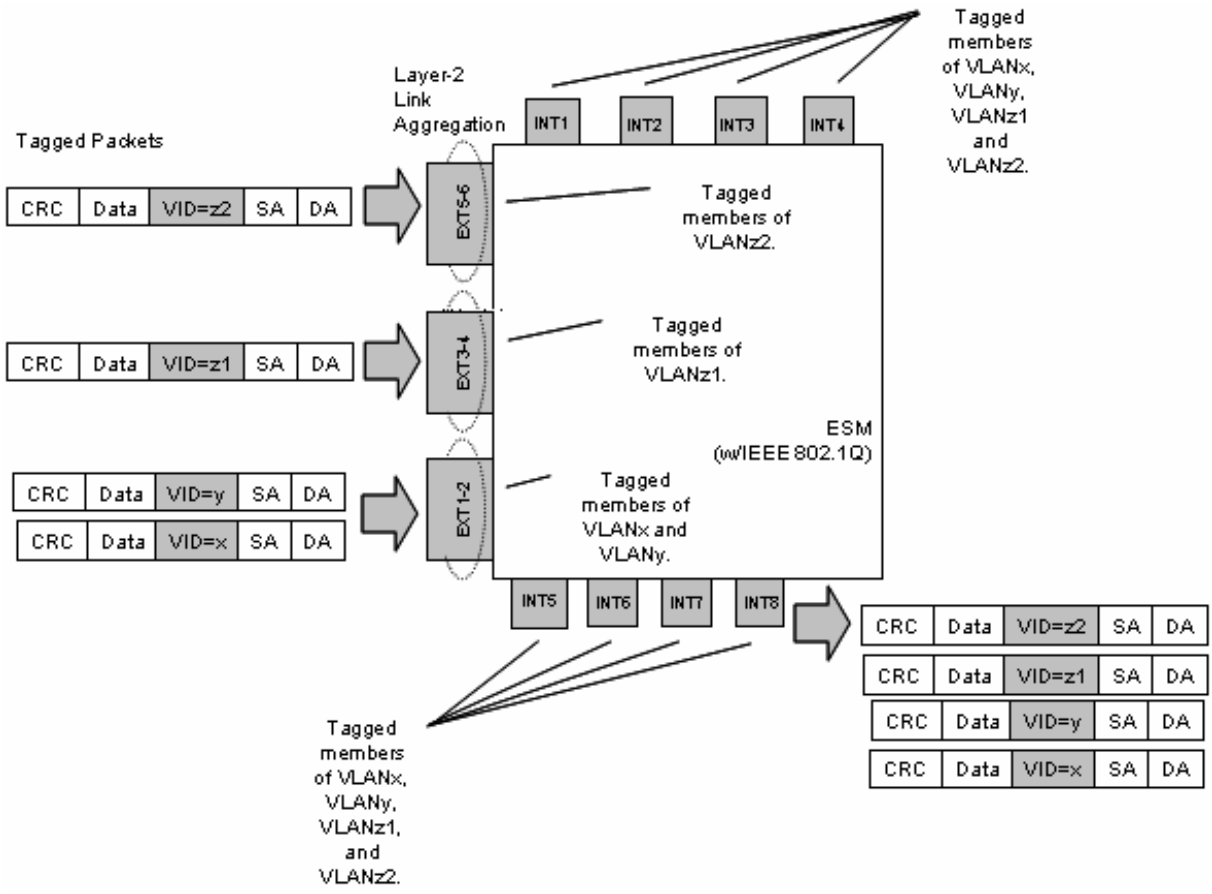
Service Plane / Network Space	VID	External Service Port(s)
Management-Plane (OAM)	x	{EXT1-EXT6}
Control-Plane (MPCP)	y	{EXT1-EXT6}
Media-Plane (Net1 media)	z1	{EXT1-EXT6}
Media-Plane (Net2 media)	z2	{EXT1-EXT6}
Peering-Plane	*Not Applicable*	{EXT1-EXT6}

NOTE: *The ESM can support a maximum of three (3) separate Layer-2 Link Aggregation trunks. This will limit the number of physically partitioned configurations possible that support Layer-2 Fault Tolerance using Link Aggregation.*

An example is provided below of an ESM configured for physical separation of traffic at the Service Network Interconnect where there are three degrees of physical separation:

- OAM and MPCP traffic only traverses links EXT1-2 (EXT1-2 are configured as members of both VLANx and VLANy),
- Net1 media traffic only traverses links EXT3-4 (EXT3-4 are configured as members of only VLANz1),
- and Net2 media traffic only traverses links EXT5-6 (EXT5-6 are configured as members of only VLANz2).

All service traffic appears on all internal ESM service ports (INT1-8 are configured as members of VLANx, VLANy, VLANz1, and VLANz2). Thus, service traffic can traverse the ESM switching fabric between the Service Network and the Service Node(s) using physically separate external links:

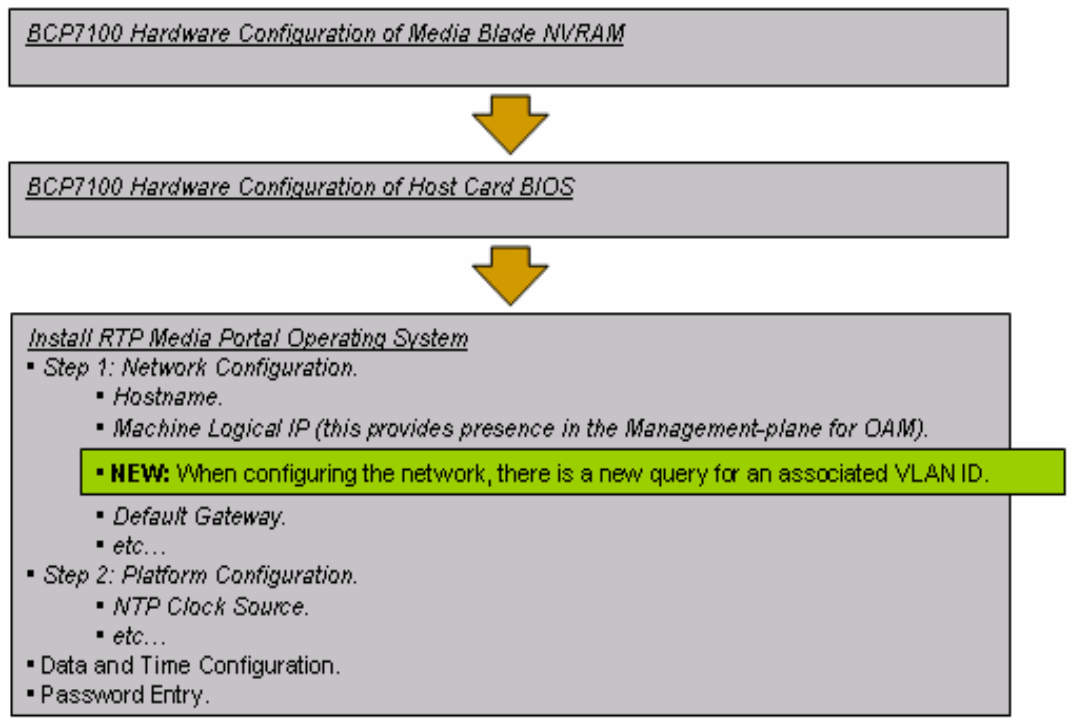


170.9.4.4 RTP Portal Installation MOP

The “RTP Portal Installation MOP” [3] includes a procedure that describes the installation and configuration of the Operating System which prepares the platform for hosting an RTP Media Portal Service Instance.

There is a new step added to this procedure that queries for information regarding the potential presence of VLAN-tagged Service Network topologies when configuring presence in the Management-plane (refer to ““RTP Portal Installation MOP” – Additions ” on page 1769). The default value for the possible Management-plane VLAN ID is “<none>” in order to provide backwards compatibility with existing multi-netted configurations.

Figure 16 "RTP Portal Installation MOP" – Additions

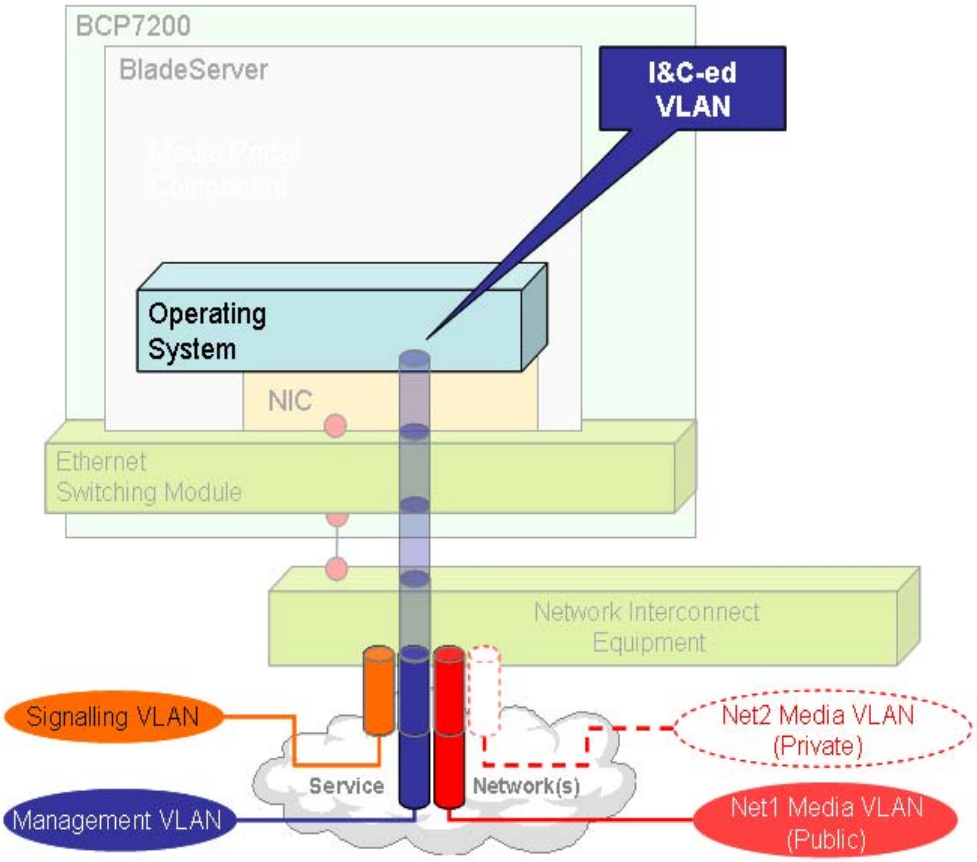


The new query added to this procedure is:

> **Enter associated VLAN? <none>**
>
> (If this BCP7200 does not reside in an IEEE 802.1Q VLAN-tagged network topology, then press the <Enter-key> to proceed with the default configuration "<none>" to establish operation in an untagged environment)

This new VLAN information is used to establish Management-plane presence in an IEEE 802.1Q VLAN-tagged network topology (refer to "BCP7200 – I&C of Management-plane VLAN " on page 1770).

Figure 17 BCP7200 – I&C of Management-plane VLAN



170.10 System Management Graphical User Interface (SMGUI)

170.10.1 Overview

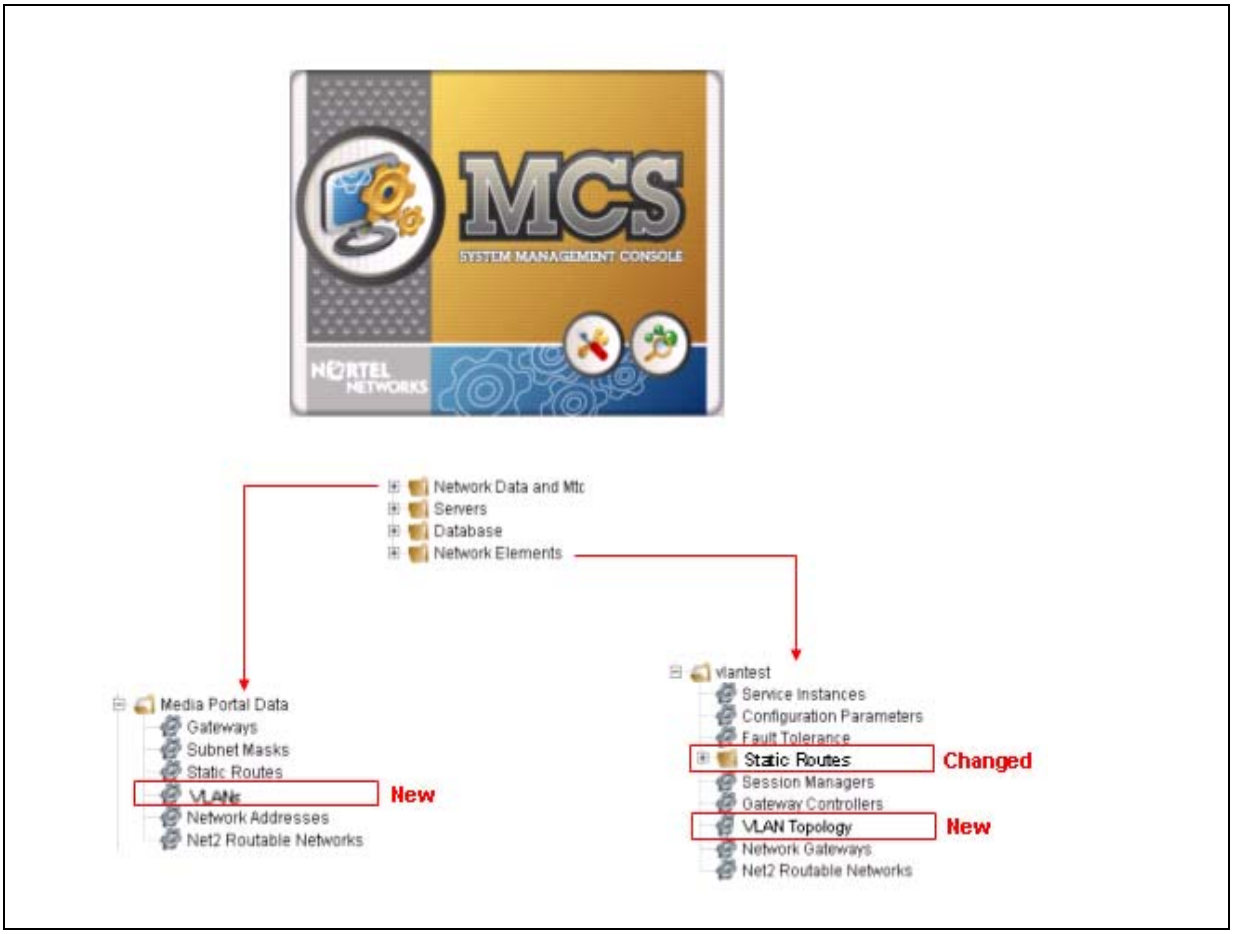
The System Management Graphical User Interface (SMGUI) is enhanced to accommodate configuration of the BCP7200 RTP Media Portal service for operation in VLAN-tagged Service Network topologies.

This new configuration information relates to (refer to “BCP7200 SMGUI – Support for VLAN-tagged Service Network Topologies ” on page 1771):

- Service Network VLAN Topology:
  - New “VLAN” configuration parameter added to “Network Data & Mtc” to permit specification of Service Network VLAN information.
  - New “VLAN Topology” configuration parameter added to the “Media Portal Cluster” data to permit association of an RTP Media Portal Service Instance’s network spaces to specific VLANs.
- Static Route VLAN Assignments:

- Changed the “Static Routes” configuration parameter in the “Media Portal Cluster” data into a data structure that permits more granular assignment of Static Routes to specific VLANs.

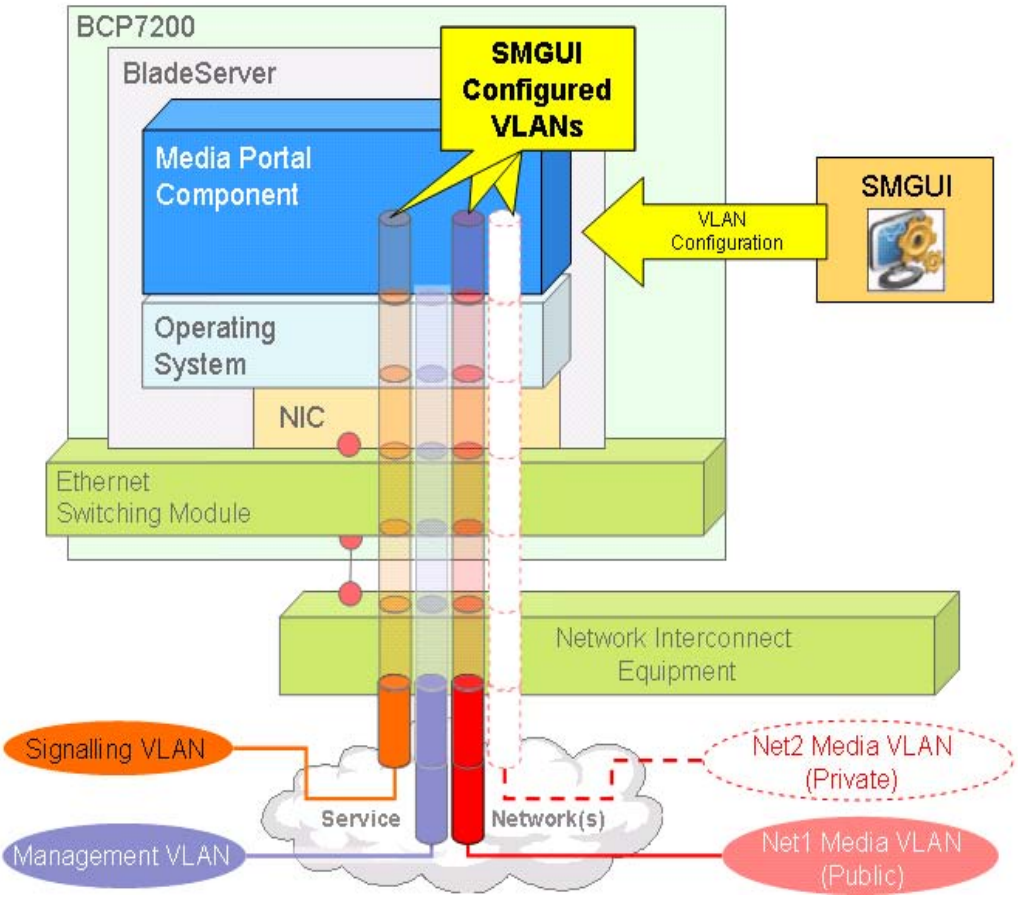
Figure 18 BCP7200 SMGUI – Support for VLAN-tagged Service Network Topologies



The introduction of VLAN information into the system enables RTP Media Portal Service Instances hosted on the BCP7200 to be configured with presence in separate VLANs that represent (refer to “BCP7200 – SMGUI Configuration of Control- and Media-plane VLANs ” on page 1772):

- a distinct network space for Control-plane traffic,
- and two separate network spaces for Media-plane traffic (one for Net1 media, and the other for Net2 media).

Figure 19 BCP7200 – SMGUI Configuration of Control- and Media-plane VLANs



170.10.1.1 SMGUI - Service Network VLAN Topology

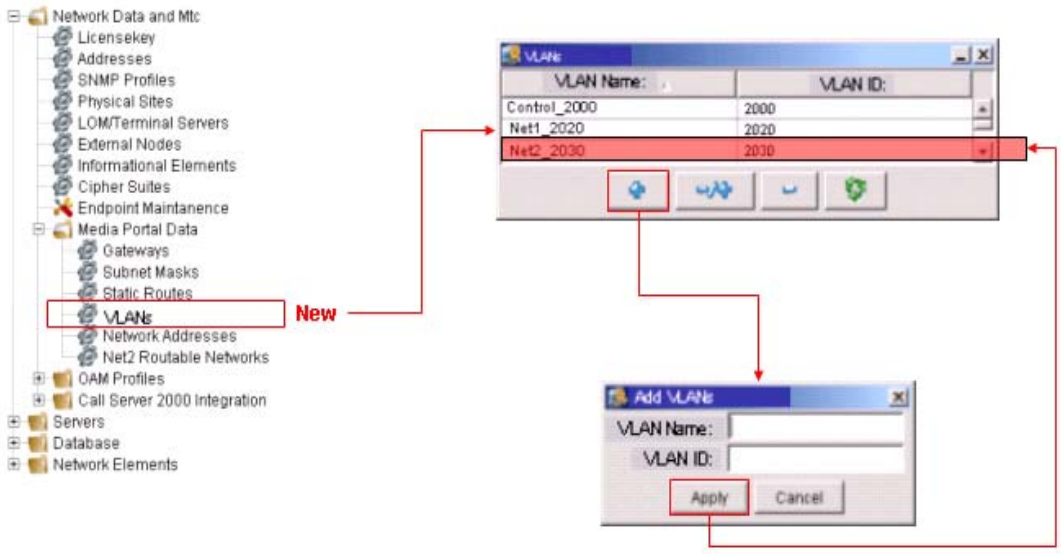
Knowledge of the Service Network VLAN Topology is entered into the system using the new “VLAN” configuration parameter added to “Network Data & Mtc”.

Every VLAN in the Service Network that is intended to be extended to the BCP7200 must be datafilled into the system as follows (refer to “SMGUI - Configuration of Service Network VLANs ” on page 1773):

1. Open the System Management Console to view the System Management GUI (SMGUI).
2. In the navigation pane (left-side) click on the “Network Data & Mtc” folder to view its contents.
3. In the navigation pane (left-side) find the “Media Portal Data” folder inside of “Network Data & Mtc” and click it to view its contents. There is a new configuration parameter (“VLANs”) present in the “Media Portal Data” folder.

4. In the navigation pane (left-side) find the new “VLANs” configuration parameter in the “Media Portal Data” folder. Click on the “VLANS” configuration parameter to open the “VLANs” configuration window in the work area (right-side pane). In the “VLANs” configuration window use:
    - the “+” button to add new Service Network VLANs into the system.
    - the “-“ button to remove Service Network VLANs from the system.
    - the “+/-“ button to edit data for Service Network VLANs already existing in the system.
5. In the “VLANs” configuration window click the “+” button to open the “Add VLANs” window and add new Service Network VLAN information into the system:
    - “VLAN Name” – a unique name in the system that represents this particular data element.
    - “VLAN ID” – this is the VLAN Identifier (VID) that defines this VLAN in the Service Network.

Figure 20 SMGUI - Configuration of Service Network VLANs

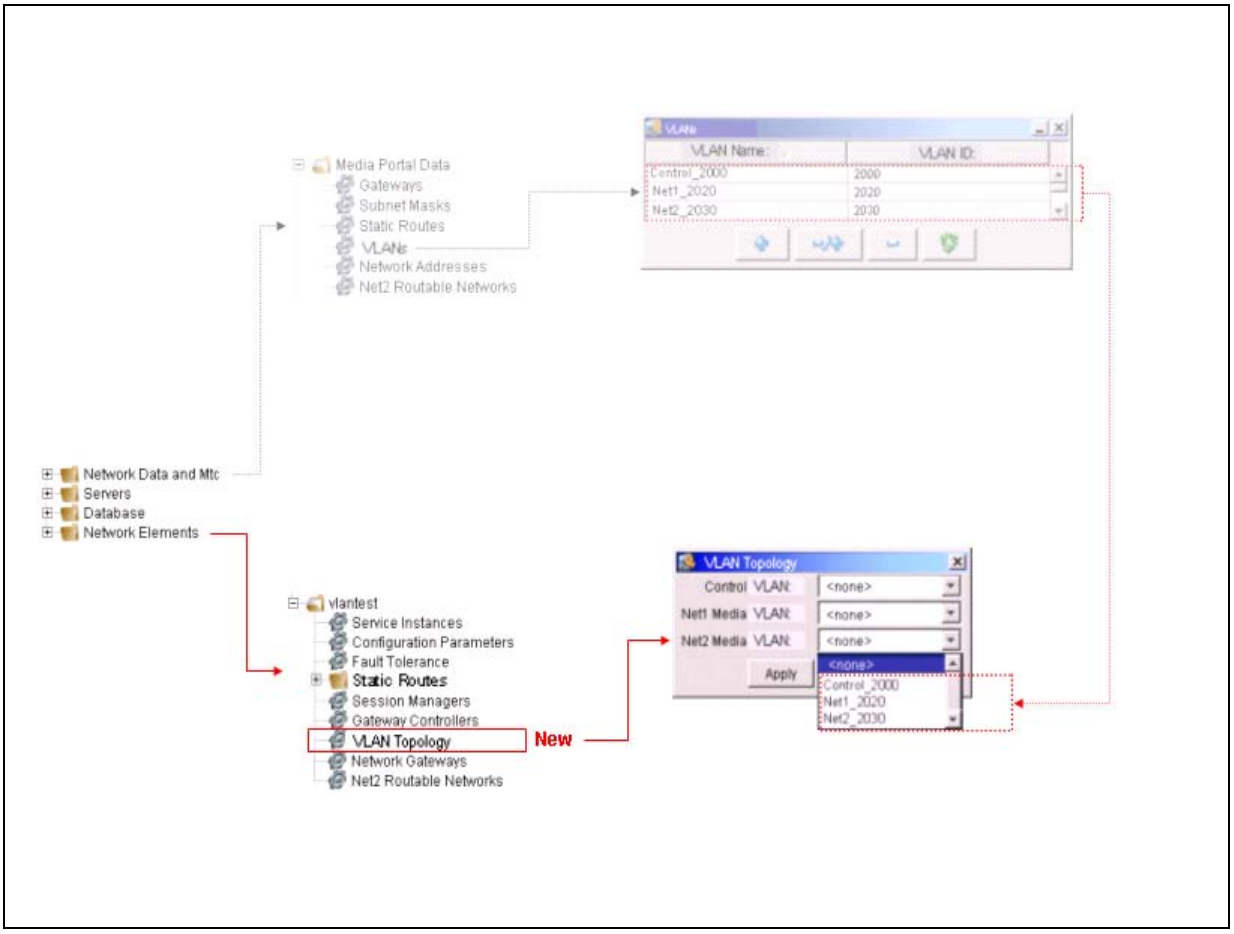


Once all of the required Service Network VLANs are defined in the system, they can be associated with any combination of BCP7200 RTP Media Portal Service Instances using the new “VLAN Topology” configuration parameters present in the “Media Portal Cluster” data as follows (refer to “SMGUI – Association of RTP Media Portal Service Instances with Service Network VLANs ” on page 1775):

1. Open the System Management Console to view the System Management GUI (SMGUI).
2. In the navigation pane (left-side) click on the “Network Elements” folder to view its contents.
3. In the navigation pane (left-side) find the “Media Portals” folder inside of “Network Elements” and click it to view its contents.
4. In the navigation pane (left-side) find the “Media Portal Cluster” folder inside of “Media Portals” and click it to view all of the BCP7200 RTP Media Portal Service Clusters datafilled in the system. Each BCP7200 RTP Media Portal Cluster has a new configuration parameter (“VLAN Topology”) that can be used to associate these entities with Service Network VLANs (when adding/editing specific “Media Portal Cluster” instances).
5. In the navigation pane (left-side) add/edit a “Media Portal Cluster” instance (i.e. open the folder to view the available configuration parameters). The new “VLAN Topology” configuration parameter is present.
6. In the navigation pane (left-side) click on the new “VLAN Topology” configuration parameter to open the “VLAN Topology” window for this “Media Portal Cluster” in the work-area (right-side pane). The “VLAN Topology” window contains three information elements (all defaulted to “<none>” to represent configuration for untagged operation):
   - “Control VLAN”: this element is used to associate a Service Network VLAN to the Control IP address.
   - “Net1 Media VLAN”: this element is used to associate a Service Network VLAN to the Net1 Media IP address.
   - “Net2 Media VLAN”: this element is used to associate a Service Network VLAN to the Net2 Media IP address.
7. In the “VLAN Topology” window (located in the right-side pane work-area) select the Service Network VLAN intended for association using the pick-list. The pick-list is populated with the Service Network VLAN information that was entered into the system using the new “VLAN” data structure located in “Network Data & Mtc”.
8. Once all desired associations are made, click the “Apply” button in the “VLAN Topology” window to submit this information into the system.

Note: *The BCP7200 does not support live update of configuration changes, so configuration data does not get picked up in run-time until the BCP7200 is cycled (e.g. Stop+Start, Kill+Start, or Restart).*

Figure 21 SMGUI – Association of RTP Media Portal Service Instances with Service Network VLANs



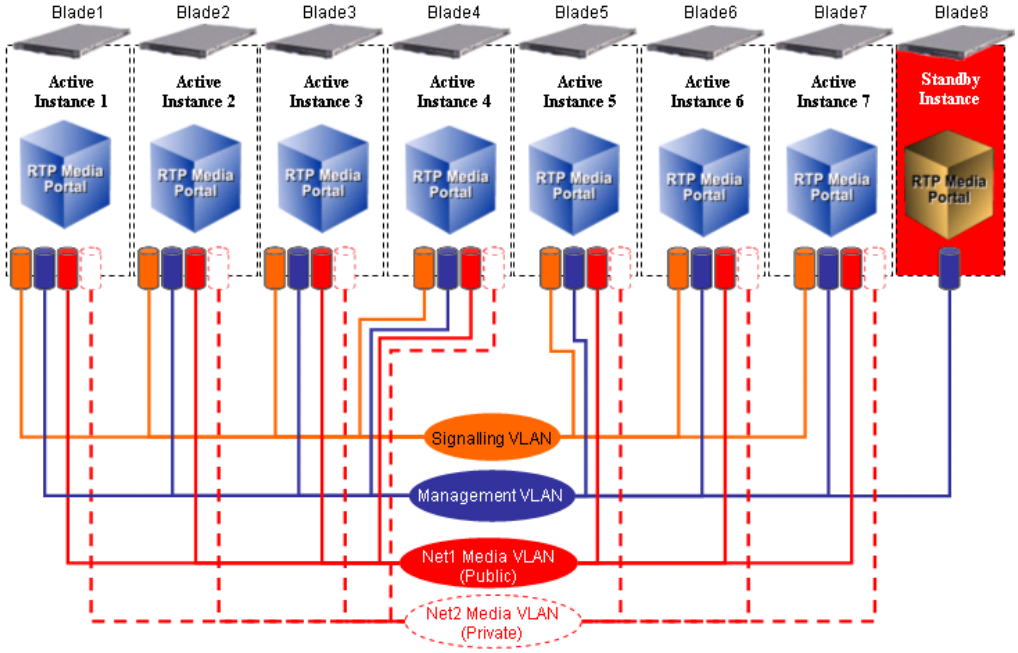
170.10.2 N+1 Fault Tolerant Service Cluster

The BCP7200 RTP Media Portal Fault Tolerant Service Cluster is enhanced to accommodate utilization of the Service Network VLAN topology during takeover actions. Thus, when the standby RTP Media Portal Service Instance detects a failure and begins running the active Service Instance, it will reconnect into the Service Network using the VLAN topology associated with the RTP Media Portal Service Instance (i.e. a Control VLAN, a Net1 Media VLAN, and a Net2 Media VLAN).

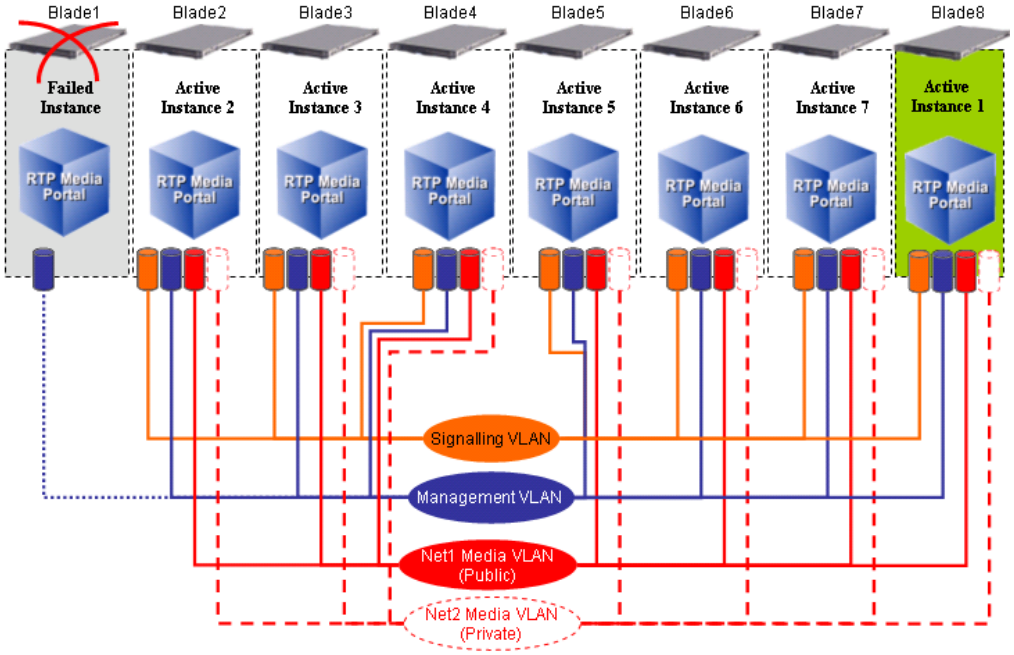
For example:

1. Assuming a stable BCP7200 “7+1” RTP Media Portal Fault Tolerant Service Cluster (Active Instances 1-7 running on Blade Servers 1-7, and the Standby

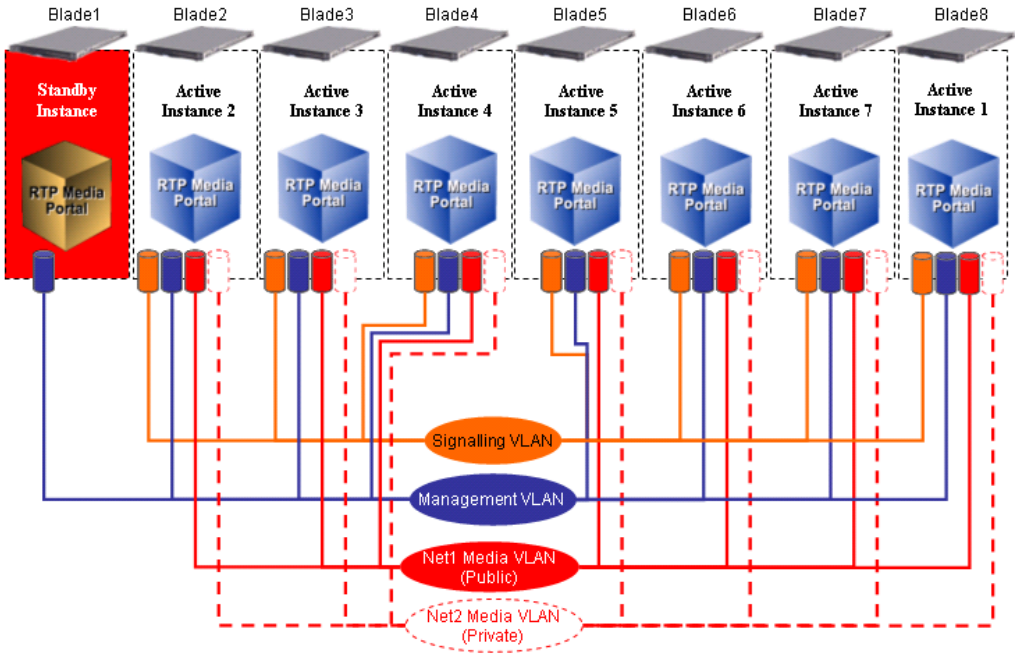
Instance running on Blade Server 8) interconnected into a VLAN-tagged Service Network:



2. In the event of a failure affecting an active RTP Media Portal Service Instance (e.g. Blade Server 1 fails destroying Active Instance 1), then the standby RTP Media Portal Service Instance will immediately instantiate itself as the affected RTP Media Portal Service Instance (Active Instance 1 begins running on Blade Server 8 – and interconnects with the Service Network using the configured VLAN network topology). The Service Cluster will continue to provide non-redundant service until the system recovers from the failure:



3. When the system recovers, the affected RTP Media Portal Service Instance (e.g. the instance running on Blade Server 1) attempts to re-join the Service Cluster and determines that it must now run as the standby Service Instance (e.g. the Standby Instance is now running on Blade Server 1). At this point, the Service Cluster is once again providing fully redundant service:

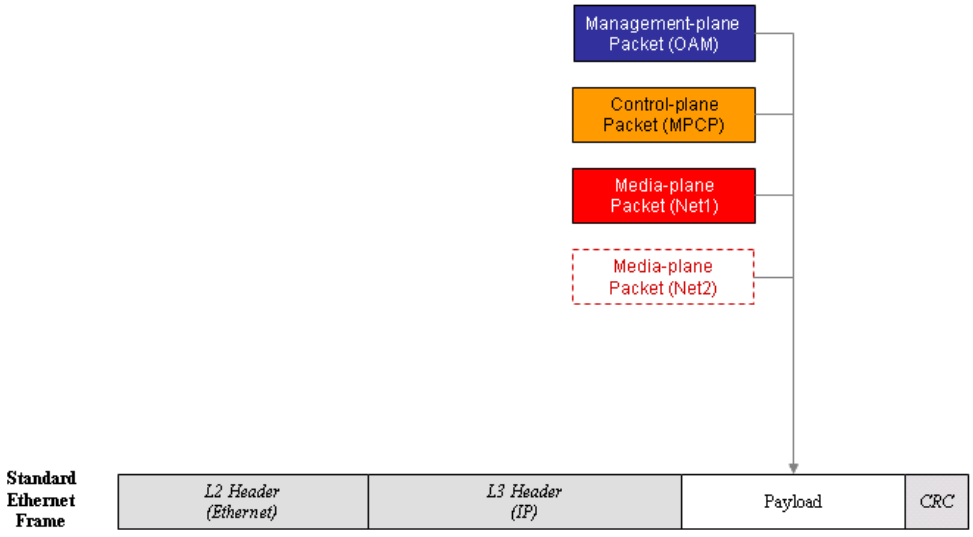


170.11 Service Packet Flows

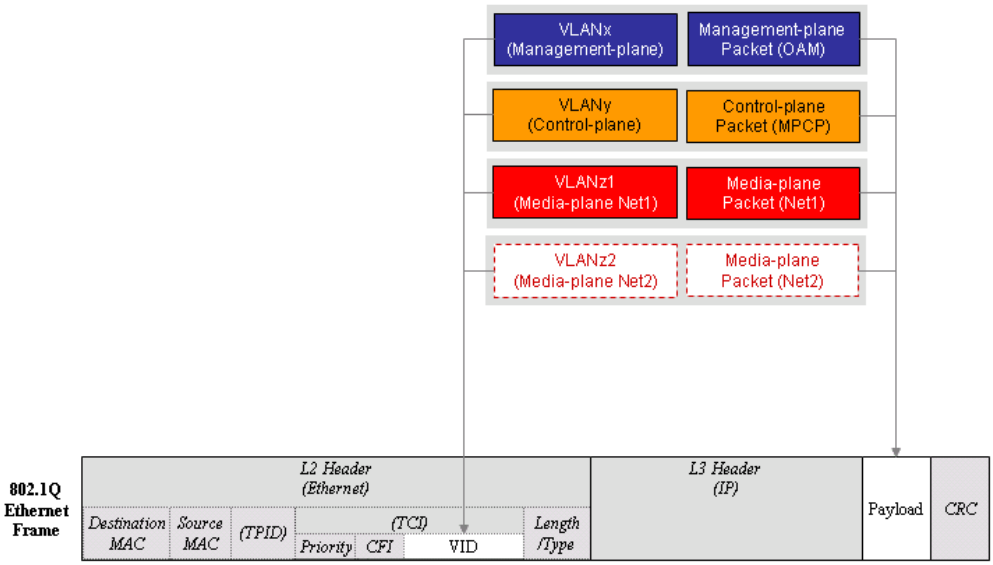
This feature provides new configuration parameters and procedures for enabling the BCP7200 to operate in IEEE 802.1Q VLAN-tagged Service Network topologies.

IEEE 802.1Q VLAN-tagged topology support is provided in addition to the previously supported untagged configuration – so the BCP7200 can now be configured for interconnect to either tagged or untagged Service Networks:

- When configured for untagged operation, the BCP7200 conveys its service packets (packets traversing each of the Service-planes: Management-plane, Control-plane, and Media-plane) in standard Ethernet frames that travel in a multi-netted flow from/to the Service Network.



- When configured for tagged operation, the BCP7200 conveys its service packets in 802.1Q Ethernet frames that are logically partitioned into separate network spaces by placing the associated VID configuration information into the VLAN Identifier (VID) field in the L2 header. In such configurations it is possible to segregate service traffic into distinct logical network spaces dedicated to conveyance of specific traffic types (e.g. Management, Control, and Media – which can be further distinguished into a Net1 Media and Net2 Media address space). In addition to placing service packets into properly tagged frames, BCP7200 RTP Media Portal Service Instances are also able to “bridge” media packets from one network space (Net1 Media) to another (Net2 Media) – and vice-versa – as a consequence of the normal operation of Media-plane functionality that the Media Packet Engine provides.



170.12 Hardware Requirements or Dependencies

This feature only applies to the BCP7200 – which is an IBM BladeCenterT (BCT) hardware platform.

170.13 Software Requirements or Dependencies

The following software changes are not required by this feature, but will occur as part of the normal course of product development:

- Upgrade to JVM 1.4.2_09 (moves the RTP Media Portal Component software onto the version of the Java Virtual Machine used across other product components).
- Upgrade to ESM firmware (up-version to collect bug-fixes, and to gain access to enhancements in the Layer-2 Trunk Failover mechanism that provide configurable control over the failover-trigger).
- Upgrade to IBM BladeCenterT (BCT) subcomponent firmware (up-version to collect bug-fixes).

170.14 Limitations and restrictions

1. IEEE 802.1Q VLAN-tagging support is only provided for the BCP7200.
2. IEEE 802.1Q VLAN-tagging support is only provided for the service traffic on the BCP7200 – there is no tagging of the out-of-band platform management traffic traversing the Management Modules in the chassis.
3. Since VLAN-tagging fundamentally changes the format of frames transmitted on a tagged port, carefully planned network designs are needed to prevent tagged frames from being transmitted to devices that do not support IEEE 802.1Q VLAN tags, or devices where tagging is not enabled.

4. The BCP7200 does not support live update of configuration changes, so configuration data does not get picked up in run-time until the BCP7200 is cycled (e.g. Stop+Start, Kill+Start, or Restart).
5. Configuration parameter default values (i.e. “<none>”) target operation in untagged topologies.
6. There are also restrictions and limitations as to the ESM’s functions and capabilities with respect to support of IEEE 802.1Q VLAN-tagging. Some of these are listed below, but please refer to most recent ESM documentation for most accurate listing:
    - The ESM can support a maximum of 128 VLANs at a time.
    - By default, the Alteon OS software is configured so that management ports are configured to the default VLAN 4095.
    - The ESM can support a maximum of three (3) separate Layer-2 Link Aggregation trunks. This will limit the number of physically partitioned configurations possible that support Layer-2 Fault Tolerance using Link Aggregation.
    - All ESM ports configured as members of a Layer-2 trunk must have the same VLAN configuration. Also,
        - all trunk member ports must be assigned to the same VLAN configuration before the trunk can be enabled.
        - changes to the VLAN settings of any trunk member cannot be applied until the VLAN settings of all trunk members have been similarly changed.

170.15 Interactions

Not Applicable.

171: Functional Description (FN) A00012905

171.1 Feature name and Feature ID

Corrective CAF: A00012905: ERS8600 Alarm Mapping Correction in IEMS

171.2 Description

This feature corrects ERS8600 alarm mappings defined in IEMS system. No user interfaces will be changed in this corrective CAF.

From SN08, some ERS8600 traps have an incorrect mapping relationship with IEMS fault code. This causes unknown and misunderstanding alarms or events in IEMS system. Refer to the FM section of this feature for the content changes of some alarms and events.

This feature will be delivered in SN09-FF release. Refer to the FM section of this feature for more details.

171.3 Hardware Requirements or Dependencies

N/A

171.4 Software Requirements or Dependencies

This Feature requires the following applications:

- IEMS Application Server SN09-FF
- SN09 ERS 8600 V3.7.2.2

171.5 Limitations and restrictions

N/A

171.6 Interactions

There are no interactions between this feature and existing features.

171.7 Glossary

IEMS - Integrated Element Management System

ERS 8600 – Ethernet Routing Switch 8600

172: Functional Description (FN) A00012974

172.1 Feature name and Feature ID

Corrective CAF: A00012974: Correct Execdata mismatch between GWC EM and Core

172.2 Purpose

Prior to SESM SN07 there is a TRUNK250 GWC profile which exec data include “ABTRK DTCEX” and “PRAB UTR250”. From SN07 the TRUNK250 profile is being changed to TRUNKNA, and “ABTRK DTCEX” becomes “ABTRK GWCEX”. Also, a valid TRUNKNA GWC has 3 pairs of exec data. That is, “AB250 GWC250” is added by A89007187. Therefore, when both SESM and Core upgrade from SN6.2 or below to SN7.0 or above, both sides need to change the TRUNK250 profile to TRUNKNA profile.

This feature provides customers a function to change the execdata of a GWC from the GWCEM GUI. If the execdata of a GWC is changed, then both the SESM database table and Core table will be updated.

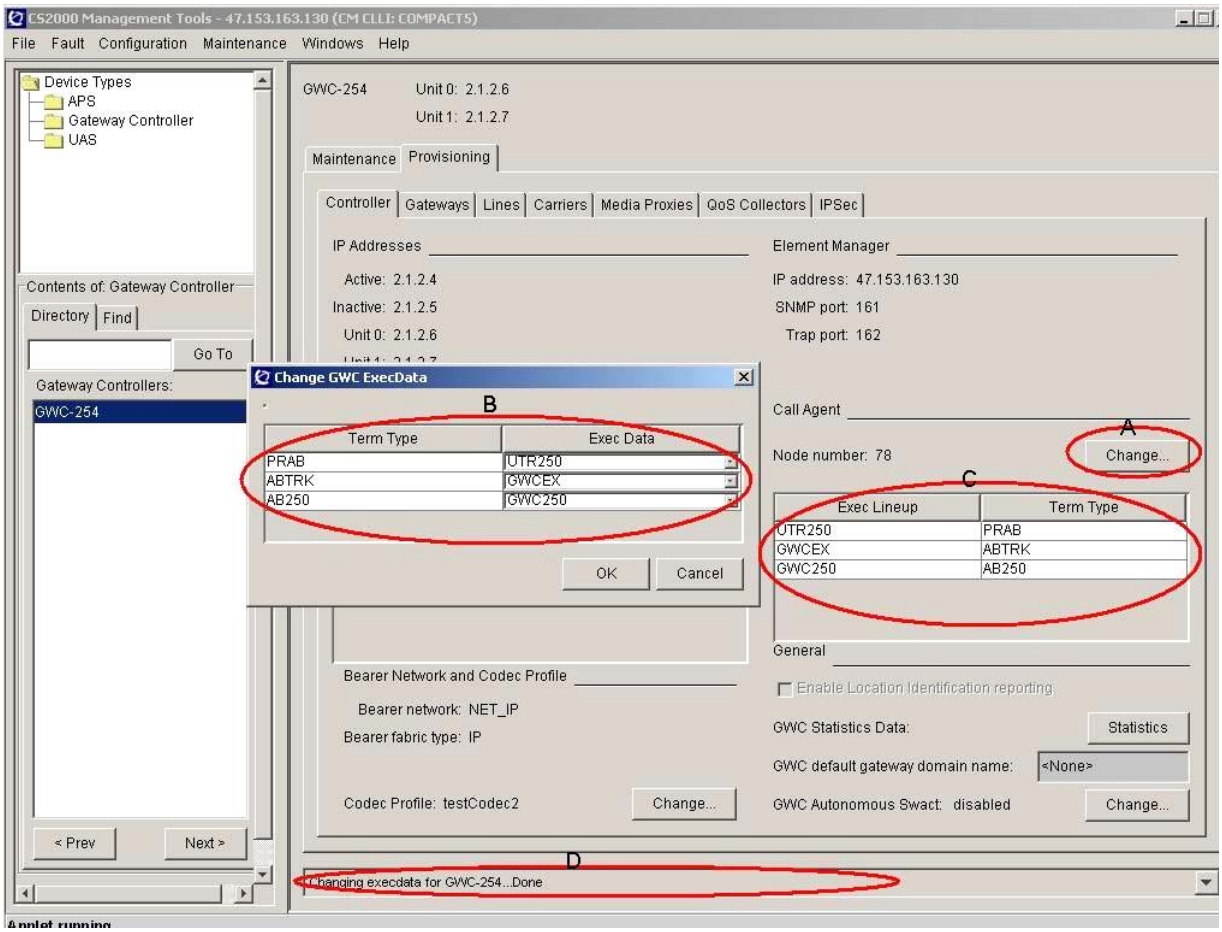
Since it is required for a GWC to have static data reloaded after a change of the exec data, a MN alarm will be generated to the IEMS for each GWC unit of a GWC pair until new static data is sent by locking and unlocking the cards.

172.3 Problem symptoms

Previously customers could choose execdata of a GWC profile for a GWC only when adding a new GWC. If the GWC has already been added into SESM the only way to change the GWC execdata is to delete the GWC and add it again. This is extremely service impacting.

This feature will introduce a new function which let customers change execdata of an existing GWC through the SESM GUI. After successful changing only a GWC, BSY/RTS operations are needed to make the new configuration valid on the GWC pair. Thus it is not necessary to delete and add a GWC in order to change the GWC execdata.

For example: Areas in red circles in the figure that follows show modification of this feature on the GUI.

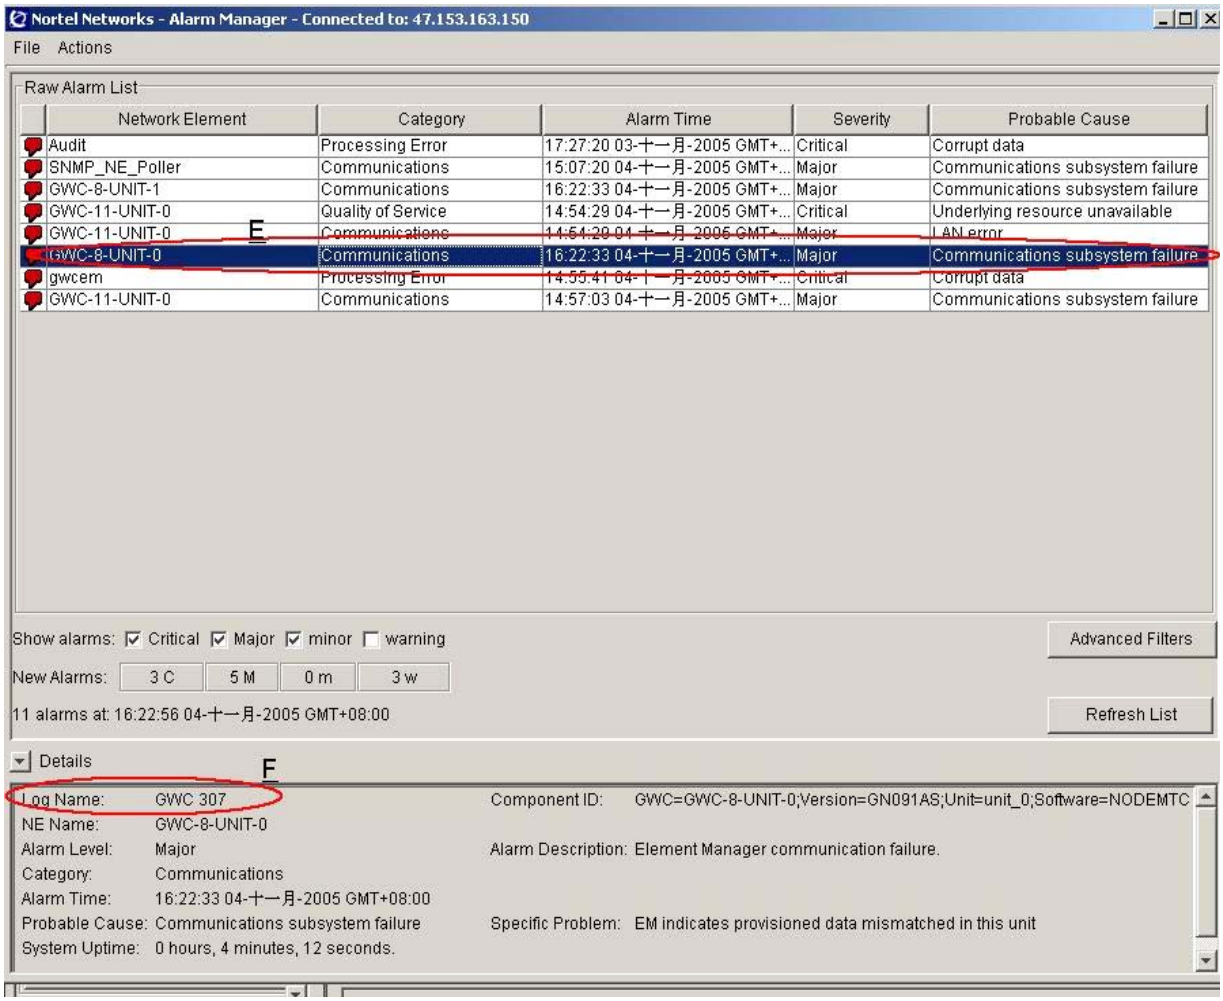


A: Add a “Change…” button

B: Pop up a new dialogue when clicking the A button

C: The fields will be refreshed after successfully changing the ExecData

D: Messages will be prompted in the status bar during the operation



E: Alarm is raised after successful change of EXECDATA

F: The Alarm type is GWC 307, which means communication with the CS 2000 GWC Manager need to be restored. This alarm can be cleared by BSY/ RTS of GWC unit.

173: Functional Description (FN) A00013063

173.1 Feature name and Feature ID

A00013063: PacketCable Multimedia for MCS and Carrier

173.2 Description

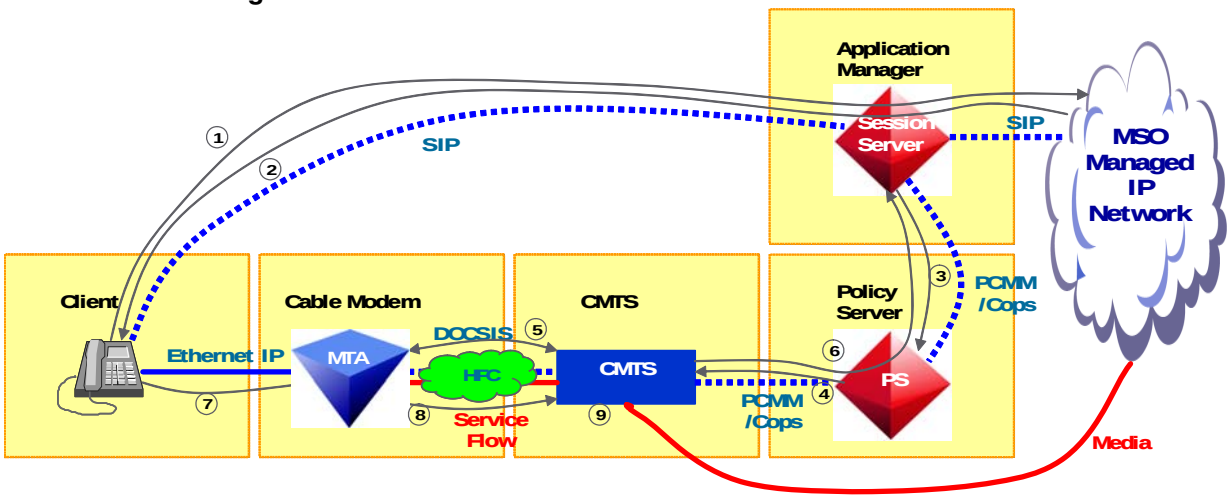
173.2.1 Functional Overview

PacketCable Multimedia is an architecture developed by CableLabs to enable MultiService Operating Companies to deliver Quality of Service enabled multimedia services over DOCSIS networks. PacketCable Multimedia extends the Dynamic Quality of Service architecture developed as part of PacketCable 1.X to allow Application Managers in the MSO network to request and obtain Quality of Service treatment for multimedia traffic flows on behalf of an end user.

The PCMM signaling implementation is compliant with PacketCable specification PKT-SP-MM-I02-040930.

The following diagram illustrates a high level call flow for a PacketCable Multimedia (PCMM) SIP call.

Figure 1 PCMM SIP Call Flow



1. SIP Client originates a session application (SIP Invite) to the Session Server and into the network to a destination client
2. The destination responds with an OK (200 OK) to the SIP Client through the Session Server
3. The application manager on the session server requests managed QoS on behalf of the SIP client by signaling to the policy server
4. The Policy Server makes policy decision and sends the request to the CMTS
5. The CMTS uses DOCSIS signaling to create service flow in the Cable Modem
6. The CMTS responds with a gate-id, which is passed via Policy Server to Session Server
7. The SIP Client sends data/media to the Cable Modem
8. Cable Modem puts data on the appropriate managed service flow to the CMTS based on classifier (e.g. IP address, port)
9. CMTS enforces policy for data on the service flow and network using the gate

Signaling
Media
High QoS Media

Activity A000011740 provided the PacketCable Multimedia (PCMM) service for the CS2K and can be referred to for the provisioning and activation of PCMM. This activity enables the use of PCMM in an MCS5200 environment. It also provides the following enhancements which apply to both the MCS and CS2K implementations except where otherwise noted:

Emergency Support - Raises the priority of the PCMM messages when a SIP call is made to an emergency number. Not supported for CS2K configuration.

Video Codec Flowspec Mapping - Allows the setting of the RSVP values for video codecs in order to communicate the bandwidth requirements for an instance of a given video session from the AM to the PS and CMTS. Audio codecs always use the values defined in PacketCable PKT-SP-CODEC specification.

Failover Support For PCMM - If the active Session Manager fails and the standby Session Manager takes over, then stable PCMM service flows (gates) are retained.

173.2.2 Emergency Support

The priority contained in the PCMM Gate-Set message is raised to the highest level when a SIP call is made to an emergency number. The Policy Server and the CMTS may use the priority value to implement priority based admission and to defend the resulting flow from being preempted. Provisioning of emergency number is accomplished using the Provisioning Client's Emergency Number and Emergency Alias Lists.

173.2.3 Failover Support For PCMM

If the AM's active Session Manager fails, and the standby Session Manager takes over, then the newly active Session Manager can communicate with the Policy Server. Also, the newly active Session Manager has knowledge of all stable PCMM service flows (gates) so it can delete them when the session ends. A stable PCMM service flow is defined as a session that was answered and the AM has received acknowledgement from the Policy Server that the PCMM service flow request was successful.

173.2.4 Video Codec FlowSpec Mapping

The following sections describe how to configure the FlowSpec video codec values which will be delivered as part of this activity. Please refer to activity A000011740 to understand how to configure the Policy Server and assign the PCMM feature to subscribers. These steps must be taken first in order to make use of the FlowSpec data described in the following sections.

173.2.4.1 Configuring FlowSpec Data

FlowSpec RSVP values are used to determine how much bandwidth is provided for video calls. Audio codecs always use the values defined in PacketCable PKT-SP-CODEC specification.

The customer is allowed to adjust video quality through modifications of the FlowSpec RSVP values for a specific codec and frame rate. A customer may configure up to 32 codec name / frame rate combinations.

Configuration of these codec values is system wide and will be used in determining video bandwidth for PCMM calls. The subscribers service package must have the Video option selected before an attempt to use the video codec FlowSpec data described in this section is made.

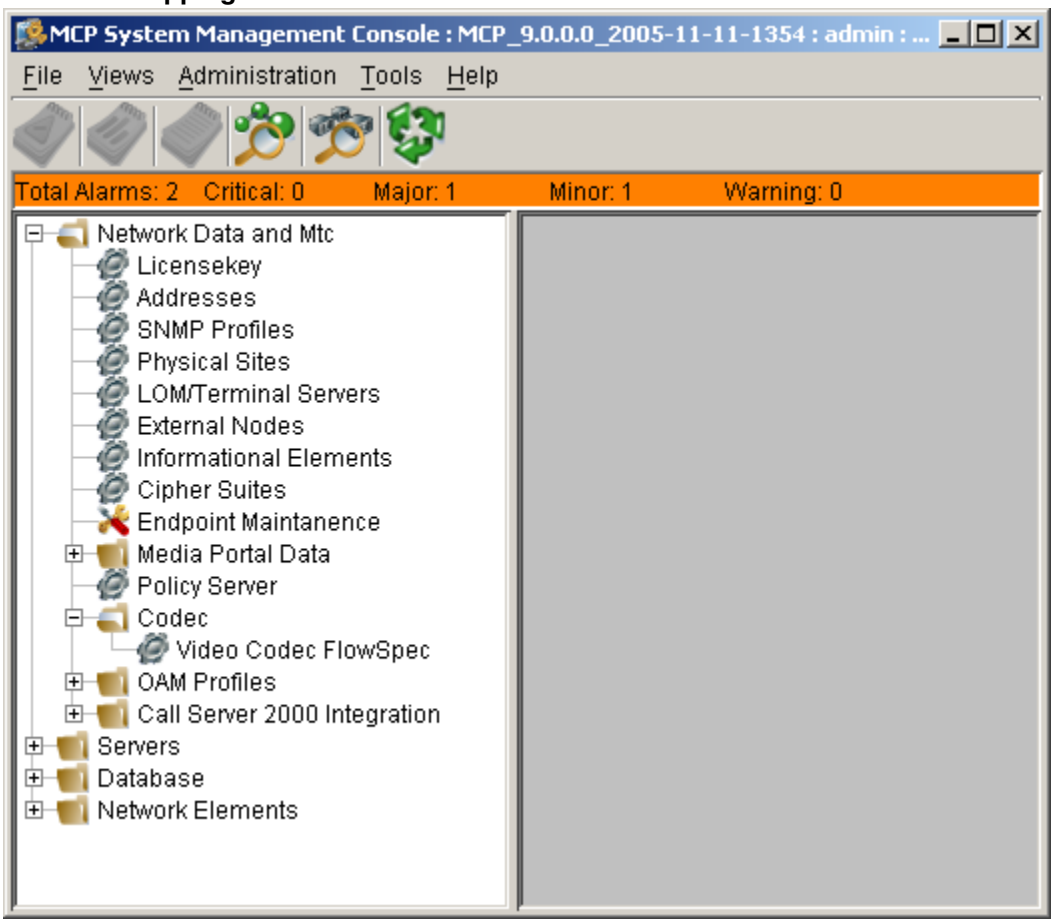
If a video codec is supplied by a SIP client during call setup and it has not been configured as part of PCMM Codec configuration, then the call will receive Best Effort service (no PCMM Service Flow) and will not render the best video quality.

Two supported video codecs are pre-provisioned in the system and they contain default FlowSpec RSVP values as follows:

Frame Rate	**Bucket Rate**	**Bucket Size**	**Peak**	**Min**	**Max**	**Rate**	**Slack**
10	30000	3000	30000	50	3000	30000	800

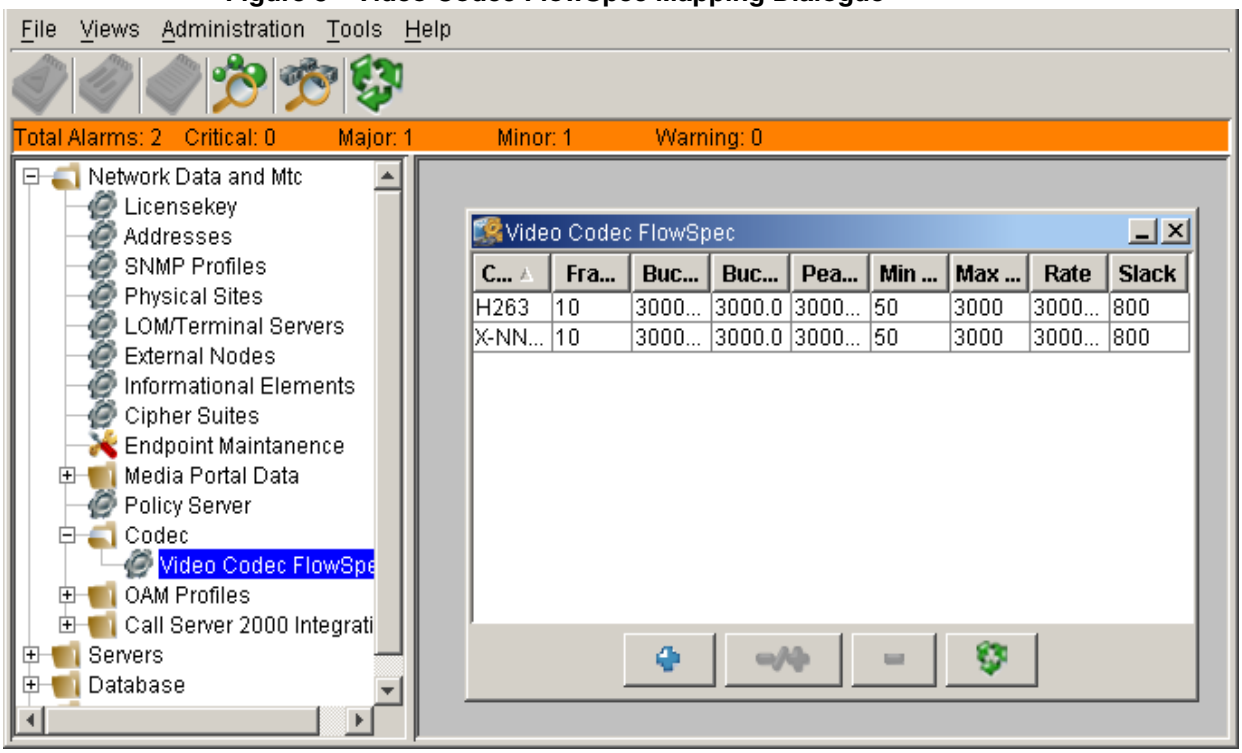
To configure the vide codec FlowSpec mappings from the MCP System Management Console expand the “Network Data and Mtc” folder and expand the “Codec” folder:

Figure 2 MCP System Management Console for Video Codec FlowSpec Mapping



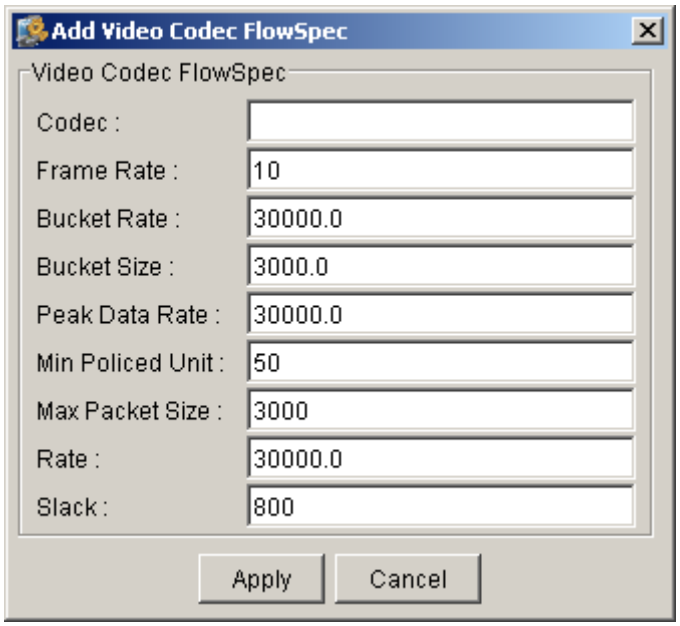
- Select the “Video Codec FlowSpec Mapping” item and the following screen appears:

Figure 3 Video Codec FlowSpec Mapping Dialogue



- Select the '+' icon and a new window appears. Enter the following fields:

Figure 4 Add Video Codec



a. **Codec**: Customer defined codec name up to 16 characters

b. Frame Rate: Video frame rate. The default is 10

c. **Bucket Rate:** Token bucket rate that the traffic conforms to in bytes per second**.** The default is 30000

d. **Bucket Size**: Size of each token in bytes. The default is 3000

e. Peak: Peak rate at which the source will send in bytes per second. The default is 30000

f. Min Unit: Minimum policed unit, usually the smallest packet size that the source will generate, in bytes. The default is 50

g. Max Units: Maximum packet size generated by the source in bytes. The default is 3000

h. Reserved Rate: Reserved rate in bytes per second. The default is 30000

i. Slack: Slack term in microseconds. The default is 800

Once these fields are entered, click “Apply” and the video codec will be configured.

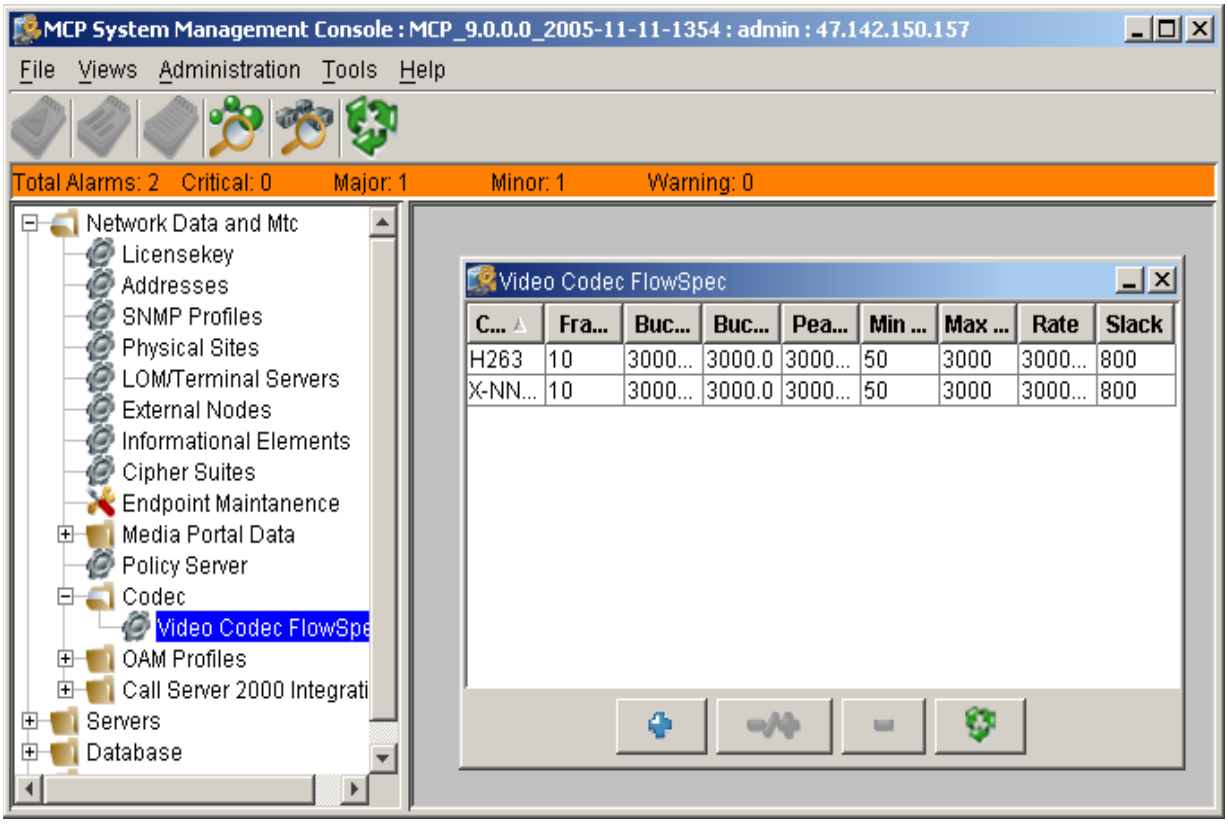
173.2.4.2 Deleting a PCMM Codec

A video codec maybe deleted using the MCS System Management Console.

In order to delete a PCMM codec entry:

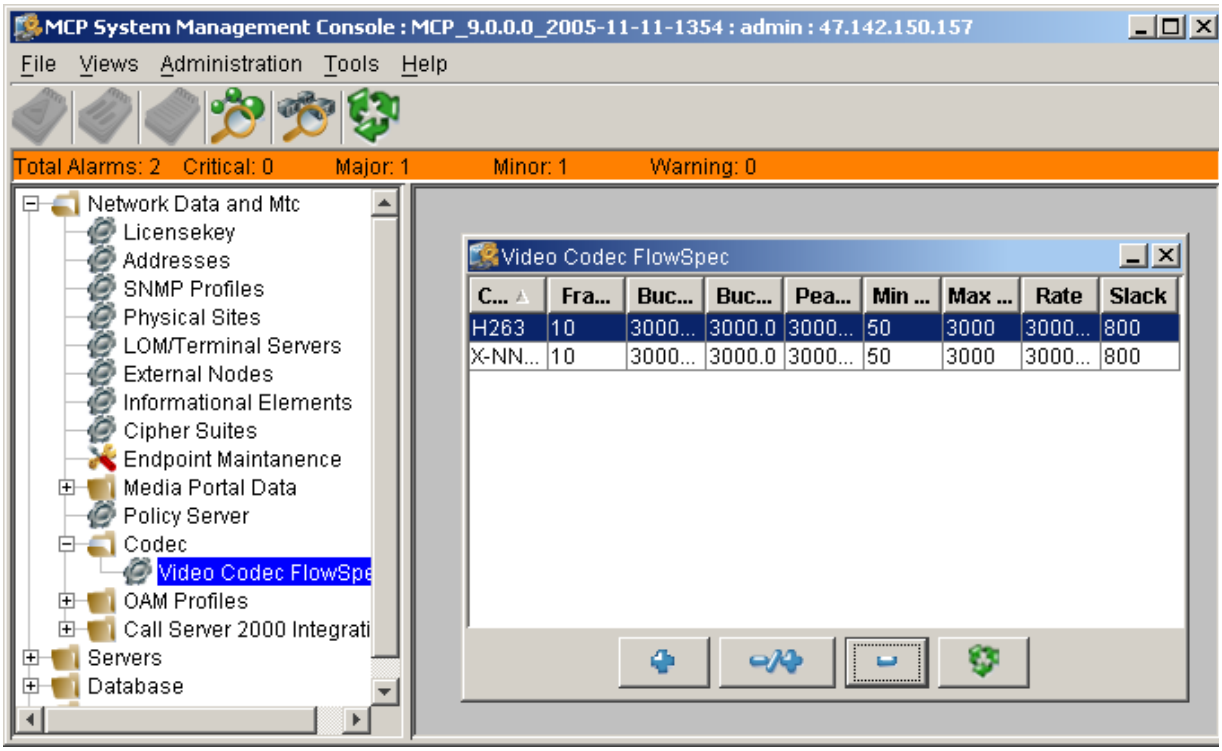
- Expand the “Network Data and Mtc” and “Codec” folders.

Figure 5 System Management for Video Codec FlowSpec Mapping



- Select the “Video Code FlowSpec Mapping” item and a new screen will appear as follows:

Figure 6 Video Codec FlowSpec Mapping Selected



- Highlight the PCMM codec to be deleted and click the “-” (minus) button
- A confirmation screen will appear- select ‘yes’ to delete, ‘no’ to cancel.

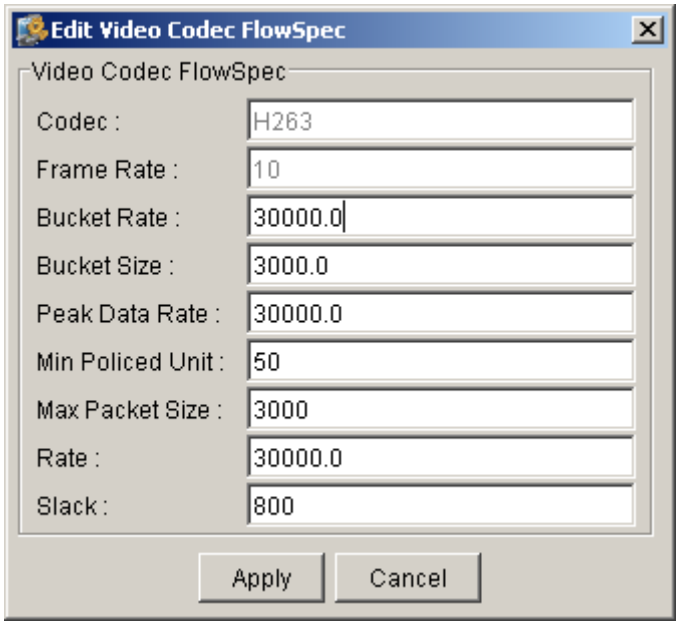
173.2.4.3 Modifying a PCMM Codec

A PCMM codec maybe modified using the MCS System Management Console.

Modifications of any field will take affect only on new calls which are established after the data is modified. Existing calls will retain their current video quality.-i.e video quality will not be renegotiated on active calls.

In order to modify a PCMM codec entry:

- Expand the “Network Data and Mtc” and “Codecs” items
- Select the “Video Code FlowSpec Mapping” item and the same screen as mentioned in the “Deleting a PCMM Codec” will appear.
- Highlight the PCMM codec to be modified and click the “+/-” button.
- The following screen will appear: Note that the codec name and framerate values cannot be modified. If a different codec/ framerate is desired you must add a new codec/framerate combination. All other fields can be modified.



- Modify any field which are allowed and depress apply. The new values will be modified stored.

173.3 Hardware Requirements or Dependencies

To deploy the PC-MM feature, the MSO needs to have PC-MM compliant cable network elements that are not supplied by Nortel. These third-party elements include cable modems, CMTSs, and a policy server.

173.4 Software Requirements or Dependencies

The policy server and CMTSs in the cable network must support PacketCable Multimedia specification PKT-SP-MM-I02-040930. The cable modems must support DOCSIS 1.1 or greater.

173.5 Limitations and restrictions

Failover for PCMM does not support the processing of unsolicited messages received from the Policy Server after the switch of activity. Therefore, the following scenario could occur:

1. A SIP session is answered and it has a PCMM service flow.
2. The active Session Manager fails and the standby Session Manager takes over.
3. Something happens on the network causing the CMTS to detect and report a loss of packets (through the Policy Server) to the Session Manager for the SIP session.

4. The call will lose it's PCMM service flow and resort to Best Effort quality of service.

173.6 Interactions

The PCMM feature sets up managed quality of service for SIP calls originating from or terminating to the cable network. PCMM operates on a half-call basis. This means that PCMM signaling and managed QoS happen only for the half of the call that is in the cable network. For example, an on-net to off-net call will only do PCMM signaling for the originating line half of the call. The trunk half of the call is not touched by PCMM.

173.6.1 Basic Call

The PCMM feature attempts to set up managed quality of service when the SDP information is known for both of the media endpoints (originating and terminating). Therefore, application of the PC-MM protocol procedures will not cause call failures, but it is possible that under some network error conditions a call might receive "best effort" QoS rather than managed QoS.

173.7 Glossary

Term	Definition
AM	Application Manager - logical network element defined in the PacketCable Multimedia architecture responsible for making bandwidth requests on behalf of a cable agnostic client.
Best effort	The default service flow. The characteristics for this service flow are defined in the cable modem config file. If a packet does not match any classifier then it is assigned to the best effort service flow.
CableLabs	A standards body that writes interface specifications and defines functional behavior for cable network elements.
Classifier	The set of parameters by which a media packet is judged to determine which service flow the packet belongs on.
Client	A SIP client
CM	Cable Modem - a cable network device that provides access to the cable network from an ethernet IP network.
CM	Call Manager - an MCS architecture component responsible for managing call-halves.
CMTS	Cable Modem Termination System - gateway between the cable HF/C network and the ethernet IP network. The CMTS receives the PCMM messages and communicates with the cable modem via DOCSIS to set up managed service flows.
COPS	Common Open Policy Service - a protocol defined in RFC 2748 that sets up a master/slave relationship between network elements for policy decisions. The PCMM protocol is an extension of COPS.
CS2M	CS2000 Management Tools - the CS2K GWC provisioning GUI

Term	Definition
DOCSIS	Data Over Cable System Interface Specification - the protocol used between cable modems and their CMTS to set up service flows and classifiers.
DIFFSERV	Differentiated Services - an IP packet marking scheme that allows IP packets to be treated differently in the network
DSCP	DIFFSERV Code Point - the bit pattern used for DIFFSERV
GETS	Government Emergency Telephone Service - a telephony service that gives higher priority to some callers so that government services can function in the presence of extremely high call loads
HF/C	Hybrid-Fiber/Coax
KRS	Key Registration System
NAT	Network Address Translator - a device that translates between public network addresses and private network addresses.
PacketCable	A subdivision of CableLabs that focuses on standards for VoIP over cable and multimedia over cable.
PC	Personal Computer (in this case)
PCMM	PacketCable Multimedia - an architecture and protocol for managing cable network bandwidth on behalf of cable agnostic clients.
PDP	Policy Decision Point - the COPS network element responsible for formulating network policy. The AM is a PDP. The PS is a PEP w.r.t. the AM and a PDP w.r.t. the CMTS.
PEP	Policy Enforcement Point - the COPS network element responsible for enforcing policies created by the PDP. The CMTS is a PEP. The PS is a PEP w.r.t. the AM and a PDP w.r.t. the CMTS.
Policy	A policy in the context of PCMM defines the access to and level of managed QoS available to a PCMM subscriber.
PS	Policy Server - network element defined in the PacketCable Multimedia architecture responsible for receiving PCMM signaling from and AM and forwarding it to the correct CMTS.
QoS	Quality of Service - the set of network characteristics that determine how a media packet is treated
SA	IPSec or IKE Secure Association
Service Flow	A managed QoS pipeline through the cable HF/C network defined by the quality of service given to the packets that transit the service flow.
SIP	Session Initiation Protocol - a VoIP signaling protocol
Socket	The IP address and port number used to communicate over an IP network to a particular service.
SS-L	Session Server Lines - a name for the MCS application server when used with CS2000

Term	Definition
TOS	Type Of Service - a set of bits in the IP header that can be used to mark IP packets for different treatment in the network. Some of the TOS bits are used for DSCP.

174: Functional Description (FN) A00013457

174.1 Feature name and Feature ID

A00013457: Message Waiting Indication using SIP VM/UM based on RFC 3842

174.2 Description

This development supports both North American and International markets.

This development is the expansion of the SN09 actid A00007544. The actid A00007544 was not tested with a SIP based UM/VM system. Also, the SN09 development was limited to the direct networking between two CS2K using SIP network. This development addresses the following three main aspects:

- Session Initiation Protocol (SIP) based network message waiting service (NMS) support based on RFC 3842 interworking with tandem solutions.
- Testing of message waiting indication (MWI) and NMS with RFC 3842 compliant SIP based 3rd party VM/UM.
- Testing of the MWI and NMS with RFC 3842 compliant SIP based open source VM/UM system.

174.2.1 SIP NMS based on RFC 3842 interworking with tandem Solutions

There are a large number of customers who are deploying the VM/UM connection with the CS2K Core or equivalent class 5 switches in a network mode. In this case, the customers have to maintain only one VM for multiple customers served via different class 5 switches (including CS2K). The existing software in CS2K Core already provide this service using NMS based on GR-866-Core using the SS7 network for public purpose and the INTERWORK subsystem network for private purpose. Also, NMS based on GR-866 is widely used with NTNA PRI connections as well as H.323 connections to the enterprise based PBX (or equivalent).

The existing software limitations were such that the tandem solutions where, the SIP based VM/UM is connected to a CS2K via SIP network and line is connected to a remote node (class 5 switch, PBX, etc.) was not supported. This

design is removing this limitation and allow the interworking between traditional network (public or private) and SIP based network VM/UM.

This feature does not cover development needed in SIP clients, SIP compliant remote node and SIP compliant VM.

Based on the converged network needs and support for multiple interfaces, the following end user devices are supported:

- Traditional Phones (e.g POTS, RES, IBN, KSET etc.)
- CICM IP sets
- Traditional Lines off of a remote switch
- Traditional Lines off of a remote SIP domain
- Traditional Lines off of a PBX
- SIP lines served by CS2K.
- SIP Lines served by a remote CS2K.

Also, the following interfaces to a message server (Voicemail) system are supported:

- Traditional SMDI and UCD/HUNT group to VM.
- Traditional VM using public SS7 network for NMS (North American market only).
- Traditional VM using private NTNA PRI for NMS (North American market only).
- Traditional VM using Interwork subsystem for NMS (North American market only).
- Traditional VM using public ETSI ISUP network for NMS (INTL market only).
- Traditional VM using private ETSI PRI network for NMS (INTL market only).
- Traditional VM using SIP NMS based on RFC 3842.

- Commercial 3rd party RFC 3842 compliant SIP VM/UM network to CS2K.
- Open Source RFC 3842 compliant SIP VM/UM network to CS2K.
- Enterprise hosted 3rd party (e.g. IP Unity) RFC 3842 compliant SIP VM/UM network to CS2K.
- Tandem solution between two CS2K interconnecting via an INTERWORK subsystem networking with a SIP VM/UM connected to one CS2K (North American market only)
- Tandem solution between two CS2K interconnecting via NTNA PRI based networking with a SIP VM/UM connected to one CS2K (North American market only).
- Tandem solution between two CS2K interconnecting via SS7 based networking with a SIP VM/UM connected to one CS2K (North American market only).
- Tandem solution between a CS2K and a PBX interconnecting via an H.323 (MCDN) based networking with a SIP VM/UM connected to the CS2K (North American market only).
- Tandem solution between two CS2K interconnecting via ETSI ISUP based networking with a SIP VM/UM connected to one CS2K (INTL market only).
- Tandem solution between two CS2K interconnecting via ETSI PRI based networking with a SIP VM/UM connected to one CS2K (INTL market only).

The combination of above user devices and VM interfaces are supported with following interoperability limitation:

The design is generic and based on RFC 3842 standards, Nortel is unable to test every possible interoperability using different hardware and different vendor equipment. Therefore, Nortel can only be able to claim the support for the tested networks. In order to make other hardware and different vendor equipment supported, proper interoperability testing must be done in Nortel-approved interoperability lab. After the complete testing, appropriate support will be provided for them as per the relationship defined in Nortel's Developer Partner Program.

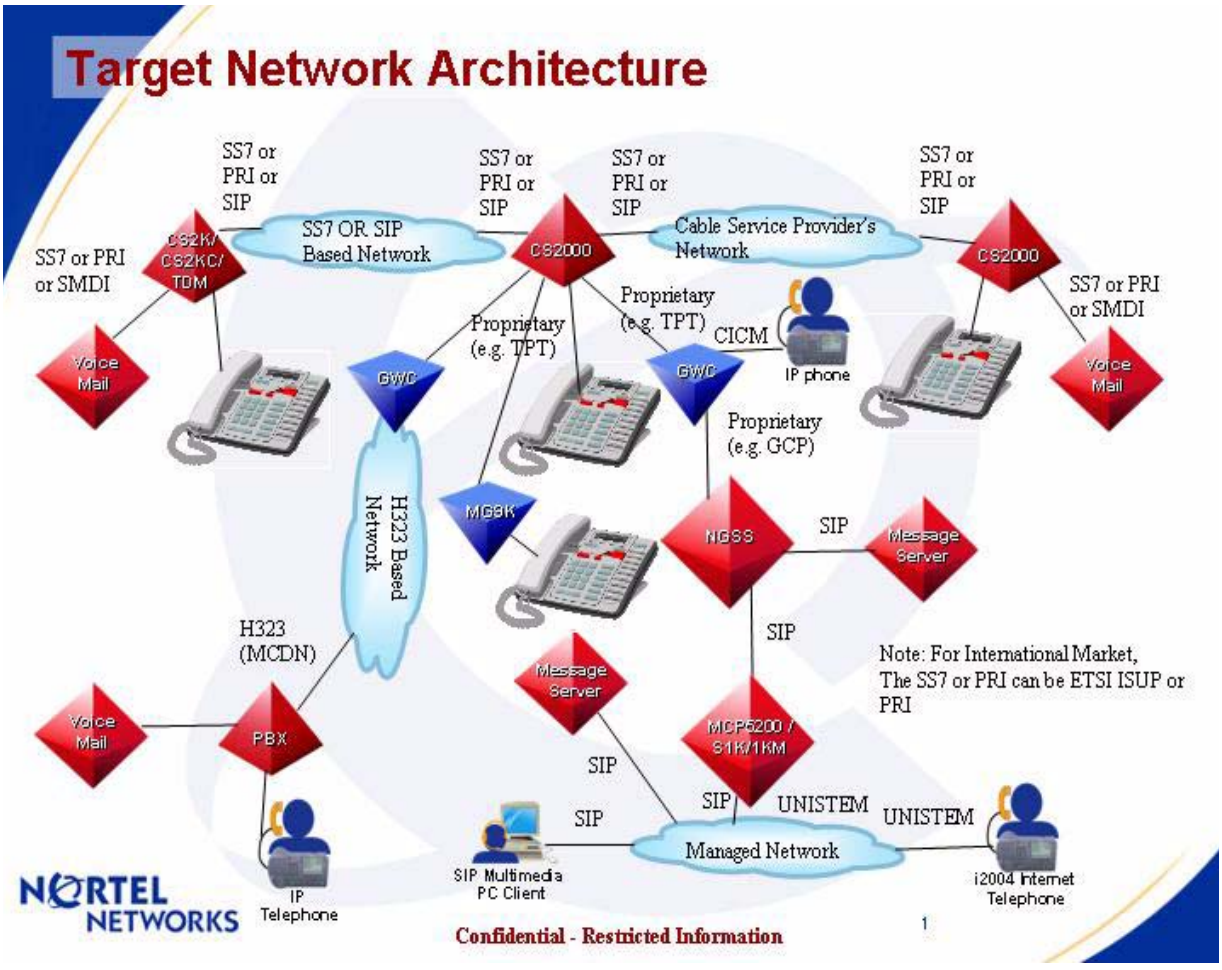
The DPNSS support for the INTL market has been developed by companion feature A00009409 and A00012847. Therefore, details for the DPNSS support please refer to A00009409 and A00012847.

The H.323 MCDN for INTL market is not covered by this actid.

174.2.2 Target Network Architecture

The feature develops a converge network architecture. In this architecture of the Message Waiting (MWT) service the VM or Message Server (MsgSrv) can reside in any network and the user device can reside in any network. The communication required for MWT service is supported by this architecture. The following figure (Figure 1) is a pictorial representation of the target architecture.

Figure 1 Target Architecture



With this development, MWT is provided across the different type of networks within a Service Provider’s network. The following are the advantages to the service provider:

- Support of MWI on end user device (i.e. terminals, phone etc.)
- Consolidation of the VM system in service provider's network
- Converged network support
- MWI to S1K/1KM and BCM

In above configuration, the Call Pilot is another type of traditional VM/UM system. The call pilot uses SMDI connectivity for VM connections.

For other topologies and how MWT service provided are described in See "Supported Configurations" on page 1803.

174.2.3 Supported Configurations

The connection and communication bases the supported configurations are separated in two categories: (1) Configurations of Voicemail or MsgSrv systems, and (2) Configurations of Lines or clients.

The configurations described here are specific to MWT service and VM communications for MWT service. These configurations assumes that the call related communications and signalling are provided prior to the MWT service and exists in the given configuration.

174.2.3.1 Configurations of Voicemail or MsgSrv Systems

The following configurations are separated by the protocol used for communication between CS2K and VM system:

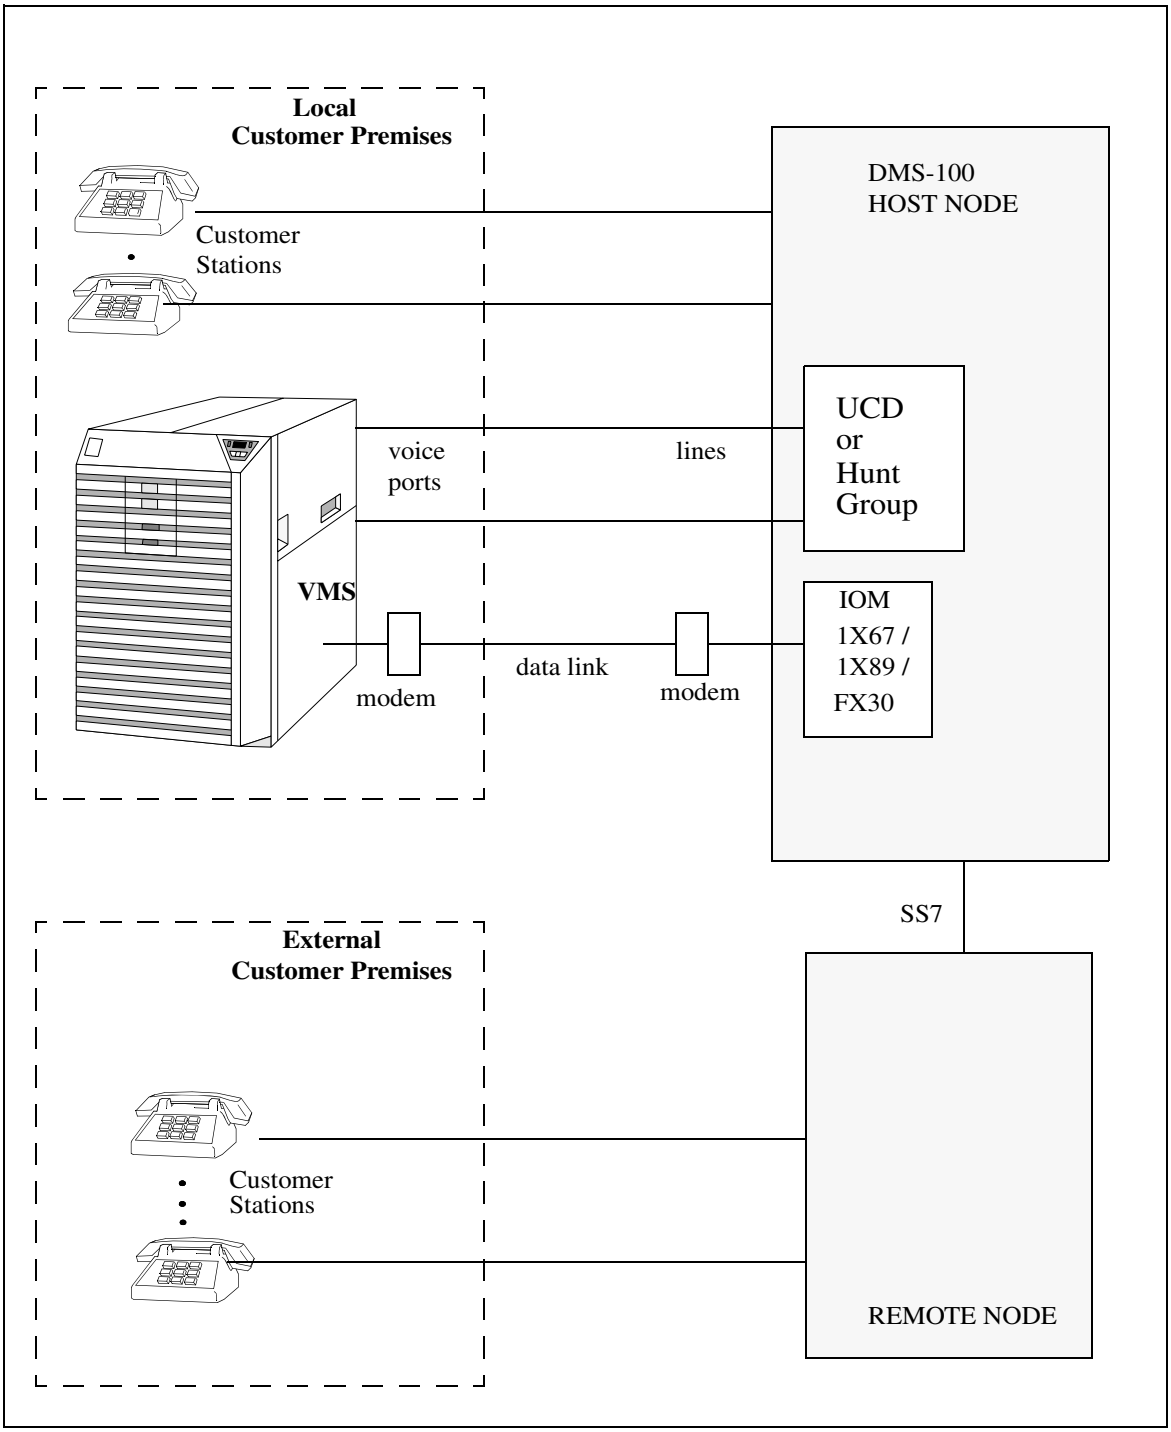
174.2.3.1.1 Traditional VM communication using UCD/HUNT group and SMDI link

This is an existing and supported configuration in CS2K/DMS. For details on this configuration, please look in the NTP 297-2051-104- SMDI Setup and Operation.

This configuration is applicable to both North American and INTL markets.

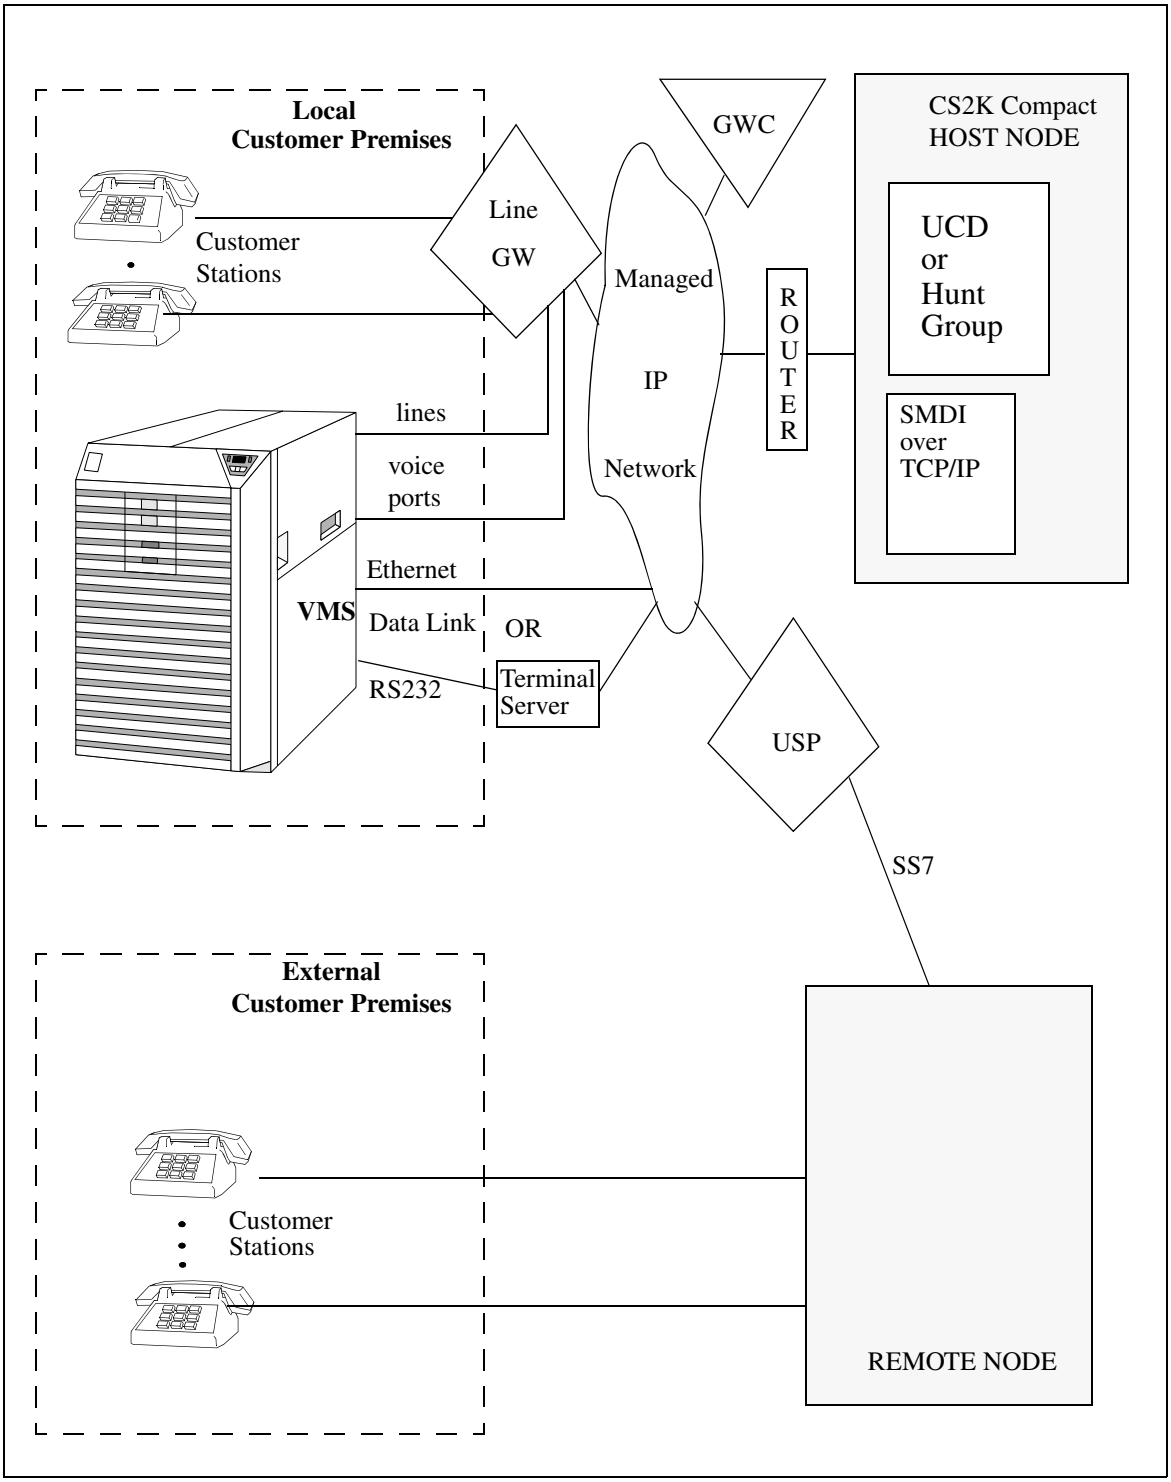
The following figure is a generic view of this configuration in DMS:

Figure 2 Simple VM Configuration in DMS



The data link in above Figure 2 is based on SMDI specifications described in the GR- 283- Core. The following figure provides a view of a simple VM configuration in the CS2K Compact:

Figure 3 Simple VM Configuration is CS2K Compact



In Figure 3 , the communication between the CS2K Compact and VM is SMDI based on GR- 283- Core. However, the transport medium is TCP/IP.

The details of this configuration can also be found in the NTP 297-2051-104 - SMDI Setup and Operation.

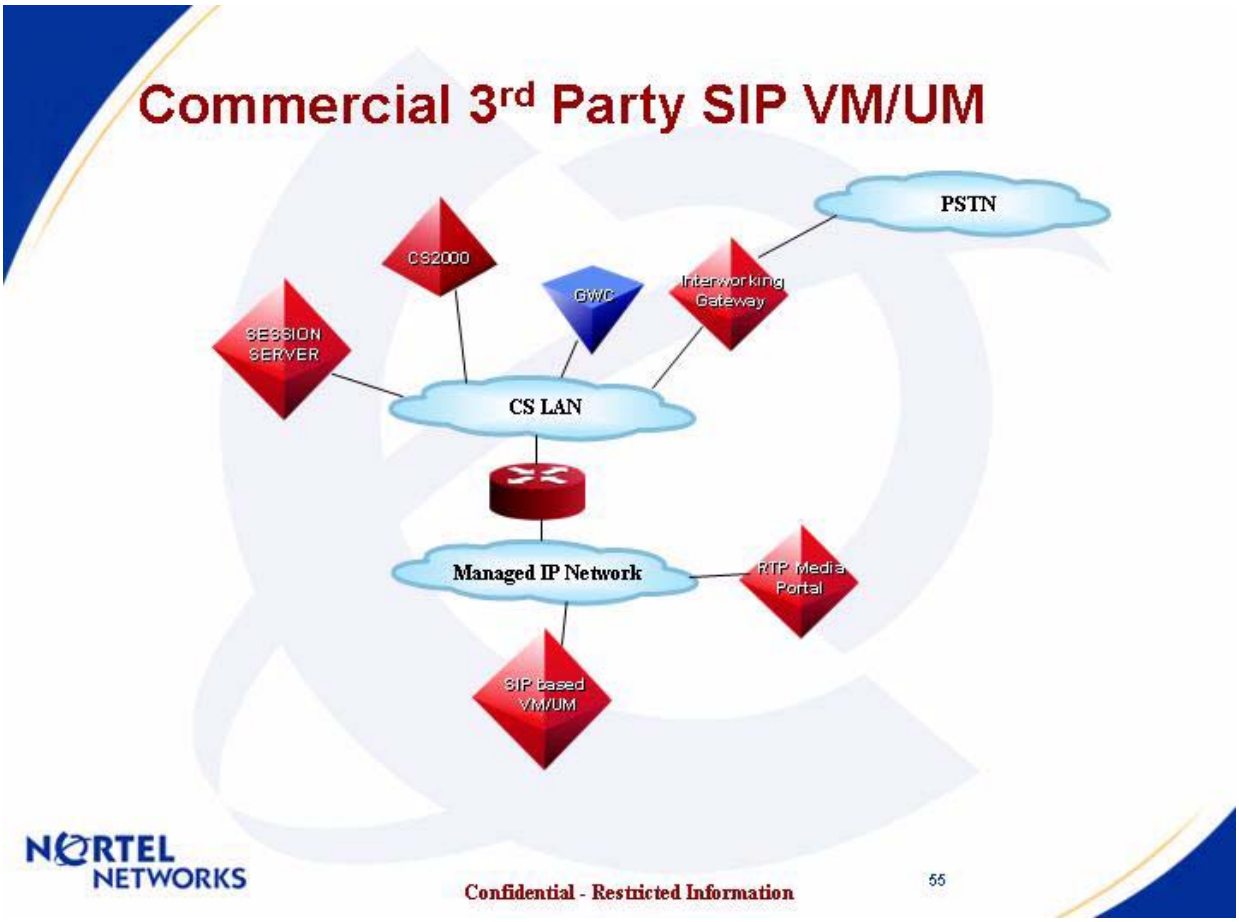
174.2.3.1.2 Network VM communication using the SS7 network

Figure 2 and Figure 3 also describe the configuration of the VM communication using the SS7 network between host node and remote node. For details, please see NTP 297-2051-104 - SMDI Setup and Operation; and NTP 297-8021-350v13 - North American Translation Guide Volume 13 of 25.

174.2.3.1.3 Commercial 3rd Party SIP UM/VM system communicating with CS2K

Figure 4 shows the configuration of the Commercial 3rd party SIP VM/UM communicating with CS2K. The commercial 3rd party SIP VM/UM can be provided by any commercial vendor. In this case, the SIP VM/UM system can reside on any location within the intranet of the customer. The SIP VM/UM system is logically connected to a Session Server. The communication between SIP VM/UM and Session Server is SIP messages defined in RFC 3261, RFC 3262, RFC 3263, RFC 3264, and RFC 3842. The RFC 3842 provides the MWI capability of SIP to the customer network.

Figure 4 Commercial 3rd Party SIP VM/UM system communicating with CS2K

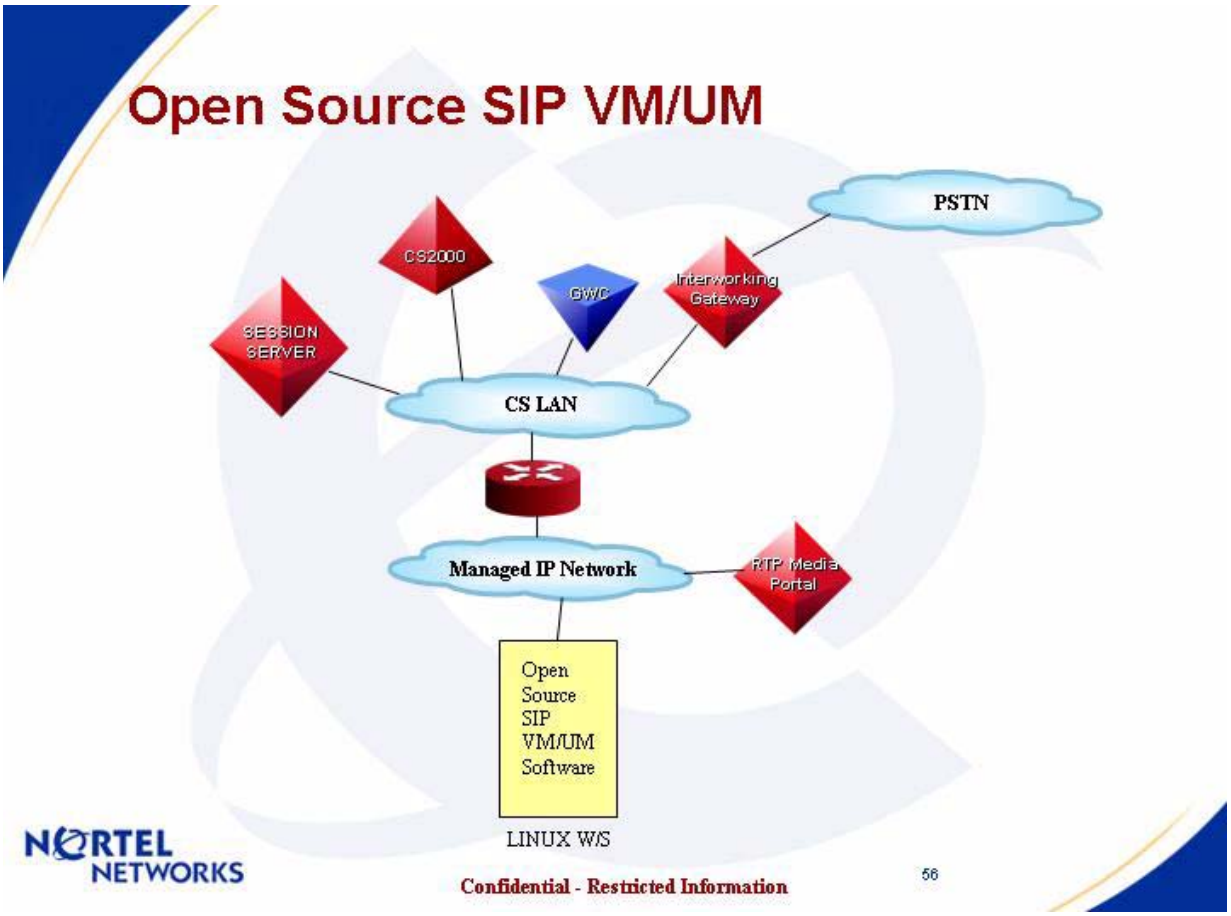


This configuration is applicable to both North American and INTL markets.

174.2.3.1.4 Open Source SIP VM/UM system with CS2K

Figure 5 shows the configuration of the Open Source SIP VM/UM communicating with CS2K. The Open Source SIP VM/UM is based on the open source software and independent from hardware or a specific 3rd party vendor. In this case the SIP VM/UM system can reside on any location within the intranet of the customer. The SIP VM/UM system is logically connected to a Session Server. The communication between SIP VM/UM and Session Server is SIP messages defined in RFC 3261, RFC 3262, RFC 3263, RFC 3264, and RFC 3842. The RFC 3842 provides the MWI capability of SIP to the customer network.

Figure 5 Open Source SIP VM/UM system communicating with CS2K

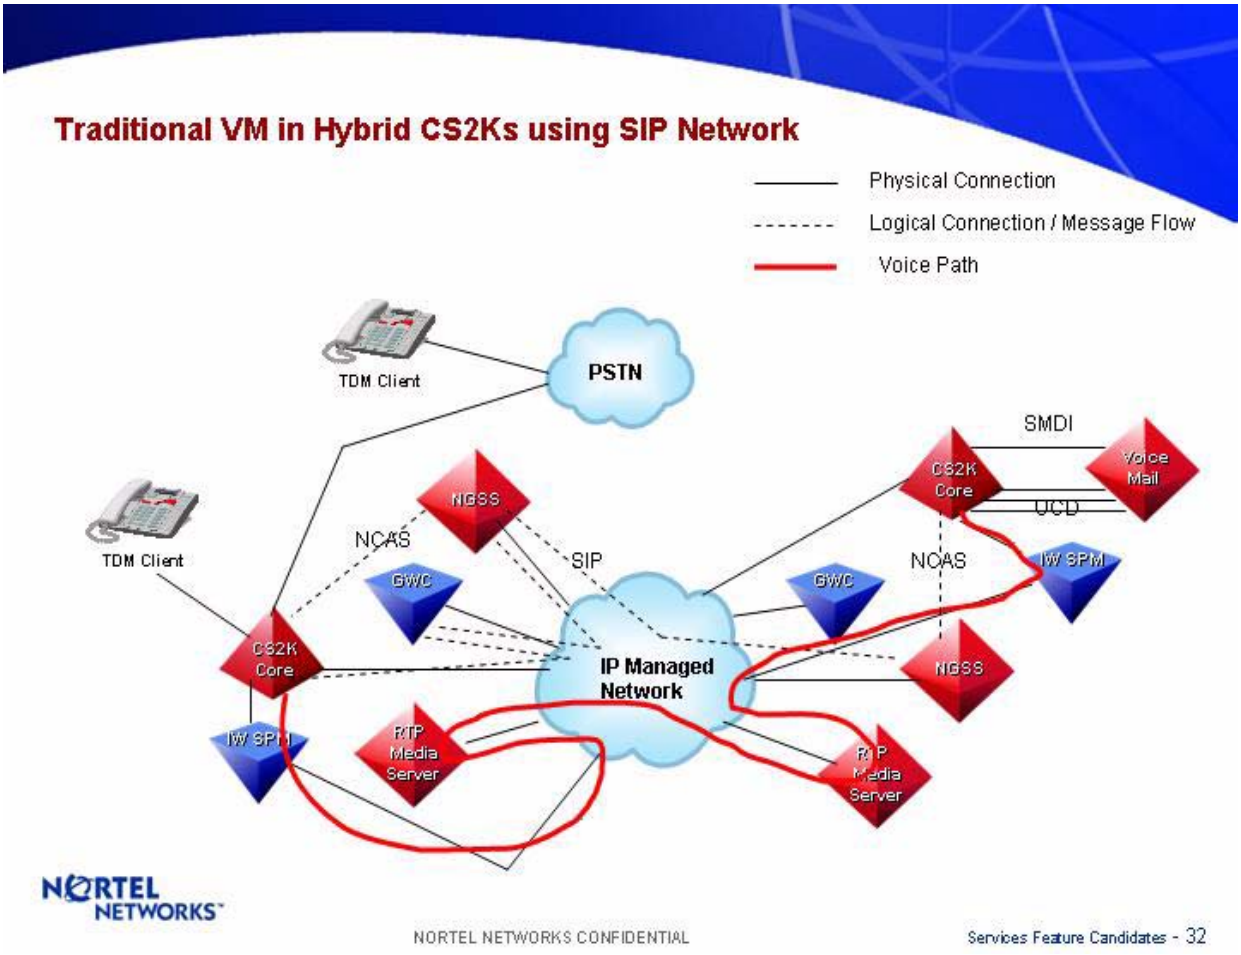


This configuration is applicable to both North American and INTL markets.

174.2.3.1.5 Traditional VM communication using SIP network

For this configuration, the VM is a traditional VM connected to one CS2K via SMDI and UCD/HUNT group. The line is on another CS2K. The RFC 3842 based SIP messages are used between two CS2K to pass MWI information for NMS.

Figure 6 Traditional VM communication using SIP network

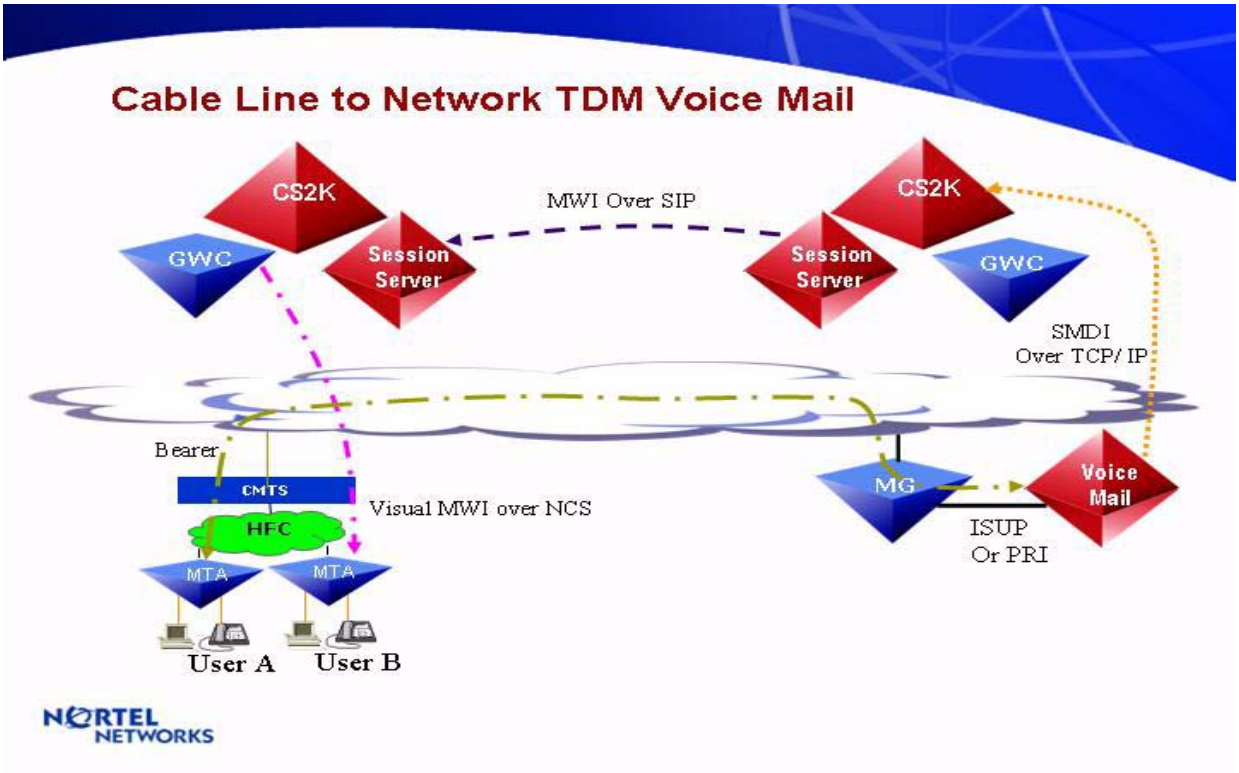


This configuration is applicable to both North American and INTL markets.

174.2.3.1.6 Network VM communication using SIP for Cable Service Providers

In cable service provider networks, the VM is connected to a CS2K compact as described in previous section 173.2.3.1.1 (Figure 3). As indicated in section 173.2.3.1.1, the communication between two CS2K Compact is based on the managed IP network using SIP signalling.

Figure 7 VM in Cable Network



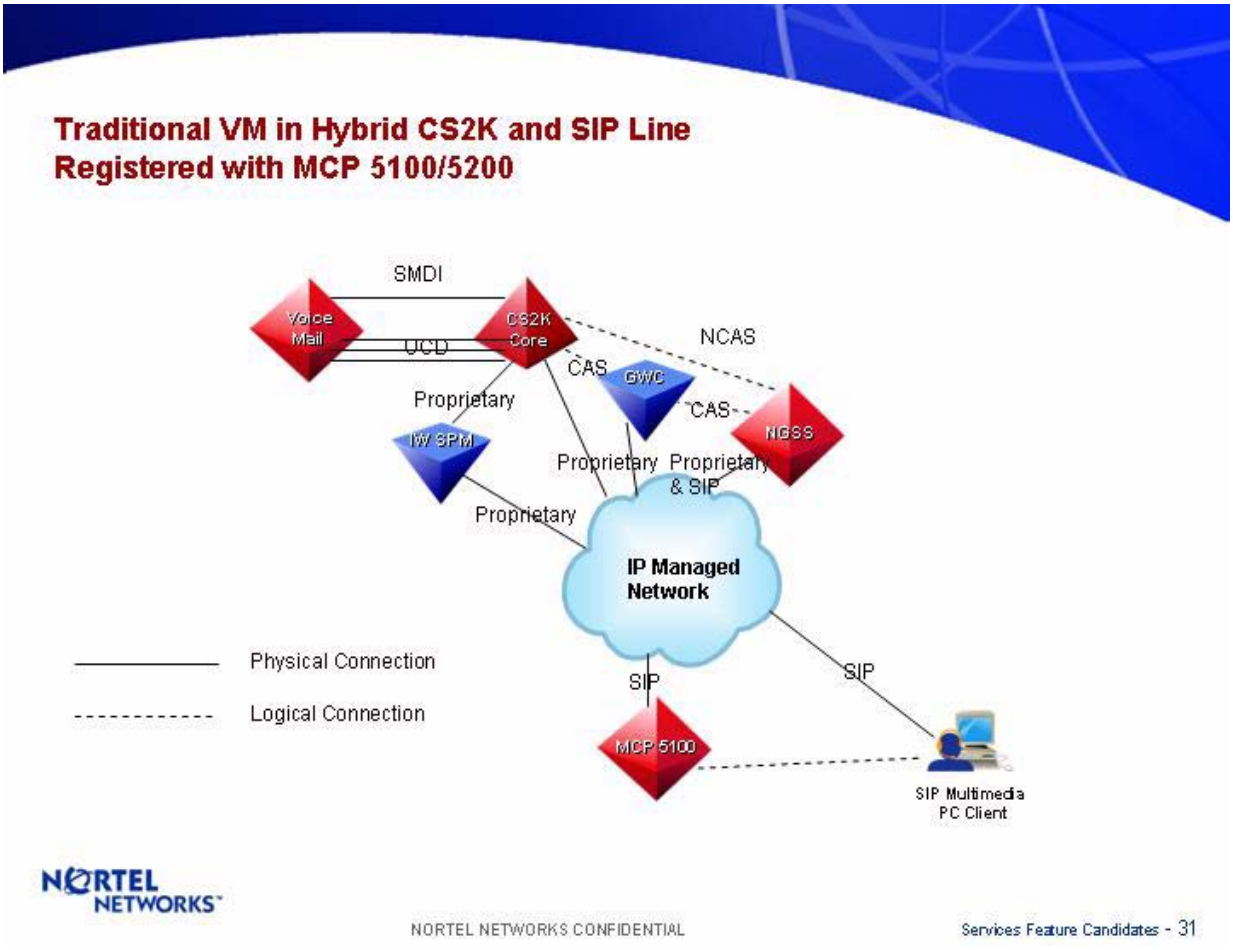
Note: The complete interoperability and compliance depends on the availability of the design lab. This configuration is quite similar to configuration describe by Figure 6 in section 173.2.3.1.5. The only major difference is the usage of MTA and conformance testing for cable lab specifications.

This configuration is applicable to both North American and INTL market.

174.2.3.1.7 VM support for MCP 5100/5200 Platform using SIP network

For this configuration, the VM is a traditional VM connected to one CS2K via SMDI and UCD/HUNT group. The SIP line is registered with the MCP 5100/ 5200 platform and the SIP line is served by the traditional VM. The CS2K is sending RFC 3842 defined SIP messages to MCP 5100/5200 platform to provide network based MWI service.

Figure 8 VM support for MCP 5100/5200 using SIP network



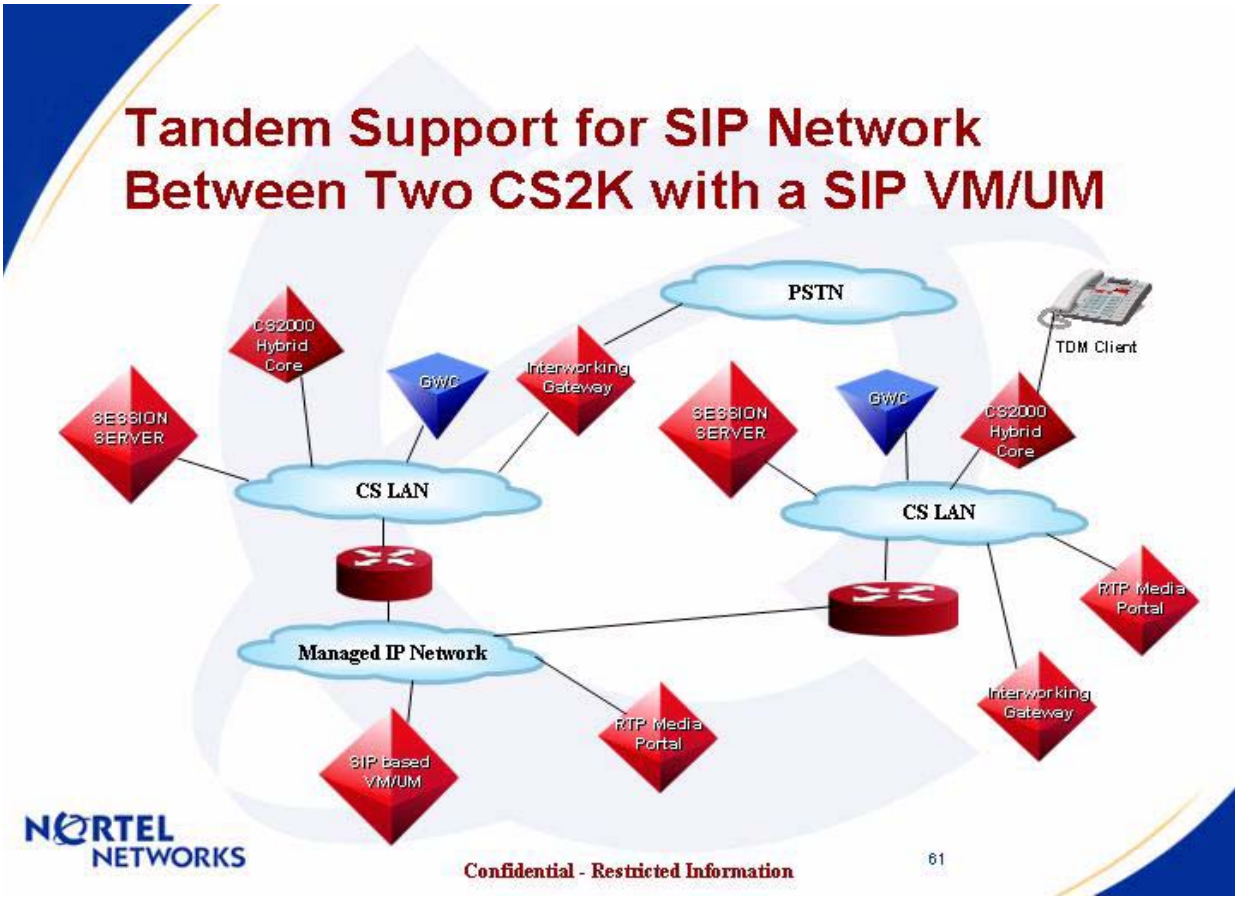
Note: In this configurations, the partial RFC 3842 supported. The CS2K send the NOTIFY messages to the remote MCP 5100/5200 only for the lines behind the MCP 5100/5200. This limitation attributes to the MCP 5100/5200 not forwarding the SUBSCRIBE message from the line to the CS2K.

This configuration is applicable to both North American and INTL market.

174.2.3.1.8 Tandem Support for Two CS2K via SIP Network and SIP VM/UM

In a hybrid network, the customer can have SIP network connections between a CS2K and remote CS2K using NGSS. With the support of the SIP VM/UM, which is network VM/UM to the one CS2K, the CS2K become a tandem switch for the NMS traffic between SIP VM/UM and lines connected to remote CS2K (See Figure 9).

Figure 9 tandem Support for SIP Network between two CS2K and SIP VM/UM

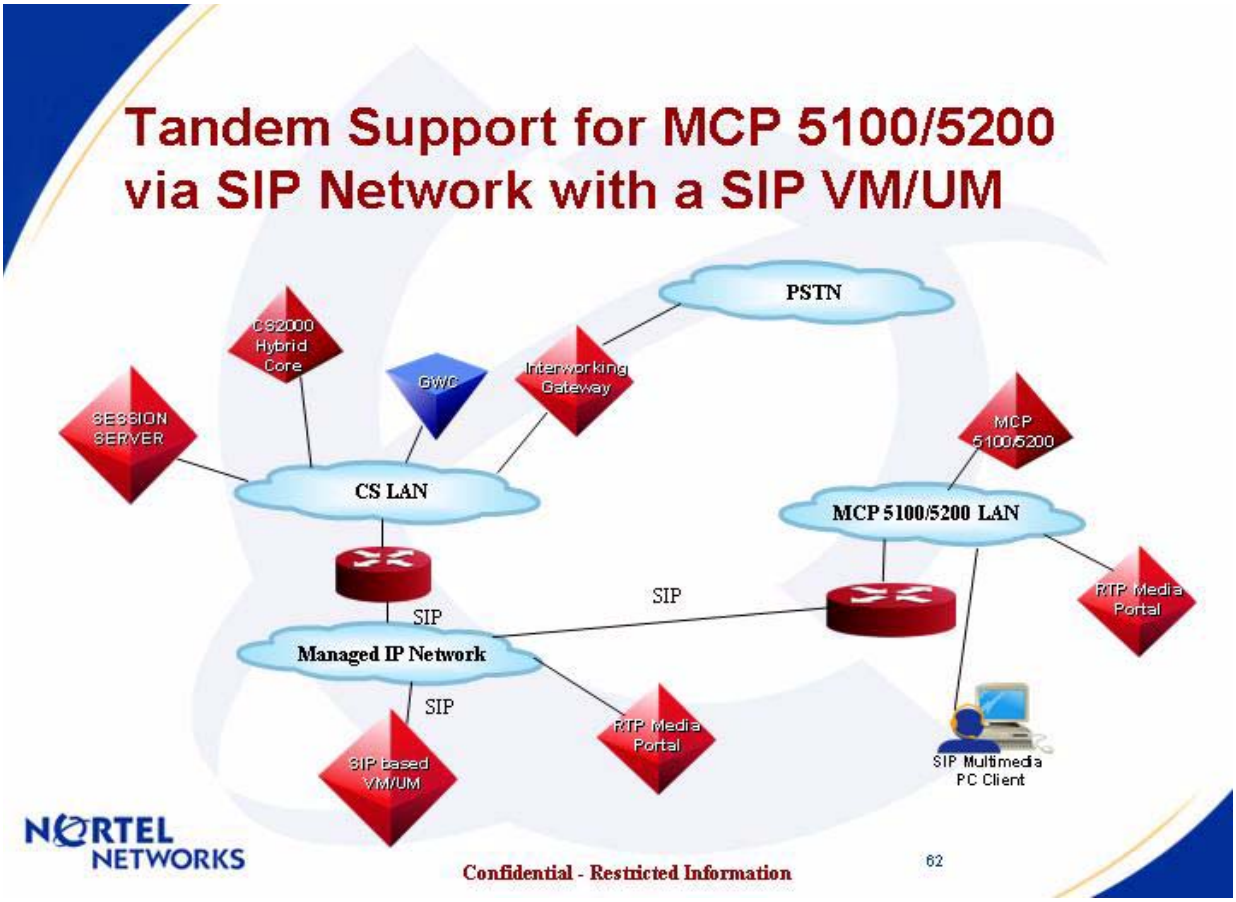


This configuration is applicable to both North American and INTL market.

174.2.3.1.9 Tandem Support for MCP 5100/5200 via SIP Network and SIP VM/UM

In a hybrid network, the customer can have SIP network connections between a CS2K and remote MCP 5100/5200 using NGSS. With the support of the SIP VM/UM, which is network VM/UM to the CS2K, the CS2K become a tandem switch for the NMS traffic between SIP VM/UM and lines connected to remote MCP 5100/5200 (See Figure 10).

Figure 10 tandem Support for MCP 5100/5200 via SIP Network and SIP VM/UM



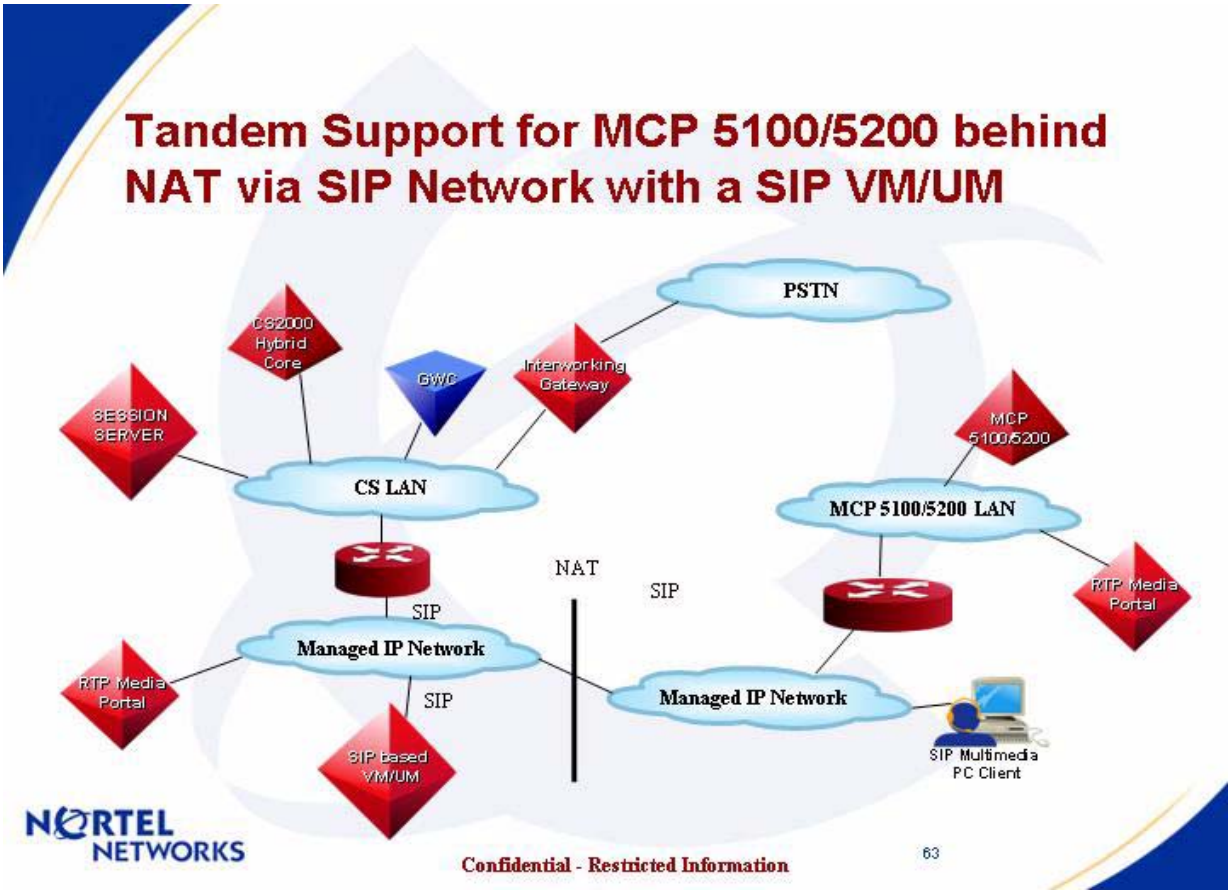
Note: In this configuration, the partial RFC 3842 supported. The CS2K send the NOTIFY messages to the remote MCP 5100/5200 only for the lines behind the MCP 5100/5200. This limitation attributes to the MCP 5100/5200 not forwarding the SUBSCRIBE message from the line to the CS2K.

This configuration is applicable to both North American and INTL market.

174.2.3.1.10 Tandem Support for a MCP 5100/5200 behind NAT and SIP VM/UM

In a hybrid network, the customer can have SIP network connections between a CS2K and remote MCP 5100/5200 behind a NAT using NGSS. With the support of the SIP VM/UM, which is network VM/UM to the CS2K, the CS2K become a tandem switch for the NMS traffic between SIP VM/UM and lines connected to remote MCP 5100/5200 behind a NAT (See Figure 11).

Figure 11 Tandem Support for MCP 5100/5200 behind NAT via SIP Network and SIP VM/UM



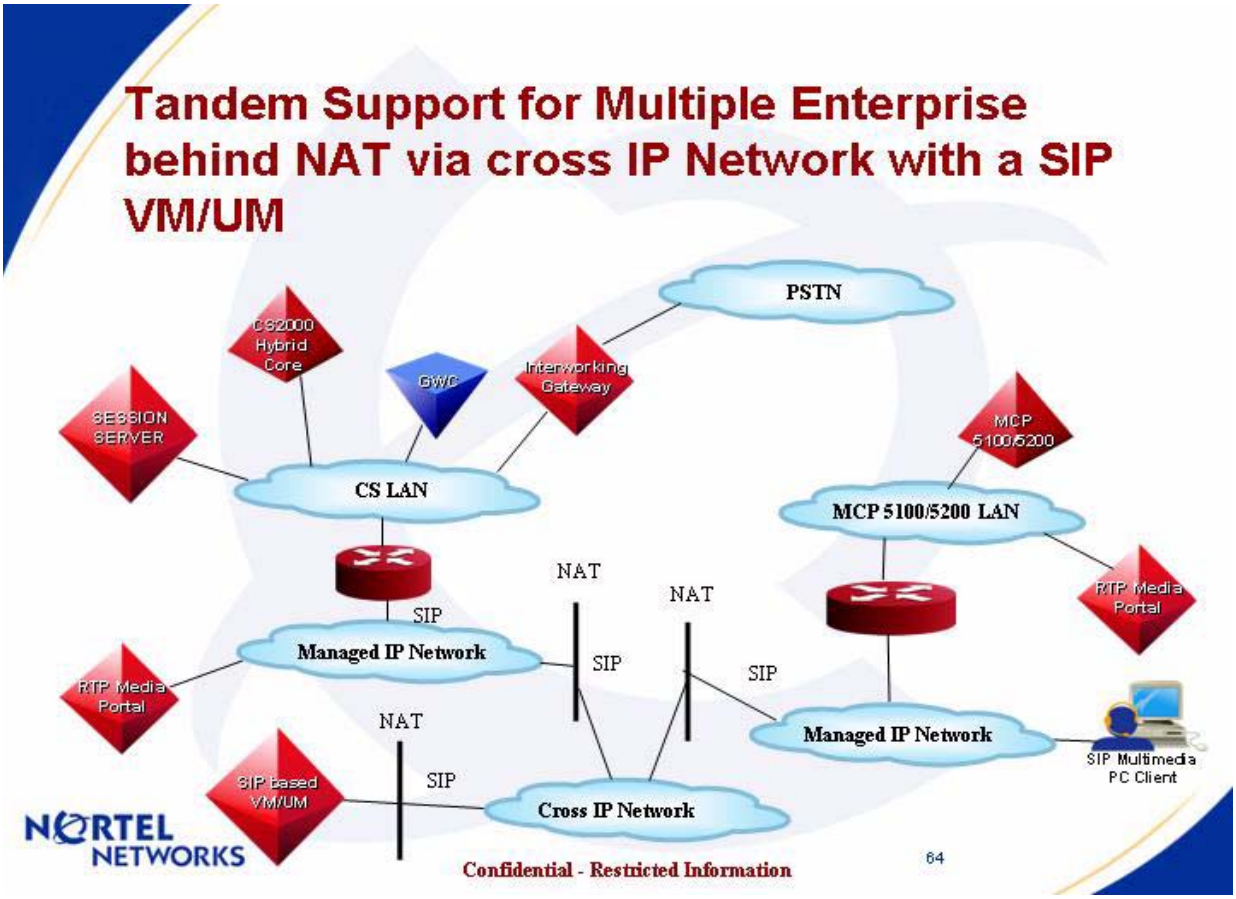
Note: In this configurations, the partial RFC 3842 supported. The CS2K send the NOTIFY messages to the remote MCP 5100/5200 only for the lines behind the MCP 5100/5200. This limitation attributes to the MCP 5100/5200 not forwarding the SUBSCRIBE message from the line to the CS2K.

This configuration is applicable to both North American and INTL market.

174.2.3.1.11 Tandem Support for Multiple Enterprise in cross IP Internet network and SIP VM/UM

In a hybrid network, the customer can have SIP network connections between one CS2K and remote CS2K behind a NAT using NGSS. With the support of the SIP VM/UM, which is network VM/UM to the CS2K behind a NAT, the CS2K become a tandem switch for the NMS traffic between SIP VM/UM behind NAT and lines connected to remote CS2K behind a NAT (cross IP Internet network) (See Figure 12).

Figure 12 Tandem Support for Multiple Enterprise in cross IP Internet network and SIP VM/UM

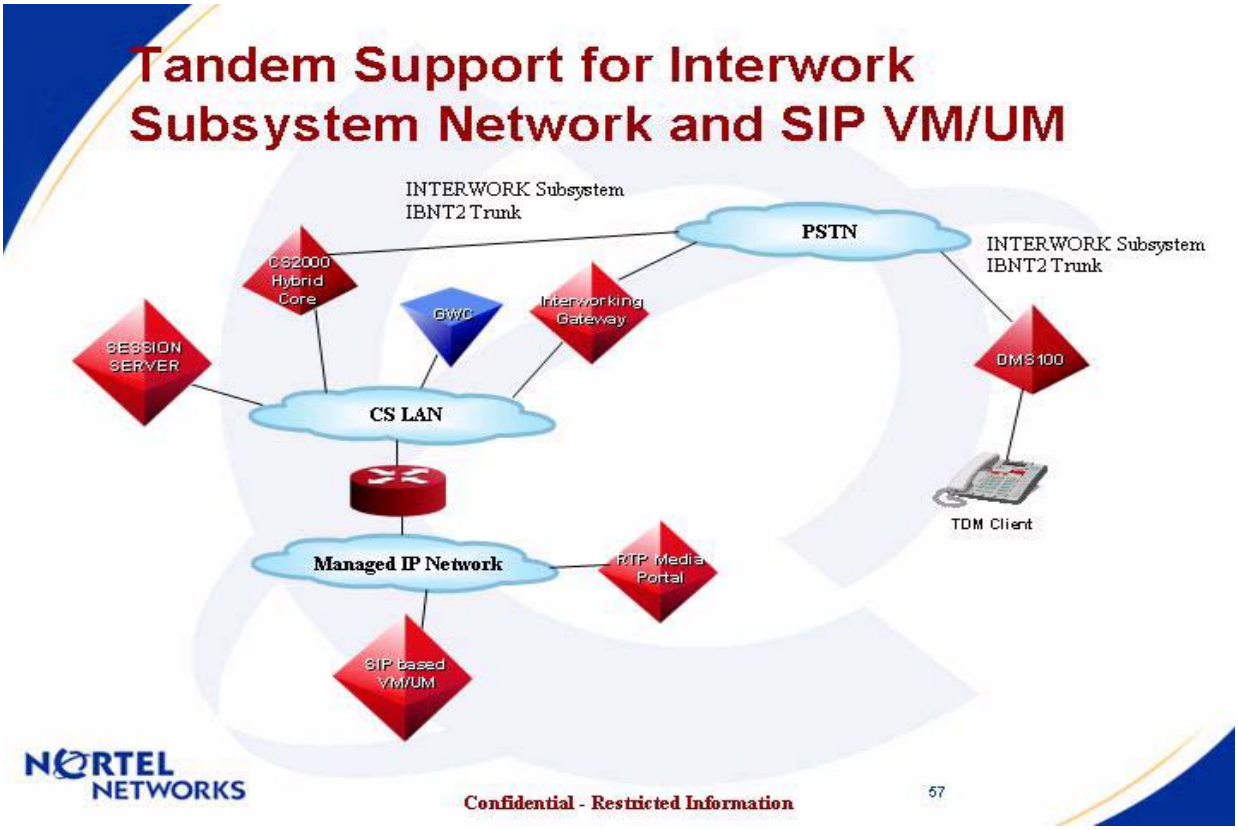


This configuration is applicable to both North American and INTL market.

174.2.3.1.12 tandem Support for INTERWORK Subsystem Network and SIP VM/UM

In a hybrid network, the customer can have private network connections between CS2K and DMS100/CS2K/CS2100 using INTERWORK subsystem based network. With the support of the SIP VM/UM, which is network VM/UM to the CS2K, the CS2K become a tandem switch for the NMS traffic between SIP VM/UM and lines connected to remote DMS100/CS2K/CS2100 (See Figure 13).

Figure 13 tandem Support for Interwork Subsystem Network and SIP VM/UM

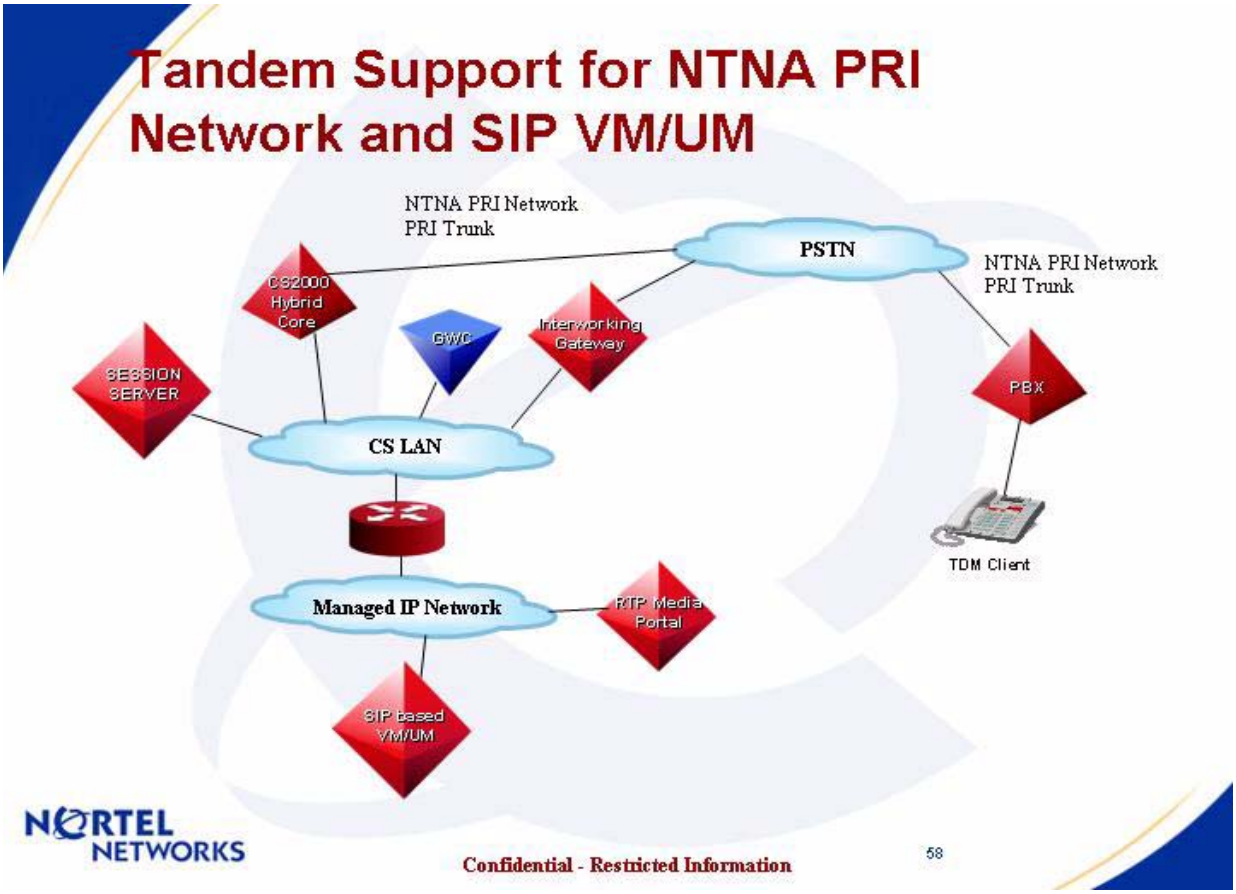


This configuration is only applicable to North American market.

174.2.3.1.13 tandem Support for NTNA PRI Network and SIP VM/UM

In a hybrid network, the customer can have private network connections between CS2K and MSL100/CS2100/CS1K/BCM/PBX using NTNA PRI based network. With the support of the SIP VM/UM, which is a network VM/UM connected to the CS2K, the CS2K become a tandem switch for the NMS traffic between SIP VM/UM and lines connected to remote PBX (See Figure 14).

Figure 14 tandem Support for NTNA PRI Network and SIP VM/UM

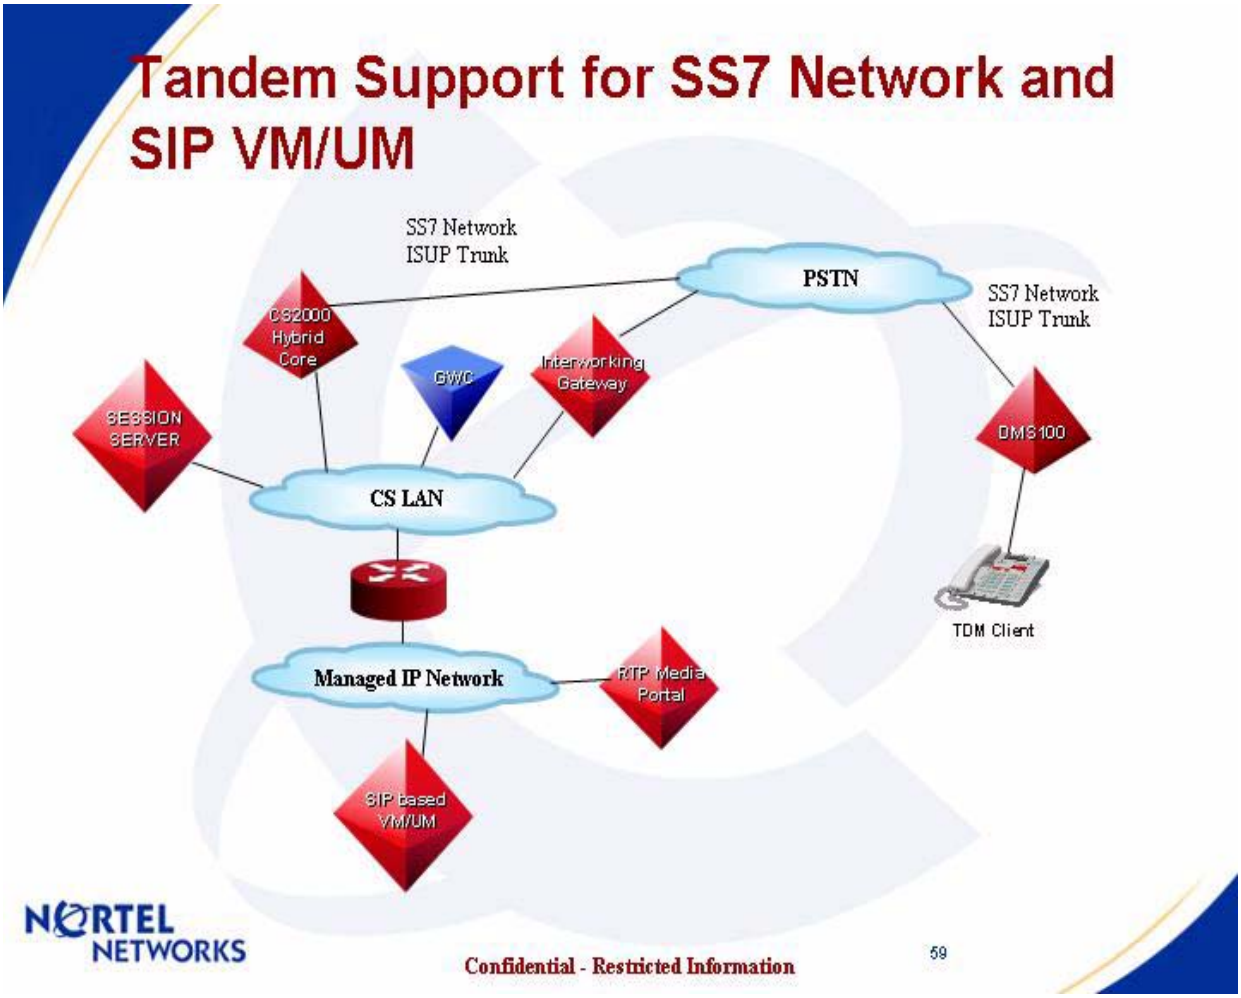


This configuration is only applicable to North American market.

174.2.3.1.14 tandem Support for SS7 Network and SIP VM/UM

In a hybrid network, the customer can have public network connections between CS2K and a remote class 5 switch interconnected via SS7 based networking. With the support of the SIP VM/UM, which is network VM/UM to the CS2K, the CS2K become a tandem switch for the NMS traffic between SIP VM/UM and lines connected to remote class 5 switch (See Figure 15).

Figure 15 tandem Support for SS7 Network and SIP VM/UM

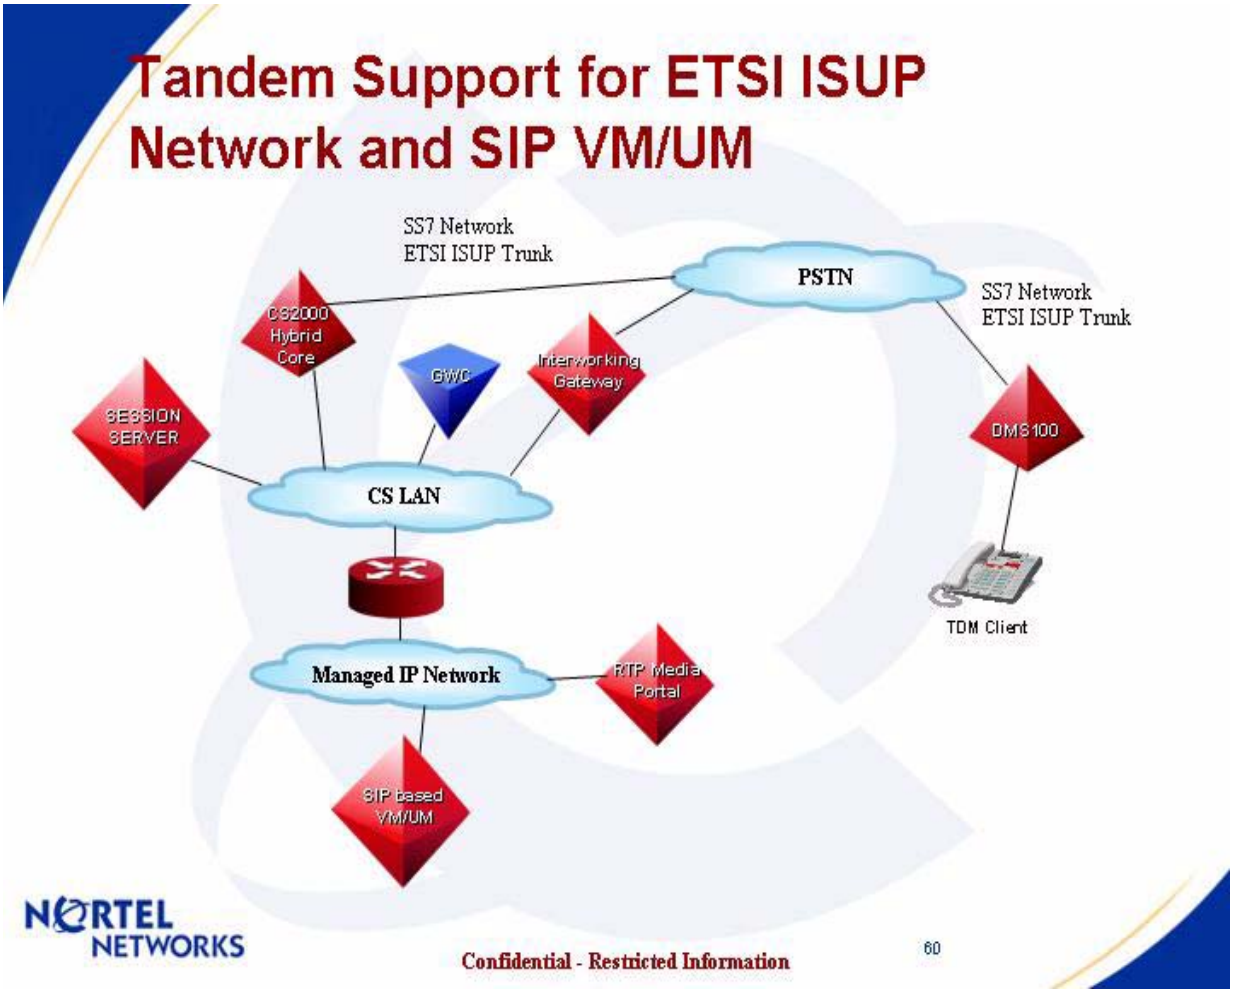


This configuration is only applicable to North American market.

174.2.3.1.15 tandem Support for ETSI ISUP Network and SIP VM/UM

In a hybrid network, the customer can have public network connections between CS2K and remote switch using ETSI ISUP based network. With the support of the SIP VM/UM, which is network VM/UM to the CS2K, the CS2K become a tandem switch for the NMS traffic between SIP VM/UM and lines connected to remote switch (See Figure 16).

Figure 16 tandem Support for ETSI ISUP Network and SIP VM/UM

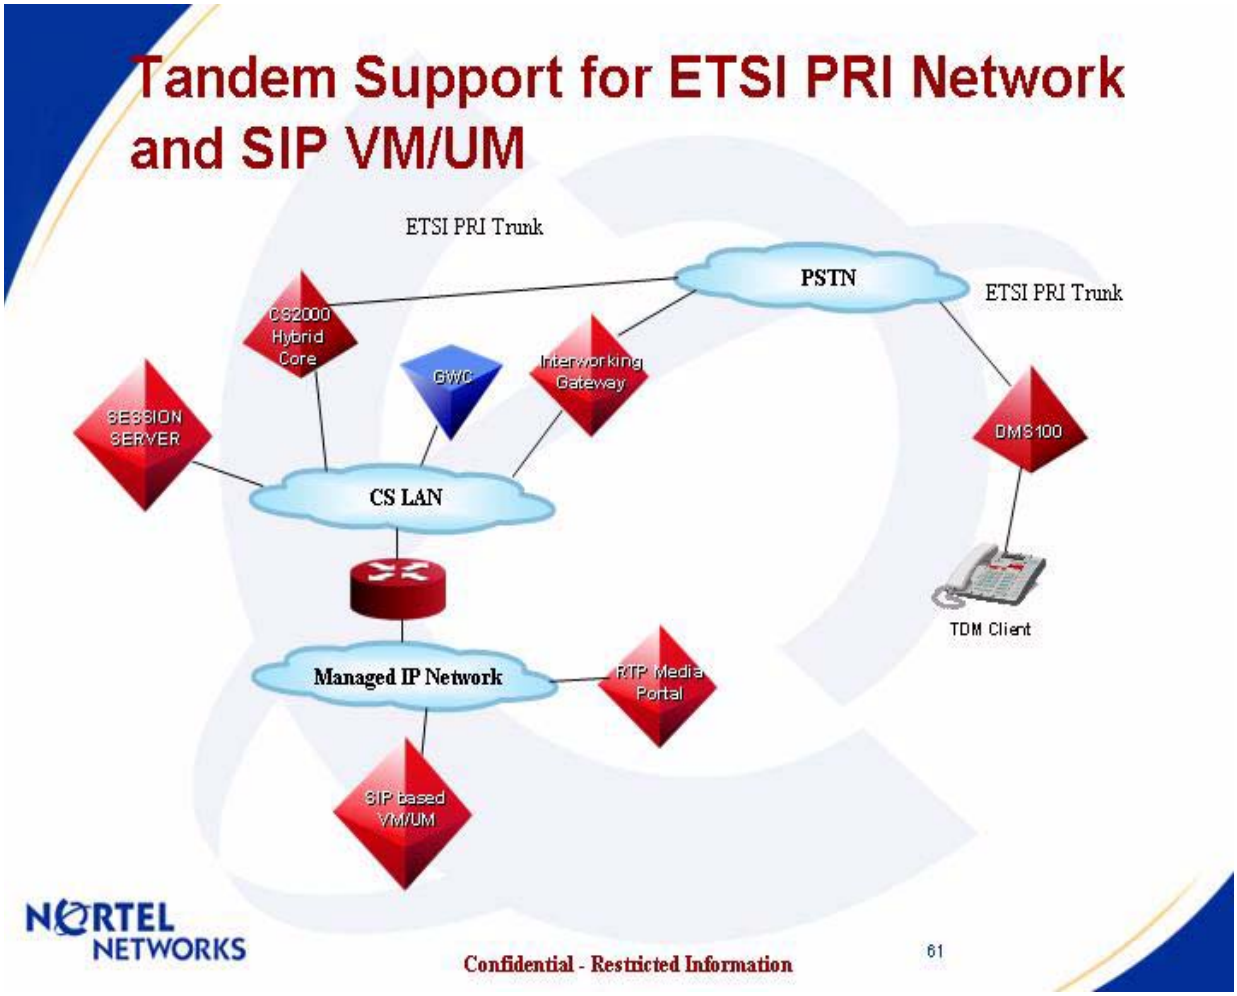


This configuration is only applicable to INTL market.

174.2.3.1.16 tandem Support for ETSI PRI Network and SIP VM/UM

In a hybrid network, the customer can have public network connections between CS2K and remote switch using ETSI PRI based network. With the support of the SIP VM/UM, which is network VM/UM to the CS2K, the CS2K become a tandem switch for the NMS traffic between SIP VM/UM and lines connected to remote switch (See Figure 17).

Figure 17 tandem Support for ETSI PRI Network and SIP VM/UM

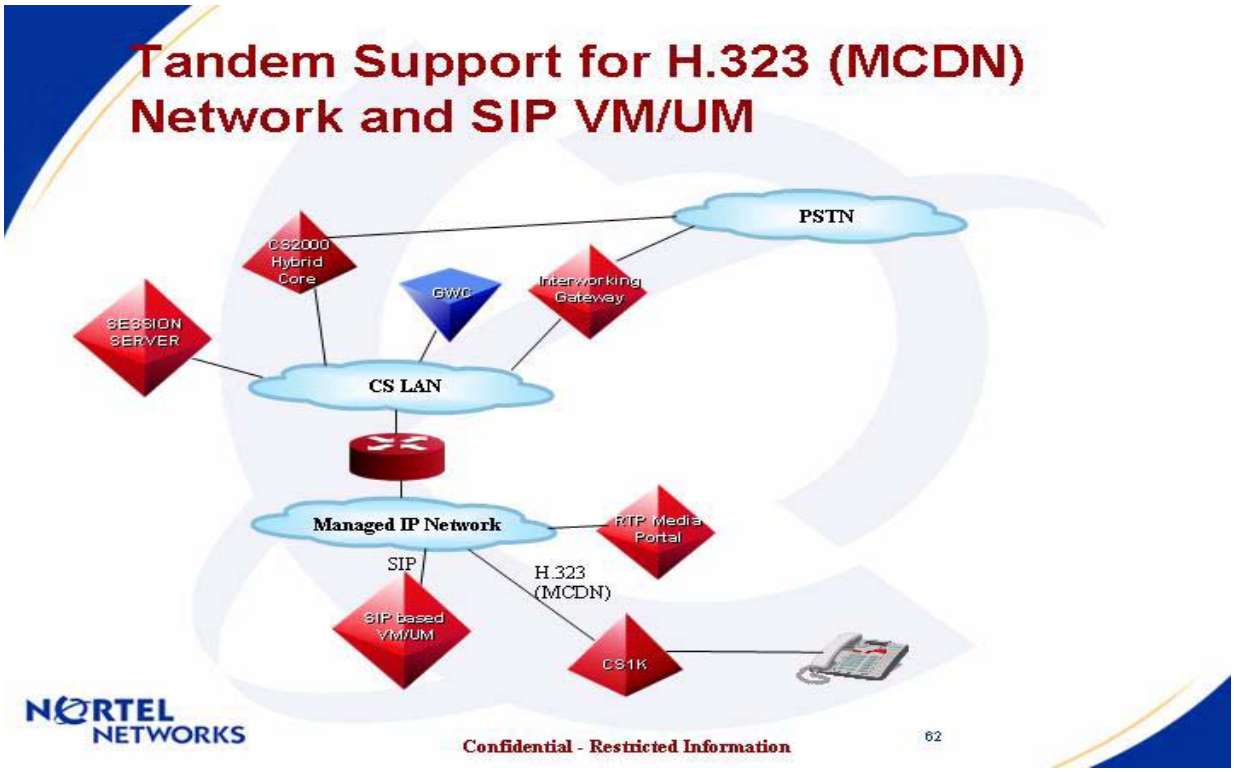


This configuration is only applicable to INTL market.

174.2.3.1.17 tandem Support for H.323 (MCDN) Network and SIP VM/UM

In a hybrid network, the customer can have private network connections between the CS2K and a CS1K/M1/BCM interconnecting via H.323 (MCDN) based networking. With the support of the SIP VM/UM, which is a network VM/UM connected to the CS2K, the CS2K become a tandem switch for the NMS traffic between SIP VM/UM and lines connected to a remote CS1K/M1/BCM via H.323 (MCDN) (See Figure 18).

Figure 18 tandem Support for H.323 (MCDN) Network and SIP VM/UM



This support is only applicable to North American market.

For INTL market, appropriate QSIG to MCDN support is required. Once the QSIG to MCDN support is fully developed, this configuration should be verified with testing under interoperability testing requirements prior to define as supported configuration.

174.2.3.2 Configurations of Lines or clients

The details of these configurations (data fill and setup) are described in the CN section of the feature. The following configurations are separated by the protocol used for communication between CS2K and line/client:

174.2.3.2.1 Lines connected via LCM/XPM

The phone line which is connected via LCM/XPM using PSTN network to the host node are supported today. In case of the SIP VM, these type of lines are considered as non-SIP lines and appropriate additional configuration is required in the Session Server.

174.2.3.2.2 CS2K hosted SIP Lines

In SN09, the CS2K hosted SIP lines support has been developed. These lines are designed such that they use implicit SUBSCRIBE to the CS2K. Therefore, these lines behave the same as lines connected via LCM/XPM for MWI perspective only.

In the future, if CS2K hosted SIP lines will be able to perform explicit SUBSCRIBE, additional work will need to be done to pass these SUBSCRIBE messages to the SIP VM/UM system. The additional work for the explicit SUBSCRIBE is not provided by this feature.

174.2.3.2.3 Lines connected via Gateways

The phone lines which are connected via a H.248-based access devices (e.g. MG9000, Calix, etc.) and MGCP-based IAD behave the same as traditional line connected to the CS2K via LCM/XPM. There is no change anticipated in this configuration. The CICM lines which are connected via an IP gateway behave the same. There is no impact to their setup and operation. In case of the SIP VM, these type of lines are considered as non-SIP lines and appropriate additional configuration is required in the Session Server.

174.2.3.2.4 Lines connected to a remote node

The lines connected to a remote node (e.g. PBX, another switch, MCP etc.) are considered as network lines. For these lines network message waiting (NMS) service is provided. The CS2K does not store any data associated with these remote lines.

174.2.3.2.5 Media Terminal Adaptor

The Media Terminal Adaptor (MTA) is used in the cable network to provide media (voice) services. From the CS2K perspective, the MTA is same as a line in the CS2K supported via gateways and gateway controller. The MWT service is provided to the MTA same way it is provided to lines connected via gateways.

> ***Note:*** The complete interoperability and compliance depends on the availability of a cable-focussed configuration in the design lab. The availability of MTA devices will allow us to perform this cable network requirement. However, it will not be overtly tested, if no lab or MTA available. Since Nortel assume that the MTA cable line is another line in the CS2K and behave same way as any other line with MWT service assignment, than this design will support the MTA.

174.2.3.2.6 Single Physical Line with Multiple VM Access

Current design of MWT service in the CS2K does not restrict a single physical line from having access to multiple VM systems. With this design, there is no change to such support. The support is provided using the data fill of the Call Forwarding on the single physical line. The following example explain how this works:

Line B is a KSET line with two different DN keys and has MWT service assigned to it.

The first key's DN is datafilled with call forwarding busy (CFB) and call forwarding do not answer (CFD) and call forwarding number to DN of VM 1.

The second key's DN is datafilled with call forwarding busy (CFB) and call forwarding do not answer (CFD) and call forwarding number to DN of VM 2.

Now let say first call to DN Key 1 encounters busy condition and forwards to the VM 1. The VM 1 records the message and send a message to CS2K to turn MWT light on for the DN Key 1. The MWT light is now lit for the first message from VM 1.

During the first call, a second call come to the DN key 2 and encounters no answer condition and forwards to the VM 2. The VM 2 records the message and send a message to CS2K to turn MWT light on for the DN Key 2. The request is now enqueued for the VM 2.

When user of Line B retrieves the message from the VM 1, the MWT light will remain lit for the second message.

Please note that the MWT request from each VM will be treated as two separate requests in the MWT service.

174.2.3.2.7 Multiple Lines with Single VM Access

The multiple lines in a given CS2K are supported by a single VM. In this case the VM has each line provisioned as individual user. This is already supported functionality. This functionality is not changed by this feature.

Some VM systems are capable to assign multiple DNs against a single mailbox (e.g. an end user with multiple phones). Therefore, when a message is recorded in the mailbox and VM is capable to provide a MWI message for each DN assigned against the mailbox. This configuration is also supported because for each DN CS2K receive a separate MWI message.

174.2.3.2.8 Multiple Lines with Multiple VM Access

This configuration is also supported in current design. The following example describes how this is supported.

Line A is a RES line with MWT service and datafilled with CFB and CFD forwarding to DN of VM 1. The VM 1 is on a remote node.

Line B is an IBN line with MWT service and datafilled with CFB and CFD forwarding to DN of VM 2. The VM 2 is on host node.

Line C is a SIP Line with MWT service and datafilled with CFB and CFD forwarding to DN of VM 3. The VM 3 is a SIP VM. The Line C is not registered.

Originator A calls Line A and Line A is busy. The call forwards to VM 1 on remote node. The VM 1 records the message from Originator A. The remote node sends a MWT message to the host node. The request of network MWT is now queued to Line A from VM 1.

Originator B calls Line B and Line B is busy. The call forwards to VM 2. The VM 2 records the message from Originator B. The VM 2 sends a MWT message to the host node. The request of local MWT is now queued to Line B from VM 2.

Originator C calls SIP Line C and SIP Line C is not registered. The call forwards to VM 3. The VM 3 records the message from Originator C. The VM 3 sends a MWT message to the host node. The request of network MWT is now queued to Line C from VM 3. The MWT notification is not sent to the Line C because it is not register. When the user of Line C sends a subscribe message for MWT after registration, the CS2K sends the current status of the MWT service in the CS2K to the line C.

174.2.4 Sample Message Details for SIP

The message details are based on the SIP Line configuration described above.

Step 1: The SIP Line SUBSCRIBE for MWT service.

Figure 19 SIP Line Register with CS2K - SUBSCRIBE Message

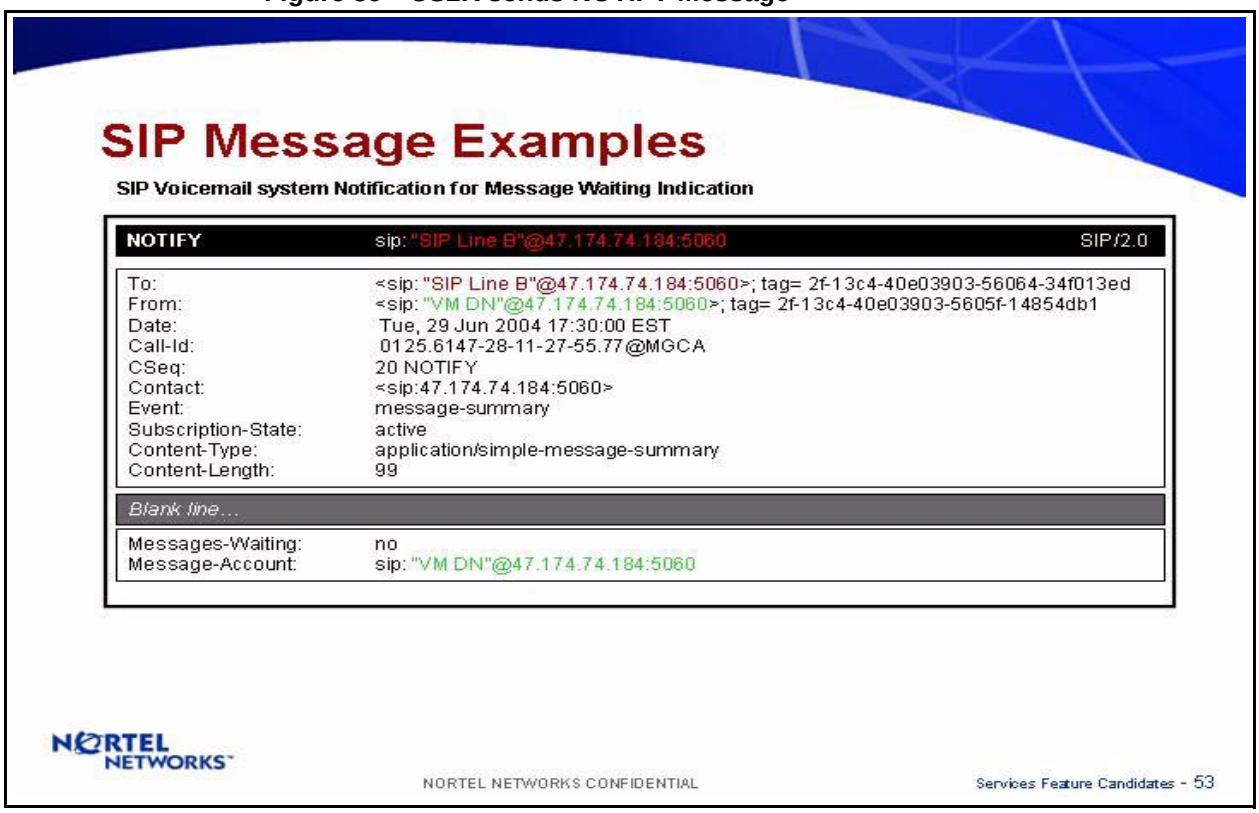

Figure 40 SIP Line - 200 OK Response

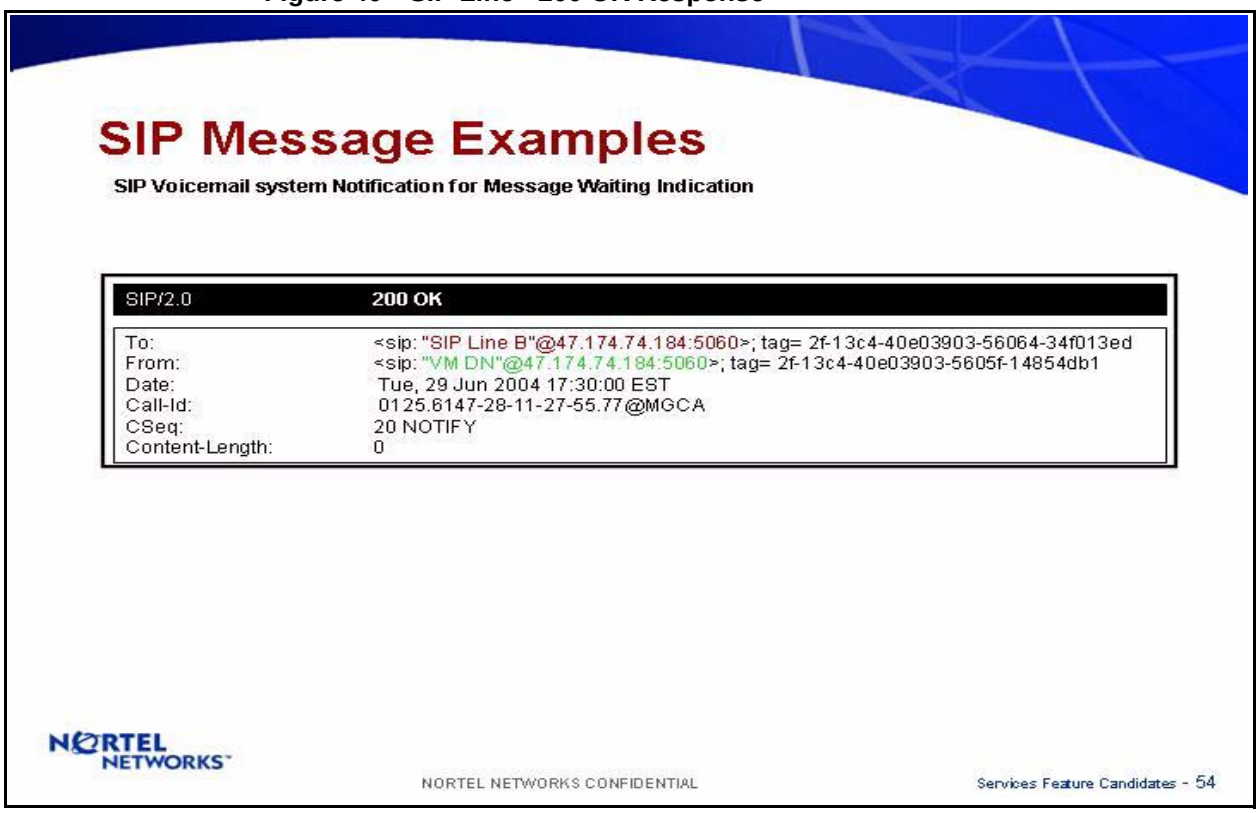

174.3 Hardware Requirements or Dependencies

This feature uses the existing hardware of CS2K Core and Session Server. The Session Server provides a standard-based SIP interface. Therefore, all commercially available 3rd party hardware and Voicemail systems are directly supported.

The commercial 3rd party VM/UM box will be used from a remote lab in Ottawa for testing purpose.

The Open Source VM/UM system is run on a LINUX platform. Therefore, it does not need any separate hardware. Lab based LINUX box will be used to create a Open Source VM/UM.

There is no new hardware dependency or requirement for this feature.

174.4 Software Requirements or Dependencies

The development depends on following 3rd party software currently exists in respective platform:

- SIP Stack from RADVISION in Session Server

The usage of this service depends on SOC MDC00078. Also, the H.323 network connectivity depends on two SOC CS2B0004 and CS2C0004.

174.5 Limitations and restrictions

The following limitations and restrictions apply to the feature:

- The NMS service sends MWI ON/OFF for the remote lines. It is assumed that the remote node or SIP Client will provide appropriate indication to the end user for the MWI. The MWI indication can not be enforced from the CS2K.
- The Call Request Retrieval (CRR) functionality can not be invoked as second leg of Three way call (TWC). This limitation is for fraud prevention.
- The Call Request Retrieval (CRR) functionality can not be invoked as second or subsequent leg of a conference (CNF) call. This limitation is for fraud prevention.
- The MWT functionality is only provided to multiple appearance directory number (MADN) primary member.
- The MWT functionality is only provided to HUNT group primary member.
- All existing MWT and NMS service limitations apply to this feature except as overtly noted in feature documentation.
- The optional data defined in the RFC 3842 are not supported by current feature. The support for the optional data can be developed in future releases.
- In cases where a Line is connected to a CS2K, the VM is connected to a remote node (e.g. MCS) via SIP network, and a G729 compatible codec is used for interconnect voice paths, the remote node or device must support RFC 2833 for out of band DTMF signalling.
- When the line is connected to a remote node (e.g. MCS) via SIP network, VM is connected to a CS2K, and a G729 compatible codec is used for interconnect voice paths than remote node or device must support RFC 2833 for out of band DTMF signalling.
- The design is generic and based on RFC 3842 standards. Testing limitations does not allow for testing every possible interoperability scenarios using different hardware and vendor equipment in a network. In order to make different hardware and vendor equipment supported, proper interoperability testing must be done in Nortel approved interoperability lab. After the complete testing, appropriate support will be provided. The configurations defined in this document are tested generically.
- The design supports maximum of 10 digit DN in form of North American and Universal DN.

- The only IP devices supported in Table IPAPPL for SOC MDC00078 (NMS over SCTP) are EIU and HIOP.
- The SETPRIME and MULTIHOMING options in Table IPAPPL are allowed to add in Table IPAPPL. However, their usage is ignored.
- The MODE option in Table IPAPPL is always SERVER. If not added by the craft person, it will be added automatically.
- The option NEWTOR in table MSGRTE is not supported.
- For international markets, only ETSI ISUP and ETSI PRI interworking is supported by this feature. The DPNSS based interworking will be supported under companion features A00012847 and A00009409.
- The digit manipulation allowed in Table MSGRTE manipulates the source or destination digits only. For SCTP selector, the source or destination digits does not have any meaning. Therefore, digit manipulation via Table MSGRTE is not supported.
- For CS2k- hosted SIP lines, the implicit subscribe has been assumed. No SUBSCRIBE message are forwarded from CS2K hosted SIP line to the SIP VM/UM. The Session Server design assumes that for these SIP lines, only the implicit SUBSCRIBE supported.
- The NOTIFY message to the MCP 5100/5200 is only supported due to limitation on MCP5100/5200 to forward the SUBSCRIBE message from the SIP device to CS2K.
- The MCP 5100/5200 based MAS as VM/UM is not supported. The MCP 5100/5200 is not capable to send/receive the NOTIFY/SUBSCRIBE messages from/to MAS for the SIP Network. It only supports the SIP device register with the MCP 5100/5200.

174.6 Interactions

The service is controlled by the CS2K Core. The Session Server and GWC only provides access to various networks and protocol conversions. Therefore, CS2K Core interactions are applicable to this service.

The existing MWT and NMS service software is used for the development of this feature. Therefore, all existing interactions apply to this expansion of service. There is no new interaction anticipated at the time of this writing.

174.7 Glossary

Term	Description
CFB	Call Forward Busy
CFD/CFDA	Call Forward Do Not Answer

Term	Description
CFU	Call Forwarding Unconditional / Call Forwarding Universal
CICM	Centrex IP Line
CRR	Call Request Retrieval
CS2K	Communication Server 2000
DMS	Digital Multiplex Switch
DN	Directory Number
EO	End Office
ETSI	European Telecommunications Standards Institute
GCP	Generic Call Protocol
GW	Gateway
GWC	Gateway Controller

VoIP	Voice over Internet Protocol

175: Functional Description (FN) A00013508

175.1 Feature name and Feature ID

A00013508: System Manager Auto-Failover Support

175.2 Description

This feature gives an overall design level changes required in the IEMS Software to integrate the System Manager Auto-Failover Support functionality in to IEMS. System Manager is already being managed by the IEMS, but due to a requirement, System Manager is going to include the Auto-Failover functionality on it, which will lead to certain changes in the Data Exchange between the IEMS and the System Manager. This document captures all such changes and the necessary IEMS side modifications required to perform the System Manager Management as expected.

The major changes with respect to the IEMS data exposure due to the Auto-Failover support will be

- SNMP Traps (Faults from the System Manager) will have the Logical IP Address as their source address instead of the physical unit IP address.
- SNMP Requests should be coming to the Logical IP Address of the System Manager to retrieve any fault or performance data.
- No Stranded data should be passed on to the OSS from the System Manager via IEMS

175.3 Customer Visible Changes in IEMS due to this Activity:

1. While Provisioning the System Manager in to IEMS, the user will have to specify the Logical IP of the System Manager in the Hostname/IP Address text field of the initial Add Node screen.

2. With this feature introduction, IEMS will be listening for Traps from the Logical IP only.

3. The Resync Alarms Menu will be enabled in the Parent System Manager Object and the same will be disabled in the Physical Unit Objects, which is the opposite of what exists now.

4. The OSS will see a new Performance major alarm and log EMJS351 if there are problems with the login details specified for collecting the PM Files from the System Manager and the same will be cleared if the problem is resolved. The problem description is one of two types:

- Unable to login to the Device: <Device Name> with the specified Username and password to collect PM data (If login fails)
- Insufficient privileges for the specified Username and password to rename the PM files on the Device: <Device Name> (If file renaming fails)

This alarm will be generated only once and will be cleared once the log situation is rectified. One important thing to note is that, if the above log situation arises, IEMS will not collect any data from the System Manager to avoid processing the same files again and again.

5. Customers should avoid configuring a direct FTP PUSH OM Collection directly from the SM/FPM to Performance data collection; otherwise, it will lead to loss of data on both the feeds (data being sent from IEMS and the data directly being pushed by the SM/FPM).

176: Functional Description (FN) A00013935

176.1 Feature name and Feature ID

A00013935: PKMTA Extraction for DPT Call

176.2 Description

This feature, A00013935: PKMTA Extraction for DPT Calls, extends the Packet Media Anchor (PktMA) removal software developed for SIP Lines to allow it to be used by Dynamic Packet Trunks (DPTs).

In SN09, a DPT call never releases the PktMA resources once one has been added to the bearer path. This means that for DPTs agents the network had to be engineered to have PktMA resources for the duration of the DPT call, whether the call was using the resource or not.With the extension of the ability to remove the PktMA to DPTs, a CS2000 network requires significantly fewer AMS 2010 gateways for the PktMA function. This results in a decreased cost for the CS2000 SIP-T solution.

The removal of the PktMA for SIP and SIP-T DPT is triggered by monitoring the functions the PktMA is currently performing and by the state of the call. Once the PktMA is no longer needed in the call it is removed from the bearer path.

Calls that will now be able to remove the PktMA are:

- Calls where the PktMA supplies audible ring back after answer such as with bind call transfer and call park
- Calls where the PktMA is used to collect addition routing information such as DISA and DMS-250 Calling Card Services (MCCS)

Services that use continuous scanning, for example reorigination, like what is provided by the STR card on an XPM will continue to require the PktMA resource for the duration of the call.

176.3 Hardware Requirements or Dependencies

This feature adds no new hardware dependencies to the system. The feature does have all the dependencies of the features it builds on. Please reference the feature documentation for A00007120 PktMA dependencies

This feature does change the number of AMS gateways that will be needed to support the PktMA function in a network. Please refer to the relevant engineering documentation to determine the number of AMS a network requires.

176.4 Software Requirements or Dependencies

This feature adds no new software dependencies to the system. The feature does have all the dependencies of the features it builds on. Please reference the feature documentation for A00007120 PMA dependencies.

176.5 Limitations and restrictions

The PktMA removal functionality provided by this feature is disabled for BICC DPTs. In addition the feature does has all the limitations and restrictions of the features it builds on. Please reference the feature documentation for A00007120 PMA limitations and restrictions.

176.6 Interactions

The CS2000 system puts all PktMA resources in to the same PktMA pools. Since a PktMA can only be used by one SIP Line or DPT at a time the PktMA resource pool must be sized to support both functions in the system.

176.7 Glossary

Term	Description
DPT	Dynamic Packet Trunk
PktMA	Packet Media Anchor

177: Functional Description (FN) A00014049

177.1 Feature name and Feature ID

A00014049: GWC and SESM support for AAL2-G726-32 codec in IP Network

177.2 Description

This Corrective CAF activity enables the Gateway Controller and SESM to support the new codec AAL2-G726-32 in the SN09.1 Release. This activity also modifies SESM provisioning rules for IP network profiles.

The AAL2-G726-32 codec can be provisioned in the SESM GUI for IP network profiles only. To facilitate rapid deployment, the AAL2-G726-32 codec is replacing the ILBC codec in codec lists on SESM and GWC. ILBC codec is removed from codec lists from SN09FF onward.

From SN09.1 release onward, an IP network codec profile list will consist of 2 or 3 valid IP codecs, one of which MUST be PCMU or PCMA codec.

177.3 Hardware Requirements or Dependencies

VSP3 and VSP3-o cards support AAL2-G726-32 codec and the prior versions of VSP cards are not compatible with this SN09.1 functionality.

177.4 Software Requirements or Dependencies

For the integrated functionality in CS2K, the PVG image which supports AAL2-G726-32 codec is required.

177.5 Limitations and restrictions

This activity removes the existing iLBC codec and introducesAAL2-G726-32 codec in Gateway Controller and SESM. Hence in SN09.1 release, iLBC codec will not be available for network provisioning.

Note: The AAL2-G726-32 codec support will be patched back to SN08 and SN09 Gateway Controller releases. Till the Gateway Controller patches are available, the Gateway Controller will interpret AAL2-G726-32 codec provisioned in SESM as iLBC.

177.6 Interactions

None.

SAM21	Services Application Module (21 slots)
SESM	Succession Element and Sub-Element Manager

178: CR Description Q01333369

178.1 Applicable Solution(s)

This applies to a CS2K running SN09FF having GWCs with one or more TGCP gateways provisioned.

178.2 Description

Toggling of T.38 from “OFF” to “ON / LOOSE”, OR from “ON/LOOSE” to “OFF” in the “Network Codec Profile” using CMT, will trigger a GW capabilities audit on all ENABLED TGCP gateways.

The gateways’ response to the GW capabilities audit will be used to update a GWC’s knowledge of gateways’ capabilities (including the TGCP packages supported on the gateways). The GWC will not include T.38 codec-options nor monitor for T.38 events in further TGCP messages if the gateways’ response doesn’t include the FXR package.

178.3 Limitations and restrictions

Craftspersons need to take specific care while deactivating T.38 in the “Network Codec Profile”. They must ensure that T.38 has been deactivated on all provisioned TGCP gateways before deactivating it on CS2K. An outage could be caused if this order of deactivating T.38 is not followed.

Note that the outage caused by the deactivation procedure is due to limitations set by T.38 specifications; that is:

- the dynamic nature in which the GW can alter its capabilities (i.e., in-service upgrades, toggling of T.38 support within the gateway EM)
- it is necessary for the GWC to discover the capabilities of the GW.
- if the GW receives a request for T.38 and it is not enabled on the GW, that request must be NACKed.

Fault Management List (FMs)

Introduction

This chapter describes impacts to fault management, such as logs and alarms, for the features planned for this release. Only those features with fault-management impacts are listed.

Featid	Title
A00007544	NCAS Link and SIP NMS Support based on RFC 3842
A00007547	SIP Lines Core Call Processing Support
A00007703	SDM/CBM Log Capacity & Robustness
A00007814.V2	REX testing for MG9000 (Media Gateway 9000) from Element Manager
A00008740	SN09 Clock Sync Robustness
A00009012.AA10	TOPS OSSAIN Service Enhancements
A00009013.AA09	TOPS announcements via UAS/AMS
A00009227	NPM Robustness
A00009235.AA09	TLS for SIP
A00009280.V3	MG9K Line Circuit Enhancements
A00009282	Emergency Stand Alone (ESA) Multiple Level Precedence and Preemption (MLPP) for MG9KEM
A00009315	Alarm Logging Failure
A00009353.AA10	GWC Unit Availability/ Health Monitoring

A00009470.AA09	SuperNode Data Manager (SDM) to support Security Assertion Markup Language (SAML) NSSwitch client
A00009515.AA14	Out-of-Band Interop with MCS
A00009532	Support host to host tunnels for all northbound OSS connections
A00009610	IEMS Calix Integration
A00009611	IEMS Keymile Integration
A00009614	Tamper-proof Key Storage and Event Generation
A00009777	IEMS Mediant 2000 Integration
A00009822	General Security Log When the User Logs Out
A00009893	Session Server Call Processing Overload
A00011827.AB14	GWC Autonomous SWACT
A00012183	Public Key Manager
A00012199	MG9K EM CPR Robustness
A00012326.AA03	SIP Lines: Authentication and Authorization
A00012403.AA08	Data Protection for SIP Lines
A00012526.AA12	TDM Call Recording Feature
A00012622	Platform HW Alarm Reporting
A00012735.AA13	Session Server Fault Handling Enhancements
A00012905	ERS8600 Alarm Mapping Correction in IEMS

1: Fault Management (FM): A00007544

1.1 Feature Name

NCAS Link and SIP NMS Support based on RFC 3842

1.2 Fault management strategy

The fault management information is provided using LOGs. The LOGUTIL CI provide the access to the LOGs generated by MWT and NMS software. The LOG are generated based on LOG framework. This feature uses the existing framework to add new LOGs in MWT and NMS software.

1.3 Fault management tools and utilities

1.3.1 Faults, Alarms and Logs

The LOGUTIL CI command is used as tools in the CS2K Core software. All existing tools and utilities are applicable in case of CS2K Core software.

The LOG generated in the GWC are passed to the CS2K Core via maintenance logs. Therefore, they are also available as part of the CS2K Core tools and utilities.
The Session Server (NGSS) LOGs are independent and uses the new mechanism to pass the LOG information to the remote system. The existing LOG tools and utilities are used in the NGSS.

1.4 Logs (For CS2K only)

The following Logs are aded in DMS/C22K Core as part of this activity:

- NMSS115: It is generated if an error occurs while sending NMS TCAP messages to SCTP
- NMSS116: It is generated if an erro occurs while receiving NMS TCAP messages from SCTP
- NMSS117: It is generated if an error occurs while sending NMS REJ messages to SCTP

- NMSS118: It is generated if an eror occurs while receiving NMS REJ messages from SCTP.

1.5 Log Title/Log ID: NMSS115

1.5.1 Formats

<Switch ID> NMSS115 <DATE> <TIME> INFO
SCTPNMS_ERR_SNT_REPORT

Error occured while sending NMS messages over SCTP.

Example:

3: Fault Management (FM): A00007703

3.1 Feature Name

SDM/CBM Log Capacity & Robustness

3.2 Fault management strategy

The fault management strategy for A00007703 (Log Capacity Enhancements) shall be consistant with the existing fault management in the LOGDEV system. No new logs or alarms will be introduced. Where necessary, SWERs may be used to alert users to error conditions that cannot be addressed via software or which can be addressed via software but which should also be communicated to support staff for debugging and troubleshooting purposes.

3.3 Fault management tools and utilities

Not applicable.

3.4 Faults, Alarms and Logs

Not applicable -- no new alarms or logs are introduced as part of A00007703.

3.5 Logs

Not applicable -- no logs will be introduced or changed by this feature.

3.6 Alarms

Not applicable -- no alarms will be introduced or changed by this feature.

3.7 Related documentation

None.

4: Fault Management (FM): A00007814

4.1 Feature Name

REX testing for MG9000 (Media Gateway 9000) from Element Manager

4.2 Fault management strategy

There are no faults generated by this feature.

4.3 Fault management tools and utilities

This feature generates the customer logs.

4.4 Logs

4.4.1 Log Title/Log ID: REX 600

4.4.1.1 Formats

REX Start/Completed log:

MSH10_I06BR REX600 JUN5 14:12:56 2164 INFO MG9K Card REX LOG NOTIFICATION
NE Number: 2 NE Name: HS9K
Card.frame0.shelf3.slot15.ITX REX completed on:
Time: Thu Jun 05 14:12:56 EDT 2003

4.4.1.2 Explanation

Description: Log report REX600 indicates the start or completion of REX on a card/card-pair. The cards under consideration are ITP, ITX and DCC.

4.4.1.3 Field Descriptions

This log report has no selected fields.

4.4.1.4 Action

None

4.4.1.5 Associated Operational Measurements or Performance Measurements

None

4.4.1.6 Additional information

None

4.4.2 Log Title/Log ID: REX 601

4.4.2.1 Formats

REX Success/Failure log:

MSH10_I06BR REX601 JUN5 14:12:56 2164 INFO MG9K Card REX LOG NOTIFICATION
NE Number: 2 NE Name: HS9K
Card.frame0.shelf3.slot15.ITX REX successful on:
Time: Thu Jun 05 14:12:56 EDT 2003

4.4.2.2 Explanation

Description: Log report REX601 indicates the success or failure of REX on a card/card-pair. The cards under consideration are ITP, ITX and DCC.

4.4.2.3 Field Descriptions

This log report has no selected fields.

4.4.2.4 Action

None

4.4.2.5 Associated Operational Measurements or Performance Measurements

None

4.4.2.6 Additional information

REX601 is generated for the failure conditions also. When the diagnostics of the card fails, REX is failed for the card under consideration.

4.4.3 Log Title/Log ID: REX 602

4.4.3.1 Formats

REX Skipped log:
MSH10_I06BR REX602 JUN5 14:12:56 2164 INFO MG9K Card REX LOG NOTIFICATION
NE Number: 2 NE Name: HS9K
Card.frame0.shelf3.slot15.ITX REX skipped on:
Time: Thu Jun 05 14:12:56 EDT 2003

4.4.3.2 Explanation

Description: Log report REX602 indicates that the REX for the card/card-pair under consideration has been skipped. The card types considered are ITP, ITX and DCC.

4.4.3.3 Field Descriptions

This log report has no selected fields.

4.4.3.4 Action

None

4.4.3.5 Associated Operational Measurements or Performance Measurements

None

4.4.3.6 Additional information

Various reasons for which REX is skipped on a card/card-pair are:

1. Unable to SWACT the card.

2. In the case of a card-pair if the REX on inactive card fails, REX for the card-pair is skipped.

3. If the duration for REX specified by the user exceeds, REX for the card/card-pair is skipped.

4.5 Alarms

NA

5: Fault Management (FM): A00008740

5.1 Feature Name

SN09 Clock Sync Robustness

5.2 Fault management strategy

Six new alarms are defined for the MG9000 ABI circuit pack by this feature. These alarms will be reported from the ABI to the DCC and subsequently to the MG9000 Element Manager is the normal way.

5.3 Fault management tools and utilities

5.3.1 Fault, Alarms, and Logs

5.4 Logs

A new MG9K ABI footprint log will be created by this feature. The purpose of the log is to capture the pertinent clock sync data that occurs during an unusual clock sync event. This data is only useful in determining if clock event were associated with XPM DS512 link closure that may have lead to an outage. This data would not be viewed by the customer for analysis. The only users of this data would be Nortel design team and possibly field support personnel.

A new MG9K ABI aer buffer is defined for capturing additional data not covered by the footprint log.

5.4.1 Formats

An example of the new footprint log is listed below:

```
CLKR643  ABI clock registers   DEC-17  14:41:39.850
 INDXCLK  DACV   ABS    REL    512    Slew   Msg    Linear Phase  Target ITP512
          ERROR  PHASE  PHASE  TX/RX  rate   links  mode   diff   phase  Rxphase
    4     0      d72    acc    1      6f4    11     3      3      1ffe   acc    6f3
    5     0      d75    acb    1fff   6f4    11     3      3      2      acc    6f3
    6     0      d75    acb    1fff   6f3    11     3      3      2      acc    6f3
    7     0      d75    acb    1fff   6f3    11     3      3      2      acc    6f3
    8     0      d75    acb    1fff   6f4    11     3      3      2      acc    6f3
    9     0      d75    acb    1fff   6f3    11     3      3      0      acc    6f2
    10    0      d72    acc    1      6f4    11     3      3      1ffe   acc    6f3
    114   d72    acc    1      6f4    11     3      3      1ffe   acc    6f3
    12    4      d75    acb    1fff   6f4    11     3      3      2      acc    6f3
    13    4      d75    acb    1fff   6f3    11     3      3      2      acc    6f3
    14    4      d75    acb    1fff   6f3    11     3      3      2      acc    6f3
    15    4      d75    acb    1fff   6f4    11     3      3      2      acc    6f3
```

0	4	d75	acb	1fff	6f3	11	3	3	0	acc	6f2
1	0	d72	acc	1	6f4	11	3	3	1ffe	acc	6f3
20	d75	acb	1fff	6f4	11	3	3	2	acc	6f3	
3	0	d75	acb	1fff	6f3	11	3	3	0	acc	6f2

An example of the new aer buffer is listed below. The contents of the buffer can be accessed by using the following dSH command on the Mg9000 ABI card

/aer/display clksync

Date	Time	CLK ERROR	DACV	ABS PHASE	REL PHASE	512 TX/RX	Slew rate	Msg links	Linear Phase mode	Phase diff	Target phase	ITP512 Rxphase
12/27/1990	00:00:00.430	0	c64	ac7	1ffc	3c9	11	0	3	0	acb	3ca
12/27/1990	00:00:00.930	0	c67	ac9	1ffe	3ca	11	0	3	1	acb	3cb
2/ 7/2005	10:36:57.850	4	c67	aca	1fff	3ca	11	0	3	1ffe	acb	3ca
2/ 7/2005	10:37:22.850	0	c71	acb	1	3cb	11	0	3	0	acb	3cb

5.4.2 Explanation

See DSUM section of this document a better explaination of the content of these logs.

5.4.3 Field descriptions

The data fields listed in the footprint and aer logs are essentially the same except the aer buffer log contains a time stamp of when a specific field exceeded its allowable data range. The data collected is the raw data contained in hardware registers on the ABI Vazaelle Field Programmable Gate Array (FPGA). The meaning of these register values is too detailed to address here and this data is only intended for the Nortel design team.

5.4.4 Action

No action is required by any customer, craft or field support personnel based on these logs. This data will be gathered and analyzed by the design team as needed to determine the root cause of any system outage.

5.4.5 Associated Operational Measurements or Performance Measurements

5.4.6 Additional information

5.5 Alarms

Six new alarms are defined for the MG9000 ABI circuit pack by this feature. These alarms will be reported from the ABI to the DCC and subsequently to the MG9000 Element Manager is the normal way.

Maj This alarm should clear within a few seconds, if this alarm is in a steady alarm condition then it indicates that the ITPs or ABI card should be replaced.

Maj

This alarm should clear within a few seconds, if this alarm is in a steady alarm condition then it indicates that the ITPs or ABI card should be replaced.

This alarm should only occur during brief periods of maintenance actions and should clear on it own. If this alarm is in a steady alarm condition then it indicates that the indicated ITP card should be replaced.

This alarm should only occur during brief periods of maintenance actions and should clear on it own. If this alarm is in a steady alarm condition then it indicates that the indicated ITP card should be replaced.Major

If this alarm occurs it indicates that both ITPs in the shelf are having clock issues and immediate analysis into the ITP alarms should be undertaken.Critical

5.5.1 Integrated Element Management GUI fields

The MG9000 Element Manager will report these six alarms in its Alarm Browser in the standard manner.

FM_List Int'l-SN09.fm

6: Fault Management (FM): A00009012

6.1 Feature Name

TOPS OSSAIN Service Enhancements

6.2 Fault management strategy

Not applicable.

6.3 Fault management tools and utilities

Not applicable

6.4 Logs

Log Title/Log ID: TEOL100

6.4.1 Formats

If OSSAIN Broadcast Announcements were used during a week, a TEOL100 log will be generated at midnight the following Sunday with the "OSSAIN Broadcast Announcements" functionality listed (other functionality may also be listed). For example:

```
TEOL100 mmdd hh:mm:ss ssdd INFO TOPS End Of Life Notification
  Use of functionality scheduled for removal:
    Functionality Used                  Scheduled Removal
    ------------------                  ---------------------
    OSSAIN Broadcast Announcements          SN10
```

6.4.2 Explanation

Description: A TEOL100 log identifies functionality no longer supported in an upcoming load. A log is generated only when a functionality is used while scheduled for removal within 3 releases. All such functionalities used in the previous week are listed in that week's EOL log.

6.4.3 Field descriptions

Table 1 Field descriptions

Field	Value	Description
Functionality Used	OSSAIN Broadcast Announcements	This field identifies the functionality that is scheduled for removal yet is being used.

Table 1 Field descriptions

Field	Value	Description
Schedule Removal	SN10	This field identifies the release in which the functionality is scheduled to be removed.

6.4.4 Action

If there is a plan in place to transition off of the identified functionality prior to upgrading to the identified release (or beyond), then the notification logs can be ignored. If there is no such plan in place, then the next level of support should be contacted to initiate an appropriate transition plan.

6.4.5 Additional information

The log indicates only that the functionality was used one or more times in the previous week. It does not indicate when the functionality was used (i.e. the time of the log itself is not at all related to the time of the usage), nor does it indicate the number of times it was used.

Log Title/Log ID: OAIN306

6.4.6 Formats

OAIN306 is generated to indicate a call routed to treatment because too many DA recalls have already been performed and the call was attempting to go to yet another DARECALL function.

Figure 1 Example log report for OAIN306

```
OAIN306 FEB28 07:46:17 8701 INFO TRMT: MAX DA RECALLS REACHED
CALLID: 0302 0011
FUNCTION: DA_RECALL
CALLING: CKT T907TI00 1
```

6.4.7 Explanation

Description: A call routed to treatment because it was routed to a function with DARECALL setup and too many DA recalls had already been processed.

6.4.8 Field descriptions

Table 2 Field descriptions

Field	Description
CALLID	Call ID of the call
FUNCTION	Function the call was routing to when it failed and routed to treatment instead.

6.4.9 Action

Check table VROPT maximum_da_recalls to ensure count is as desired. Note this will include TOPS operator DA recalls also.

Check table OAFUNDEF to ensure the function datafill DARECALL is set as desired.

Change transfer or trigger information to route to different function.

Maintain a count in context block to route appropriately.

Log Title/Log ID: OAIN301

6.4.10 Formats

OAIN301 is generated to indicate a service change over a SN transition did not happen because of an error. Errors can include called party attached and call orig of country direct.

Figure 2 Example log report for OAIN301

```
OAIN301 FEB28 07:46:17 8701 TBL OSSAIN RESOURCE PROBLEM
CALLID: 0302 0011
TROUBLE: SERVICE CHANGE FAILED
```

6.4.11 Explanation

Description: Service change attempt over transition to SN failed because called party attached or call origination is country direct.

6.4.12 Field descriptions

Table 3 Field descriptions

Field	Description
CALLID	Call ID of the call

6.4.13 Action

SN needs to release called party and then request service change via OAP.

6.5 Alarms

Not applicable.

6.6 Related documentation

A00009012 - TOPS OSSAIN Service Enhancements

7: Fault Management (FM): A00009013

7.1 Feature Name

TOPS announcements via UAS/AMS

7.2 Fault management strategy

This activity does not introduce any new element for which a fault management strategy is needed. It adheres to the existing fault management strategy for Succession announcements and for TOPS.

7.3 Fault management tools and utilities

Existing fault management tools and utilities for Succession announcements apply to the announcements for this activity.

7.3.1 Faults, Alarms and Logs

This activity makes minor changes in two existing legacy DMS logs.

7.4 Log: TOPS113

Log Title/Log ID: TOPS113

This is an existing legacy DMS log, documented in Log Report Reference Manual. The log can also be generated by the CS 2000 CM. This feature changes the fixed string in the Event Label field. This activity changes that string from

```
TOPS DRAM PLAY TRBL
```

to

```
ANNOUNCEMENT PLAY TRBL
```

7.4.1 Formats

7.4.1.1 NTSTD

Format:

```
<Office Id>     TOPS113 <MMMDD hh:mm:ss> <seq #> INFO ANNOUNCEMENT PLAY TRBL
        CKT <trkid>
        CHECK FOR INCOMPLETE DATAFILL IN TABLE ANNPHLST
```

Example:

```
RTPC09AZ     TOPS113 JAN03 01:16:53 7985 INFO ANNOUNCEMENT PLAY TRBL
        CKT         TOPCOMAMF 0
        CHECK FOR INCOMPLETE DATAFILL IN TABLE ANNPHLST
```

7.4.1.2 SCC2

Standard for CM.

7.4.1.3 Syslog

7.4.1.4 SNMP

N/A

7.4.1.5 Integrated Element Manager GUI Fields

N/A

7.4.2 Explanation

Unchanged.

7.4.3 Field descriptions

Unchanged.

7.4.4 Action

Unchanged.

7.4.5 Associated Operational Measurements or Performance Measurements

Unchanged.

7.4.6 Additional information

In SN06 the last line of the log body was changed from

```
CHECK FOR INCOMPLETE DATAFILL IN TABLE DRMUSERS
```

to

```
CHECK FOR INCOMPLETE DATAFILL IN TABLE ANNPHLST
```

This was done under a CR and was not documented in NTPs. The reason for the change was that activity A19013546 introduced table ANNPHLST, which replaced table DRMUSERS. All NTP references to DRMUSERS in the description of this log should be changed to refer to ANNPHLST.

7.5 Log: TOPS104

Log Title/Log ID: TOPS104

This is an existing legacy DMS log, documented in Log Report Reference Manual. The log can also be generated by the CS 2000 CM. The only change made by this activity is in the TROUBLE CODE field.

7.5.1 Formats

7.5.1.1 NTSTD

Format:

```
<Office Id>     TOPS104 <MMMDD hh:mm:ss> <seq #> INFO ACTS TROUBLE
        CKT <trkid1>
        CKT <trkid2> CKT <trkid3> CKT <trkid4>
```

```
INCOMING TRK = CKT <trkid>
OUTGOING TRK = CKT <trkid>
CLGNO = <dn> CLDNO = <dn>
TROUBLE CODE = <trouble text>
```

Example:

```
RTPC09AZ     TOPS104 APR01 12:00:00 2112 INFO ACTS TROUBLE
   CKT         ACTSTOPS 111
   CKT        ACTSTOPS 111 CKT         ACTSTOPS 111 CKT         RCVRCOIN 12
   INCOMING TRK = CKT          LNTOPSI  4
   OUTGOING TRK = CKT          LNTOPSO  4
   CLGNO = 613-621-1002         CLDNO = 212-220-1111
   TROUBLE CODE = MISCELLANEOUS_ACTS_TRBL
```

7.5.1.2 SCC2

Table 1 NTSTD/SCC2 Optional Header Fields

Field Name	Used (Y/N)	Value	Fixed/ Variable	type	size	Description
Event Label	Y	ACTS TROUBLE	Unchanged; see Log Report Reference Manual.			
Equipment ID	N					

Table 2 Log Body Fields

Field Name	Used (Y/N)	Value(s)	Fixed/ Variable	Description
Other fields are unchanged.				

Table 2 Log Body Fields

Field Name	Used (Y/N)	Value(s)	Fixed/ Variable	Description
TROUBLE CODE	Y	CDC_DSP1_FAIL CDC_DSP2_FAIL CDC_DSP3_FAIL CDC_RAM_FAIL CDC_ROM_FAIL CDC_TRAP MISCELLANEOUS_ACTS_TRBL MISC_CDC_FAIL MISC_ANNOUNCEMENT_FAIL RECEIVER_SUSPECTED		Indicates the trouble.

7.5.2 Explanation

The Traffic Operator Position System (TOPS) subsystem generates this report when the operator keys “suspect CDC” trouble at the operator position, or when unexpected messages are received from the coin detector circuit (CDC), the digital recorded announcement machine (DRAM) cards, or the packet media server (UAS or MS 2000 Series).

7.5.3 Field descriptions

The TROUBLE CODE field is the only one changed by this activity.

Table 3 Field descriptions

Field	Value	Description
TROUBLE CODE	NO_REPLY_FROM_DRAM	This value can no longer be generated.
TROUBLE CODE	MISC_DRAM_FAIL	This value can no longer be generated.
TROUBLE CODE	MISC_ANNOUNCEMENT_FAIL	Indicates a miscellaneous problem with an announcement used for an ACTS call. Probably an unexpected message has been received from the announcement machine. When this trouble code is generated, the TOPS104 log is most often accompanied by another log that provides more detailed information.
TROUBLE CODE	*other values*	The meaning of the other values is unchanged. See Log Report Reference Manual.

7.5.4 Action

Most often this log indicates a hardware problem, and the action is to diagnose the indicated circuit cards from the MAP (maintenance and administration position) and replace cards if necessary. The first CKT field in the log body is the agent reporting the problem.

If the agent reporting the problem is an ACTS announcement, check for other logs that may accompany this one and may provide more specific information. If the problem cannot be diagnosed using other logs, then check CM table ANNMEMS to determine whether it is a DRAM announcement (HDWTYPE = DRAM) or a packet announcement (HDWTYPE = UAS). Packet announcement members do not correspond to specific hardware circuits. Table ANNMEMS will identify the logical AUD node that was controlling the announcement, and table SERVSINV will associate that AUD node with a Gateway Controller. Follow standard troubleshooting procedures for the media servers that are controlled by that Gateway Controller.

7.5.5 Associated Operational Measurements or Performance Measurements

Unchanged.

7.6 Alarms

N/A

7.7 Related documentation

Log Report Reference Manual.

8: Fault Management (FM): A00009227

8.1 Feature Name

Feature A00009227 - NPM Robustness

8.2 Fault management strategy

The standard MG9K EM Fault Management strategy will apply to the NPM Patch Alarm. The alarm will by displayed by the MG9K EM Alarm Browser, logged in NT standard format to the SSPFS CUST logs and forwarded to northbound OSS.

8.3 Fault management tools and utilities

Alarm Browser - Reports alarms from registered events. When an alarm is generated, it is displayed in the Alarm Browser along with the date and time, the NE Id, the resource (where the alarm was generated), the severity and probable cause. Highlighting the alarm displays the description of the alarm in the text box at the bottom of the Alarm Browser.

Log Adaptor - Generates logs from registered events. The log names and numbers are predetermined and are matched with the incoming event. A log with the corresponding name and number which contains the date, time, physical location, severity and any other pertinent information is generated and placed into a separate file.

8.4 Logs and Alarms

There will be a single new patch alarm fault raised and cleared by the MG9000 to indicate when a restart is required for a patch on a specific card. The MG9000 will manage both raise and clear actions based on its own patching implementation.

8.4.1 Explanation

8.4.1.1 patchAlarmFault

Title: patchAlarmFault

Name: PATC

Description: This log is generated when a patchAlarmFault is received from an MG9000 DCC card.

Severity: MAJOR

Event Type: Trouble

8.4.2 Format

The Log Delivery application for this feature generates logs in the Number 2 Switch Control Center (SCC2) format and the NT standard (STD) format.

8.4.3.1 Patch Alarm Fault

Table 1 Field descriptions PATC 300

Field	Value	Description
office identification	String	Identifies the switch that generates the log. This field is optional. The maximum length of this field is 12 characters.
alarm	***,**,*, or blank	Indicates the alarm type of the log report. ***=critical, **=major, *=minor, blank = no alarms/warning
threshold	+ or blank	Indicates if a threshold is set for the log report. Plus (+) sign indicates that a threshold was set; if a blank, a threshold was not set.

Table 1 Field descriptions PATC 300

Field	Value	Description
report identification	AAAA nnn	Identifies the log subsystem that generates the report. This field uses 2-4 alphabetical characters and the number 100-999 of the log report in this subsystem. For this log AAAA= MGC and nnn=300.
day	String	Identifies the day of the week.
mmmmdd	January-December (01-31)	Identifies the month and date the report generates.
hh:mm:ss	00-23 00-59 00-59	Identifies the hour, the minute, and the second the report generates.
zone	PST, EST, MST, CST, AST	Identifies the time zone.
yyyy	0000-9999	Year
ssdd	0000-9999	Defines a different sequence number for each log report generated.
event type	TBL, INFO, etc	Trouble, Service Summary, State Change, Information, Threshold and Expert. Threshold for this log.
patch id	String	Patch identification.
event id	String	The Log Title.
NE Number	integer	Number of the NE
NE Name	string	Name of the NE
nnUemgEventTime	DateandTime	The Date and Time the event occurred in the following format: day mmmmdd hh:mm:ss zone yyyy

Table 1 Field descriptions PATC 300

Field	Value	Description
nnUemgAlarmSeverity	String	warning
Description	string	Patch(es) require a restart primary to instrument changes

8.4.4 Action

PATC 301 - Restart primary to instrument changes.

8.4.5 Associated Operational Measurements or Performance Measurements

- None.

4. PLOA and SLOA Alarm Forwarding to OSS(DSUM) - MG9000 Alarm forwarding feature.

9: Fault Management (FM): A00009235

9.1 Feature Name

Feature A00009235 - TLS for SIP

9.2 Fault management strategy

The TLS security feature for the SIP Gateway application on the CS2000 Session Server includes new logs and alarms to be defined. This section details the logs and alarms that the TLS security feature has defined.

An alarm monitoring process will be used to compare thresholds values with current operating conditions. As alarmable conditions occur, the process will ensure that the appropriate alarm is raised.

9.3 Fault management tools and utilities

This feature utilizes the current log and alarm display mechanisms in use by the SS-Trunks. There will be new alarms and logs defined, but there will not be any new display mechanisms. Refer the to documented activity (in pls fmdoc) A00003933 (Succession Communication Server (SCS) 2000 - Session Server Manager 2000 - SIP Gateway application) for the overall log and alarm tools and utilities.

This feature generates logs and alarms under the purview of the SIP Gateway application Call Processing. These logs and alarms are only generated and reported on the SIP Gateway application.

They can be viewed via the SIP Gateway Maintenance web browser interface on the Session Server Manager - SIP Gateway application web page. The body of log formats shown in this document are the format for the Session Server logs if viewed from the IEMS (Integrated Element Manager System). Log formats may differ if logs are viewed from the Session Server Web Interface. The content will not differ, just the format and/or the headers.

References to TLS-based logs and alarms not found in this document will be found in the documentation to feature A00006893 in PLS FMDOC.

9.3.1 Faults, Alarms and Logs

9.4 Logs

All logs and associated alarms will have the name start with SIPS (for SIP Security).

The following new logs have been created/modified:

- SIPS608 - TLS Certificate Policy failure (new).
- SIPS609 - Security Parameter Changed (new).
- SIPS604 - TLS Initialization Logs (changed).

The following new alarm related logs have been created/modified:

- SIPS303 - Certificate Mismatch in Server Certificate
- SIPS305 - TLS Initialization Failure (changed from previous release)
- SIPS308 - Failed Certificate Policy Check

9.4.1 SIPS608 - TLS Certificate Policy failure log

9.4.1.1 Formats

9.4.1.1.1 Syslog

Following is the format of the log:

<Date> <Time> <DeviceName> sipgwyappln: SIPS608 <Severity> <Type> TLS ^M Certificate Policy failure, <IP Address>:<Port>^M

Following are values/explanations of the variable values presented above:

- <Date>: Current date
- <Time>: Current time
- <Severity>: The Severity of the log (MINOR).
- <Type>: The type of log (INFO)
- <DeviceName>: The name assigned to the Session Server
- <IP Address> : The IP address of the remote side of the connection
- <Port> : The port number of the connection

Example:

```
 Mar 2 09:53:57 NGSS sipgwyappln: SIPS608 MINOR INFO TLS Certificate Policy
failure, 172.16.172.104:55263
```

9.4.1.2 Explanation

The SIPS608 log is generated when the remote side of the connection presents a certificate that does not conform to the selected local certificate policy.

9.4.1.3 Field descriptions

Table 1 Field descriptions

Field	Value	Description
<DATE>	<Mon> <DD>	Current date when the log occurred.
<Time>	<HH>:<MM>:<SS>	Current time when the log occurred.
<DeviceName>		Name of the session server.
<Severity>	MINOR	Severity level of the log
<Type>	INFO	informational or initialization log.
<IP Address>	<a>.<b>.<c>.<d>	IP address of remote side of connection
<Port>	<xxx>	The Port number of the connection

9.4.1.4 Action

There are two courses of action. The first would be to remove the certificate policy that is preventing the certificate from the Security Parameters Configuration Web Page on the SS-Trunks. The second course of action (and the preferred one) would be to enforce the local certificate policy throughout the network (forcing the Remote SIP Server to present a certificate that conforms to the certificate policy).

See “Certificate Policy Check Failure Alarm” on page 1922 for more details.

9.4.1.5 Associated Operational Measurements or Performance Measurements

None for this log.

9.4.1.6 Additional information

None.

9.4.2 SIPS609 - TLS Security Parameter Changed log

9.4.2.1 Formats

9.4.2.1.1 Syslog

Following is the format of the log:

<Date> <Time> <DeviceName> sipgwyappln: SIPS609 <Severity> <Type> TLS ^M Security Parameter <SecParmName> updates^M OLD: <OldText>^M NEW: <NewText>

Following are values/explanations of the variable values presented above:

<Date>: Current date

<Time>: Current time

<DeviceName>: The name assigned to the Session Server

<Severity>: The Severity of the log (NONE).

<Type>: The type of log (“TLS”)

<process>: process class that raised the log (either sipgwyappln: or certClass:)

<Unit#>: The unit number assigned (either 0 or 1)

<SecParmName>: One of:

- "MaxTLSSessions",
- "localTLSport",
- "numOfTLSEngines",
- "SessionCachingEnabled",
- "SessionCacheValidDuration",
- "SessionCacheSize",
- "SelfSignedCertificatesAllowed",
- "TLSAllowedCipherSuites",
- "TLSServerCertPath",
- "TLSServerKeyPath",
- "TLSTrustedCertsPath",
- "ThrottleEnabled",
- "ThrottleBurstDurationinSecs",
- "ThrottleSustainedDurationinSecs",
- "ThrottleBurstEventThreshold",
- "ThrottleSustainedEventThreshold",
- "TlsEnabled",

- "ExitOnFailTLSInitialization",
- "RequireLocalCertificatePolicy",
- "RequirekeyUsage",
- "RequireauthorityKeyIdentifier",
- "RequiresubjectKeyIdentifier",
- "RequireprivateKeyUsagePeriod",
- "RequiresubjectAltName",
- "RequireissuerAltName",
- "RequirebasicConstraints",
- "RequireextKeyUsage",
- "AlarmMinimumDisplayTimeMinutes",
- "AlarmThresholdDroppedConnections",
- "AlarmThresholdAuthenticationFailure",
- "AlarmThresholdCertExpiryDays",
- "AlarmThresholdLocalCertificatePolicy"

<OldText>: One of

- For the non-AlarmThreshold logs: “<value>”, where:
  - <value>: the old value of the entry
- For the AlarmThreshold logs: “Minor = <min>, Major = <maj>, Critical = <crit>”, where:
  - <min>: the old minor threshold value
  - <maj>: the old major threshold value
  - <crit>: the old critical threshold value

<NewText>: One of

- For the non-AlarmThreshold logs: “<value>”, where:
  - <value>: the new value of the entry
- For the AlarmThreshold logs: “Minor = <min>, Major = <maj>, Critical = <crit>”, where:
  - <min>: the new minor threshold value
  - <maj>: the new major threshold value
  - <crit>: the new critical threshold value

Example:

```
Mar 11 12:31:12 NGSS sipgwyappln: SIPS609 NONE      TLS Security Parameter
AlarmThresholdAuthenticationFailure updated OLD: Minor = 2, Major = 4, Critical =
6 NEW: Minor = 2, Major = 4, Critical = 5
Mar 11 12:31:37 NGSS sipgwyappln: SIPS609 NONE      TLS Security Parameter
ExitOnFailTLSInitialization updated OLD: 1 NEW: 0
```

9.4.2.2 Explanation

The SIPS609 logs are generated whenever a TLS Security Parameter is changed by the user.

9.4.2.3 Field descriptions

Table 2 Field descriptions

Field	Value	Description
<DATE>	<Mon> <DD>	Current date when the log occurred.
<Time>	<HH>:<MM>:<SS>	Current time when the log occurred.
<DeviceName>		Name of the session server.
<Severity>	CRIT	Severity level of the log
<Type>	“ “	Informational log
<SecParmName>	<SecParmName>	Name of the parameter as seen from the Security Parameters Configuration web page.
<OldText>	<OldText>	The text representation of the old value of the parameter(s)
<NewText>	<NewText>	The text representation of the new value of the parameter(s)

9.4.2.4 Action

None. Informational log only.

9.4.2.5 Associated Operational Measurements or Performance Measurements

None.

9.4.2.6 Additional information

None.

9.4.3 SIPS604: Certificate Information Logs

These logs were originally implemented in SN08. The Certificate Effective Date log is the new content being documented here. Everything else remains the same as in SN08.

9.4.3.1 Formats

9.4.3.1.1 Syslog

Following is the format of the log:

<Date> <Time> <DeviceName> sipgwyappln: SIPS604 <Severity> <Type> TLS <Log Message>

Following are values/explanations of the variable values presented above:

- <Date>: Current date
- <Time>: Current time
- <DeviceName>: The name assigned to the Session Server
- <Severity>: The Severity of the log (NONE).
- <Type>: The type of log (INFO)
- <Log Message>: one of:
  - — none/info: "^M Local Certificate Effective: Year=<YYYY>, Month = <MM>, Day = <DD>^M"
  - — none/info: "^M Local Certificate Expires: Year=<YYYY>, Month = <MM>, Day = <DD>^M"

Examples:

```
Oct  8 15:17:07 comit.ngss.unit1 sipgwyappln: SIPS604 NONE INFO TLS ^M    Local
Certificate Effective: Year=2004, Month = 10, Day = 8^M

Oct  8 15:17:07 comit.ngss.unit1 sipgwyappln: SIPS604 NONE INFO TLS ^M    Local
Certificate Expires: Year=2005, Month = 10, Day = 8^M
```

9.4.3.2 Explanation

The SIPS604 log is generated twice during the initialization of the Call Processing application (i.e. during the unlock). These logs indicates when the current local certificate will become effective, and when it will expire.

9.4.3.3 Field descriptions

Table 3 Field descriptions

Field	Value	Description
<DATE>	<Mon> <DD>	Current date when the log occurred.

Table 3 Field descriptions

Field	Value	Description
<Time>	<HH>:<MM>:<SS>	Current time when the log occurred.
<DeviceName>		Name of the session server.
<Severity>	NONE	Severity level of the log
<Type>	INFO	informational.
<Log Message>	see bulleted list	Log message text.

9.4.3.4 Action

On an info log, no immediate action is required.

9.4.3.5 Associated Operational Measurements or Performance Measurements

Not applicable to this log.

9.4.3.6 Additional information

None.

9.4.4 SIPS303 - TLS Certificate Mismatch alarm log

9.4.4.1 Formats

9.4.4.1.1 Syslog

Following is the format of the log:

<Date> <Time> <DeviceName> sipgwyappln: SIPS303 <Severity> <Type> TLS ^M Certificate Mismatch in Server Certificate NCGL=<DeviceName>;Unit=<UnitNumber>;SIPS = Certificate Mismatch in Server Certificate ^M

Following are values/explanations of the variable values presented above:

- <Date>: Current date
- <Time>: Current time
- <Severity>: The Severity of the log (CRITICAL).
- <Type>: The type of log (INFO)
- <DeviceName>: The name assigned to the Session Server
- <UnitNumber>: The node {0 or 1} where the alarm was generated.

Example:

```
Apr  7 16:38:21 yang alarmd: SIPS303 CRIT TBL  Certificate Mismatch in Server
Certificate NCGL=yang;Unit=0;SIPS = Certificate Mismatch in Server Certificate
```

9.4.4.2 Explanation

Every minute, the SS-Trunks compares the data in the certificate and key files on the active side, to those on the inactive side. The SIPS303 log is generated if the two sets of files do not match each other. An alarm is also raised.

If the two files do not match each other, a number of consequences may occur, depending on the nature of the changes made to the files.

Effects may include:

- Inability to use the EM Web Server after the next swact or reboot.
- Inability to run TLS-based calls after the next swact or reboot.
- Dropping of all TLS-based calls after the next swact.

Needless to say, this is a log/alarm that should be acted on immediately. See the “Action” section below for more details.

9.4.4.3 Field descriptions

Table 4 Field descriptions

Field	Value	Description
<DATE>	<Mon> <DD>	Current date when the log occurred.
<Time>	<HH>:<MM>:<SS>	Current time when the log occurred.
<DeviceName>		Name of the session server.
<Severity>	CRITICAL	Severity level of the log
<UnitNumber>	0 or 1	which one of the two units generated the log.
<Type>	INFO	informational or initialization log.

9.4.4.4 Action

The proper certificate and key files must be restored to their place on both the active and inactive nodes. Check to ensure that the Certificate and Key provided to the call processing application are in the correct directory (as pointed to by the Database entry). It may be that the database entry is incorrect or corrupt.

The location of the files for the certificate and key are specified by the values stored in the database.

Root access to the SS-Trunks is normally required to correct this condition. This is because the server.key file is readable and writeable only by root.

Obtain the backup copies of these files made during install or upgrade, or during certificate replacement. Install them on *both* nodes using the cert_mgnt tool. Details on the backup/restore using cert_mgnt or other means can be found in the CN for this feature or the SS-Trunks install/upgrade NTP NN10346-611.

If the backup copies are not immediately available, it may be possible to copy the files from one node to the other. The sipgwyappln application must be running in a normal state on the node with the complete fileset for this to happen. Details on copying files between nodes can be found in the CN for this feature or the NTP quoted above.

In the worst case, if no backup copies exist, the user may wish to create or import an entirely new set of certificate and key files. Be warned: creating new self-signed certificates will likely require datafilling of the certificate on every peer SIP server in the network. And it will require the user to restart CallP on both nodes during a maintenance window.

The user will want to determine who has damaged or removed these files, because this may be the result of a security breach in the user's network.

The SS-Trunks produces CRT700 and CRT701 customer logs that are produced when the system cert_mgnt tool creates these files; look for these logs to determine if someone has made recent changes.

The user will want to ensure that the certificate and key files are meant to be together (by running the cert_mgnt tool).

9.4.4.5 Associated Operational Measurements or Performance Measurements

None for this log.

9.4.4.6 Additional information

None.

9.4.5 SIPS305 - TLS Engine failure log

These logs are output by TLS when it fails to initialize, and by the TLS alarm code when an alarm is raised to flag TLS initialization failure.

9.4.5.1 Formats

9.4.5.1.1 Syslog

Following is the format of the log:

<Date> <Time> <DeviceName> sipgwyappln: SIPS305 <Severity> <Type> NCGL=<DeviceName>;Unit=<UnitNumber> TLS <Log Message>

Following are values/explanations of the variable values presented above:

- <Date>: Current date
- <Time>: Current time
- <DeviceName>: The name assigned to the Session Server
- <Severity>: The Severity of the log (CRIT).
- <Type>: The type of log (INIT)
- <UnitNumber>: The number {0,1} of the SS-Trunks.
- <Log Message>:
  - crit/init: “^M TLS Local Key and Cert do not match^M”
  - crit/init: “^M TLS Failed client init^M”
  - crit/init: “^M TLS Failed Server init^M”
  - crit/init: “^M TLS Failed to load Certificate^M”
  - crit/init: “^M TLS Failed to load Key^M”
  - crit/init: “^M TLS Failed to Init^M”
  - crit/init: “^M TLS Failed to get pointer^M”
  - crit/init: “^M TLS Failed to create thread^M”
  - crit/init: “^M TLS Failed Local Certificate Policy^M”
  - crit/init: “^M TLS is Not Enabled NCGL=<DeviceName>;Unit=<UnitNumber> TLS is Not Enabled^M” where <UnitNumber> is the number of the unit where the alarm was generated.

Examples:

```
Mar  1 10:06:53 NGSS sipgwyappln: SIPS305 CRIT INIT TLS ^M    TLS Failed Local
Certificate Policy^M
Mar  1 10:06:53 NGSS alarmd: SIPS305 CRIT TBL  TLS is Not Enabled
NCGL=NGSS;Unit=0;SIPS TLS is Not Enabled
```

9.4.5.2 Explanation

The SIPS305 log is generated during the initialization of the Call Processing application (i.e. during the unlock). If one of the critical logs come out, it

means that there is a problem with the initialization, and the application is unable to start.

9.4.5.3 Field descriptions

Table 5 Field descriptions

Field	Value	Description
<DATE>	<Mon> <DD>	Current date when the log occurred.
<Time>	<HH>:<MM>:<SS>	Current time when the log occurred.
<DeviceName>		Name of the session server.
<Severity>	CRIT	Severity level of the log
<Type>	INIT or TBL	initialization log / trouble log.
<UnitNumber>	0 or 1	which one of the two units generated the log.
<Log Message>	see bulleted list	Log message text.

9.4.5.4 Action

On a critical severity log, check to ensure that the Certificate and Key provided to the call processing application are in the correct directory (as pointed to by the Database entry). Then ensure that the Certificate and Key files themselves are not corrupted or tampered with. Ensure that the certificate and key files are meant to be together (by running the cert_mgnt tool). See “SIPS604: Certificate Information Logs” on page 1910 for more information.

Alternatively contact the next level of support.

Once the problem is resolved, and the user ‘unlocks’ the application again, there will be 3 logs indicating resolution.

- SIPM500

```
Feb  9 13:15:40 comit.ngss.unit1 sipgwymtc: SIPM500 NONE INFO SIP Gateway
Application Maintenance State Change ^M        [Administrative : Locked          -
> Unlocked      ]^M       [Operational    : Enabled        -> Enabled       ]^M
[Control         : Not Suspended    -> Not Suspended  ]^M        [Procedural      :
Not Terminating -> Not Terminating]^M      [User Requested : Yes]^M      [Reason
: Unlock command issued]^M         [Web User ID     : mtc]^M
```

- SIPS605
- SIPS604 (2 of them: one for certificate effective date; one for certificate expiry date)

9.4.5.5 Associated Operational Measurements or Performance Measurements

Not applicable to this log.

9.4.5.6 Additional information

Normally, the cert_mgnt CLI will provision the certificate and key files properly. If this interface has not been run prior to the attempt to bring the call processing application in service, or has been run improperly, unexpected results could occur. Extra information as to the cause of the problem will likely reside in the initialization trace logs provided in the /opt/apps/logs directory (look for siptrace.<date>.server.<pid>).

9.4.6 SIPS308 - Failed Certificate Policy Check Alarm Log

9.4.6.1 Formats

9.4.6.1.1 Syslog

Following is the format of the log:

<Date> <Time> <DeviceName> sipgwyappln: SIPS308 <Severity> <Type> ^M TLS Local Certificate Policy Mismatch NGSS=NCGL;Unit=<UnitNumber>;SIPS Failed <count> certificate policy checks.^M

Following are values/explanations of the variable values presented above:

- <Date>: Current date
- <Time>: Current time
- <Severity>: The Severity of the log.
- <Type>: The type of log (INFO)
- <DeviceName>: The name assigned to the Session Server
- <UnitNumber>: The number {0,1} of the SS-Trunks.
- <count>: The number of certificate policy checks that have failed.

Example:

```
Mar  2 14:44:46 NGSS alarmd: SIPS308 MINOR TBL  TLS Local Certificate Policy
Mismatch NCGL=NGSS;Unit=0;SIPS Failed 1 certificate policy checks
```

9.4.6.2 Explanation

The SIPS308 log is generated when enough certificate policy failures have occurred to generate an alarm. See 9.5.3 “Certificate Policy Check Failure Alarm” on page 1922 for more information.

9.4.6.3 Field descriptions

Table 6 Field descriptions

Field	Value	Description
<DATE>	<Mon> <DD>	Current date when the log occurred.
<Time>	<HH>:<MM>:<SS>	Current time when the log occurred.
<DeviceName>		Name of the session server.
<Severity>	MINOR	Severity level of the log
<UnitNumber>	0 or 1	which one of the two units generated the log.
<Type>	INFO	informational or initialization log.

9.4.6.4 Action

There are two courses of action. The first would be to remove the certificate policy that is preventing the certificate from the Security Parameters Configuration Web Page on the SS-Trunks.

The second course of action (and the preferred one) would be to enforce the local certificate policy throughout the network (forcing the Remote SIP Server to present a certificate that conforms to the certificate policy).

9.4.6.5 Associated Operational Measurements or Performance Measurements

None for this log.

9.4.6.6 Additional information

None.

9.5 Alarms

The following list of alarms has been created or changed for this feature:

- Fail to construct TLS client or server engine (changed).
- Certificate mistmatch between active/inactive host (new).
- Failed Certificate Policy Check (new).

The following alarms have not changed in SN09, but now have provisionable alarm thresholds. Consult this feature's CN document for more details.

- Connection Requests Dropped Alarm.
- Connection Handshake Failure Alarm.
- TLS Local Certificate Expiration Alarm.

9.5.1 Certificate Mismatch Alarm

Many of the details on this alarm and the appropriate response are documented in section 9.4.4 “SIPS303 - TLS Certificate Mismatch alarm log” on page 1911.

9.5.1.1 Integrated Element Manager GUI Fields

Table 7 IEMS Alarm GUI Field descriptions

Field	Value
Severity	NONE, or CRIT
Category	*Certificate Mismatch*
LogName	SIPS
LogNumber	303
EventType	TBL
EventLabel	TBL
ProbableCause	*versionMismatch*
SpecificProblem	TLS Certificate Mismatch
BodyText	Certificate Mismatch in Server Certificate

The original alarm log is not refreshed.

9.5.1.2 Explanation

Description: The SIPS303 log is generated whenever the certificate or private key files on the SS-Trunks do not match between the active and inactive nodes .

Severity: Critical. A certificate mismatch means that a SWACT could lead to the dropping of TLS calls, or that TLS CallP may not be active on the next reboot. It may also mean that the EM web server is inoperative, or will become inoperative on the next SWACT or node reboot. See 9.4.4.2 “Explanation” on page 1912 for more information.

9.5.1.3 Action

See 9.4.4.4 “Action” on page 1912 for detailed instructions on how to respond.

9.5.1.4 Corresponding Clear Log

Log Title: SIPS303 with severity NONE.

9.5.2 TLS Engine Failure Alarm

This alarm has been changed in SN09; it was first implemented in SN08. Please reference feature documentation for A00006893 for details on the SN08 implementation.

9.5.2.1 Integrated Element Manager GUI Fields

Table 8 IEMS Alarm GUI Field descriptions

Field	Value
Severity	NONE or CRIT
Category	*TLS Engine Failure*
LogName	SIPS
LogNumber	305
EventType	TBL
EventLabel	TBL
ProbableCause	*fileError*
SpecificProblem	TLS has failed to initialize properly, and needs to be restarted.
BodyText	TLS is Not Enabled

9.5.2.2 Explanation

The TLS Engine has failed to initialize when SS-Trunks CallP started. This may or may not have resulted in the termination of CallP on the SS-Trunks.

The SIPS305 customer log is generated during the alarming of TLS Engine failure. This log will inform the user of the exact reason that the TLS engine failed to start.

This alarm will only occur when the exitOnFailTLSinitialization security parameter is set to ‘N’. We recommend that exitOnFailTLSinitialization always be set to ‘Y’, and ‘Y’ is the default value.

9.5.2.3 Action

It is recommended that exitOnFailTLSinitialization be set to 'Y'. After that parameter is set to 'Y', this alarm will not occur in future cases of TLS initialization failure. Instead, the CallP application will not run if TLS cannot initialize properly.

The text of the associated SIPS305 customer log dictates the action.

The following error messages may be output in the SIPS305 customer log:

1. "TLS Failed to load Key"

2. "TLS Failed to load Certificate"

3. "TLS Failed Server init"

4. "TLS Local Key and Cert do not match"

5. "TLS Failed client init"

6. "TLS Failed to create thread"

7. "TLS Failed to get pointer"

8. "TLS Failed to Init"

9. "TLS Failed Local Certificate Policy"

The appropriate actions for these messages are as follows:

For messages 1, 2, and 4:

a. Check for the existence and validity of the certificate and key files. Restore these from backup if necessary. See 9.4.4.4 "Action" on page 1912 for a detailed method of validating these files.

b. If CallP is running, and the exitOnFailTLSinitialization security parameter is set to 'N', then: Change the value of parameter TlsEnabled to "Y" on the SecurityParmConfig EM web page. This will attempt a restart of TLS.

c. Else: Manually suspend/lock (if required) and unsuspend/unlock CallP from the Maintenance EM web page.

d. If the alarm is not cleared after this, contact Nortel Technical Support.

For messages 3, 5, 6, 7, and 8:

a. If CallP is running, and the exitOnFailTLSinitialization security parameter is set to 'N', then: Change the value of parameter TlsEnabled to "Y" on the SecurityParmConfig EM web page. This will attempt a restart of TLS.

b. Else: Manually suspend/lock (if required) and unsuspend/unlock CallP from the Maintenance EM web page.

c. If the alarm is not cleared after this, contact Nortel Technical Support.

For message 9, there are two alternatives:

a. Set the “RequireLocalCertificatePolicy” parameter on the SecurityConfigParms EM web page to “N”. This is a stopgap measure that will allow TLS to come up even if the certificate defies the local certificate policy.

   i. If CallP is running, and the exitOnFailTLSinitialization security parameter is set to ‘N’, then: Change the value of parameter TlsEnabled to “Y” on the SecurityParmConfig EM web page. This will attempt a restart of TLS.

   ii. Else: Manually suspend/lock (if required) and unsuspend/unlock CallP from the Maintenance EM web page.

b. Provision a new certificate that follows the established security policy. This is usually the preferred option, but may take a significant amount of time to accomplish, depending on the Public Key Infrastructure policy of the customer.

   i. If the customer allows self-signed certificates, a new self-signed certificate may be provisioned on this SS-Trunks using the cert_mgnt tool. However, this new self-signed certificate will have to be provisioned as a trusted certificate on all the SS-Trunks’s peer SIP servers.

   ii. If CallP is not running: Manually suspend/lock and unsuspend/unlock CallP from the Maintenance EM web page.

   iii. If CallP is running: Change the value of parameter TlsEnabled to “Y” on the SecurityParmConfig EM web page. This will attempt a restart of TLS.

c. If steps a and/or b do not work, contact Nortel Technical Support

9.5.2.4 Corresponding Clear Log

Log Title: SIPS305 with severity NONE.

9.5.3 Certificate Policy Check Failure Alarm

9.5.3.1 Integrated Element Manager GUI Fields

Table 9 IEMS Alarm GUI Field descriptions

Field	Value
Severity	NONE, MINOR, MAJOR, or CRIT
Category	*Certificate Policy Check Failure*
LogName	SIPS
LogNumber	308
EventType	TBL
EventLabel	TBL
ProbableCause	*thresholdCrossed*
SpecificProblem	A number of certificates violating the provisioned certificate policy on the SS-Trunks have been submitted by peer SIP servers.
BodyText	Failed <certificate_count> certificate policy checks <updatetext>

BodyText explanation: The BodyText entry for the log will contain “Failed <number> certificate policy checks”. However, over time, other events may occur, and the alarm BodyText will be updated with “Failed <number> certificate policy checks in the last minute<updatetext>”, where <updatetext> is one of:

- “, <numberminor> Minor events since alarm creation” for Minor alarms
- “, <numbermajor> Major, <numberminor> Minor events since alarm creation” for Major alarms or
- “, <numbercritical> Critical, <numbermajor> Major, <numberminor> Minor events since alarm creation” for Critical alarms.

The original alarm log is not refreshed.

9.5.3.2 Explanation

The customer has the option of setting requirements on TLS certificates submitted by other servers, using certain parameters provisionable on the SecurityParmsConfig web page on the EM.

If certificates are submitted by remote SIP servers that violate the policy set by the customer, the remote servers' certificates will be rejected, and calls from that server will not be allowed.

If a certain number of remote servers' certificates are failed, an alarm is generated. The number of failures that trigger an alarm is provisionable via the AlarmThresholdLocalCertificatePolicy parameter on the SecurityParmsConfig web page.

The default provisioned values for this alarm are minor=1, major=2, critical=5.

The log/alarm will be raised at least 30 minutes, and if the problem has ceased, the clear alarm log will be generated.

9.5.3.3 Action

The customer has two options here:

1. Disable the certificate policy restrictions set on the SecurityParmsConfig web page. The policy restrictions can be turned off by setting the RequireLocalCertificatePolicy parameter to 'N'.
    a. This option is intended as a stopgap, so that the customer can permit calls from offending servers while new certificates are issued to those servers.
2. Provision new certificates on the offending servers, that meet the customer's certificate policy. If self-signed certificates are used on the offending servers, the certificates will require datafilling on multiple peer SIP servers.
    a. This is the preferred option, but it may take significant time to complete this task.

9.5.3.4 Corresponding Clear Log

Log Title: SIPS308 with severity NONE.

9.6 Related documentation

A00009235 CN section, in PLS FMDOC.

10: Fault Management (FM): A00009280

10.1 Feature Name

MG9K Line Circuit Enhancements

10.2 Fault management strategy

This feature does not introduce new faults.

10.3 Fault management tools and utilities

10.3.1 Faults, Alarms and Logs

Alarm Browser - Reports alarms from registered events. When an alarm is generated, it is displayed in the Alarm Browser along with the date and time, the NE Id, the resource (where the alarm was generated), the severity and probable cause. Highlighting the alarm displays the description of the alarm in the text box at the bottom of the Alarm Browser.

Log Adaptor - Generates logs from registered events. The log names and numbers are predetermined and are matched with the incoming event. A log with the corresponding name and number which contains the date, time, physical location, severity and any other pertinent information is generated and placed into a separate file.

10.4 Logs

The Log Delivery application for this feature generates logs in the Number 2 Switch Control Center (SCC2) format and the NT standard (STD) format.

There is no change in the existing format of Line Circuit alarms, except that the description part has an added statement about the DN number associated with the Line circuit alarm. If no DN is associated, then the 'DN Affected: None' would be displayed.

Once an alarm is reported, any subsequent changes to the DN would not get reflected in the alarm log of that line circuit or in the description part of the line circuit alarm on the Alarm Browser.

10.4.1 Formats

10.4.1.1 NTSTD

NorLineFault
SWLN301 ***Jan12 01:02:40 3409 TBL MG9K NorLineFault
Location: 18-c018-FrameFFF.Shelf3.Slot21.SAAL.p7
Notification Id: 399
State: not acknowledged
Category: equipment

Cause: Equipment Malfunction
Time: Jan 12 01:02:40 1970
Component Id: Card.frame0.shelf3.slot21.SAAL.p7
Specific Problem:norLineFault
Description: linefault
DN Affected: 6195210102
Site Flr RPos Bay_id
Cary 02 H02 MG9F 012

10.4.1.2 SCC2

NorLineFault
*** SWLN301 3409 TBL MG9K NorLineFault
Location: 18-c018-FrameFFF.Shelf3.Slot21.SAAL.p7
Notification Id: 399
State: cleared
Category: equipment
Cause: Equipment Malfunction
Time: Jan 12 01:02:40 1970
Component Id: Card.frame0.shelf3.slot21.SAAL.p7
Specific Problem: NorLineFault
Description: linefault
DN Affected: 6195210102
Site Flr RPos Bay_id
Cary 02 H02 MG9F012

10.5 Alarms

No new alarms are added as a part of this CCAF.

The Description part of a line circuit alarm would have an added statement namely:

DN Affected: <Associate DN>

If no DN is associated with a line circuit then the below statement would be appended to the description part of the line circuit alarm:

DN Affected: None

Once alarm is reported any subsequent changes to DN would not get reflected in the alarm log of that line circuit or in the description part of the line circuit alarm on the Alarm Browser.

10.6 Related documentation

None.

11: Fault Management (FM): A00009282

11.1 Feature Name

Emergency Stand Alone (ESA) Multiple Level Precedence and Preemption (MLPP) for MG9KEM

11.2 Fault management strategy

The standard MG9k EM Fault Management strategy will apply to the faults for this feature. Alarms will be displayed by the MG9K EM Alarm Browser, logged in NT standard format to the SSPFS CUST logs and forwarded to northbound OSS.

11.3 Fault management tools and utilities

Alarm Browser - Reports alarms from registered events. When an alarm is generated, it is displayed in the Alarm Browser along with the date and time, the NE Id, the resource (where the alarm was generated), the severity and probable cause. Highlighting the alarm displays the description of the alarm in the text box at the bottom of the Alarm Browser.

Log Adaptor - Generates logs from registered events. The log names and numbers are predetermined and are matched with the incoming event. A log with the corresponding name and number which contains the date, time, physical location, severity and any other pertinent information is generated and placed into a separate file.

11.4 Logs and Alarms

No new alarms will be added. A new alarm reason will be generated for ESA download problems from the Core when the timestamp of the Core file is more than 48 hours old.

The alarm will be displayed at the Alarm Browser at the subnet as well as the well as the alarm browser for each corresponding network element. A log is also generated. Both are NE level alarms.

11.4.1 Explanation

11.4.1.1 ESA311

Title: Core Download Failed

Name: ESA

Description: This log is generated by the EM in when a problem is detected when trying to download the datafile from the core.

This new condition is when the Core datafile is more than 48 hours old, indicating that the file on the Core is not being generated nightly.

Severity: Minof

Event type: ESA Core Data Download

11.4.2 Field descriptions

11.4.2.1 ESA311 (nnEsaCoiFault)

Table 1 Field descriptions ESA304

Field	Value	Description
office identification	String	Identifies the switch that generates the log. This field is optional. The maximum length of this field is 12 characters.
alarm	***,**,*, or blank	Indicates the alarm type of the log report. ***=critical, **=major, *=minor, blank = no alarms/warning
threshold	+ or blank	Indicates if a threshold is set for the log report. Plus (+) sign indicates that a threshold was set; if a blank, a threshold was not set.
report identification	AAAA nnn	Identifies the log subsystem that generates the report. This field uses 2-4 alphabetical characters and the number 100-999 of the log report in this subsystem. For this log AAAA= MGC and nnn=600.
day	String	Identifies the day of the week.
mmmmdd	January-December (01-31)	Identifies the month and date the report generates.

Table 1 Field descriptions ESA304

Field	Value	Description
hh:mm:ss	00-23 00-59 00-59	Identifies the hour, the minute, and the second the report generates.
zone	PST, EST, MST, CST, AST	Identifies the time zone.
yyyy	0000-9999	Year
ssdd	0000-9999	Defines a different sequence number for each log report generated.
event type	TBL, INFO, etc	Trouble, Service Summary, State Change, Information, Threshold and Expert. TBL for this log.
event id	String	The Log Title.
NE Number	integer	Number of the NE
NE Name	string	Name of the NE
Fault Type	string	The type of the fault: ESA Community of Interest
nnUemgEventTime	DateandTime	The Date and Time the event occurred in the following format: day mmmmdd hh:mm:ss zone yyyy
nnUemgAlarmSeverity	String	Major
Description	string	Failed to ping members of communityof interest

11.4.2.2 ESA312 (Internodal ESA Provisioning Fault)

Table 2 Field descriptions ESA304

Field	Value	Description
office identification	String	Identifies the switch that generates the log. This field is optional. The maximum length of this field is 12 characters.
alarm	***,**,*, or blank	Indicates the alarm type of the log report. ***=critical, **=major, *=minor, blank = no alarms/warning
threshold	+ or blank	Indicates if a threshold is set for the log report. Plus (+) sign indicates that a threshold was set; if a blank, a threshold was not set.
report identification	AAAA nnn	Identifies the log subsystem that generates the report. This field uses 2-4 alphabetical characters and the number 100-999 of the log report in this subsystem. For this log AAAA= MGC and nnn=600.
day	String	Identifies the day of the week.
mmmmdd	January-December (01-31)	Identifies the month and date the report generates.
hh:mm:ss	00-23 00-59 00-59	Identifies the hour, the minute, and the second the report generates.
zone	PST, EST, MST, CST, AST	Identifies the time zone.
yyyy	0000-9999	Year
ssdd	0000-9999	Defines a different sequence number for each log report generated.

Table 2 Field descriptions ESA304

Field	Value	Description
event type	TBL, INFO, etc	Trouble, Service Summary, State Change, Information, Threshold and Expert. TBL for this log.
event id	String	The Log Title.
NE Number	integer	Number of the NE
NE Name	string	Name of the NE
Fault Type	string	The type of the fault: Processing Error
nnUemgEventTime	DateandTime	The Date and Time the event occurred in the following format: day mmmmdd hh:mm:ss zone yyyy
nnUemgAlarmSeverity	String	Major
Description	string	Internodal ESA provisioning failure

11.4.3 Action

ESA304 (nnEsaCoiFault):

Check failure cause in alarm or log text and perform corrective action This will typically require network route troubleshooting. The MG9000 will clear the alarm autonomously once the root cause is fixed.

ESA312 (Internodal ESA provisioning failure):

Check failure log in the alarm or log text (most common is communication failure between the MG9000 EM and the MG9000). Once the root cause is fixed the alarm can be cleared by running and audit on the affected NE, or hitting “Apply” button on the Internodal ESA configuration GUI.

11.4.4 Associated Operational Measurements or Performance Measurements

None.

12.6 Related documentation

13: Fault Management (FM): A00009353

13.1 Feature Name

GWC Unit Availability/ Health Monitoring

13.2 Fault management strategy

None

13.3 Fault management tools and utilities

None

13.4 Logs

None

13.5 Alarms

An alarm will be raised whenever the PreSwact audit fails for two consecutive cycles.The text of the alarm describes which component has led to the failure.It will be reflected in the SESM as well as in the GWC with the available status of the GWC in the SESM reflecting “DEGRADED”. The audit runs periodically and raises alarm for PSA fail on error conditions. A duplicate alarm for the same reason as that of an existing one will not be raised. Following are the alarm details:

- **Alarm format** - The alarm will be having the following characteristics

Description	: PreSwact Audit Failure
Component	: NODEMTC
Category	: QualityOfService
ProbableCause	: ‘resourceAtOrNearingCapacity’ for resource exhaust. ‘performanceDegraded’ for Unit Jam.

- **Severity** - Major
- **Cause or condition** — PreSwactAudit Failure
- **Duration** — The alarm will be raised when ever the PreSwact Audit fails on error conditions and gets cleared when the error condition is cleared.

The alarm will also have a specific reason for the alarm apart from a generic description. This will describe which component has led to the failure.

13.5.1 Causes for the Alarm

The PreSwact Audit alarm will be raised under the following conditions:

1. Monitored base resource reaches the threshold level.
2. Monitored application resource reaches the threshold level.
3. Existing PreSwact Audit check fails for an error condition.
4. When the standby unit is jammed to prevent it from taking up the activity.

13.5.2 Clearing the Alarm

PreSwact Audit alarm will be raised whenever PreSwact Audit fails.This alarm will be cleared when the fault is cleared as PSA will be running periodically other than running during Swacts.The PSA will pass for a resource when its usage comes down with in limits.

For example, if the Request resource remains exhausted over two consecutive PreSwact Audit cycles, the PSA will fail and the alarm with corresponding failure reason will be raised. If in the subsequent cycles the Request resource level comes down within limits, PSA will pass and hence the alarm will be cleared for the resource.

13.5.3 Integrated Element Manager GUI Fields

None

13.6 Related documentation

None

14: Fault Management (FM): A00009470

14.1 Feature Name

SuperNode Data Manager (SDM) to support Security Assertion Markup Language (SAML) NSSwitch client

14.2 Fault management strategy

The feature will log SAML client configuration changes to SDM Security Logs.

Note: Please refer to SN08 IEMS Integration feature document in PLS FMDOC (a00007489) for detail information on SDM Security Logs for SN08 functionality.

14.3 Fault management tools and utilities

14.3.1 Faults, Alarms and Logs

SDM Security Logs utility will be used by this feature.

14.4 Logs

Log Title/Log ID: USER_ACT_Security_Naming_Service/ SDM_MID_defn.security.0012

14.4.1 SDM Security log

The existing SN08 security log will be used for naming service configuration changes. The following is an example of a security log when naming service is changed from LOCAL to SAML.

Feb 4 11:12:20 wcary2p4 sdmmtc[19512]: class_security.ver02 EVENT.TYPE="USER_ACT_Security_Naming_Service" DOC="RMI" STAT="Success" DST="wcary2p4" DST.USR="root" SRC.OFFEND="47.129.112.179" HOST.TYPE="application" TTY="pts/4" MESSAGE="Naming Service was changed - Current: LOCAL New: SAML" MID="SDM_MID_defn.security.0012"

Both USER_ACT_Security_Naming_Service and SDM_MID_defn.security.0012 are an existing security log EVNT.TYP and MID.

14.5 Alarms

Not applicable to this feature.

15.1 Feature Name

Out-of-Band Interop with MCS

15.2 Fault management strategy

15.3 Logs

New NCAS class log will be generated by the SIP Gateway Application under this activity. It will be generated for the following event: OOB Refer is Rejected

This log can be viewed via the SIP Gateway Maintenance web browser interface on the Session Server Manger - SIP Gateway application web page.

No alarms will be generated in connection with this

15.3.1 NCAS LOGS

New customer log that will be generated by this feature:

- NCAS501 - OOB REFER REJECTED

15.3.1.1 NCAS501 OOB REFER Rejected

Log NCAS501 “OOB REFERREJECTED” is generated when an Out-of-Band REFER Request that has been received by the Session Server does not validate and this the request can not be accepted.

Log Title: OOB

Name: NCAS 501

Description: OOB REFER REJECTED

Event Type: Trouble

FORMAT: For the NCAS 501 log, the following are values/explanations of the variable values:

- alarmLevel = NONE
- componentID = NCAS
- category = Communications
- description = OOB Refer Rejected

- probable cause = Incorrect Header
- specific cause = ReferTo or ReferBy Header Incorrect
- correlationIdList = None
- neVendorSpecificInfo = None
- technologySpecificInfo = None
- reportName = NCAS
- reportNum= 501
- eventType = TBL
- label = OOB

ACTION: Verify Header Population

16: Fault Management (FM): A00009532

16.1 Feature Name

Support host to host tunnels for all northbound OSS connections

16.2 Fault management strategy

Not applicable.

16.3 Fault management tools and utilities

Not applicable.

16.4 Logs

No new logs are being added because of this feature. The following section is added for informational purposes.

16.4.1 IPsec syslog messages

The Solaris implementation of IPsec automatically sends all failure logs to syslog /var/adm/messages. We do not have control over this. However when the Server Security Manager (SSM) makes any changes to the IPsec security rules, the wrapper scripts will output any attempted changes to /var/log/securitylog.

The Solaris IPsec itself does not seem to generate any failure messages because security could be compromised, however IKE does seem to generate failure messages to syslog.

Sample IKE failure message would look like the following:

```
messages.0:Mar 25 15:40:04 wnc1s01h /usr/lib/inet/in.iked: [ID
313954 daemon.notice] IKE_DELETE_PAYLOAD_RECEIVED:
20040325204004:   Source addr:47.142.217.23 Destination
addr:47.142.217.22 SPI:0x0100005d350a7d6c0100006b743037d4
Description:Received delete notification
```

All other possible failure messages that could get generated to syslog is shown below for IKE.

16.5 Alarms

No new alarms are being added because of this feature.

16.6 Related documentation

17: Fault Management (FM): A00009610

17.1 Feature Name

IEMS Calix Integration

17.2 Fault management strategy

17.3 Active Alarm List

In order to retrieve the active alarm list for a C7 shelf IEMS will query the calixAllAlarmTable from the CALIX-FAULT-MIB. This will happen for the following conditions

1 After the discovery for C7 network is completed while provisioning a C7 Network

2 A cold start trap is received from the C7 shelf or network

3 User issues a manual Re-Synchronize Alarms command from the IEMS client

4 System time is less that the previous system time for a calix trap

To query, IEMS will use the C7 network's configured IP address and the UDP port assigned for that shelf.

Following table lists the mapping between the columns of the alarm table and the IEMS event and also other properties of the IEMS event

Alarm Table Field	***IEMS Event Field***
CalixAllAlarmObjIndex	Entity*
CalixAllAlarmCntIndex	NotificationID
calixAllAlarmObjTl1Aid	Entity*, ComponentID#,location(bodyText) with only the shelf name
CalixAllAlarmObjClass	-
CalixAllAlarmSeverity	Severity critical(3) – critical major(2) – major minor(1) – minor unknown(4) – minor
CalixAllAlarmType	Entity*,SpecificProblem

CalixAllAlarmSrvEffect	LogNumber unknown – 300 serviceAffecting – 301 nonServiceAffecting – 302
CalixAllAlarmLocation	ComponentID# nearEnd(1), farEnd(2),bothEnds(3),notApplicable(4)
CalixAllAlarmDateTime	Time
calixAllAlarmTimeStamp	-
Calix Resync Alarm	Text
Other	ProbableCause
Other	Category
FLT	EventType
Fault	EventLabel

* - An entity uniquely identifies an alarm. Entity for an alarm is formed by combining ipAddress(C7 network), calixAllAlarmObjTl1Aid, calixAllAlarmType and calixAllAlarmObjIndex.

- componentID is formed combining calixAllAlarmObjTl1Aid and calixAllAlarmLocation. If location value is 'notApplicable' then componentID is calixAllAlarmObjTl1Aid or else it is calixAllAlarmObjTl1Aid (calixAllAlarmLocation)

Note: As there is no column in the alarm table that can be used as the text for the IEMS alarm it is set to 'Calix Resync Alarm'.

17.3.1 Calix trap handling

The following traps from the C7 device will be handled in IEMS

17.3.1.1 Cold Start Trap

On receiving a cold start trap from the calix device, IEMS will re-synchronize the C7network and the C7 Shelf alarms.

17.3.1.2 Calix Alarm Raise Notification Trap

This trap is recognized as an alarm in IEMS. The severity of the alarm is based on the value of the CalixTrapAlarmSeverity varbind.

The following table lists the mapping of varbinds of this trap to IEMS event.

CalixTrapAlarm varbind	***IEMS Event Field***
calixTrapTl1Aid	entity*, componentID#, location(bodyText) only the node and shelf part
CalixTrapAlarmTransition	determines whether alarm is raised or cleared

CalixTrapAlarmSeverity	Severity critical(3) – critical major(2) – major minor(1) – minor unknown(4) – minor
CalixTrapAlarmType	entity*, specificProblem
CALX	LogName
calixTrapSrvEffect	LogNumber unknown – 300 serviceAffecting – 301 nonServiceAffecting - 302
calixTrapCondDescr	text
calixTrapLocation	ComponentID# nearEnd(1), farEnd(2),bothEnds(3),notApplicable(4)
calixTrapObjClass	-
calixTrapObjIndex	entity*
calixTrapSerialNr	sequenceNumber
There is no varbind to get the alarm generated time. Will use the current IEMS time while adding the alarm.	time
Other	probableCause
Other	category
Fault – For rising alarm Cleared – For falling alarm	eventLabel
FLT – For rising alarm INFO – For falling alarm	eventType

17.3.1.3 Threshold Crossing Alert Trap

The TCA traps will be added in IEMS with a severity of MINOR. The following table lists the mapping of varbinds of this trap to IEMS event

TCA Trap Varbind	*IEMS Event Field*
calixTrapTl1Aid	entity*, componentID#,location(bodyText) only the node and shelf part
calixTrapCondType	entity, specificProblem
Minor	severity
CALX	logName

calixTrapCondState	*logNumber* cleared(1) – 800 standing(2) – 801 transient(3) – 802 notApplicable(4) - 803 *state*(bodyText) cleared(1) – Cleared standing(2) – Raised transient(3) –Transient notApplicable(4) – N/A
calixTrapCondDescr	text
calixTrapLocation	componentID nearEnd(1), farEnd(2),bothEnds(3),notApplicable(4)
calixTrapMonValue	-
calixTrapThLevel	-
calixTrapTmPeriod	-
calixTrapObjClass	-
calixTrapObjIndex	entity
calixTrapSerialNr	sequenceNumber
Other	probableCause
Other	category
TCA	eventLabel
THR	eventType

17.3.1.4 Remove/Restore Traps

The remove/restore traps will be added as informational events in IEMS. The following table shows the mapping of the varbinds of this trap to the fields in IEMS event

Remove/Restore TrapVarbind	***IEMS Event Field***
calixTrapTl1Aid	entity,location(bodyText) only the node and shelf part
calixTrapObjState	text
calixTrapObjClass	-
calixTrapObjIndex	entity
calixTrapSerialNr	sequenceNumber

CALX	logName
501 – For calixRemoveEvent 502 – For calixRestoreEvent	logNumber
INFO	eventType
EntityRemove – For calixRemoveEvent EntityRestore – For calixRestoreEvent	eventLabel

17.3.2 Alarm Correlation & Propagation

All the traps are associated with the C7 shelf, except the cold start trap, based on the calixTrapTl1Aid varbind. If the pattern for this varbind doesn't match the standard pattern, then the traps are associated with the C7 network.

The cold start trap is not associated with any of the calix objects. When this trap is received in IEMS then all the existing alarms for the C7 network, including the shelves, are cleared and an IEMS 609 INFO event is generated that is associated with the C7 network.

All the traps are propagated from the C7 shelf to the C7 node and to the C7 network.

17.3.3 Trap Loss Detection

Whenever IEMS detects a trap loss, i.e. when the sequenceNumber in the trap is greater than the previous sequenceNumber plus one, then IEMS would generate an informational event to notify this trap loss. It is desirable that the user performs a manual resync for the alarms once the count of this alarm increases. Following are the properties of the IEMS event that will be generated

IEMS Event Field	***Value***
Entity	Name of the C7 network as generated by IEMS
logName	IEMS
logNumber	603
severity	INFO
eventType	INFO
eventLabel	Missed Notifications
category	Other
location	C7 network IP address
componentID	IEMS=name of the C7 network as generated by IEMS

text	Notification(s) missed in ML (comma separated missed sequenceNumbers

17.3.4 Sample Northbound Trap Format

Chennai *** CALX301 JAN27 12:50:17 0001 TBL C7 Fault
Location: N1-1
Notification Id: 1
State: Raised
Category: other
Cause: other
Time: Jan 27 12:50:17 2005
Component Id: N1-1-IG1-EOC(farEnd)
Specific Problem: embeddedOperChanDuplexFail
Description: Calix Resync Alarm

The properties for the above trap are

Event Field	***Value***
calixAllAlarmObjIndex	2360320
calixAllAlarmCntIndex	1
calixAllAlarmObjTl1Aid	N1-1-IG1-TMC
calixAllAlarmObjClass	igDataLink(17)
calixAllAlarmSeverity	Critical(3)
calixAllAlarmType	timeSlotMgmtChannelDuplexFail(126)
calixAllAlarmSrvEffect	serviceAffecting(2)
calixAllAlarmLocation	FarEnd(2)
calixAllAlarmDateTime	01-27-2005,12:50:17
calixAllAlarmTimeStamp	15 days, 14 hours, 35 minutes, 28 seconds.

17.4 Menu Handling

The menu for any of the C7 objects will appear on right-clicking any of these objects in the respective maps. Following table shows the menu items for each of these objects.

C7 Network	Managed Object Properties Delete Object and Traces Re-Synchronize Inventory Re-Synchronize Alarms Events And Alarms Launch Calix iMS Launch TL1 Command Line UnManage Update Status
C7 Node	Managed Object Properties Re-Synchronize Alarms Events And Alarms Launch Calix iMS Launch TL1 Command Line
C7 Shelf	Managed Object Properties Re-Synchronize Alarms Events And Alarms Launch Calix iMS Launch TL1 Command Line

The Delete Object And Traces menu will be provided only for C7 network. This is because the C7 Shelf and C7 Nodes are auto discovered from the C7 network. On deleting the C7 network the respective nodes and shelves will also be deleted.

17.5 Configuring Radius Secrets

User will be given the option of configuring the radius secrets. If he configures then it will be applied for both the Calix GUI Launch IP address as well as the Command Line IP address. This will be provided in the C7 Provisioning screen. Only the users that are part of the secadm group would be able to modify the secrets.

Also default radius secret for Calix devices can be configured from Edit --> Default Secrets option in the Security Administration. A new type will be added for Calix in this GUI.

17.6 Launch

The iMS GUI launch as well as the TL1 Command Line launch would be permissible only to the users that belong to the MG domain.

17.6.1 Launch Calix iMS

The following steps are taken in order to launch the Calix IMS

1 User executes the 'Launch Calix IMS' by right clicking the network,node or shelf

2 IEMS requests https://<IEMS IP>/<Calix IP>/func/launchIMS.jnlp passing the userName, password TTL token,IEMS IP, Calix IP and the telnet wrapper command

3 The SSPFS apache proxy forwards the request to Calix and the necessary jars are downloaded to the IEMS client

4 Calix iMS client runs

5 The Calix iMS connects to the IEMS server using SSH and executes the command specified. This is actaully the telnet wrapper that is getting invoked.

6 The telnet wrapper queries the IEMS database using the Calix network IP to determine the actual logon script.

7 The necessary acccess control is performed and security and audit logs are generated.

8 On successful verification the logon script is invoked. The expect script uses the userName and SU token passed to the telnet wrapper to perform an SSH command line port forwarding to the Calix device.

9 IMS GUI becomed operational

Note: The final launch url has to be finalized

17.6.2 Launch TL1 Command Line

The following steps are taken in order to launch the TL1 Command Line

1 User executes the 'TL1 Command Line' by right clicking the network,node or shelf

2 IEMS client obtains two SU tokens

3 Using mindterm IEMS client will SSH to the IEMS server using the userName and an SU Token and execute the telnet wrapper command passing the necessary parameters

4 The telnet wrapper queries the IEMS database using the Calix network IP to determine the expect script.

5 The necessary acccess control is performed and security and audit logs are generated.

6 On successful verification the expect script is invoked. The expect script uses the userName and SU token passed to the telnet wrapper to perform an SSH command line port forwarding to the Calix device.

7 TL1 Command Line is operational

17.6.3 Telnet Wrapper

The telnet wrapper is a generic script that can be used to perform command line proxy to a device. The arguments that have to be passed to the script are

- IP Address of the target device
- Any additional parameters that are required by the actual logon script

Using the passed IP address of the target device the telnet wrapper will query the IEMS DB to obtain the type and version of the device. Using this informationa it would obtain the necessary logon script to be invoked.

Necessary access control is performed to identify if the user has permissions to invoke this operation. Security and audit logs are generated. A new operation named 'Command Line Proxy' will be added in the Security Administration to represent the launches that would require commandline proxy. This would be used to perform access control for the Calix iMS Launch and the TL1 Command Line Launch that would be using the command line proxy.

On successful verification the actual logon script in invoked to login to the device.

The telnet wrapper gets executed as part of the restricted shell. For this purpose during the installation of IEMS server the telnet wrapper would be registered with servman.

Note: As the IP address in the only parameter used to obtain actual logon script there may be a possibility that multiple devices are running in the same IP address. Then currently there is no way to determine the correct logon script. Currently for Calix this may not be a problem since the IP for a C7 network is unique.

17.7 Peformance Collection

In order to perform data collection for Calix, provision will be given in the existing Add Job and Report Job screen to select the Calix objects. In the Device Type list box 'C7 Shelf' option would be provided. On selecting this all the discovered calix shelf objects would be listed in the Device List. The user can select the shelves for which data has to be collected.

To get the data the calix network IP address and the corresponding shelf port will be used.

18: Fault Management (FM): A00009611

18.1 Feature Name

IEMS Keymile Integration

18.2 Fault management strategy

The Fault management interface employed by IEMS for the Keymile UNEM and UMUX devices will be based on SNMP. The design uses the fault data that the UNEM server sends on behalf of the UMUX devices it manages as well as itself in the northbound direction and makes the required conversions into a well-defined format at the IEMS layer. The IEMS does not provide a one-to-one mapping between the Keymile UNEM and UMUX alarms, rather it groups the alarms based on X.733 categories.

18.3 Northbound Events (Alarm and Logs)

18.3.1 Communication Alarms

The UNEM proxy agent sends an alarmRaisedTrap when an event on a UNEM managed entity (i.e. a managed UMUX NE or the UNEM itself) causes a standing communication condition and has immediate or potential impact on the operation or performance of the entity in question.

Table 27: Communication Alarm

19: Fault Management (FM): A00009614

19.1 Feature Name

Tamper-proof Key Storage and Event Generation

19.2 Fault management strategy

IEMS and SSPFS will create logs and alarms for:

- Expiration of certificates, expiration of system and local accounts and the passwords for system and local accounts.
- Attempts to add/modify/delete key material including cryptographic keys, userids, passwords, and SNMP community strings.

19.3 Fault management tools and utilities

The scope of this feature in perspective to fault management is to provide a method of reporting information to the end-user; all tools and utilities for the analysis and handling procedures are controlled and maintained by the SESM Alarm Manager or IEMS.

19.4 Logs

Security logs will be created for both successful and failed attempts to add/ modify/ delete key material. Security log examples are shown below.

19.4.1 Database Password Change Logs

<date and time> PROG=pfsora_set_pwd SRC.USR=<userName> SRC=<clientNetworkID> STAT=Success EVNT.TYPE=USER_ACT_EMS_Prov CMD=Change_password MESSAGE="Database password change for: <user>"

<date and time> PROG=pfsora_set_pwd SRC.USR=<userName> SRC=<clientNetworkID> STAT=Failure EVNT.TYPE=USER_ACT_EMS_Prov CMD=Change_password MESSAGE="Invalid user for database password change: <user>"

<date and time> PROG=pfsora_set_pwd SRC.USR=<userName> SRC=<clientNetworkID> STAT=Failure EVNT.TYPE=USER_ACT_EMS_Prov CMD=Change_password MESSAGE="Invalid machine used for database password change:< networkId>"

19.4.2 Certificate Creation and Change Logs

<date and time> PROG=apache.sh SRC.USR=<userName> SRC=<clientNetworkID> STAT=Success EVNT.TYPE=USER_ACT_Security CMD=CERT_Add MESSAGE="Fresh certificate installed"

<date and time> PROG=apache.sh SRC.USR=<userName> SRC=<clientNetworkID> STAT=Success EVNT.TYPE=USER_ACT_Security CMD=CERT_Mod MESSAGE="Certificate changed"

19.4.3 ssh Key Creation/Change Logs

<date and time> PROG=keygen.sh SRC.USR=<userName> SRC=<clientNetworkID> STAT=Success EVNT.TYPE=USER_ACT_Security CMD=KEY_Mod MESSAGE="ssh key change"

<date and time> PROG=keygen.sh SRC.USR=<userName> SRC=<clientNetworkID> STAT=Failure EVNT.TYPE=USER_ACT_Security CMD=KEY_Mod MESSAGE="Invalid user for ssh key change: <user>"

<date and time> PROG=keygenWithoutBoopTransferr.sh SRC.USR=<userName> SRC=<clientNetworkID> STAT=Success EVNT.TYPE=USER_ACT_Security CMD=KEY_Mod MESSAGE="ssh key change"

<date and time> PROG=keygenWithoutBoopTransferr.sh SRC.USR=<userName> SRC=<clientNetworkID> STAT=Failure EVNT.TYPE=USER_ACT_Security CMD=KEY_Mod MESSAGE="Invalid user for ssh key change: <user>"

19.4.4 IPSec IKE Policy Creation and Deletion Logs

Currently, when an IKE policy is added or deleted, a security log is generated. Those logs will be replaced with logs in the new format, shown below. Also, logs will be generated from the server (utility) level.

<date and time> PROG=ike_policy SRC.USR=<userName> SRC=<clientNetworkID> STAT=Success EVNT.TYPE=USER_ACT_Security CMD=PARAM_Add MESSAGE="IKE rule added. Rule: <IKE rule> "

<date and time> PROG=IKEUtil.java SRC.USR=<userName> SRC=<clientNetworkID> STAT=Success EVNT.TYPE=USER_ACT_Security CMD=PARAM_Add MESSAGE="IKE entry added"

<date and time> PROG=ike_policy SRC.USR=<userName> SRC=<clientNetworkID> STAT=Success EVNT.TYPE=USER_ACT_Security CMD=PARAM_Del MESSAGE="IKE rule deleted. Rule: <IKE rule> "

<date and time> PROG=IKEUtil.java SRC.USR=<userName> SRC=<clientNetworkID> STAT=Success EVNT.TYPE=USER_ACT_Security CMD=PARAM_Del MESSAGE="IKE entry deleted"

<date and time> PROG=ike_policy SRC.USR=<userName> SRC=<clientNetworkID> STAT=Failure EVNT.TYPE=USER_ACT_Security CMD=PARAM_Add MESSAGE="Problem occurred loading IPSec rules on other cluster unit"

<date and time> PROG=ike_policy SRC.USR=<userName> SRC=<clientNetworkID> STAT=Failure EVNT.TYPE=USER_ACT_Security CMD=PARAM_Add MESSAGE="Could not Sync IPSec data”

<date and time> PROG=ike_policy SRC.USR=<userName> SRC=<clientNetworkID> STAT=Failure EVNT.TYPE=USER_ACT_Security CMD=PARAM_Add MESSAGE="IKE rule could not be added. Rule: <IKE rule> ”

<date and time> PROG=ike_policy SRC.USR=<userName> SRC=<clientNetworkID> STAT=Failure EVNT.TYPE=USER_ACT_Security CMD=PARAM_Add MESSAGE="IKE configuration data could not be updated”

<date and time> PROG=ike_policy SRC.USR=<userName> SRC=<clientNetworkID> STAT=Failure EVNT.TYPE=USER_ACT_Security CMD=PARAM_Add MESSAGE="IKE preshared key data could not be updated”

<date and time> PROG=IKEUtil.java SRC.USR=<userName> SRC=<clientNetworkID> STAT=Failure EVNT.TYPE=USER_ACT_Security CMD=PARAM_Add MESSAGE="IKE entry could not be added"

<date and time> PROG=ike_policy SRC.USR=<userName> SRC=<clientNetworkID> STAT=Failure EVNT.TYPE=USER_ACT_Security CMD=PARAM_Del MESSAGE="IKE key could not be deleted. Rule: <IKE rule>"

<date and time> PROG=ike_policy SRC.USR=<userName> SRC=<clientNetworkID> STAT=Failure EVNT.TYPE=USER_ACT_Security CMD=PARAM_Del MESSAGE="IKE rule could not be deleted. Rule: <IKE rule>"

<date and time> PROG=ike_policy SRC.USR=<userName> SRC=<clientNetworkID> STAT=Failure EVNT.TYPE=USER_ACT_Security CMD=PARAM_Del MESSAGE="IKE rules could not be updated"

<date and time> PROG=ike_policy SRC.USR=<userName> SRC=<clientNetworkID> STAT=Failure EVNT.TYPE=USER_ACT_Security CMD=PARAM_Del MESSAGE="IKE key could not be updated"

<date and time> PROG=ike_policy SRC.USR=<userName> SRC=<clientNetworkID> STAT=Failure EVNT.TYPE=USER_ACT_Security CMD=PARAM_Del MESSAGE="IKE configuration data could not be updated"

<date and time> PROG=ike_policy SRC.USR=<userName> SRC=<clientNetworkID> STAT=Failure EVNT.TYPE=USER_ACT_Security CMD=PARAM_Del MESSAGE="IKE preshared key data could not be updated"

<date and time> PROG=ike_policy SRC.USR=<userName> SRC=<clientNetworkID> STAT=Failure EVNT.TYPE=USER_ACT_Security CMD=PARAM_Del MESSAGE="Problem occurred loading IPSec rules on other cluster unit"

<date and time> PROG=ike_policy SRC.USR=<userName> SRC=<clientNetworkID> STAT=Failure EVNT.TYPE=USER_ACT_Security CMD=PARAM_Del MESSAGE="Could not Sync IPSec data"

<date and time> PROG=IKEUtil.java SRC.USR=<userName> SRC=<clientNetworkID> STAT=Failure EVNT.TYPE=USER_ACT_Security CMD=PARAM_Del MESSAGE="IKE entry could not be deleted""

19.4.5 IPSec Key Change Log

Currently, when an IPSec key is changed, a security log is generated. Those logs will be replaced with logs in the new format, shown below. Also, logs will be generated from the server (utility) level.

<date and time> PROG=chg_key SRC.USR=<userName> SRC=<clientNetworkID> STAT=Success EVNT.TYPE=USER_ACT_Security CMD=PARAM_Mod MESSAGE="Preshared key modified"

<date and time> PROG=chg_key SRC.USR=<userName> SRC=<clientNetworkID> STAT=Success EVNT.TYPE=USER_ACT_Security CMD=PARAM_Mod MESSAGE="Attempt to modify Preshared key"

<date and time> PROG=IKEUtil.java SRC.USR=<userName> SRC=<clientNetworkID> STAT=Success EVNT.TYPE=USER_ACT_Security CMD=PARAM_Mod MESSAGE="Preshared key modified"

<date and time> PROG=chg_key SRC.USR=<userName> SRC=<clientNetworkID> STAT=Failure EVNT.TYPE=USER_ACT_Security CMD=PARAM_Mod MESSAGE="Attempt to modify Preshared key"

<date and time> PROG=chg_key SRC.USR=<userName> SRC=<clientNetworkID> STAT=Failure EVNT.TYPE=USER_ACT_Security CMD=PARAM_Mod MESSAGE="Could not change Preshared key"

<date and time> PROG=chg_key SRC.USR=<userName> SRC=<clientNetworkID> STAT=Failure EVNT.TYPE=USER_ACT_Security CMD=PARAM_Mod MESSAGE="IKE preshared key data could not be updated"

<date and time> PROG=chg_key SRC.USR=<userName> SRC=<clientNetworkID> STAT=Failure EVNT.TYPE=USER_ACT_Security CMD=PARAM_Mod MESSAGE="Problem occurred loading IPSec rules on other cluster unit"

<date and time> PROG=chg_key SRC.USR=<userName> SRC=<clientNetworkID> STAT=Failure EVNT.TYPE=USER_ACT_Security CMD=PARAM_Mod MESSAGE="Could not Sync IPSec data"

<date and time> PROG=IKEUtil.java SRC.USR=<userName> SRC=<clientNetworkID> STAT=Failure EVNT.TYPE=USER_ACT_Security CMD=PARAM_Mod MESSAGE="Could not modify preshared key"

19.4.6 IPSec IPSec Policy Creation and Deletion Logs

Currently, when an IPSec policy is added or deleted, a security log is generated. Those logs will be replaced with logs in the new format, shown below. Also, logs will be generated from the server (utility) level.

<date and time> PROG=ipsec_policy SRC.USR=<userName> SRC=<clientNetworkID> STAT=Success EVNT.TYPE=USER_ACT_Security CMD=PARAM_Add MESSAGE="IPSec rule added. Rule: <IPSec rule> "

<date and time> PROG=IPSecUtil.java SRC.USR=<userName> SRC=<clientNetworkID> STAT=Success EVNT.TYPE=USER_ACT_Security CMD=PARAM_Add MESSAGE="IPSec entry added"

<date and time> PROG=ipsec_policy SRC.USR=<userName> SRC=<clientNetworkID> STAT=Success EVNT.TYPE=USER_ACT_Security CMD=PARAM_Del MESSAGE="IPSec rule deleted. Rule: <IPSec rule> "

<date and time> PROG=IPSecUtil.java SRC.USR=<userName> SRC=<clientNetworkID> STAT=Success EVNT.TYPE=USER_ACT_Security CMD=PARAM_Del MESSAGE="IPSec entry deleted"

<date and time> PROG=ipsec_policy SRC.USR=<userName> SRC=<clientNetworkID> STAT=Failure EVNT.TYPE=USER_ACT_Security CMD=PARAM_Add MESSAGE="Problem occurred loading IPSec rules on other cluster unit"

<date and time> PROG=ipsec_policy SRC.USR=<userName> SRC=<clientNetworkID> STAT=Failure EVNT.TYPE=USER_ACT_Security CMD=PARAM_Add MESSAGE="Could not Sync IPSec data”

<date and time> PROG=ipsec_policy SRC.USR=<userName> SRC=<clientNetworkID> STAT=Failure EVNT.TYPE=USER_ACT_Security CMD=PARAM_Add MESSAGE="IPSec rule could not be added. Rule: <IPSec rule> ”

<date and time> PROG=IPSecUtil.java SRC.USR=<userName> SRC=<clientNetworkID> STAT=Failure EVNT.TYPE=USER_ACT_Security CMD=PARAM_Add MESSAGE="IPSec entry could not be added"

<date and time> PROG=ipsec_policy SRC.USR=<userName> SRC=<clientNetworkID> STAT=Failure EVNT.TYPE=USER_ACT_Security CMD=PARAM_Del MESSAGE="IPSec rule could not be deleted. Rule: <IPSec rule>"

<date and time> PROG=ipsec_policy SRC.USR=<userName> SRC=<clientNetworkID> STAT=Failure EVNT.TYPE=USER_ACT_Security CMD=PARAM_Del MESSAGE="Problem occurred loading IPSec rules on other cluster unit"

<date and time> PROG=ipsec_policy SRC.USR=<userName> SRC=<clientNetworkID> STAT=Failure EVNT.TYPE=USER_ACT_Security CMD=PARAM_Del MESSAGE="Could not Sync IPSec data"

<date and time> PROG=IPSecUtil.java SRC.USR=<userName> SRC=<clientNetworkID> STAT=Failure EVNT.TYPE=USER_ACT_Security CMD=PARAM_Del MESSAGE="IPSec entry could not be deleted""

19.5 Alarms

19.5.1 Password Expiration Warning Alarm

```
Component Id     :
cbm850=wnc0s0rv;NODE=wnc0s0rv,CLASS=SEC,SECTYPE=Expiration,OBJECT=password,USER=maint
Severity         : Warn
State            : ISTb
Report Name      : SPFS
Report Number    : 350
Application      : IEMS_EXPIRATION_CHECKER
Algorithm Used   : Algorithm1
Category         : QualityOfService
Event Type       : INFO
Probable Cause   : unspecifiedReason
Description      : password expiry
Specific Problem : The password for user 'maint' will expire in 5 day(s)
User Data        :
Recovery Action  :
Time When Raised : Mon Jan 17 12:57:10 2005
```

19.5.2 Password Expiration

```
Component Id     :
cbm850=<SERVER>;NODE=<SERVER>,CLASS=SEC,SECTYPE=Expiration,OBJECT=password,USER=maint
Severity         : Minor
State            : ISTb
Report Name      : SPFS
Report Number    : 350
Application      : IEMS_EXPIRATION_CHECKER
Algorithm Used   : Algorithm1
Category         : QualityOfService
Event Type       : TBL
Probable Cause   : unspecifiedReason
Description      : password expiry
Specific Problem : The password for user 'maint' has expired
User Data        :
```

```
Recovery Action  :
Time When Raised : <DATE and TIME>
```

19.5.3 Account Expiration Warning Alarm

```
Component Id     :
cbm850=<SERVER>;NODE=<SERVER>,CLASS=SEC,SECTYPE=Expiration,OBJECT=account,USER=maint
Severity         : Warn
State            : ISTb
Report Name      : SPFS
Report Number    : 350
Application      : IEMS_EXPIRATION_CHECKER
Algorithm Used   : Algorithm1
Category         : QualityOfService
Event Type       : INFO
Probable Cause   : unspecifiedReason
Description      : account expiry
Specific Problem : The account for user 'maint' will expire in 5 day(s)
User Data        :
Recovery Action  :
Time When Raised : <DATE and TIME>
```

19.5.4 Account Expiration Alarm

```
Component Id     :
cbm850=<SERVER>;NODE=<SERVER>,CLASS=SEC,SECTYPE=Expiration,OBJECT=account,USER=maint
Severity         : Minor
State            : ISTb
Report Name      : SPFS
Report Number    : 350
Application      : IEMS_EXPIRATION_CHECKER
Algorithm Used   : Algorithm1
Category         : QualityOfService
Event Type       : TBL
Probable Cause   : unspecifiedReason
Description      : account expiry
Specific Problem : The account for user 'maint' has expired
User Data        :
Recovery Action  :
Time When Raised : <DATE and TIME>
```

19.5.5 Certificate Expiration Alarm

```
Component Id     :
cbm850=<SERVER>;NODE=<SERVER>,CLASS=SEC,CLASSTYPE=EXPIRED,SUBTYPE=HTTPSCERT,FILE=<FILE>
Severity         : Minor
State            : ISTb
Report Name      : SPFS
Report Number    : 350
Application      : SSPFS_RES_MON
Algorithm Used   : Algorithm1
Category         : QualityOfService
Event Type       : TBL
Probable Cause   : unspecifiedReason
Description      : certificate expiration
Specific Problem : https certificate has expired
User Data        :
```

```
Recovery Action  :
Time When Raised : <DATE and TIME>
```

19.5.6 Certificate Expiration Alarm Clearing

```
Component Id     :
cbm850=<SERVER>;NODE=<SERVER>,CLASS=SEC,CLASSTYPE=EXPIRED,SUBTYPE=HTTPSCERT,FILE=<FILE>
Severity         : Cleared
State            : InSv
Report Name      : SPFS
Report Number    : 350
Application      : SSPFS_RES_MON
Algorithm Used   : Algorithm1
Category         : QualityOfService
Event Type       : INFO
Probable Cause   : unspecifiedReason
Description      : certificate expiration
Specific Problem : https certificate is no longer expired
User Data        :
Recovery Action  :
Time When Raised : <DATE and TIME>
```

19.6 Related documentation

20: Fault Management (FM): A00009777

20.1 Feature Name

IEMS Mediant 2000 Integration

20.2 Fault management strategy

MG 3200 behaves in a similar way as that of MS2000 devices except for a few new Traps. IEMS will use a similar kind of approach as that of MS2000 to handle the faults form MG 3200 and the additional faults.

SNMP Fault Mapping would remain the same as that of MS2000 for the AcBoard Traps (mentioned on the DID - referenced), coldStart and authenticationFailure traps.

A new Trap named dsx1LineStatusChange will also be forwarded from MG 3200 device. This trap will be mapped to an INFO event in the IEMS.

It is expected that MG 3200 will not send ATM MIB Traps which are a part of MS2000 device.

IEMS will take care of synchronizing the alarms between the IEMS and MG 3200 device. Re-synchronization of Alarms will happen using the IETF MIB support and Notification Log MIB Support available in the MG 3200 device. IEMS assumes that everything relating to this implementation is similar to MS200 device. Re-sync Operation will be invoked under following situations:

1. While Configuring the MG 3200 in to IEMS

2. If IEMS misses a Trap (This will be sequence number based and IEMS assumes that MG 3200 supports alarm retrieval based on its sequence number as in MS2000)

3. When invoking re-synchronization Manually.

4. When ever a coldStart trap is received from the MG 3200

5. During IEMS restart (if the device is present in the db)

The Fault Mapping for the MG 3200 traps are as mentioned below,

Trap Name	OID	LogKey
acBoardFatalError	.1.3.6.1.4.1.5003.9.10.1.21.2.0.1	MGTH301
acBoardConfigurationError	.1.3.6.1.4.1.5003.9.10.1.21.2.0.2	MGTH302

acBoardTemperatureAlarm	.1.3.6.1.4.1.5003.9.10.1.21.2.0.3	MGTH303
acBoardEvBoardStarted	.1.3.6.1.4.1.5003.9.10.1.21.2.0.4	MGTH500
acBoardEvResettingBoard	.1.3.6.1.4.1.5003.9.10.1.21.2.0.5	MGTH300
acgwAdminStateChange	.1.3.6.1.4.1.5003.9.10.1.21.2.0.7	MGTH501
acBoardEthernetLinkAlarm	.1.3.6.1.4.1.5003.9.10.1.21.2.0.10	MGTH307
acActiveAlarmTableOverflow	.1.3.6.1.4.1.5003.9.10.1.21.2.0.12	MGTH309
acOperationalStateChange	.1.3.6.1.4.1.5003.9.10.1.21.2.0.15	MGTH312
acKeepAlive	.1.3.6.1.4.1.5003.9.10.1.21.2.0.16	MGTH313
acNATTraversalAlarm	.1.3.6.1.4.1.5003.9.10.1.21.2.0.17	MGTH314
acEnhancedBITStatus	.1.3.6.1.4.1.5003.9.10.1.21.2.0.18	MGTH600
acPerformanceMonitoringThresholdCrossing	.1.3.6.1.4.1.5003.9.10.1.21.2.0.27	MGTH800
dsx1LineStatusChange	.1.3.6.1.2.1.10.18.15.0.1	MGTH601
coldStart	.1.3.6.1.6.3.1.1.5.1	Will not be sent to NB All prior alarms from the device will be cleared and "Re-sync" operation will be invoked as the device has been reset.
authenticationFailure	.1.3.6.1.6.3.1.1.5.5	Will not be sent to NB

Apart from these, the Trap VarBinds will be parsed and mapped in to event properties as follows,

IEMS Event Property	**Values associated for the Property**
Name	From Trap Varbind: *acBoardTrapGlobalsName*
LogName	MGTH
LogNumber	As specified in Fault Mapping table provided above
Source	From Trap Varbind: *acBoardTrapGlobalsSource*
Unique ID	acBoardTrapGlobalsUniqID

Severity	From Trap Varbind: *acBoardTrapGlobalsSeverity* (based on its value severity will vary) dsx1LineStatusChangeTrap will be given a INFO severity
EventType	FLT for "Raise" events and INFO for "Clear" events
State	Will be based on the severity value. For traps with severity Clear (i.e. severity =5) the state will be "*Clear*" , for all other severity the state will be "*Raise*".
Category	From Trap Varbind: *acBoardTrapGlobalsType* (communications | qualityOfService | processingError | equipment | environmental | other)
Probable Cause	From Trap Varbind: *acBoardTrapGlobalsProbableCause*.
Specific Problem	Value to be provided
Description	From Trap Varbind: *acBoardTrapGlobalsTextualDescription*.
Info1	From Trap Varbind: *acBoardTrapGlobalsAdditionalInfo1*
Info2	From Trap Varbind: *acBoardTrapGlobalsAdditionalInfo2*
Info3	From Trap Varbind: *acBoardTrapGlobalsAdditionalInfo3*
Time	From Trap Varbind: *acBoardTrapGlobalsDateAndTime*

NorthBound SCC2 Log format:

21: Fault Management (FM): A00009822

21.1 Feature Name

General Security Log When the User Logs Out

21.2 Fault management strategy

This feature logs the interaction with Client Session Monitor. A security log is generated when the Client Session Monitor processes the notification of the authentication and client lifetime events. Logs are generated as per the MFT Logging Guidelines(FW3.3 Loggin Service Guidelines).

21.3 Fault management tools and utilities

21.3.1 Faults, Alarms and Logs

The logs output are information only logs.

Security logs are generated for registering successful authentications to the Client Session Monitor. If the Client Session Monitor can not decrypt the information received to register authentication or client lifetime events, an information log is output. Security logs are generated when the clients indicate a successful login and logout.

21.4 Logs

21.4.1 Formats

The format of a security log is

Date Logger Src_usr Src Dst Stat Evnt_type Cmd Message

21.4.2 Explanation

21.4.2.1 Authentication

When the Client Session Monitor interface is called to register an authentication event, the following example log is output to the security log

Mar 31 18:27:48 wnc0y0nr PROG=CSNotifierEngine.java SRC.USR=rtpu SRC=47.142.122.200 STAT=Success EVNT.TYPE=USER_ACT_Security CMD=SESSION_AUTHENTICATED MESSAGE="User Authenticated: SID = 53, LastLoggedIn=Last login: Thu Mar 31 18:28:00 EST 2005 from 47.142.211.68 to 47.142.122.200"

This is an information log only, no action is required.

21.4.2.2 Client start

When the Client Session Monitor interface is called to register a client start event, the following example log is output to the security log:

Mar 31 18:18:10 wnc0y0nr PROG=CSNotifierEngine.java SRC.USR=rtpu SRC=47.142.122.200 STAT=Success EVNT.TYPE=USER_ACT_Security CMD=SESSION_START MESSAGE="doSessionStart Successful: SID = 52"

This is an information log only, no action is required.

21.4.2.3 Client stop

When the Client Session Monitor interface is called to register a client stop event, the following example log is output to the security log:

Mar 31 17:55:19 wnc0y0nr PROG=CSNotifierEngine.java SRC.USR=UNKNOWN SRC=47.142.122.200 STAT=Success EVNT.TYPE=USER_ACT_Security CMD=SESSION_STOP MESSAGE="doSessionEnd Stopped: SID = 42, Reason = User Exit"

This is an information log only, no action is required.

21.4.2.4 Could not decrypt

When the Client Session Monitor interface can not decrypt the information received, the following example log is output to the security log:

Feb 21 18:30:33 comp5iems CSM:class_security.ver02 SRC_USR="rtpo" STAT=”Fail”EVNT_TYPE=”USER_ACT_Security” CMD=”SESSION_Authentication” MESSAGE=”RegisterClientSessionStopCould not decrypt message”

21.4.2.5 Mark done

When the Client Session Monitor receives a request to manually mark an active session as stopped (.e.g. the Mark Done from the GUI is executed), the following example log is output to the security log:

Apr 2 07:17:28 wnc0y0nr PROG=CSNotifierEngine.java SRC.USR=UNKNOWN SRC=47.142.211.35 STAT=Success EVNT.TYPE=USER_ACT_Security CMD=SESSION_STOP MESSAGE="doSessionEnd Stopped: SID = 237, Reason = Admin Marked Done"

21.4.2.6 SID not valid

When the Client Session Monitor interface is called to register a client start or stop event and the session Id is not valid, the following example log is output to the security log:

Feb 21 18:30:33 comp5iems CSM:class_security.ver02 SRC_USR="rtpo" STAT=”Fail”EVNT_TYPE=”USER_ACT_Security”

CMD=”SESSION_Stop” MESSAGE=”RegisterClientSessionStop dropping invalid session stop because SID not valid: SID=5678”

21.4.3 Field descriptions

Table 41: MFT Security Log Fields

Field Name	Type	Max	Max length Syslog	Definition	Required
Date	*Date*		*15 +1*	*ISO 8601 standard format expressed as yyyyMMddhhmmssZ in java.text.Simple-DateFormat notation. This field is expected in all logs*	*Mandatory*
Level	*String*	*16*	*5*	*ASCII expression of logging level and not an integer.*	*Mandatory*
Logger	*String*	*256*		*ASCII expression of the logger name as chosen by the application that does the logging*	*Mandatory*
Src_usr	*String*	*128*	*8+32+3*	*The source user name or identification*	*Mandatory*
Src	*String*	*256*	*39+1*	*The value should contain the source device’s host name, or its IP address and (optionally) the port number.*	*Mandatory*
Process	*String*	*32*	*32+1*	*The value should contain the process name and process ID for the process on the device that generated the message.*	*Mandatory*
Msg	*String*	*1024*	*4+64+3*	*The log message itself.*	*Mandatory*
Stat	*String*	*32*	*5+7+3*	*The state or status of the process. Possible values: Failure, Success, Start or End*	*Mandatory*
Log_type	*String*	*64*	*9+11+3*	*Type of the log message. Possible values: Trace, Application, Security, Exception*	*Mandatory*
Dst	*String*	*256*	*4+39+3*	*The address of the destination in the same format as the source*	*Mandatory*
Doc	*String*	*1024*	*4+64+3*	*The name of the accessed resource*	*Mandatory*
Mid	*String*	*64*	*4+64+3*	*The concept is to log message identifiers instead of actual messages so that the message identifier can be used to look up a language specific form of the message in display tools*	*Mandatory*

Table 41: MFT Security Log Fields

Field Name	Type	Max	Max length Syslog	Definition	Required
Src_offend	*String*	*256*	*11+39+3*	*The address of the originating device generating information which triggered a security log event in the same format as the source*	*Optional*
Dst_usr	*String*	*128*	*8+32+3*	*The destination user name or identification*	*Optional*
Src_mail	*String*	*128*	*9+32+3*	*The source email address*	*Optional*
Vol	*Integer*		*4+10+1*	*The number of bytes*	*Optional*
Vol_sent	*Integer*		*9+10+1*	*The number of bytes sent*	*Optional*
Vol_rcvd	*Integer*		*9+10+1*	*The number of bytes received*	*Optional*
Cnt	*Integer*		*4+10+1*	*The number of articles, files, events*	*Optional*
Cnt_sent	*Integer*		*9+10+1*	*The number of articles, files, events sent*	*Optional*
Cnt_rcvd	*Integer*		*9+10+1*	*The number of articles, files, events received*	*Optional*
Host	*String*	*256*	*5+39+3*	*The name of the host that issues the log*	*Optional*
Host_type	*String*	*64*	*10+32+3*	*The device type from which the log was generated*	*Optional*
Prog_file	*String*	*256*	*10+32+3*	*The name of the program source file from which the log was generated*	*Optional*
Prog_line	*Integer*		*10+10+1*	*The line number of the Prog_source file*	*Optional*
Tty	*String*	*16*	*4+16+3*	*The tty field describes the user's physical connection to the host*	*Optional*
Prot	*String*	*64*	*5+8+3*	*The protocol field specifies the protocol used*	*Optional*
Cmd	*String*	*1024*	*4+64+3*	*The command field is an issued command*	*Optional*
Evnt_type	*String*	*64*	*10+32+3*	*The evnet type field specifies the type or classification of the event*	*Optional*
Src_oid	*String*	*64*	*8+64+3*	*The object identifier is a unique registration number for a device, which will be part of the X.500 directory*	*Optional*

Table 41: MFT Security Log Fields

Field Name	Type	Max	Max length Syslog	Definition	Required
Log_date	*String*		*15+1*	*The original date of the log message. Used when logs are spooled and held before being sent by the logging service to the final destination*	*Optional*

22: Fault Management (FM): A00009893

22.1 Feature Name

Session Server Call Processing Overload

22.2 Fault management strategy

To provide notification of SIP Gateway application overload-related events on the Session Server, new logs and alarms are created by this activity.

22.3 Fault management tools and utilities

22.3.1 Faults, Alarms and Logs

New STGW700 logs are added to cover various scenarios:

- Generated when the Flow Control Rate changes. Note that this log can be generated when the application is not in overload, such as when it is still recovering from an earlier overload state.
- Generated when an IP address is either removed from or re-added to the Access Control List as a result of babbling node isolation.
- Generated when a critical, major or minor CPU occupancy level has been reached.

22.4 STGW700 SIP Gateway Application FCR Change Log

22.12 Related documentation

23: Fault Management (FM): A00011827

23.1 Feature Name

GWC Autonomous SWACT

23.2 Fault management strategy

Two new critical CMT alarms are introduced by this activity. The new alarms identify the following conditions:

- Communication with the GWC's associated gateways is down
- Autonomous SWACT initiated

The first alarm is raised if communication to the GWC's associated gateways is lost. This alarm is cleared when communication is detected with at least one associated gateway. It is also cleared when the GWC is manually or automatically SWACT and is raised again on the newly active unit if communication is still lost with all the associated gateways.

The second alarm is raised when an autonomous SWACT is initiated due to a loss of communication to all the associated media gateways. This alarm indicates that the system has taken action in an attempt to restore communication. This alarm remains active until manually cleared or gets automatically cleared when the GWC is SWACT back to the original active unit.

These alarms are raised in addition to the existing major alarms raised against each gateway that loses communication with the GWC. These alarms are raised prior to the SWACT and cleared as communication is restored to each individual gateway after the SWACT.

23.3 Fault management tools and utilities

23.3.1 Faults, Alarms and Logs

New logs and alarms are generated as tools to identify a potential network outage. The new alarms are:

- GWC 318 - Indicates that an autonomous SWACT has been initiated
- GWC 319 - Indicates that communication with the GWC's associated gateways is down

Along with the alarms the following logs are generated.

- PM181 - GWC SWACT indication with reason

23.4 Logs

23.4.1 Log Title/Log ID: PM181

23.4.1.1 Formats

23.4.1.1.1 NTSTD

Row 1:<Log Header>
Row 2:<Event>
Row 3:<Reason>

23.4.1.2 Example

RTPY09AW PM181 APR27 08:13:20 2502 INFO GWC 7
GWC activity dropped.
Reason: no GW communication

23.4.1.3 Explanation

The existing PM181 is used to report a GWC SWACT has occurred. The format of this log is unchanged.

The Autonomous SWACT activity adds a new reason to the PM181 log to indicate the cause of the autonomous SWACT. In this case, the reason indicates that a SWACT has occurred due to loss of communication with all associated media gateways.

23.4.1.4 Field descriptions

Table 42: Field descriptions

Field	Value	Description
Reason	no GW communication	Communication with all associated media gateways has been lost.

23.4.1.5 Action

This log indicates a problem in the network exists. The Element Managers for related network components should be used to identify the root cause.

BodyText	Autonomous SWACT initiated

23.5.1.2 Example of Alarm in CMT Alarm Manager

Log Name:GWC 318
NE Name:GWC-9-UNIT-0
Alarm Level:Critical
Category:Communications
Alarm Time:15:17:33 16-Nov-2005 EST
Probable Cause:Underlying resource unavailable
SystemUptime:23 hours, 10 minutes, 4 seconds.
Component ID: GWC=GWC-9-UNIT-0;Version=GN91AWJK; Unit=unit_0;Soft-ware=AUTOSWACT
Alarm Description: Autonomous SWACT initiated
Specific Problem: GWC-9-UNIT-0: No communication with associated media gateway(s)

23.5.1.3 Explanation

Description: This log indicates that the autonomous SWACT has been initiated to restore communication with the GWC's associated media gateways.

Severity: Critical

23.5.1.4 Action

The Element Managers for related network components should be consulted to identify failures within the network. This alarm can be manually cleared or gets automatically cleared when the GWC is swact back to the original active unit.

24: Fault Management (FM): A00012183

24.1 Feature Name

Public Key Manager

24.2 Fault management strategy

This document describes the fault management details for all the components of feature A00012183 - IPSEC PKI Support. This document includes the following components:

- PKManager
- GWCEM
- MG9kEM
- SSM

PKManager applies the following strategy:

- Security logs are monitored by security personnel and are first to be notified of impending expiring certificates via logs. Alarms are monitored by maintenance / fault personnel so alarms are last resort signals.
- Security logs are generated for any changes to alarm level or alarm threshold configuration. PKManager certificate generation activity or replacement (distribution) activities, revocation and certificate request generation.
- Generate standard audit logs and SSPFS security logs for all operations that involve security parameters, any key input by an operator, any change to which key to use (imported vs. internally generated).
- Generate major alarm when key generation fails and when certificate distribution fails.
- Generate security logs and escalating alarms as indicated below when certificate approaches its expiration date based on configured major alarm in advance time and configured minor alarm in advance time.
- PKManager will alarm imported certificate expirations only. Expiration of internally generated certificate results in generation and distribution of new certificate to EM. A log is generated not an alarm.
- Clear alarm and generate security log when alarmed certificate is replaced.

Thresholds for alarm level escalation for certificates with impending expiration dates are listed below. The maximum severity for non-call process service affecting certificates is a major alarm. Only certificates whose expiration is impending that are used as part of call control or call processing operations are to escalate to a critical alarm level.

Minor alarm - default threshold is 168 hours. This time is configurable by an operator at the PKGUI.

Major alarm - default threshold is 72 hours. This time is configurable by an operator at the PKGUI but must be less than minor alarm. Highest level for non-call control related certificates i.e. OAM&P, HTTPS

Critical alarm - call control related certificate has expired.

GWCEM applies the following strategy:

GWCEM uses existing SESM fault management structure.

MG9kEM applies the following strategy:

Existing Mg9kEM fault management framework and structure is followed.

SSM applies the following strategy:

The existing Fault Management strategy will apply to the faults for SSM PKI.

24.3 Fault management tools and utilities

PKManager -

The PKI GUI provides the ability for users to browse outstanding alarms generated by the PKManager.

GWCEM -

GWCEM uses existing SESM Alarm Manager to support alarm reporting, alarm history retrieval and browsing.

Mg9kEM -

MG9kEM alarms can be viewed from the Alarm Browser GUI.

SSM -

No special tools required for SSM logs.

24.4 Logs

PKManager Log Section:

Security logs are generated for any changes to alarm level or alarm threshold configuration or replacement (distribution) activities, revocation and certificate request generation. A log is generated when an internally generated certificate expires. Security personnel and are notified of impending expiring certificates via logs.

Security Log location
The Security Log file is stored at:

/var/log/securitylog

24.4.1 PKManager Certificate Generation Logs

No new customer logs.

MG9kEM Log Section:

24.4.4 New MGEM715 audit log

24.4.4.1 Formats

This audit log is generated whenever a user attempts to set or clear the “Use Certificate” indicator for the NE. The audit can be found at: /var/log/auditlog.

Here is an example of the new MGEM715 log:

```
Jun 25 15:07:28 wnc1s04n MGEM: joeuser 704
Clearing use certificate indicator MG9K: co33 [33]
```

Here is the description of the fields:

Table 1 Field descriptions

Field	Description	Example
Date/Time	Date and Time stamp of the log	Jun 25 15:07:28
Host Name	Host machine name	wnc1s04n
Application Name	Specifies the application producing the log.	MGEM
User Name	User name attempting the action	joeuser
Log number	The log number	704
Log Text	Specifies the action attempted and any associated details.	Clearing use certificate indicator MG9K: co33 [33]

24.4.4.2 Action

This log is informational, no action is required.

SSM Log Section:

24.4.5 SSPFS IPsec syslog messages

The Solaris implementation of IPsec automatically sends all failure logs to syslog /var/adm/messages. We do not have control over this. However when the servlet makes any changes to the IPsec security rules, the wrapper scripts will output any attempted changes to /var/log/securitylog.

The Solaris IPsec itself does not seem to generate any failure messages because security could be compromised, however IKE does seem to generate failure messages to syslog.

Sample IKE failure message would look like this.

```
messages.0:Mar 25 15:40:04 wnc1s01h /usr/lib/inet/in.iked: [ID
313954 daemon.notice] IKE_DELETE_PAYLOAD_RECEIVED:
20040325204004:   Source addr:47.142.217.23  Destination
addr:47.142.217.22  SPI:0x0100005d350a7d6c0100006b743037d4
Description:Received delete notification
```

All other possible failure messages that could get generated to syslog is shown below for IKE.

24.5 Alarms

PKManager Alarm Section:

24.5.1 Key/Certificate Generation Failure Major Alarm Log

Log Title:PKM300

24.5.1.1 Formats

NTSTD log format:

RTP2 ** PKM300 SEP23 17:25:00 0401 TBL PKM Certificate generation failure
Location: PKManager=wnc0s0jd
NotificationID: 2000091
State: Raise
Category: Processing Error
Cause: Failed to create X509 certificate
Time: SEP23 17:25:00 2005
Component Id: PKManager
Specific Problem: Failed to create valid certificate for CN, GWC-1 42.45.123.56
Description: Attempt to create and validate an X509 certificate failed.

Table 2 Log Field descriptions

Field	Value
Category	Trouble
Severity	MAJ
LogName	PKM
LogNumber	300
Day Time	mmmdd hh:mm:ss

Table 2 Log Field descriptions

Field	Value
Sequence Number	sequential log number
EventType	TBL
Device ID	PKM
EventLabel	Certificate generation failure
Location	PKManager=hostname
Notification Id	0-65535
Category	Processing error
Cause	Failed to create X509 certificate
Day Time Year	MMMdd hh:mm:ss YYYY
Component Id	PKManager
SpecificProblem	Failed to create valid certificate for CN, GWC-1 42.45.123.56
Description	Attempt to create and validate an X509 certificate failed

24.5.1.2 Explanation

This Log is generated when an attempt to create and validate an X509 certificate has failed.

24.5.1.3 Action

Verify that the PKManager has been installed and initially configured properly. Review installation procedures and initial configuration procedures.

24.5.2 Key/Certificate Generation Failure Alarm Cleared Log

Log Title:PKM300

24.5.2.1 Formats

NTSTD log format:

RTP2 PKM300 SEP23 17:35:00 0401 TBL PKM Certificate generation failure

Location: PKManager=wnc0s0jd
NotificationID: 2000091
State: Cleared
Time: SEP23 17:35:00 2005

Location	PKManager=hostname
Notification Id	0-65535
Category	Processing error
Cause	An X509 certificate has expired
Day Time Year	MMMdd hh:mm:ss YYYY
Component Id	PKManager
SpecificProblem	Expired certificate for CN, GWC-2 42.45.123.16
Description	A certificate used during call control operations has expired

24.5.5.2 Explanation

This Log is generated when an X509 certificate used by a device to authenticate itself during call control operations has expired. The device cannot send or receive call control messages.

24.5.5.3 Action

Verify the status for the device's certificate. if the certificate is PKManager generated certificate and the status is delivery failure. Determine why it has failed to be delivered. If the certificate is an imported certificate and the status is expired. Generate a new certificate for the device, import the certificate, verify the PKManager successfully delivers the certificate.

24.5.6 Certificate Expired Critical Alarm Cleared Log

EventLabel	Last Alarm Before a Certificate Expiration
Location	PKManager=hostname
Notification Id	0-65535
Category	Advanced Warning
Cause	Last alarm before X509 certificate expires
Day Time Year	MMMdd hh:mm:ss YYYY
Component Id	PKManager
SpecificProblem	A certificate will expire soon CN, GWC-2 42.45.123.16
Description	Last forewarning of an impending certificate expiration

24.5.9.2 Explanation

This Log is generated when the expiration date of an X509 certificate has reached the forewarning date for the last alarm before expiration. A previous forewarning date has already passed. The alarm raised at that time has being escalated.

24.5.9.3 Action

1) Check that the in advance of expiration thresholds are configured properly. If not correct these.(ie. they are invalid or set too soon)

2) Verify the status and expiration date for the device's certificate. If the certificate is a PKManager generated certificate and the status is delivery

failure. Determine why it has failed to be delivered. If the certificate is an imported certificate. Generate a new certificate for the device, import the certificate, verify the PKManager successfully delivers the certificate.

24.5.10 Certificate Forewarning of Expiration Major Alarm Cleared Log

EventType	TBL
Device ID	PKM
EventLabel	First Alarm Forewarning of a Certificate Expiration
Location	PKManager=hostname
NotificationID	0-65535
State	Cleared
Day Time Year	MMMdd hh:mm:ss YYYY

24.5.12.2 Explanation

This Log is generated when an X509 certificate has been replaced and delivered successfully to the device after the replaced certificate had triggered the initial forewarning alarm before expiration log.

24.5.12.3 Action

None.

GWCEM Alarm Section:

24.5.13 New Alarm: GWCEM fail to retrieve the cert.

This new alarm will be raised when GWCEM fail to retrieve the certificates from PKBClient.

24.5.13.1 Cause and condition

This scenario will happen if the PKBM is not ready for certificate retrieve or communication errors.

24.5.13.2 Alarm format

The format of this alarm should be:

Network Element: CS2K Config Manager

Alarm Level: Critical

Category: Environment

Alarm Time: <Data and time when the alarm was raised>

Probable Cause: PKBM is not ready for certificate retrieve or communication errors.

Description: GWCEM fail to retrieve the certificates.

24.5.13.3 Response Action

Action is required to check the communication between GWCEM and PKBClient or between PKBClient and PKBroker.

Mg9kEM Alarm Section:

24.5.14 New IPSC 307 - 312 alarms

24.5.14.1 Formats

The following alarms are raised or cleared when the Mg9kEM receives the "nnIpsecCertifFault" trap from the gateway:

Alarm ID	Fault Type Description
IPSC 307	certificate has expired
IPSC 308	certificate is about to expire in 4 days
IPSC 309	certificate has invalid from date
IPSC 310	remote certificate verification failed
IPSC 311	certificate is missing Subject Alt. Name
IPSC 312	time of date not set at the gateway

The above alarms have the same basic format. The fault type received from the "nnIpsecCertifFault" determines the alarm id and fault description. Here is an example of a IPSC 310 alarm:

MSH10_I06BR IPSC 310 JUN2 13:35:15 6550 Major TBL MG9K nnIpsecCertifFault

Location: 1-RM9K-Frame007.Shelf1.Slot13
Notification Id: 57493
State: cleared
Category: Equipment Alarm

Cause: remote certificate verification failed
Time: May 30 15:18:48 2003
Component Id: Card.frame0.shelf1.slot13.ITP
Specific Problem: Ipsec Cert Fault
Description: remote certificate verification failed

Site	Flr	RPos	Bay_id
CARY	***02***	***BB17***	***MG9F 007***

Here are the descriptions of the fields:

24.5.14.2 Action

Correct the reported error condition associated with the alarm. For example, ensure the certificates used are current and valid.

24.5.15 New IPSC 313 alarm

24.5.15.1 Formats

The IPSC 313 alarm is raised when the EM attempts but fails to deliver certificates to the gateway. This alarm is cleared when subsequent delivery attempt succeeds.

Here is an example of a IPSC 313 alarm:

MSH10_I06BR IPSC 313 JUN2 13:35:15 6551 Major TBL MG9KEM CERT DELIVERY ERROR

24.5.15.2 Action

Correct the reported error condition associated with the alarm then retry the download request.

SSM Alarm Section:

No new or changed alarms.

25: Fault Management (FM): A00012199

25.1 Feature Name

MG9K EM CPR Robustness

25.2 Fault management strategy

No additional fault management is provided by this feature.

25.3 Fault management tools and utilities

25.3.1 Faults, Alarms and Logs

Customer logs will be generated whenever EM user opts for “clear persist and discover” functionality. Existing Reinitalize Gateway log will be used.

25.4 Logs

NE606

25.4.1 Formats

Jun 3 02:18:19 wnc0s0pe MG9kEMFactory_9:_V2_~I=MG9K~H=wnc0s0pe~A=MG9kEMFactory_9~S=2663~~ NE606 NONE INFO MG9K Reinitialize Gateway Event Description: Reinitialize Gateway Event Sent Time: Fri Jun 03 02:18:19 EDT 2005

25.4.2 Explanation

Each time user clicks on “Clear persist and discover” button in NE Discovery View, NE606 log will be generated.

25.4.3 Field descriptions

Table 1:

Field	Description	Example
Date/Time	Date and time stamp of the log	Jun 3 02:18:19
Host Name	Host machine name	wnc0s0pe
Application Name	The application producing the log	MG9kEMFactory_9
User Name	MG9K EM User name	rtpu
Log Number	The log number	NE606
Log Text	The action being taken	Reinitialize Gateway Event

25.4.4 Action

This is information log only. No action required.

25.4.5 Associated Operational Measurements or Performance Measurements

None

25.4.6 Additional information

None

25.5 Alarms

None

25.6 Related documentation

None

26: Fault Management (FM): A00012326

26.1 Feature Name

SIP Lines: Authentication and Authorization

26.2 Fault management strategy

The fault management information is provided using LOGs. The LOGUTIL CI provide the access to the LOGs generated. The LOGs are generated based on LOG framework. This feature uses the existing framework to add new LOGs.

26.3 Fault management tools and utilities

26.3.1 Faults, Alarms and Logs

The LOGUTIL CI command is used as tools in the CS2K Core software. All existing tools and utilities are applicable in case of CS2K software.

26.4 Logs (For CS2K only)

The following reasons have bee added in the existing LOG IBN110 as part of this activity.

- AUTH_ACCT_ON_MULTIPLE_SESSIONS: Reason added to LOG IBN110. It is generated when Multiple sessions are present while invoking the Acct/Auth codes flash entry feature.
- BLV_IN_PROGRESS: Reason added to existing LOG IBN110. It is generated if the invoker of ACCT/AUTH or the connected party is being verified by the Operator.

26.5 Log Title/Log ID, Log Reason: IBN110, AUTH_ACCT_ON_MULTIPLE_SESSIONS

26.5.1 Formats

<Switch ID> IBN110 <DATE> <TIME> INFO AUTH_ABUSE
<LEN> <DN> <KEY>
TYPE=AUTH ACCT ON MULTIPLE SESSIONS
<CUSTOMER_GROUP>
<DIGITS_DIALLED>

Example:

```
RTPT08BM      IBN110 SEP29 11:25:56 0425 INFO AUTH_ABUSE
      SS   00 0 00 27    DN 6136215077     KEY  1
       TYPE = AUTH ACCT ON MULTIPLE SESSIONS
       CUSTOMER_GROUP =          IBNTST
```

DIGITS_DIALLED = BB

27: Fault Management (FM): A00012403

27.1 Feature Name

Data Protection for SIP Lines

27.2 Fault management strategy

This feature will inherit all the functionality currently available with legacy implementation.

27.3 Fault management tools and utilities

27.4 Logs

27.4.1 Explanation

Log Title: Aud501

Name: Data Dump for a Local Test Desk (LTD) extension block

Description: The Audit subsystem generates this report when there is a data dump for a local test desk (LTD) extension block. Extension blocks are used to provide additional data space for a call condense block (CCB), which stores only enough data to describe a basic call.

Event type: The log is encountered when performing a test against a line with NDC option.

Please refer to the North American DMS-100 Log Report Reference Manual Volume 2 for a description of this log.

27.4.2 Format

27.4.3 Field descriptions

27.4.4 Action

27.4.5 Associated Operational Measurements or Performance Measurements

27.4.6 Explanation

Log Title: TRMT 22

Name: NDC_IN_EFFECT

Description: Busy Verify fails because there is no double connection call.

Event type: The log is encountered when performing a test against a line with NDC option.

Please refer to the North American DMS-100 Log Report Reference Manual Volume 2 for a description of this log.

27.4.7 Format

28.2.2 Explanation

When TDM Call Recording TRNKINFO criteria is met, if the trunk information is not accessible by SCAI, the new parameter, TRNKINFO, will not be sent and SCAI600 will be generated.

28.2.3 Field descriptions

Table 3: Field descriptions

Field	Value	Description
INFO	MISSING TRNKINFO	TRNKINFO missing from tables listed in log and could not be sent in ICM message also noted in log.
TABLES	GATWYINV/GWEPCARR	Tables where datafill is missing.
TRUNK	CLLI	Incoming trunk
NODENO	Int	Node number of incoming trunk

Table 3: Field descriptions

Field	Value	Description
TRMNO	Int	Term number of incoming trunk
MESSAGE	{DV-CALL-OFFERED-U, DV-CALL-QUEUED-U}	The ICM message for which the log SCAI600 is generated.
LINK ID		Identifies link in table SCAICOMS to which the ICM corresponds. For X.25: Identifies the calling data network address (DNA). Subfields Protocol, MPC, and Link are included. For TCP: Identifies the internet protocol (IP) address.
DEVICE		*For X.25:* MPC # and the Link # *For TCP:* Not Applicable
SCAI GROUP		Identifies the scai group as datafilled in SCAIGRP Table with which the ECM session is established.
LINKSET NAME		Name of linkset.

28.2.4 Action

Check the datafill in tables GATWYINV and GWEPCARR.

29: Fault Management (FM): A00012622

29.1 Feature Name

Platform HW Alarm Reporting

29.2 Hardware alarms

Hardware alarms are reported under new alarm family HWER. Both the server and chassis monitors are capable of raising these alarms. Initially these four new reports are created.

HWER 701 - Cooling Device Malfunction

- For the BC-T platform: HWER 701 is derived from the monitors.blowers table. The alarm is raised when one or more blowers have any state value other than “good”. The alarm severity is Critical if both blowers are faulty, otherwise the severity is Major.
- For the Langley platform: HWER 701 is derived from the tCoolingDevice and tOperationalState tables. The alarm is raised when one or more cooling devices have an operational state not equal to vEnabled. The alarm severity is Critical if any of the faulty cooling devices are unspared, otherwise the severity is Major.

HWER 702 - Power Supply Malfunction

- For the BC-T platform: HWER 702 is derived from the powerModuleHealthTable table. The alarm is raised when one or more power modules have a state not equal to “good”. The alarm severity is Critical if any of the faulty power modules are unspared, otherwise the severity is Major.
- For the Langley platform: HWER 702 is derived from the tPowerSupply and tOperationalState tables. The alarm is raised when one or more power supplies have an operational state not equal to vEnabled. The alarm severity is Critical if any of the faulty power supplies are unspared, otherwise the severity is Major.

HWER 703 - Temperature Threshold Exceeded

- For the BC-T platform: HWER 703 is derived from the bladeTemperaturesTable and bladeTemperatureThresholdsTable tables. The alarm is raised when one or more bladeSensorNTemp probes report a value greater than the corresponding warning threshold. The sensor value table in the report text consists an inequality (“actual > expected” and the sensor name for each sensor out of spec. The alarm severity is Major.
- For the Langley platform: HWER 703 is derived from the tTemperatureProbe table. The alarm is raised when one or more

temperature probes report that a55TemperatureStatus is any value other than vOk. The sensor value table in the report text consists of the a55TemperatureStatus and the a55TemperatureProbeDescription variables for each sensor out of spec. The alarm severity is Major

HWER 704 - Processor Malfunction

- For the BC-T platform: HWER 704 is not reported for BC-T.
- For the Langley platform: HWER 704 is derived from the tProcessor and tOperationalState tables. The alarm is raised when one or more processors have an operational state not equal to vEnabled. The alarm severity is Major.

29.3 Alarm templates

The template for HWER 701 appears in Table 1. The device state table consists of two columns containing the device name and the device state as reported through the relevant MIB. The severity is Major if the malfunction results in loss of redundancy, Critical if it results in total loss of cooling.

Table 1: HWER 701 Report Format

Property Name	Property Value
Report Number	HWER 701
Description Text	Cooling Device Malfunction <device-state-table>
Clear Condition	All cooling devices are functioning normally.
Corrective Action	Replace defective cooling devices.

The template for HWER 702 appears in Table 2. The device state table consists of two columns containing the device name and device state as reported through the relevant MIB. The severity is Major if the malfunction results in loss of redundancy, Critical if it results in loss of power.

Table 2: HWER 702 Report Format

Property Name	Property Value
Report Number	HWER 702
Description Text	Power Supply Malfunction <device-state-table>
Clear Condition	All power supplies are functioning normally.

Table 2: HWER 702 Report Format

Property Name	Property Value
Corrective Action	Replace defective power supplies.

The template for HWER 703 appears in Table 3. The sensor value table consists of two columns containing the problem text and description of each sensor for which the reported value exceeds the threshold. Sensors reporting normal values are not shown.

Table 3: HWER 703 Report Format

Property Name	Property Value
Report Number	HWER 703
Description Text	Temperature Threshold Exceeded <sensor-value-table>
Clear Condition	All temperature sensors report normal values.
Corrective Action	Restore effective cooling for this equipment.

The template for HWER 704 appears in Table 4. The device state table consists of two columns containing the device name and device state as reported through the relevant MIB. The severity is Critical.

Table 4: HWER 704 Report Format

Property Name	Property Value
Report Number	HWER 704
Description Text	Processor Malfunction <device-state-table>
Clear Condition	All processors are functioning normally.
Corrective Action	Replace defective processors.

30: Fault Management (FM): A00012735

30.1 Feature Name

Session Server Fault Handling Enhancements

30.2 Fault management strategy

This section provides information on logs and alarms for the features under the Session Server Fault Handling elements. This activity builds upon the fault management services and software of NCGL Platform Manager in A00004005 introducing support for managing some new fault conditions.

30.3 Fault management tools and utilities

No new tools and utilities are introduced by this activity. The current approach to fault management applies.

30.4 Session Server Fault Handling Logs and Alarms.

This section describes the logs and alarms introduced by this activity.

The logs and alarms can be viewed via the web browser interface on the Succession Communication Server 2000 NCGL Platform Manager - via Alarms panel and Customer Logs panel.

This activity introduces the following logs:

30.4.1 Fault Handling Alarms/Logs

- XTS382, XTS682: Chassis Sensor Fault
- XTS383, XTS683: Power Supply Sensor Fault

30.4.2 Field Description

The new logs follow the existing XTS log format and are composed of the fields shown in the table given below.

Field	Value	Description
Time and Date Stamp	Alphanumeric	The time and date the log was generated
Hostname or Host ID	Alphanumeric	The hostname or host id of the unit that generated the log.

Process Name	Alphanumeric	Identifies the NCGL or application process that generated the report.
Log Number	Alphanumeric	The component prefix and number of the log
Severity	Alphanumeric	The log severity (may be related to alarm severity)
Event Type	Alphanumeric	The type of trouble recorded
Label	Alphanumeric	Title label for the log.
Component Id	Alphanumeric	The component id is the unit hostname.
Description	Alphanumeric	Description of the log including location information when applicable and sensor details.

Here is an example platform /var/log/custlog entry:

Dec 9 06:22:41 NGSS0 alarmd: XTS382 MAJOR FLT Chassis Fault Detected NGSS0 Chassis sensor alarm raised. 2 sensors are reporting failures.

Here is an example alarm entry from the platform web pages:

Type: Equipment

ID: Threshold Crossed

Date: Friday December 8, 2005 02:39:06 PM

Host: NGSS1

Description: Chassis sensor alarm raised. 1 sensor is reporting a failure.

Here is a sample from an IEMS resident log file.

Dec 9 15:00:35 rtpo-cmt IEMS: _V2_~I=~H=rtpo-cmt~A=IEMS~S=1017~~ XTS383 MAJOR FLT XTS Fault Location: RTPOSST0-Unit-1;172.18.164.14 Notification Id: 17^M State: Raised^M Category: equipment Cause: thresholdCrossed(51) Time: Dec 09 15:00:19 2005 Component Id: RTPOSST0_1 Specific Problem: Description: Power supply alarm raised in module A. 1 sensor is reporting a failure.

Dec 9 15:07:00 rtpo-cmt IEMS: _V2_~I=~H=rtpo-cmt~A=IEMS~S=2218~~ IEMS607 NONE INFO IEMS Autogenerated Clear^M Location: RTPOSST0-Unit-1;172.18.164.14^M NotificationID: 17^M State: Clear^M Time: Dec 09 15:07:00 2005^M Specific Problem: ^M Category: equipment^M Component Id: RTPOSST0_1^M Description: Raised log: XTS383; Power supply alarm raised in module A. ^M 1 sensor is reporting a failure.

30.4.3 Fault Handling Alarms/Logs

The fault handling elements produces the following alarm and logs.

30.4.3.1 XTS382

30.4.3.1.1 Explanation When there is a sensor reports a failure condition, an XTS382 alarm is raised on the Alarms panel of the NCGL Session Server unit. An XTS382 log is generated.

30.4.3.1.2 Format Alarm/Log: Power Supply Failure Alarms/Logs

Type: Equipment

ID: equipmentMalfunction

Event: FLT

Label: Chassis Sensor Fault

Severity:

- Minor: a single, minor sensor fault has been detected by the hardware sensors for the unit's power supplies
- Major: either multiple, minor or at least one major sensor fault has been detected
- Critical: not currently generated

30.4.3.1.3 Field descriptions See section 30.4.2 Field Description.

30.4.3.1.4 Action On the NCGL Platform Manager web pages view the Sensor Information, System Information panels. Examine existing alarms and associated logs.

Inspect the environmental conditions of the unit.

If the Sensor Status field of the Sensor Information page indicates that presence is not detected, confirm that all drives and FRUs are correctly seated and latched into the chassis.

Consider chassis replacement or contact technical support if the condition continues.

30.4.3.1.5 Associated Operational Measurements or Performance Measurements

None.

30.4.3.1.6 Additional information None.

30.4.3.2 XTS682

30.4.3.2.1 Explanation When XTS382 Chassis Sensor fault condition and alarm is cleared. An alarm trap and INFO log XTS682 are generated.

30.4.3.2.2 Format Alarm/Log: Power Supply Alarm Cleared

Type: Equipment

ID: equipmentMalfunction

Event: INFO

Label: Power Supply Alarm Cleared

Severity: None

30.4.3.2.3 Field descriptions See Section 30.4.2 Field Description.

30.4.3.2.4 Action None.

30.4.3.2.5 Associated Operational Measurements or Performance Measurements None.

30.4.3.2.6 Additional information None.

30.4.3.3 XTS383

30.4.3.3.1 Explanation When there is one or more sensors report failure conditions with either power supply module A or B, an XTS383 alarm is raised on the Alarms panel of the NCGL Session Server unit.

30.4.3.3.2 Format >> Alarm/Log: Fans Failure Alarms/ Logs

----> Type: Equipment

---->ID: equipmentMalfunction

---->Event: FLT

---->Label: Fans Problem

---->Severity: Minor, Major

30.4.3.3.3 Field descriptions

See Section 30.4.2 Field Description.

30.4.3.3.4 Action

On the NCGL Platform Manager web pages view the Sensor Information, System Information panels. Examine existing alarms and associated logs.

Inspect the environmental conditions of the affected power supplies in the unit.

If the Sensor Status field of the Sensor Information page indicates that presence is not detected, confirm that the power supply module is correctly seated and latched into the chassis.

Consider chassis replacement or contact technical support if the condition continues.

If the alarm is critical, contact Nortel Networks support personnel for assistance.

30.4.3.3.5 Associated Operational Measurements or Performance Measurements

None

30.4.3.3.6 Additional information

None

30.4.3.4 XTS683

30.4.3.4.1 Explanation

When XTS383 Minor/Major Power Supply Sensor Fault alarm condition is cleared. a INFO alarm/log XTS683 is generated.

30.4.3.4.2 Format

>>Alarm/Log: Fans Problem Alarm Cleared

---->Type: Equipment

---->ID: EquipmentMalfunction

---->Event: INFO

---->Label: Power Supply Condition Cleared

---->Severity:None

30.4.3.4.3 Field descriptions

See Section 30.4.2 Field Description

30.4.3.4.4 Action

None

30.4.3.4.5 Associated Operational Measurements or Performance Measurements

None

30.4.3.4.6 Additional information

None

31: Fault Management (FM): A00012905

31.1 Feature Name

ERS8600 Alarm Mapping Correction in IEMS

31.2 Fault management strategy

The ERS8600 faults descriptions in IEMS was outstanding until now. In SN09-FF feature A00012905, several ERS8600 faults severities were changed. This feature is intended to enhance the existing mapping of the ERS8600 events and provide the associated customer documentation in the "Carrier Voice over IP Fault Management Logs Reference manual (NN10275-909)" and the "Carrier VOIP OSS Guide Advanced Feature Guide" for ERS8600 faults.

In this document, all the ERS8600 faults will be described in the following.

31.3 Fault management tools and utilities

In a Carrier VOIP CS2000 central office the ERS8600s should be configured to forward their SNMP traps to the IEMS. The IEMS mediates these SNMP traps converting them into normalized customer log events. This normalization process provides the following:

- Converts the ERS8600 SNMP TRAPs into an alarm raise, alarm clear or an info customer log event.

- These normalized events are forwarded to the IEMS northbound interfaces (SCC2, NTstd, custlog, SNMP). Please refer to the "OSS Guide Advance Feature Guide" (PLN-i09-OSS) for a description of these northbound interfaces.

- Correlates these incoming SNMP TRAPs to a ERS8600 configured in the IEMS inventory.

- Persists these normalized events in the IEMS server allowing the craftperson to view them in the IEMS event browser (which provides both a real-time and historical view of all ERS8600 normalized events) and alarm browser (which provides a real-time view of the incoming ERS8600 alarms).

31.4 ERS8600 alarm clearing policy

When working with the ERS8600 faults in the IEMS it is important to understand how these alarms are cleared. The ERS8600 does not support an interface that allows a northbound manager (i.e, the IEMS) the ability to resync with the ERS8600 alarm states. In addition, the ERS8600 does not support a direct mapping between all of its alarm raise events and clear events it sends.

As a result the ERS8600 alarms can be cleared one of six ways from the IEMS alarm view (i.e., the IEMS alarm browser). These include:

- The ERS8600 sends a clear for an associated alarm that it previously raised. The IEMS performs the correlation between raise and clear and removes the associated alarm form the IEMS alarm view. It is important to note that the ERS8600 does not send an explicit clear event for all the ERS8600 alarms that are raised.

- Performing a manual clear in the IEMS alarm browser. This allows a craftperson to remove an alarm in the IEMS view that is no longer active in the ERS8600 (Note: This only clears the alarm in the IEMS).

- Performing a manual delete in the IEMS alarm browser. This allows a craftperson to remove an alarm in the IEMS view that is no longer active in the ERS8600 (Note: This only clears the alarm in the IEMS).

- IEMS Age based clearing Policy: This mechanism utilizes an automated alarm ageing clearing policy in the IEMS server. The alarm clearing job (refer to the 'administration tools | jobs | alarm clearing policy' in the IEMS JWS client) clears all alarms from the IEMS view for the configured device types based upon the alarms age. By default this policy is configured to clear all alarms that are older then 7 days. In addition, by default, the ERS8600 device type is included in this policy. This policy ensures that ERS8600 alarms do not continue to accumulate in the IEMS alarm view (Note: This only removes the alarm in the IEMS).

- IEMS NB SNMP Agent clear request. (Note: This only removes the alarm in the IEMS).

- Executing the /opt/nortel/iems/current/bin/purgeTempData.sh script on the IEMS server. Please note that this clears all alarm, event and performance data history for all devices on the IEMS server.

31.5 Alarms brief overview

This table contains all the ERS8600 alarms in the IEMS side. They will be described in the following sections.

Alarm Index	Alarm Name	Trap OID (v2c)	MDM Fault Code (Hex)	IEMS Event (severity)	SN09 IEMS log	Correction in IEMS SN09-FF
1	risingAlarm	1.3.6.1.2.1.16.0.1	S C1220008	minor	PP 310	
2	fallingAlarm	1.3.6.1.2.1.16.0.2	S C1220008	clear	PP 311

16	rcnAggLinkDown (PP371)	rcnAggLinkUp (PP370)
17	rcnbgpBackwardTransition (PP369)	rcnbgpEstablished (PP368)

About the alarm clearing rule, IEMS judges it from the severity level. If the severity level is 5, IEMS considers it is a clear alarm. For those alarms without explicit corresponding clear alarm, IEMS will clear them when it reaches the age time or the alarms are cleared manually.

31.6 Alarm (PP310)

risingAlarm, Trap OID is1.3.6.1.2.1.16.0.1

31.6.1 Explanation

The PP310 alarm signifies that is generated when an alarm entry crosses its rising threshold and generates an event that is configured for sending SNMP traps.

This alarm is set when an alarm threshold is crossed. The text of the alarm message identifies the alarm value that triggered the alarm, the item that was being monitored, and the threshold level.

A rising alarm indicates that the alarm is triggered when the alarm value rises above the threshold value.

A falling alarm indicates that the alarm is triggered when the alarm value falls below the threshold value.

The falling alarm clears the rising alarm.

31.6.2 Action

Please refer to ERS8600 Fault Management document.

31.6.3 Corresponding Clear Log

PP311.

31.6.3.1 Format

31.6.3.2 NTSTD

Not available.

31.6.4 Field descriptions

This alarm has no selected fields.

31.6.5 Associated Operational Measurements or Performance Measurements

This alarm has no associated OM registers.

31.6.6 Additional information

This alarm requires no additional information.

31.7 Alarm (PP311)

fallingAlarm, Trap OID is1.3.6.1.2.1.16.0.2

31.7.1 Explanation

The PP311 alarm signifies that is generated when an alarm entry crosses its falling threshold and generates an event that is configured for sending SNMP traps.

31.7.2 Action

Please refer to ERS8600 Fault Management document.

31.7.3 Corresponding Clear Log

This alarm has no corresponding clear alarm.

31.7.3.1 Format

31.7.3.2 NTSTD

Not available.

31.7.4 Field descriptions

This alarm has no selected fields.

31.7.5 Associated Operational Measurements or Performance Measurements

This alarm has no associated OM registers.

31.7.6 Additional information

This alarm requires no additional information.

31.8 Alarm (PP313)

coldStart, Trap OID is1.3.6.1.6.3.1.1.5.1.0

31.8.1 Explanation

The PP313 alarm signifies that the SNMPv2 entity, acting in an agent role, is reinitializing itself and that its configuration may have been altered.

31.8.2 Action

Please refer to ERS8600 Fault Management document.

31.8.3 Corresponding Clear Log

This alarm has no corresponding clear alarm.

31.8.3.1 Format

31.8.3.2 NTSTD

zsups3f8 PP313 OCT26 01:28:48 0009 INFO PP Fault
Location: ERS8600_RTP;47.142.106.1
State: None
Category: operator
Cause: Agent reinitialized itself with default settings
Time: Oct 26 01:28:48 2005
Component ID: ERS8600=47.142.106.1
Specific Problem: Agent reinitialized itself with default settings
Description: A coldStart trap signifies that the snmp agent is reinitializing itself with default settings.
.1.3.6.1.6.3.1.1.4.1.0: .1.3.6.1.6.3.1.1.5.1.0
.1.3.6.1.2.1.1.3.0: 40 days, 16 hours, 52 minutes, 18 seconds.

31.8.4 Field descriptions

Table 5: Field descriptions

Field	Value	Description
Location	IP address	Indicates the IP address of the event source.
Time	character string	Indicates the date and time of the alarm.
Component Id	character string	Indicates the IP address and node ID of the device.

31.8.5 Associated Operational Measurements or Performance Measurements

This alarm has no associated OM registers.

31.8.6 Additional information

This alarm requires no additional information.

31.9 Alarm (PP315)

warmStart, Trap OID is1.3.6.1.6.3.1.1.5.2.0

31.9.1 Explanation

The PP315 alarm signifies that the SNMPv2 entity, acting in an agent role, is reinitializing itself such that its configuration is unaltered.

31.9.2 Action

Please refer to ERS8600 Fault Management document.

31.9.3 Corresponding Clear Log

This alarm has no corresponding clear alarm.

31.9.3.1 Format

31.9.3.2 NTSTD

zsups3f8 PP315 OCT26 01:28:48 0011 INFO PP Fault

31.15 Alarm (PP324)

rcnChasFanDown, Trap OID is1.3.6.1.4.1.2272.1.21.0.7

31.15.1 Explanation

The PP324 alarm signifies that the SNMPv2 entity, acting in an agent role, has detected that the rcChasFanOperStatus object for one of its power supply unit is about to transition into the down state.

This trap is set when the fan goes down. The alarm is cleared when the fan comes up again.

For 3 slot and 6 slot chassis, there is a single fan.

A 10 slot chassis has two fans; one that cools the top 5 slots and the other that cools the bottom 5 slots.

The chassis will overheat even if a single fan goes down. So both the fans are needed for the chassis to be operational.

zsups3f8 * PP360 OCT26 01:28:48 0037 TBL PP Fault
Location: ERS8600_RTP;47.142.106.1

State: Raised
Category: environmental
Cause: Virtual OSPF neighbor state change
Time: Oct 26 01:28:48 2005
Component ID: ERS8600=47.142.106.1; ospfRouterId=47.142.106.70
Specific Problem: Virtual OSPF neighbor state change
Description: Virtual neighbor state change: RouterId = 47.142.106.70 (NbrArea = 47.154.182.56 NbrRouter = 47.154.182.1 State = loading)
.1.3.6.1.6.3.1.1.4.1.0: .1.3.6.1.2.1.14.16.2.3
.1.3.6.1.2.1.1.3.0: 40 days, 16 hours, 52 minutes, 18 seconds.

31.51.4 Field descriptions

Table 48: Field descriptions

Field	Value	Description
Location	IP address	Indicates the IP address of the event source.
Time	character string	Indicates the date and time of the alarm.
Component Id	character string	Indicates the IP address, ospfRouterId and node ID of the device.
Severity	minor/clear	Indicated the alarm severity. It is determined by the State value.
State (In the Description)	character string	State = “down”, “attempt”, “init”, “twoWay”, “exchangeStart”, “exchange”, “loading”, indicates warning alarm. State = “full”, indicates clear alarm.

31.51.5 Associated Operational Measurements or Performance Measurements

This alarm has no associated OM registers.

31.51.6 Additional information

This alarm requires no additional information.

31.52 Alarm (PP361)

ospfIfConfigError, Trap OID is1.3.6.1.2.1.14.16.2.4

31.52.1 Explanation

The PP361 alarm signifies that a packet has been received on a non-virtual interface from a router whose configuration parameters conflict with this router's configuration parameters. Note that the event option Mismatch should cause a trap only if it prevents an adjacency from forming.

31.52.2 Action

Please refer to ERS8600 Fault Management document.

31.52.3 Corresponding Clear Log

This alarm has no corresponding clear alarm.

Configuration Management List (CNs)

Introduction

This chapter describes impacts to configuration management, such as hardware/software requirements, data schemas, and service orders for the features planned for this release. Only those features with configuration-management impacts are listed.

Featid	Title
A00007217	ITRANS Media Proxy Selection
A00007544.AB06	NCAS Link and SIP NMS Support based on RFC 3842
A00007547.AB12	SIP Lines Core Call Processing Support
A00007814.V3	REX testing for MG9000 (Media Gateway 9000) from Element Manager
A00008090.AA14	SBA: Alternate Scheduled Closure of Billing Files
A00008522	SESM Support for SIP Lines
A00008601.AA03	IW-SPM-IP Fully Provisionable Codec Lists for G.711/G.729
A00008629.AA08	GEM-II AAL2 IW-SPM SN09 Core Preparation Work
A00009011.AA02	TOPS Internet Protocol (IP) Security Enhancements
A00009012.AA10	TOPS OSSAIN Service Enhancements
A00009013.AA09	TOPS announcements via UAS/AMS
A00009036.AA07	Table HOMELRN Option SITE Expansion
A00009078.AA11	ICM Dual CTI
A00009085.AA06	ACD & ICM Capacity Expansion

A00009091.AA33	Equal Access (EA) LPIC Privilege Routing
A00009129.AA11	Controlled Hot Swact
A00009189	SESM Support for 64 Character FQDN
A00009190.AA23	Universal Carrier Protocol (UCP) C7UPTMR Enhancements
A00009200.AA14	Packet Trunking Trunk Test: Milli-watt Tone Swap
A00009207.AA05	DPT Trunk Testing Support
A00009218	MG9K Data Audit Robustness
A00009227	NPM Robustness
A00009235.AA09	TLS for SIP
A00009280.V3	MG9K Line Circuit Enhancements
A00009282	Emergency Stand Alone (ESA) Multiple Level Precedence and Preemption (MLPP) for MG9KEM
A00009339.AA16	Packet Cable T.38 Support
A00009375 & 9376	CICM Third-party Corrective Content Patching & CICM Selective Binary Component Patching
A00009463.AA08	CBM to Support Centralized User Authentication with IEMS
A00009470.AA09	SDM to support Security Assertion Markup Language (SAML) NSSwitch client
A00009520	Trunk blocking tools for MG4K and GWC on SN09
A00009532	Support host to host tunnels for all northbound OSS connections
A00009576.AC04	H.323 RASLess Provisioning
A00009611	IEMS Keymile Integration
A00009655	BladeCenter-T RTP Media Portal
A00009822	General Security Log When the User Logs Out
A00009839	Ability to apply patches during ESUP upgrade
A00009840	CBM IPSec Northbound Interface

A00009890	Provisioning for Media Proxy insertion for SIP lines
A00010303	Map Level Service Control Application Programming Interface
A00010742	GWC EM Enhancements to Support SIREN
A00010880	ABI SMU Support
A00011167	MG9KEM Central Userid and Password Support
A00011281	MS2000 IPSec Configuration via IEMS
A00011827.AB14	GWC Autonomous SWACT
A00012001.V5	IEMS Call Server 2000 SIP Integration
A00012183	Public Key Manager
A00012198.V2	GLC12 Coin Card Support from EM
A00012199	MG9K EM CPR Robustness
A00012215	Global Line Card Field Programmable Gate Array
A00012223, A00012217, A00012225	SESM Support for SIP Lines, Part 2
A00012526.AA12	TDM Call Recording Feature
A00012527.AA21	Provisioning of CS2K trunks on GW and Carrier basis
A00012570	Disabling Non-secure Network Services in SSPFS
A00012889	Passphrase Protected Keys for SSH

1.1 Feature Name

ITRANS Media Proxy Selection

1.2 Initial Configuration

N/A

1.3 Office/Subnet parameters (OP/SP) (CM & SESM)

N/A

1.4 Upgrade Considerations

There are two sets of upgrade consideration. Upgrade of a GWC to SN09 and the upgrade of the CS2000 Management Tool Element manager to SN09.

For the CS2000 MT the impact is as follows:

On an upgrade of the CS2000MT to SN09, Media Proxies already provisioned on a GWC (as GWC Media Proxies) will remain as GWC default media proxies, whether or not the GWC is upgraded to SN09. If a GWC has been upgraded to SN09, The GWC media proxies will be sent to the GWC with an additional field indicating that they are GWC media Proxies.

The Media Proxies already on the system can be used after upgrade to create Media Proxy Groups regardless of whether they have been allocated to a GWC as a GWC Media Proxy.

One effect of an upgrade of the CS2000MT to SN09 will be to change the ID of all Media Proxies to use the new global ID structure. The Global ID is a unique ID across call servers representing a Network element. Each type of network element (eg Media Proxy) is allocated a set range of available IDs. The upgrade will convert the ID of any existing Media Proxies and Network Zones to the new format. New VPNs that are added will also use the new global ID format.

On the CS2000 MT User interface, the result of the upgrade will be to display the new gui panels for Media Proxy Groups and associated actions.

Upgrades of the CS2000MT from SN07 and SN08 to SN09 will be supported.

For a GWC upgrade the impact is as follows:

Once the CS2000 MT has been upgraded, the user can then begin to provision MP Groups and associate them with Network Zones (in order that the media Proxy Groups be used during call processing) as appropriate. However these changes will only be added to GWCs that are at SN09. GWCs with older loads will not be sent the Media Proxy Group or VPN data.

If a GWC is upgraded to SN09 on a newly upgraded SN09 CS2000MT, the Itrans NAT and LBL Network Zones will be sent to the GWC(s) with a "none" or "0" value for the Media Proxy group and VPN fields.

The upgrade should not have any additional impact on call processing.

SN07 and SN08 based GWCs will not support the Media Proxy Group and VPN functionality.

1.4.1 Dump and Restore (CM)

1.4.2 Element Management Upgrade

1.4.3 Downgrade impact

If the upgrade of a GWC to SN09 is aborted, the Media Proxy Group and VPN data will be removed from the GWC and all Media Proxies will revert back to being GWC default Media Proxies only.

1.5 Data schema (DS) (CM, MIBS, RDB)

1.5.1 MIB Interface

The mib is used to communicate provisioning information to the GWC. The design of the mib takes into account restrictions imposed by GWC architecture and SESM architecture.

This section describes the changes that will be made to the Mibs in order to enable the feature functionality. The Mibs that will be changed are the GWC-MIDDLE-BOX-MIB and the GWC-MEDIA-PROXY-MIB.

1.5.1.1 GWC-MIDDLE-BOX-MIB

GWC-MIDDLE-BOX-MIB adds two new fields:

- The **MiddleBoxMPGroupId** field is used to identify the preferred MediaProxyGroup for the middle box. The value of this field is used to index into the MediaProxyGroup table on the GWC. A GWC can have a maximum of 8 groups and there may be up to 512 MP groups in the system. The design component determines what range the above field can take in the mib.
- The **MiddleBoxVpnGID** field represents a global Identifier indicating the VPN that the MiddleBox is part of (applies to NATs only). If this field is set to 0, it means that the NAT does not belong to any provisioned or shared VPN.

1.5.1.2 GWC-MEDIA-PROXY-MIB

GWC-MEDIA-PROXY-MIB adds two new fields.

MediaProxyInGWCGroup is used to indicate whether or not the Media proxy has been provisioned as a media Proxy on the GWC. This field can be set to Y or N. A value of Y indicates that the Media Proxy belongs to the group of default media Proxies on the GWC (it may or may not be in one or more MP groups as well). A value of N means that the Media Proxy is not part of the group of default media Proxies but that it must be in at least one MP group because it is present on the GWC.Service Orders (SO) (CM & SESM).

MediaProxyGlobalID This fields represents a unique global ID for a specific MediaProxy within the system.

There is also a new table added to the GWC-MEDIA-PROXY-MIB. This is a new table to convey MediaProxy Group Data to the GWC. The new structure is defined as follows:

mediaProxyGroupTable - table containing data on MediaProxyGroups. Each Entry in the table consists of a sequence of the following sets of fields:
mediaProxyGroupID - The global id of the Media Proxy Group.
mediaProxyID - The global id that identifies a Media Proxy in the Media Proxy Group.

mediaProxyGroupEntryStatus - the entry status of the row.

The table has been designed to accommodate any number of media proxies in a group, however, the number of media proxies in a group in SN09 is restricted to a maximum of 5.

1.8.1.1 GUI name:AddMPGroup

Add Media Proxy Group Dialog

1.8.1.1.1 Functional description

The purpose of this Dialog is to add a new Media Proxy group and add up to five Media Proxies to the group. Only previously provisioned Media Proxies can be added to a Media Proxy group. A Media Proxy can be added to more than one group.

There are a maximum of 512 Media Proxy Groups allowed in the system. A Media Proxy group may be selected from the left hand list and the “Add>>” button used to transfer it to the right hand list of selected media Proxies for the Group.

A Media Proxy group may be selected from the right hand list and the “<<Rem” button used to transfer it to the list of available Media Proxies on the left.

A name must be entered in the dialog box at the top. This should be a unique and meaningful name.

When an appropriate number of Media Proxies have been selected and the name filled in, the ok button can be selected.

1.8.1.1.2 GUI usage and implications

This gui is used to create a new group containing a subset of the Media Proxies on the system. The group can then be allocated to an ITRANs Middlebox and

in turn associated with a gateway. When this happens the GWC for the gateway is provisioned with details of the Media Proxies in the group.

A group must have been provisioned using this dialog before an ITRANs Middlebox can be associated with a group.

The Media Proxies must have been provisioned on the system prior to this GUI being invoked. If this is not the case then no Media Proxies will be available to be added to the group.

This is launched using the CS2000 Management Tools interface

1.8.1.1.8 Supplementary information

NONE

1.8.1.2 GUI name: ChangeMPGroup

Change Media Proxy Group Dialog

1.8.1.2.1 Functional description

The Change Media Proxy Group Dialog is a new Dialog to allow the alteration of the Media Proxies contained within a selected Media Proxy group. It is similar in appearance to the AddMPGroup Dialog.

A Media Proxy group may be selected from the left hand list and the “Add>>” button used to transfer it to the right hand list of selected Media Proxies for the Group.

A Media Proxy group may be selected from the right hand list and the “<<Rem” button used to transfer it to the list of available Media Proxies on the left.

The name of the group may not be changed.

1.8.1.2.2 GUI usage and implications

This Gui is to be used when any changes to the number of media proxies in the group are to be made (subject to the maximum limit). It is also to be used when one or more of the Media Proxies in the group is to be replaced with another.

Any additional Media Proxies must exist prior to this GUI being invoked. If this is not the case then no additional Media Proxies will be available to be added to the group. The addMediaProxy dialog enables Media Proxies to be added.

Media Proxies cannot be deleted from the system if they are in a Media Proxy group.

1.8.1.2.3 GUI size

Table 4 New or modified GUIs

Abbreviated GUI name	Minimum instances	Maximum instances	Information on memory
ChangeMPGroup	0	1	N/A

1.8.1.2.4 GUI fields

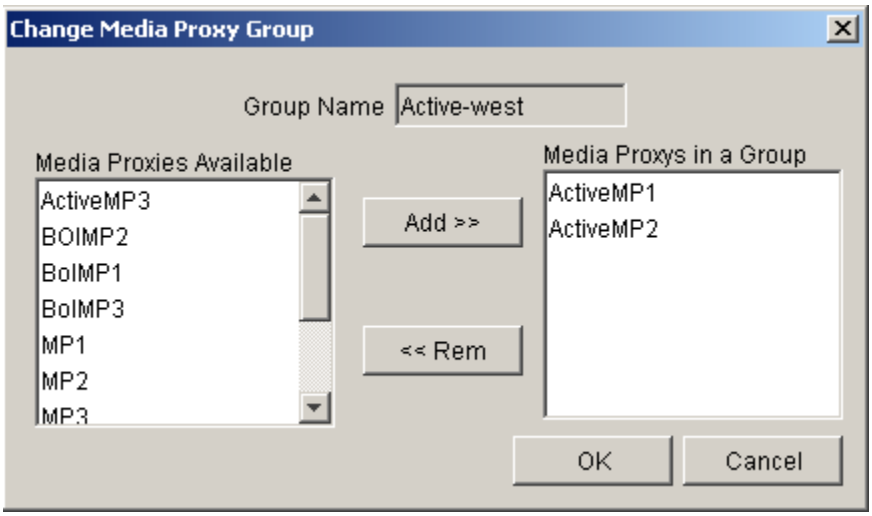
The following table lists fields for GUI ChangeMPGroup.Media Proxies must have been provisioned before the ChangeMPGroup dialog is invoked.

Table 5 GUI field descriptions

Field	New or Changed	Subfield	Entry	Explanation and action	Associated MIB entry
Media Proxies	New	none	range of Media proxies	this displays the media proxies which can be added to the group	
Media Proxy Group	New	none	selected media proxies (max of 5)	This box shows the list of media proxies which have been selected for the group.	

1.8.1.2.5 Usage example

The following example shows sample datafill or menu selection for GUI ChangeMPGroup:



1.8.1.2.6 GUI release history update
New Dialog, first release.

This is launched using the CS2000 Management Tools interface

1.8.1.2.8 Supplementary information
NONE

1.8.1.3 GUI name: MPGroupTab
Media Proxy Groups Tab

1.8.1.3.1 Functional description
This tab is designed to show a list of Media Proxy Groups along with a comma separated list of the Media Proxies belonging to that group.

The tab also displays the following buttons:

Add - to add a new Media Proxy Group. When clicked this will launch the AddMPGroup Dialog described in section 12.8.2.3.

Delete - to delete a Media Proxy Group that has been selected from the list. When selected a dialog will ask for confirmation that the selected Media proxy group is to be deleted. This delete will fail if the Media Proxy Group is associated with any ITRANs Middleboxes that are on a GWC.

Change - to change the Media Proxies listed against a selected Media Proxy Group. When selected this will launch the ChangeMPGroup" Dialog described in section 12.8.2.4.

Properties - The properties button will launch the “Describe Media Proxy Group.”

1.8.1.3.2 GUI usage and implications

This GUI is used for display purposes and to provide a central point of access for all Media Proxy Group operations.

1.8.1.3.3 GUI size

Table 6 New or modified GUIs

1.8.1.10 GUI name: Add VPN

Add VPN Dialog.

1.8.1.10.1 Functional description

This is a new dialog box that is used when a new VPN is being created. The dialog contains a text box in which the user adds a new VPN name. On clicking the OK button the VPN is created but is not assigned to any NAT. The new VPN will automatically be added to the VPN combo box on the addnat dialog.

An optional check box “Shared Id” will display a field into which a specific Global ID can be entered for the VPN. This is to be used when the VPN is shared across Element managers. It does reuire that the ID to be shared is not already allocated to another VPN.

This dialog can only be called from the Add NAT dialog or the “Add” Button on the VPN details dialog.

1.8.1.10.2 GUI usage and implications

This dialog can only be called from the Add NAT dialog or by clicking the “Add” button on the VPN Details Dialog. It is used to create a new VPN.

1.10 OSSGate Interface Changes

1.10.1 XML Command Changes

The following new interfaces introduced in SN09 to manage Media Proxy Groups:

- Add Media Proxy Group - Add a new Media Proxy Group and the Media Proxys associated with that group.
- Query Media Proxy Group. - There are three types of query:
  - — List all the Media Proxys within a Media Proxy Group.
  - — List all Media Proxy Groups assigned against a Gateway Controller.
  - — List all the Media Proxy Groups that a Media Proxy belongs to.
- Change Media Proxy Group - Modify the list of Media Proxys assigned to a group.
- Delete Media Proxy Group - Delete a Media Proxy group.

The following new interfaces introduced in SN09 to manage VPNs.

- Add VPN - Add a new VPN with the specified name.
- Delete VPN - Delete a VPN from the list of VPNs.

The following interfaces will be modified in SN09 to make use of Media Proxy groups:

- Add Network Zone - When a Network zone is created, allow it to be optionally associated with a Media Proxy Group and/or a VPN. This requires changes to Add NAT and add LBL.
- Add NAT - When a Nat middlebox is created, allow it to be optionally associated with a Media Proxy Group and/or a VPN.
- Add LBL - When a LBL middlebox is created, allow it to be optionally associated with a Media Proxy Group.
- Query Network Zone - Extend the query to return the Media Proxy Group and VPN.
- Query Nat - Extend the query to return the Media Proxy Group and VPN.
- Query LBL - Extend the query to return the Media Proxy Group.
- Change Network Zone - Change the Media Proxy Group and/or VPN assigned to a middlebox.
- Change NAT - Change the Media Proxy Group and/or VPN assigned to a Middlebox.
- Change LBL - Change the Media Proxy Group assigned to a Middlebox.

1.10.1.1 Add MP Group XML command

Add Media Proxy Group is a new command in SN09. The command defines a new group and adds between one and five Media Proxies to that group.

The XML for this command is shown in Figure 1, the schema is defined in Appendix B and error messages returned are described in Appendix C. Appendix D provides a description of each tag.

Figure 1 XML command to Add Media Proxy Group

```
<?xml version="1.0" encoding="UTF-8" ?>
 <CommandList>
  <Command>
   <Interface>ITransIf</Interface>
    <Methods>
     <addMPGroup usn="1" version="1.0">
      <Parameters>
       <MPGroupName>aGroup</MPGroupName>
       <MPname>mp1</MPname>
       <MPname>mp11</MPname>
       <MPname>mp111</MPname>
       <MPname>mp1111</MPname>
       <MPname>mp11111</MPname>
     </Parameters>
     </addMPGroup>
    </Methods>
  </Command>
 </CommandList>
```

1.10.1.2 Response XML

  </Response>
</CommandList>
```

1.10.1.3 Query MP Group XML command

Query Media Proxy Group is a new command in SN09. Three versions of the command provide queries to return the following information:

- The list of Media Proxies contained in a Media Proxy Group
- List all Media Proxy Groups
- The list of Media Proxy Groups a Media Proxy belongs to
- The list of Media Proxy Groups associated with a Gateway Controller

The three versions of XML for this command are shown in Figure 2, the schema is defined in Appendix B and error messages returned are described in Appendix C. Appendix D provides a description of each tag.

Figure 2 XML command to Query MP Group

result" /></ReturnData></ChangeMPGroup>      </Methods>
  </Response>
</CommandList>
```

1.10.1.7 Delete MP Group XML command

Delete Media Proxy Group is a new command in SN09. The command deletes the definition of a Media Proxy Group.

The XML for this command is shown in Figure 4, the schema is defined in Appendix B and error messages returned are described in Appendix C. Appendix D provides a description of each tag.

Figure 4 XML Command to Delete MP Group

```
<?xml version="1.0" encoding="UTF-8" ?>
 <CommandList>
  <Command>
   <Interface>ITransIf</Interface>
    <Methods>
     <deleteMPGroup usn="1" version="1.0">
      <Parameters>
       <MPGroupName>aGroup</MPGroupName>
      </Parameters>
     </deleteMPGroup>
    </Methods>
  </Command>
 </CommandList>
```

1.10.1.8 Response XML

```
<CommandList>
  <Response>
    <Interface>ITransIf</Interface>
    <Methods>
<deleteMPGroup usn="1" version="1.0"><ReturnData><ReturnCode value="0" text="Successful
result" /></ReturnData></deleteMPGroup>     </Methods>
  </Response>
</CommandList>
```

1.10.1.9 Add VPN XML command

Add VPN is a new command in SN09. The command adds the definition of a new VPN.

The XML for this command is shown in Figure 5, the schema is defined in Appendix B and error messages returned are described in Appendix C.Appendix D provides a description of each tag.

Figure 5 XML Command to Add VPN

```
<?xml version="1.0" encoding="UTF-8" ?>
 <CommandList>
  <Command>
   <Interface>ITransIf</Interface>
    <Methods>
     <addVPN usn="1" version="1.0">
     <Parameters>
         <vpnName>VPN11</vpnName>
      </Parameters>
     </addVPN>
    </Methods>
  </Command>
 </CommandList>
```

1.10.1.10 Response XML

```
<?xml version='1.0'?>
<CommandList>
  <Response>
    <Interface>ITransIf</Interface>
    <Methods>
<addVPN usn="1" version="1.0"><ReturnData><ReturnCode value="0" text="Successful result" /
></ReturnData></addVPN>      </Methods>
  </Response>
</CommandList>
```

1.10.1.11 Delete VPN XML command

Delete VPN is a new command in SN09. The command deletes the definition of a VPN.

The XML for this command is shown in Figure 6, the schema is defined in Appendix B and error messages returned are described in Appendix C. Appendix D provides a description of each tag.

Figure 6 XML Command to Delete VPN

```
<?xml version="1.0" encoding="UTF-8" ?>
 <CommandList>
  <Command>
   <Interface>ITransIf</Interface>
    <Methods>
     <deleteVPN usn="1" version="1.0">
     <Parameters>
         <vpnName>VPN11</vpnName>
      </Parameters>
     </deleteVPN>
    </Methods>
  </Command>
 </CommandList>
```

1.10.1.12 Response XML

```
<?xml version='1.0'?>
<CommandList>
  <Response>
    <Interface>ITransIf</Interface>
    <Methods>
<deleteVPN usn="1" version="1.0"><ReturnData><ReturnCode value="0" text="Successful
result" /></ReturnData></deleteVPN>      </Methods>
  </Response>
</CommandList>
```

1.10.1.13 Add Network Zone XML command

The existing Add Network Zone command is extended in SN09. The additional tag <preferredMPGroup> allows a Media Proxy Group to be optionally associated with a Network Zone when a Network Zone is created. The additional tag <vpnName> allows a VPN to be optionally be associated with a Network Zone providing its type is NAT or Composite Nat.

The XML for this command is shown in Figure 7, the schema is defined in Appendix B and error messages returned are described in Appendix C. Appendix D provides a description of each tag.

Figure 7 XML Command to Add a Network Zone

```
<?xml version="1.0" encoding="UTF-8" ?>
 <CommandList>
  <Command>
   <Interface>ITransIf</Interface>
    <Methods>
     <addNetworkZone usn="1" version="1.0">
     <Parameters>
         <Name>NZ1</Name>
         <Service>NAT</Service>
        <PreferredMPGroup>MPG1</PreferredMPGroup>
      </Parameters>
     </addNetworkZone>
    </Methods>
  </Command>
</CommandList>
```

1.10.1.14 Response XML

```
<?xml version='1.0'?>
<CommandList>
  <Response>
    <Interface>ITransIf</Interface>
    <Methods>
<addNetworkZone usn="1" version="1.0"><ReturnData><ReturnCode value="0" text="Successful
result" /></ReturnData></addNetworkZone>      </Methods>
  </Response>
</CommandList>
```

1.10.1.15 Add NAT XML command

The existing Add NAT command is extended in SN09. The additional tag <preferredMPGroup> allows a Media Proxy Group to be optionally associated with a NAT when a NAT is created. The additional tag <vpnName> allows a VPN to be optionally be associated with a NAT.

The XML for this command is shown in Figure 8, the schema is defined in Appendix B and error messages returned are described in Appendix C. Appendix D provides a description of each tag.

Figure 8 XML Command to Add a NAT middlebox

```
<?xml version="1.0" encoding="UTF-8" ?>
 <CommandList>
  <Command>
   <Interface>ITransIf</Interface>
    <Methods>
     <addNAT usn="1" version="1.0">
     <Parameters>
        <NATname>MkI</NATname>
            <PreferredMPGroup>MPG1</PreferredMPGroup>
      </Parameters>
     </addNAT>
    </Methods>
  </Command>
</CommandList>
```

1.10.1.16 Response XML

```
<?xml version='1.0'?>
<CommandList>
  <Response>

<addNAT usn="1" version="1.0"><ReturnData><ReturnCode value="0" text="Successful result" /
></ReturnData></addNAT>      </Methods>
  </Response>
</CommandList>
```

1.10.1.17 Add LBL XML command

The existing Add LBL command is extended in SN09. The additional tag <preferredMPGroup> allows a Media Proxy Group to be optionally associated with a LBL middlebox when a LBL middlebox is created.

The XML for this command is shown in Figure 9, the schema is defined in Appendix B and error messages returned are described in Appendix C. Appendix D provides a description of each tag.

Figure 9 XML Command to Add a LBL middlebox

```
<?xml version="1.0" encoding="UTF-8" ?>
<CommandList>
 <Command>
  <Interface>ITransIf</Interface>
   <Methods>
    <addLBL usn="1" version="1.0">
    <Parameters>
       <LBLname>LBL1</LBLname>
            <RUDescription>SPC_Default_RU</RUDescription>
            <MaxCount>10</MaxCount>
            <PreferredMPGroup>MPG1</PreferredMPGroup>
    </Parameters>
   </addLBL>
  </Methods>
 </Command>
</CommandList>
```

1.10.1.18 Response XML

```
<?xml version='1.0'?>
<CommandList>
  <Response>
    <Interface>ITransIf</Interface>
    <Methods>
<addLBL usn="1" version="1.0"><ReturnData><ReturnCode value="0" text="Successful result" /
></ReturnData></addLBL>      </Methods>
  </Response>
</CommandList>
```

1.10.1.19 Query Network Zone XML command

The existing Query Network Zone command is extended in SN09. When either individual or multiple network Zones are queried the response is extended to include the Media Proxy Group and VPN, if any, the Network Zone has.

- List all Network Zoness
- The details of a single network Zone.
- The list of Network Zones having a specified Media Proxy Group.

The optional tag <preferredMPGroup> is used to allow the query to be based on a specified Media Proxy Group.

The XML for this command is shown in Figure 10, the schema is defined in Appendix B and error messages returned are described in Appendix C.

Figure 10 XML Command to Query Network Zone

```
<?xml version="1.0" encoding="UTF-8" ?>
 <CommandList>
  <Command>
   <Interface>ITransIf</Interface>
    <Methods>
     <queryNetworkZone usn="1" version="1.0">
     <Parameters>
      </Parameters>
     </queryNetworkZone>
    </Methods>
  </Command>
 </CommandList>
```

1.10.1.20 Response XML

```
<?xml version='1.0'?>
<CommandList>
  <Response>
     <Interface>ITransIf</Interface>
     <Methods>
<queryNetworkZone usn="1" version="1.0"><ReturnData>
<NetworkZone>
       <ID>10</ID>
       <Name>COMP1</Name>
       <ParentID>0</ParentID>
</NetworkZone>
<NetworkZone>
       <ID>11</ID>
       <Name>NZ1</Name>
       <ParentID>0</ParentID>
</NetworkZone><ReturnCode value="0" text="Successful result" /></ReturnData></
queryNetworkZone>     </Methods>
  </Response>
</CommandList>
```

1.10.1.21 Query NAT XML command

The existing Query NAT command is extended in SN09. When either individual or multiple NAT middleboxes are queried the response is extended to include the Media Proxy Group and VPN, if any, that each NAT has.

- List all NATs
- The details of a single NAT.
- The list of NATs having a specified Media Proxy Group.

The optional tag <preferredMPGroup> is used to allow the query to be based on a specified Media Proxy Group.

The XML for this command is shown in Figure 11, the schema is defined in Appendix B and error messages returned are described in Appendix C.

Figure 11 XML Command to Query NAT Middlebox

```
<?xml version="1.0" encoding="UTF-8" ?>
<CommandList>
 <Command>
  <Interface>ITransIf</Interface>
   <Methods>
    <queryNAT usn="1" version="1.0">
    <Parameters>
       <NATname>Nat1</NATname>
     </Parameters>
    </queryNAT>
   </Methods>
 </Command>
</CommandList>
```

1.10.1.22 Response XML

```
<?xml version='1.0'?>
<CommandList>
  <Response>
    <Interface>ITransIf</Interface>
    <Methods>
<queryNAT usn="1" version="1.0"><ReturnData><NATname>ssssss</
NATname><NATType>1</NATType><ParentMB></
ParentMB><PreferredMPGroup>LONDON</PreferredMPGroup><VPNname>UK<VPNname>
<ReturnCode value="0" text="Successful result" /></ReturnData></queryNAT>     </Methods>
  </Response>
</CommandList>
```

1.10.1.23 Query LBL XML command

The existing Query LBL command is extended in SN09. When either individual or multiple LBL middleboxes are queried the response is extended to include the Media Proxy Group, if any, each LBL has. There are three types of query for this element:

- List all LBLs
- The details of a single LBL.
- The list of LBLs having a specified Media Proxy Group.

The optional tag <PreferredMPGroup> enables this extended query.

The XML for this command is shown in Figure 12, the schema is defined in Appendix B and error messages returned are described in Appendix C.

Figure 12 XML Command to Query LBL Middlebox

```
Query single LBL:
<?xml version="1.0" encoding="UTF-8" ?>
 <CommandList>
  <Command>
   <Interface>ITransIf</Interface>
    <Methods>
     <queryLBL usn="1" version="1.0">
     <Parameters>
        <LBLname>LBL1</LBLname>
      </Parameters>
     </queryLBL>
    </Methods>
  </Command>
 </CommandList>

 Query All LBLs:
  <?xml version="1.0" encoding="UTF-8" ?>
 <CommandList>
  <Command>
   <Interface>ITransIf</Interface>
    <Methods>
     <queryLBL usn="1" version="1.0">
     <Parameters>
      </Parameters>
     </queryLBL>
    </Methods>
  </Command>
 </CommandList>

  MPG based query:
 <?xml version="1.0" encoding="UTF-8" ?>
 <CommandList>
  <Command>
   <Interface>ITransIf</Interface>
    <Methods>
     <queryLBL usn="1" version="1.0">
     <Parameters>
       <PreferredMPGroup>MPG1</PreferredMPGroup>
      </Parameters>
     </queryLBL>
    </Methods>
  </Command>
 </CommandList>
```

1.10.1.24 Response XML

```
single response:
<?xml version='1.0'?>
<CommandList>
  <Response>
    <Interface>ITransIf</Interface>
    <Methods>
<queryLBL usn="1" version="1.0"><ReturnData><LBLname>LBL1</LBLname><CounterGWC>0</
CounterGWC><RUDescription>SPC_Default_RU</RUDescription><MaxCount>10</
MaxCount><ParentMB></ParentMB><PreferredMPGroup>MPG2</PreferredMPGroup><ReturnCode value="0"
text="Successful result" /></ReturnData></queryLBL>    </Methods>
  </Response>
</CommandList>

multiple response:
<?xml version='1.0'?>
<CommandList>
  <Response>
    <Interface>ITransIf</Interface>
    <Methods>
<queryLBL usn="1" version="1.0"><ReturnData><LBLname>LBL1</LBLname><LBLname>LBL2</
LBLname><ReturnCode value="0" text="Successful result" /></ReturnData></queryLBL>    </Methods>
  </Response>
</CommandList>

response for MPG query:
<?xml version='1.0'?>
<CommandList>
  <Response>
    <Interface>ITransIf</Interface>
    <Methods>
<queryLBL usn="1" version="1.0"><ReturnData><LBLname>LBL2</LBLname><ReturnCode value="0"
text="Successful result" /></ReturnData></queryLBL>    </Methods>
  </Response>
</CommandList>
```

1.10.1.25 Change Network Zone XML command

The existing Change Network Zone command is extended in SN09. When the MediaProxyGroup of the network Zone is to be changed the optional tag <preferredMPGroup> is used to specify the new Media Proxy Group. The optional tag <vpnName> is used to specify the VPN name.

The XML for this command is shown in Figure 13, the schema is defined in Appendix B and error messages returned are described in Appendix C.

Figure 13 XML Command to Change Network Zone

```
<?xml version="1.0" encoding="UTF-8" ?>
 <CommandList>
  <Command>
   <Interface>ITransIf</Interface>
    <Methods>
     <changeNetworkZone usn="1" version="1.0">
     <Parameters>
        <Name>NZ1</Name>
        <PreferredMPGroup>MPG2</PreferredMPGroup>
      </Parameters>
     </changeNetworkZone>
    </Methods>
  </Command>
 </CommandList>
```

1.10.1.26 Response XML

```
<?xml version='1.0'?>
<CommandList>
  <Response>
    <Interface>ITransIf</Interface>
    <Methods>
<changeNetworkZone usn="1" version="1.0"><ReturnData><ReturnCode value="0"
text="Successful result" /></ReturnData></changeNetworkZone> </Methods>
  </Response>
</CommandList>
```

1.10.1.27 Change NAT XML command

The existing Change NAT command is extended in SN09. When the MediaProxyGroup or VPN associated with the NAT is to be changed the optional tag <preferredMPGroup> is used to specify the new Media Proxy Group. The optional tag <vpnName> is used to specify the new VPN name.

The XML for this command is shown in Figure 14, the schema is defined in Appendix B and error messages returned are described in Appendix C.

Figure 14 XML Command to Change NAT

```
<?xml version="1.0" encoding="UTF-8" ?>
 <CommandList>
  <Command>
   <Interface>ITransIf</Interface>
    <Methods>
     <changeNAT usn="1" version="1.0">
     <Parameters>
        <NATname>MkI</NATname>
             <PreferredMPGroup>MPG2</PreferredMPGroup>
      </Parameters>
     </changeNAT>
    </Methods>
  </Command>
 </CommandList>
```

1.10.1.28 Response XML

```
<?xml version='1.0'?>
<CommandList>
   <Response>
      <Interface>ITransIf</Interface>
      <Methods>
<changeNAT usn="1" version="1.0"><ReturnData><ReturnCode value="0" text="Successful
result" /></ReturnData></changeNAT>      </Methods>
   </Response>
</CommandList>
```

1.10.1.29 Change LBL XML command

The existing Change LBL command is extended in SN09. When the MediaProxyGroup associated with the LBL is to be changed the optional tag <preferredMPGroup> is used to specify the new Media Proxy Group.

The XML for this command is shown in Figure 15, the schema is defined in Appendix B and error messages returned are described in Appendix C.

Figure 15 XML Command to Change LBL

```
<?xml version="1.0" encoding="UTF-8" ?>
 <CommandList>
  <Command>
   <Interface>ITransIf</Interface>
    <Methods>
     <changeLBL usn="1" version="1.0">
     <Parameters>
        <LBLname>LBL1</LBLname>
                <PreferredMPGroup>MPG2</PreferredMPGroup>
      </Parameters>
     </changeLBL>
    </Methods>
  </Command>
 </CommandList>
```

1.10.1.30 Response XML

```
<?xml version='1.0'?>
<CommandList>
  <Response>
    <Interface>ITransIf</Interface>
    <Methods>
<changeLBL usn="1" version="1.0"><ReturnData><ReturnCode value="0" text="Successful
result" /></ReturnData></changeLBL>     </Methods>
  </Response>
</CommandList>
```

1.10.2 Additional OSSGate Changes

The Network Zone xml interface is common to both the CS2KMT and the SPC. Any changes added made to the network Zone xml must be implemented for the SPC as well as the CS2KMT. As this feature has introduced changes to the network Zone xml files shared by the SPC, the expectation is that there will be a feature on the SPC to absorb the impact of these changes.

1.11 Configuration Walkthrough

1.11.1 Creating a Media Proxy Group

A MPG is allocated as follows using the CS2000 Management tools GUI:

1) In the main network devices Panel, select the Media Proxies Tab.

2) In the “Media Proxies” Tab select the “Media Proxy Groups” Tab.

3) Click on the “Add” button to display the “Add Media Proxy Group” dialog.

4) Enter the name of the Media Proxy Group in the field at the top of the dialog

5) Select in turn up to 5 media proxies to add to the group by highlighting each and pressing the “add>>” button. If a MP is added in error it can be removed using the “<<rem” button.

6) If the creation fails, a message window will be displayed and the media proxy group will not be added.

1.11.2 Changing a Media Proxy Group

A MPG is modified as follows using the CS2000 Management tools GUI:

1) In the main network devices Panel, select the Media Proxies Tab.

2) In the “Media Proxies” Tab select the “Media Proxy Groups” Tab.

3) Select (highlight) the Media Proxy Group to be changed.

4) Click on the “Change” button to display the “Change Media Proxy Group” dialog.

5) Select any media proxies to be removed from the group by highlighting each and pressing the “<<rem” button. If a MP needs to be added it can be added using the “add>>” button.

6) If the change fails, a message box will be displayed and the change will not take effect.

A Media Proxy Group may not be modified in this way if it is associated with a Network Zone that is associated with a Gateway on a Gateway Controller. If such a Media Proxy Group must be changed, the Media Proxy Group must first be disassociated from the Gateway Controller. This can be achieved by changing the Group on the Network Zone, then changing the Media Proxy Group, before changing the network zone to have the group again.

WARNING: If the Media Proxy Group on the network Zone is changed or removed, this will affect the media proxies that are available for call processing for the duration of the change.

1.11.3 Deleting a Media Proxy Group

A MPG is deleted as follows using the CS2000 Management tools GUI:

1) In the main network devices Panel, select the Media Proxies Tab.

2) In the “Media Proxies” Tab select the “Media Proxy Groups” Tab.

3) Select the Media Proxy Group to be deleted.

4) Click on the “Delete” button at the bottom of the panel to delete the selected media Proxy Group.

5) if the deletion fails, a message box will be displayed.

A Media Proxy Group cannot be deleted if it is associated with a Network Zone.

1.11.4 Assigning a media Proxy Group

When a Network Zone is created using the CS2000 Management Tools Gui, a Media Proxy Group can be assigned to it as follows:

1) From the relevant Network Zone tab (NAT, LBL or composite) click the “Add..” button.

2) Using the “Media Proxy Group” drop down box, select a preferred media proxy group from the list of groups available.

3) proceed with the rest of the provisioning of the network Zone as normal.

4) If the creation fails, the details will be displayed in a message pane. The Network Zone will not be added.

When the Network Zone has been created, it can be used by a gateway as follows:

5) When provisioning a Media Gateway on a GWC, select an ITrans capable profile for the Media Gateway.

6) The Network Zone having the Media Proxy Group should be set as the adjacent middlebox for the media gateway. If the Network Zone is part of a chain of middleboxes then, in order for the gateway to use its Media Proxy Group, the network Zones closer to the media gateway in the chain must not have a preferred Group.

1.11.5 Changing the associated Media Proxy Group

To change the media proxy group associated with a Network Zone the following steps must be followed:

1) In the appropriate Network Zones tab, highlight the Network Zone that you wish to change.

2) Hit the “change” button to display the “Change Network Zone” Dialog

3) Select the new Media proxy Group from the drop down list box that appears on the Change Network Zone dialog and click on ok to action the change.

5) If the change fails, details will be displayed in a message pane. The change will not take effect.

WARNING: Changing a Media Proxy Group on a Network Zone that is provisioned on a gateway controller may affect call processing. Media Proxies may be made unavailable for the duration of the change.

1.11.6 Assigning a shared VPN when creating a Network Zone

When a Network Zone is created using the CS2000 Management Tools Gui, a VPN can be assigned to it as follows:

1) From the relevant Network Zone tab (NAT, LBL or composite) click the “Add..” button.

2) If available Click the “use VPN” check (tick) box.

3) From the drop down list which is made visible, select a VPN name. Or click the “create VPN” button to create a new one.

4) A specific VPN ID may be selected. This is used when a VPN spans multiple Call Servers.

5) Proceed with the rest of the provisioning of the network Zone as normal.

6) If the creation fails, the details will be displayed in a message pane. The Network Zone will not be added.

1.12 Appendix A for A00007217: Authorisation groups

The table below shows the Authorisation groups and permissions given for the new methods and operations that are being introduced for this feature. The access rights are aligned with those of the existing Itrans functionality (Media Proxies and Network Zones). Existing authorisation groups remain unchanged by this feature.

Command	**User Group**				
	mgcadm	**mgcrw**	**mgcmtc**	**mgcsprov**	**mgcro**
addMPGroup	X	X			
changeMPGroup	X	X			
queryMPGroup	X	X	X	X	X
deleteMPGroup	X	X			
addVPN	X	X			
deleteVPN	X	X			
queryVPN	X	X	X	X	X

1.13 Appendix B for A00007217: XML validation schemas

```
<xsd:schema xmlns:xsd="http://www.w3.org/2001/XMLSchema"

1.14 Appendix C for A00007217: Error codes and messages

Table 31 Return codes when command is unsuccessful

Cause of error	Return code	Example return messages
Incorrect command version in query	301	Unsupported version
Platform applications internal error: OSS Interface applications cannot connect to required server application	302	Interfacing error

Error codes have not yet been assigned. This section will need completing. before the feature completes.

1.14.1 Example Error Message

```
<?xml version='1.0'?>

      <Response>
        <Interface>ITransIf</Interface>
          <Methods>
             <queryNAT usn="1.0" version="1.0">
              <ReturnData>
                 <NATname>nat1111</NATname>
                  <ReturnCode value= "305" text="NAT not found"/>
              </ReturnData>
             </queryNAT usn="1.0">
```

```
        </Methods>
    </Response>
</CommandList>
```

1.15 Appendix D for A00007217: XML Commands: description of method parameters

1.15.1 Parameter definitions (new in SN09)

- **MPGroupName** - The unique name of the Media Proxy Group. TYPE *NoSpaceNameType*.
- **itransMPGroupName** - The same MPGroupName as defined above. This tag is used in the non-Itrans operations to give the context of Internet Transparency. TYPE *NoSpaceNameType*.
- **preferredMPGroup** - The id of the media Proxy Group.
- **vpnName** - The unique name of the VPN. TYPE *NoSpaceNameType*.

1.15.2 Method Parameters

Method parameters are defined below. Input data is mandatory except where indicated otherwise.

1. **addMPGroup** - Method to create a new Media Proxy Group. This method has the following parameters:

- Input data:
  - usn
  - version
  - MPGroupName. The unique name of the Media Proxy Group.
  - MPname. A list of between one and five Media Proxies which belong to the group that is being created.
- Output data:
  - usn (value should be the same as the input)
  - version (value should be the same as the input)
  - ReturnCode - indicates via an integer value if the command has been successful or, if not, the error type and includes a brief textual message with further information.

2. **queryMPGroup** - A set of methods to query Media Proxy Groups. This method has the following parameters, one of the three optional parameters must be supplied:

- Input data:

– usn

– version

– MPGroupName (optional). Query to return the list of Media Proxies in a the group.

– MPname (optional). Query to list the Media Proxy Groups the Media Proxy belongs to.

– GWCName (optional). Query to list the Media Proxy Groups assigned against the Gateway controller.

• Output data:

– usn (value should be the same as the input)

– version (value should be the same as the input)

– MPname (returned when the MPGroupName option is used)

– MPGroupName (returned when either the MPname or GWCName options are used)

– ReturnCode - indicates via an integer value if the command has been successful or, if not, the error type and includes a brief textual message with further information.

3. **changeMPGroup** - Method to change the list of Media Proxies assigned to a Media Proxy Group. This method has the following parameters:

• Input data:

– usn

– version

– MPGroupName. The unique name of the Media Proxy Group which must already exist.

– MPname. A list of between one and five Media Proxies which are now to be assigned to that group.

• Output data:

– usn (value should be the same as the input)

– version (value should be the same as the input)

– ReturnCode

4. **deleteMPGroup** - Method that deletes a Media Proxy Group. This method has the following parameters:

• Input data:

– usn

– version

– MPGroupName. The name of the existing Media Proxy Group that is to be deleted.

• Output data:

– usn (value should be the same as the input)

– version (value should be the same as the input)

– ReturnCode

5. **addVpn** - Method to Add a new VPN identifier. This method has the following parameters:

• Input data:

– usn

– version

– vpnName. The name of the VPN which is being created.

• Output data:

– usn (value should be the same as the input)

– version (value should be the same as the input)

– ReturnCode

6. **deleteVpn** - Method to delete an existing VPN identifier. This method has the following parameters:

• Input data:

– usn

– version

– vpnName. The name of the VPN which is being deleted.

• Output data:

– usn (value should be the same as the input)

– version (value should be the same as the input)

– ReturnCode

2: Configuration (CN): A00007544

2.1 Feature Name

NCAS Link and SIP NMS Support based on RFC 3842

2.2 Hardware and Software Requirements

The design depends on the RADVISION stack in Session Server (NGSS) for SIP. There is no additional hardware or software requirements.

If the remote node/system/VM/switching entity complies with the standard protocols supported by this design, then it will be able to interwork with the CS2K. Appropriate changes should be developed in the remote systems and this design have no specific information on configurations of the remote systems.

2.3 Initial Configuration

By default the SOC for the design are at idle state. Therefore, no service will be provided by this design. At initial configurations, it is assumed that standard datafill exists in the DMS/CS2K, GWC and NGSS. The new configurations associated with this feature do not exist.

For supported configurations, please See “Configuration Walkthrough” on page 2241.

2.4 Office/Subnet parameters (OP/SP) (CM & SESM)

This design does not require any office parameter or subnet parameter. However, it does requires definition of appropriate IP address, Port number and application name for the NCAS link. For details, please See “Data schema (DS) (CM, MIBS, RDB)” on page 2230. No details are added here.

2.4.1 New/modified office/subnet parameters

Not applicable.

2.5 Upgrade Considerations

2.5.1 Dump and Restore (CM)

Not Applicable.

2.5.2 Element Management Upgrade

Not Applicable.

2.5.3 Downgrade impact

Not Applicable.

2.6 Data schema (DS) (CM, MIBS, RDB)

2.6.1 New/modified tables, MIBs, or Database Schema

Table 1 New or modified tables

Table/MIB name	NEW/CHANGED/ or DELETED/	Table Control (NEW/ OLD/UNCHANGED)
IPAPPL	CHANGED	UNCHANGED
MSGRTE	CHANGED	UNCHANGED

2.6.2 Table/MIB/Remote Database Schema information

2.6.2.1 Name: IPAPPL

IP APPLICATION TABLE

2.6.2.1.1 Functional description

This table contains information about the IP addresses and Port numbers of remote system needed for the SCTP communication. This table also contains information about what application this tuple is datafilled.

2.6.2.1.2 Usage sequence and implications (CM Only)

This table should be datafilled first to create a NCAS link.

2.6.2.1.3 Size

Not changed.

Table 2 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory

2.6.2.1.4 Fields/OIDs

The following table lists fields/OIDs for IPAPPL.

<conditional information>

Table 3 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
OPT	Changed	SERVICE	NMS	New added service

2.6.2.1.5 Datafill example

The following example shows sample datafill for table IPAPPL.

2 NCAS SCTP EIU (IPV4 47 142 160 171) (IPV4 47 142 160 172) $ 4990

(APPLICATION NMS) $

2.6.2.1.6 Table release history update

The NMS is added in this release. The Table was created in SN07 release.

2.6.2.1.7 Supplementary information

None.

2.6.2.1.8 Translation verification and other tools

The Table IPAPPL does not use translation verification tools.

2.6.2.2 Name: MSGRTE

MESSAGE ROUTING TABLE

2.6.2.2.1 Functional description

This table provides the routing of the message based on the selector in the table.

2.6.2.2.2 Usage sequence and implications (CM Only)

The datafill for the NCAS link should be done in Table IPAPPL prior to datafilling this table.

2.6.2.2.3 Size

Not changed.

Table 4 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory

2.6.2.2.4 Fields/OIDs

The following table lists fields/OIDs for MSGRTE

Table 5 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
MSGRTRES	Changed	MSGRTE_SEL	NCAS instance H323 H323GWC	New selector SCTP is added.

2.6.2.2.5 Datafill example

The following example shows sample datafill for table MSGRTE:

PUBLIC 6137221440 6137221540 (SCTP 2) $

2.6.2.2.6 Table release history update

New selectors are added.

2.6.2.2.7 Supplementary information

None.

2.6.2.2.8 Translation verification and other tools

Not Applicable.

2.7 Service Orders (SO) (CM & SESM)

Not Applicable.

2.8 Software optionality control (SOC)

Based on PLM input this section will be updated.

Table 6 SOC

SOC option name:	MDC00078
SOC option title:	NMS Over IP (SCTP)
SOC option control type:	State
New SOC option?	Yes
SOC option order code	00041296
Option defined in DRU:	CCM
Affected products:	All

2.9 Element Management

2.9.1 New/modified GUIs

Table 7 New or modified GUIs

GUI name	NEW, CHANGED, or DELETED
Remote SIP Server	Changed
Config Data	Changed

2.9.2 GUI information

2.9.2.1 GUI name: Remote SIP Server

Remote SIP Server

2.9.2.1.1 Functional description

A remote SIP Server is a remote SIP device that the Session Server Manager communicates with via the session initiation protocol. Two examples are other Call Server 2000s or a Multimedia Communication Server (MCS).

2.9.2.1.2 GUI usage and implications

SIP Gateway remote SIP server provisioning is performed by opening the "Remote SIP Server" folder in the left menu. Once there, the following may be performed:

- Remote SIP Server datafill may be added by clicking on the "Add Server" link.
- Remote SIP Servers may also be listed by clicking on "List Servers".
- After listing the Remote SIP servers, the user may choose to delete a particular remote SIP server or modify the data for a particular SIP server.

2.9.2.1.3 GUI size

Not Applicable.

2.9.2.2 GUI name: Config Data

Configurable Parameter

2.9.2.2.1 Functional description

Before the SIP Gateway application is brought into service, base configuration parameters should be modified to appropriate values.

While many parameters exist on the “Config Data” page, **care** must be taken when changing any of them.

2.9.2.2.2 GUI usage and implications

All the configurable parameters are found on the **Configurable Parameters** page. That page is reached from the Session Server Manager main page via:

- Click on the Provisioning folder
- Click on the Application folder
- Click on the SIP Gateway folder
- Click on **Config Data**

REX_SCHEDULE	NEW	OLD

4.6.2 Table/MIB/Remote Database Schema information

4.6.2.1 Name: REX_SCHEDULE

Routine EXercise Schedule database table.

4.6.2.1.1 Functional description

Table REX_SCHEDULE lists the schedule assignments for every NE that has to undergo REX.

REX_SCHEDULE table is used to store the schedule information for the NEs that have to execute REX. This table is updated when the user inputs a schedule to execute REX on an NE, removes the REX for an NE, after the execution of REX on an NE.

4.6.2.1.2 Usage sequence and implications (CM Only)

None.

4.9 Element Management
MG9000 Element manager will be used to execute REX on a given NE.

The EM user will be able to schedule REX and view the progress details of REX on a given NE. REX GUI can be launched from the configuration menu of Subnet view. User will be able to monitor the progress details of REX on the REX GUI and in NE Specific Desktop View.

REX views are similar to that of audit in MG9000 EM.

4.9.1 New/modified GUIs

Table 4 New or modified GUIs

GUI name	NEW, CHANGED, or DELETED
REX NE View	NEW
NE Specific Desktop View	CHANGED

4.9.2 GUI information

4.9.2.1 GUI name: REX NE View

4.9.2.1.1 Functional description

REX NE View: This new GUI is introduced under the submenu option MG9KEM NE Specific Desktop view ->Configuration. This GUI allows the user to schedule REX and also view the progress details on the selected NE.

User is allowed to “Add” an NE to be REXed. During “Add” of NE for REX, user inputs the schedule for an NE, by checking the day of the week, hour and minutes on the day of the week when the REX will be executed and duration of REX to be executed and mode of REX.

User can also remove the REX scheduled for an NE.

Progress details of the REX on the selected NE is made available to the user on this GUI.

Note: *REX GUI is subject to change in its appearance to match the enhanced Audit GUI. This change will happen after the IT completion of REX feature. It will be done as part of a CR.*

4.9.2.1.2 GUI usage and implications

To schedule an NE for REX

1 “Add” button is pressed to add the NE for REX.

2 On pressing “Add”, a new panel is opened which will list all the NEs in the given subnet. Select the NE. select mode of REX, select card types on which REX has to be executed, select the day of the week, hour and minutes on the day of the week selected, duration of REX on the selected NE.

3 “Apply” button has to be pressed. On pressing Apply, NE is scheduled for REX with user input data. Newly opened panel closes and the user is in REX NE View.

4 REX NE View lists all the NEs whose schedule is already input by the user. On selecting the NE, state of REX and the progress details are displayed on REX NE View.

To remove REX on already scheduled NE

1 Select the NE from the NE list of REX NE View.

2 On pressing “Remove” button, REX for the selected NE is aborted.

To View the Progress details of REX

1 Select the NE from the NE list of REX NE View.

2 Text area called “Progress details” of REX NE View shows the status of REX on the selected NE.

4.9.2.1.3 GUI size

Table 5 New or modified GUIs

Abbreviated GUI name	Minimum instances	Maximum instances	Information on memory
REX NE View	1	1	TBD

4.9.2.1.4 GUI fields

The following table lists fields for GUI REX NE View.

Table 6 GUI field descriptions

Field	New or Changed	Subfield	Entry	Explanation and action	Associated MIB entry
“Add” Button	New	-	-	1. “Add” button is pressed to add the NE for REX. 2. On pressing “Add”, a new panel is opened which will list all the NEs in the given subnet. Select the NE. Select the day of the week, hour and minutes on the day of the week selected, duration of REX on the selected NE. On pressing “Add” button, a check is made if an Audit schedule exists on the current NE 3. “Apply” button has to be pressed. On pressing Apply, NE is scheduled for REX. Newly opened panel closes and the user is in REX NE View. On pressing “Apply” button, validations on the fields are done and prompted to the user. If an Audit schedule on this NE is scheduled at the same instant as REX, a warning message is prompted to the user. If the user confirms REX is scheduled. 4. REX NE View lists all the NEs whose schedule is already input by the user. On selecting the NE, state of REX and the progress details are displayed on REX NE View.	NA

Table 6 GUI field descriptions

Field	New or Changed	Subfield	Entry	Explanation and action	Associated MIB entry
Remove Button	New	-	-	1. Select the NE from the NE list of REX NE View. 2. On pressing “Remove” button, REX for the selected NE is aborted.	NA
Suspend Button	New	-	-	1. Select the NE from the NE list of REX NE View. 2. On pressing “Suspend” button, REX for the selected NE is Disabled/suspended.	NA
Resume Button	New	-	-	1. Select the NE from the NE list of REX NE View. 2. On pressing “Resume” button, REX for the selected NE is Resumed/enabled.	NA
REX Mode	New	-	1. Without SWACT 2. With SWACT	1. If the user selects “without SWACT” option, in that case, REX is executed only on the inactive card of the card pair. 2. If the selected option is “with SWACT”, REX is executed on both the cards of a pair. Inactive card undergoes REX execution, followed by a SWACT on active card and REX on newly inactive card.	NA

Table 6 GUI field descriptions

Field	New or Changed	Subfield	Entry	Explanation and action	Associated MIB entry
Card Types	New	1. DCC 2. ITP 3. ITX	-	1. On selecting DCC, REX will be executed on DCC cards of the NE under consideration which otherwise will be skipped. 2. On selecting ITP, REX will be executed on ITP cards of the NE under consideration which otherwise will be skipped. 3. On selecting ITX, REX will be executed on ITX cards of the NE under consideration which otherwise will be skipped.	NA
REX Schedule	New	Run Immediately	-	If run immediately option is chosen, Day of week, Hour and minute fields are disabled. On clicking on Apply, REX is immediately executed on the given NE.	NA
Day of Week	New	1. Sunday 2. Monday 3. Tuesday 4. Wednesday 5. Thursday 6. Friday 7. Saturday 8. Hour 9. Minutes	-	If Run immediately is deselected, Day of Week, Hour and Minute is enabled. User is able to select the day of the week on which the REX needs to be executed. Hour and Minute would enable user to input the time at which, REX will be executed on the day(s) of week selected.	NA
Current State	New	-	-	This field is a non editable field. It informs the user the state of the REX on the selected NE. State of the REX being “Ready to run”, “Running REX”, “Completed REX”.	NA

Table 6 GUI field descriptions

Field	New or Changed	Subfield	Entry	Explanation and action	Associated MIB entry
Progress Details	New	-	-	This text area displays the success/failure of the operations performed during REX on the selected NE. Operations during REX being, LOCK, UNLOCK, SWACT and Diagnose.	NA
REX Duration	New	1. Hour 2. Minutes	-	The fields Hour and Minutes enable the user to input the duration for which the REX can execute at its maximum limit. If the duration of REX exceeds the input value, REX is failed for such an NE	NA

4.9.2.1.5 Usage example

The following Figure-1 shows the GUI for REX NE View. Figure-2 shows the Create Schedule View which is displayed when “Add” button of REX NE View is clicked.

Figure 1: REX NE View

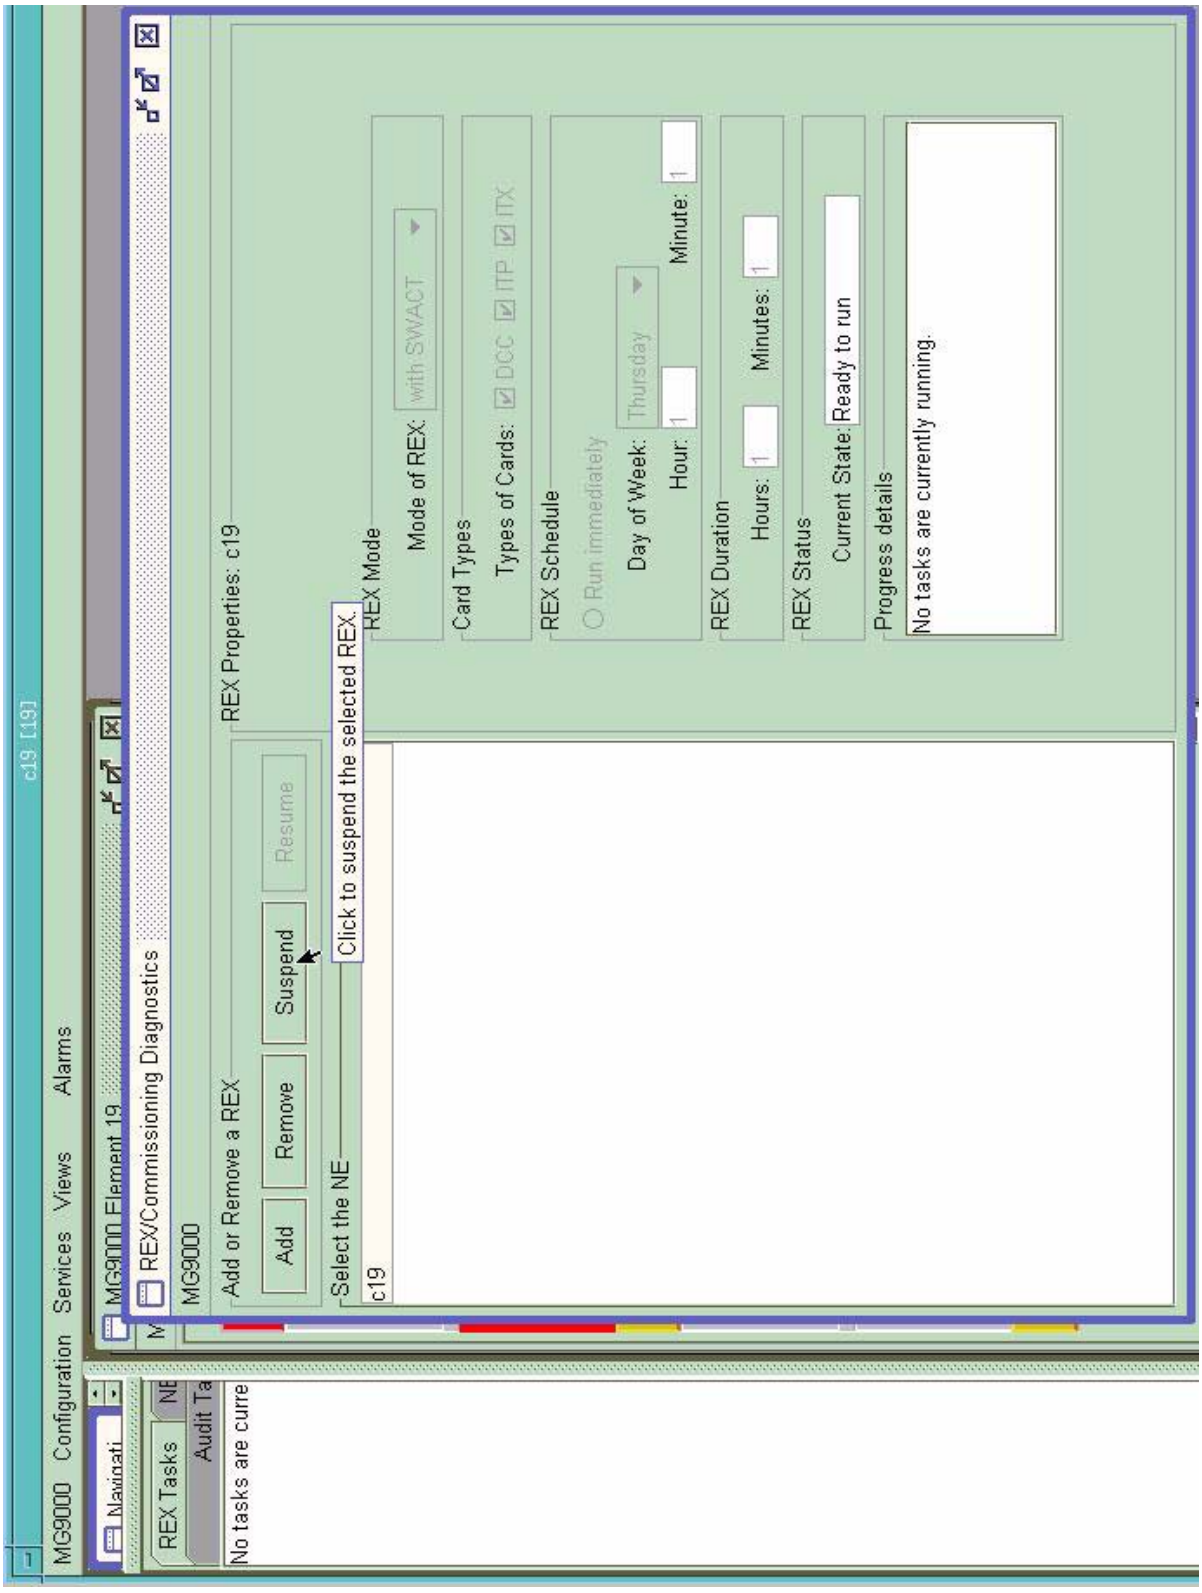

Figure 1.1 -Warning message if an Audit schedule exists at the same instant when REX is being scheduled.

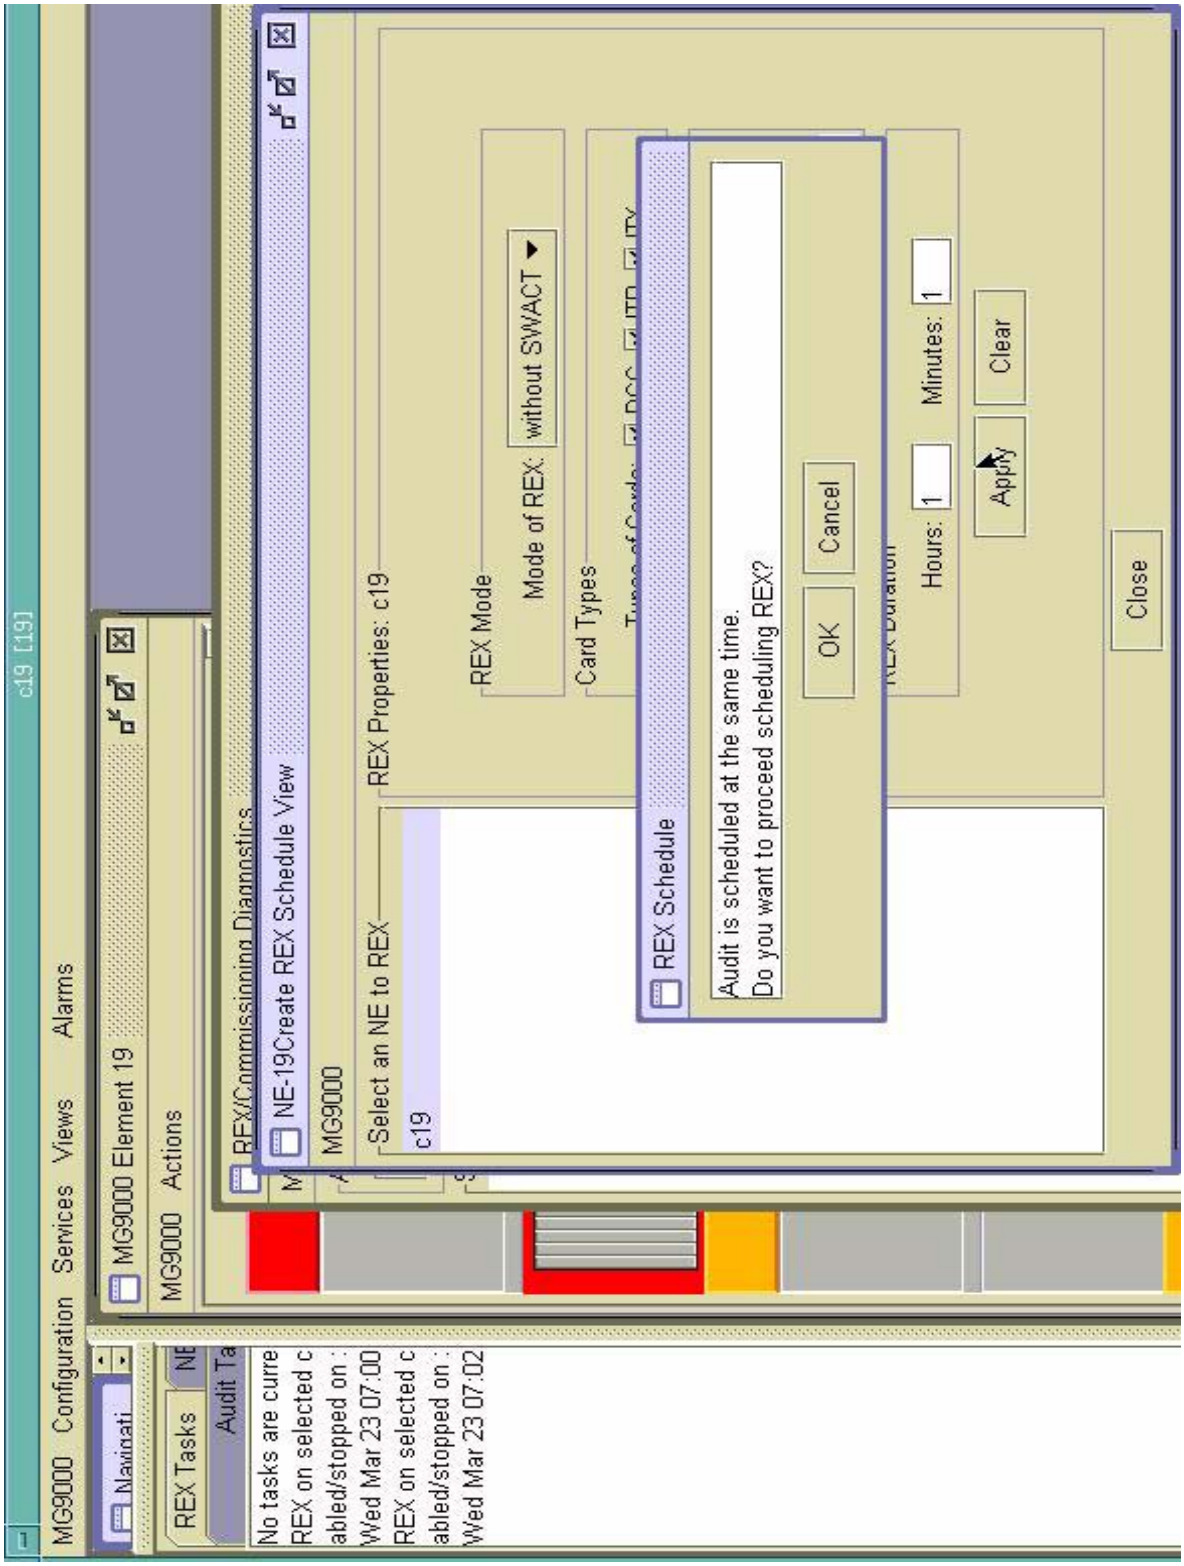

Figure-2 Create Schedule View

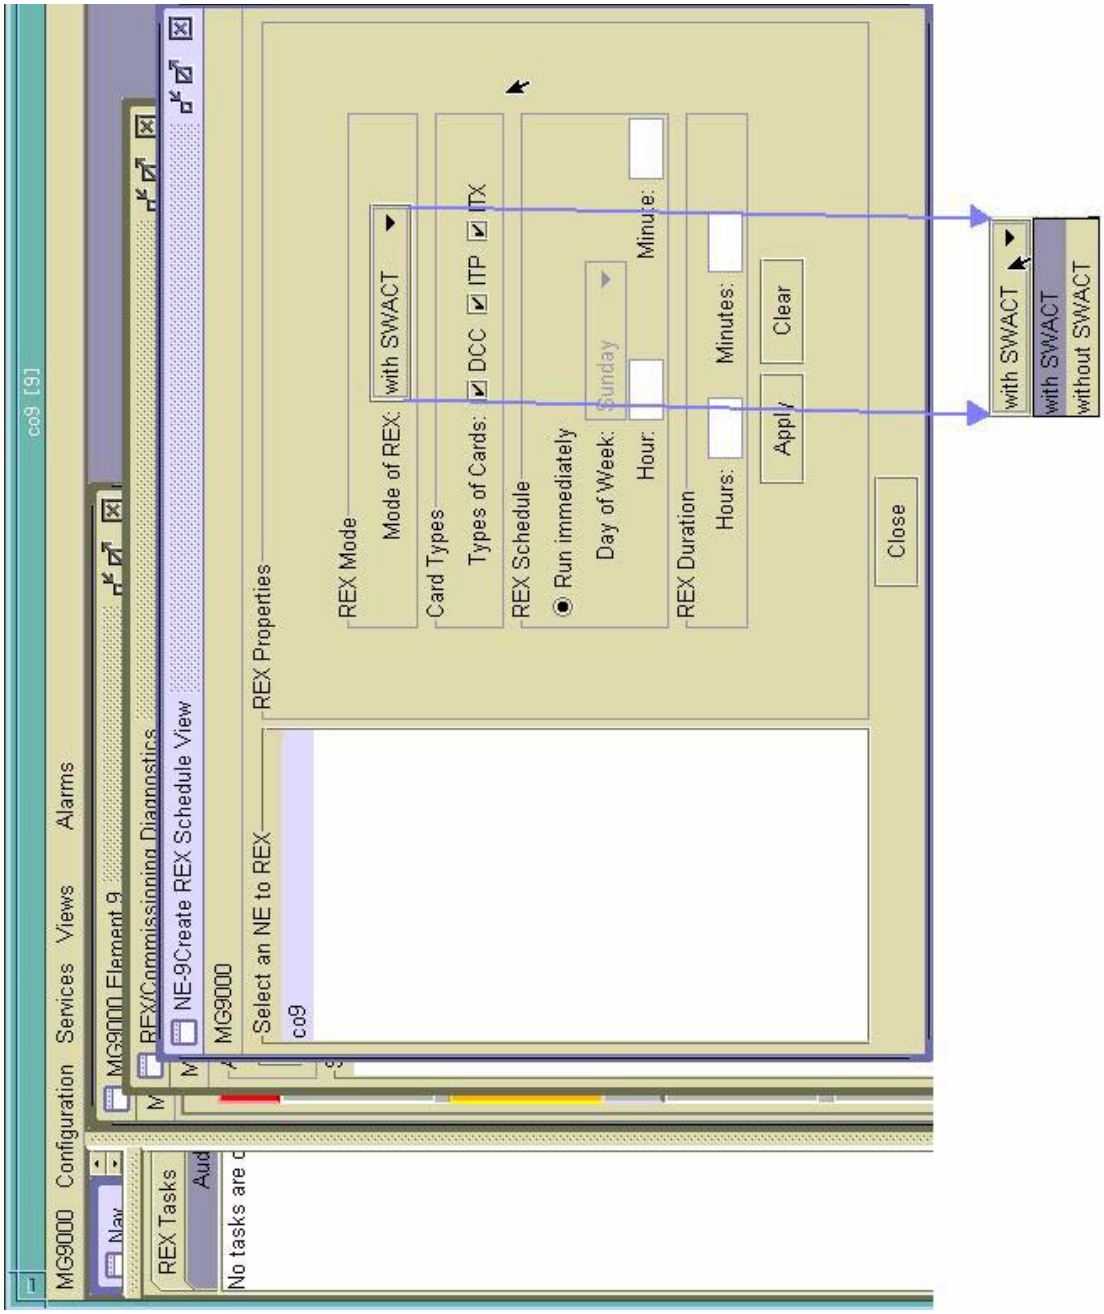

4.9.2.1.6 GUI release history update

A new GUI is introduced to schedule REX. REX NE View allows the user to schedule REX on an NE.

4.9.2.1.7 Context sensitive launching information

On clicking “REX NE” of Configuration menu from NE Specific Desktop view, REX NE View is launched. On clicking the “Add” button of REX NE View, Create Schedule View is launched.

4.9.2.1.8 Supplementary information

None.

4.9.2.2 GUI name: NE Specific Desktop View

NE Specific Desktop View provides REX progress details on its left panel.

4.9.2.2.1 Functional description

NE Specific Desktop View opens on clicking on MG9000 from subnet view. The configuration submenu of this view contains a new menu item “REX NE” as shown in Figure-3. This option enables user to launch REX GUI.

A tab is added on the left of NE Specific Desktop View to display the status of REX. Progress details of REX such as success/failure of operations like LOCK, UNLOCK, SWACT, Diagnose are displayed to the user.

4.9.2.2.2 GUI usage and implications

On clicking the NE from the Subnet view, NE Specific Desktop View is launched.

Following Figure-3 shows the GUI when the configuration menu item is clicked from NE Specific Desktop view. Menu item “REX NE” is introduced, which, when clicked, launches REX GUI.

4.9.2.2.3 GUI size

Table 7 New or modified GUIs

Abbreviated GUI name	Minimum instances	Maximum instances	Information on memory
NE Specific Desktop View	1	1	TBD

4.9.2.2.4 GUI fields

The following table lists fields for GUI NE Specific Desktop View that are related to REX.

Table 8 GUI field descriptions

Field	New or Changed	Subfield	Entry	Explanation and action	Associated MIB entry
REX NE	New	-	-	On clicking REX NE option of Configuration menu, REX NE View is launched	NA

Table 8 GUI field descriptions

Field	New or Changed	Subfield	Entry	Explanation and action	Associated MIB entry
REX Tasks tab	New	-	-	A text area that provides the status of REX to the user on the current NE. Status such as success/failure of LOCK, UNLOCK, SWACT and Diagnose are displayed to the user.	NA

4.9.2.2.5 Usage example

Figure -3 shows the NE Specific Desktop View with the “REX NE” option in configuration menu.

Figure -4 shows the “REX Tasks” tab of NE Specific Desktop View.

Figure -3 REX NE menu option

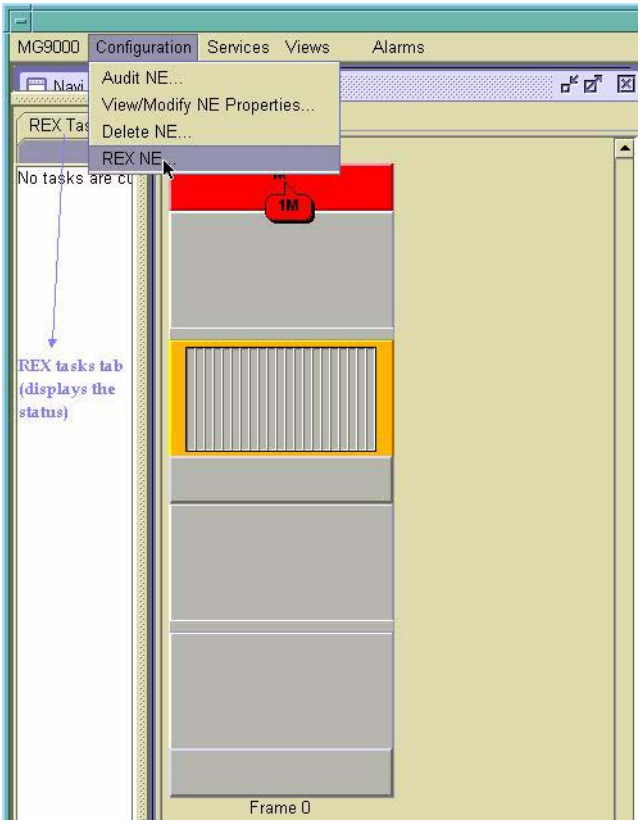

Figure -4 REX tasks tab on NE Specific Desktop View

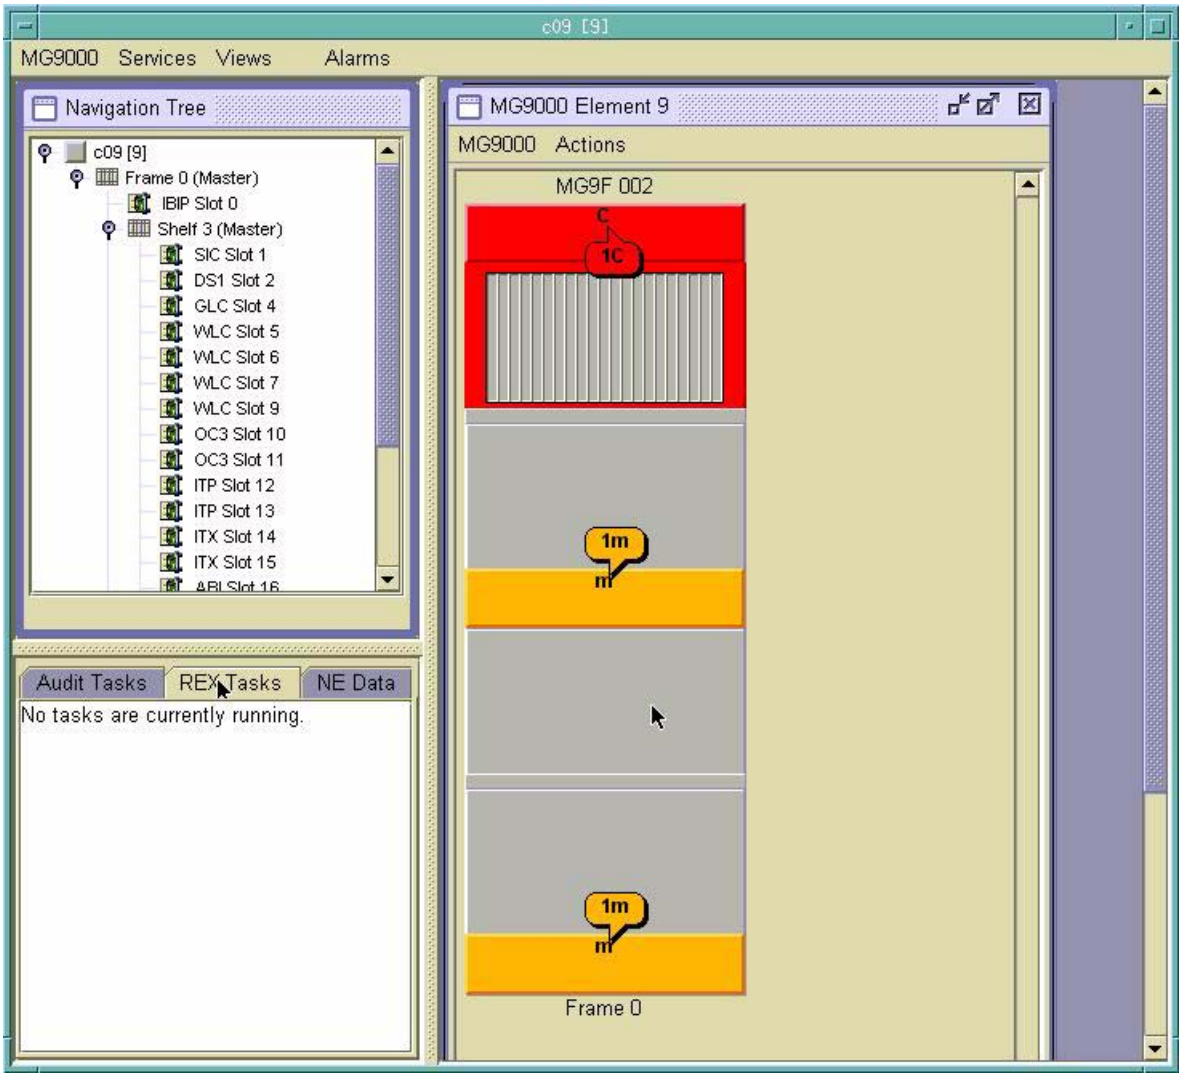

4.9.2.2.6 GUI release history update

A new submenu item “REX NE” is added to Configuration menu of NE Specific Desktop View

A new tab is introduced on the left panel of NE Specific Desktop View to display the status of REX on the current NE.

4.9.2.2.7 Context sensitive launching information

REX NE option and the REX tasks tab is present only if the EM release is SN09 or higher.

5.6.2.2.1 Functional description
A new MIB variable ‘rcSchFileCloseInterval’ is introduced to store the Scheduled Closure Time if the functionality of ’Files closed at scheduled intervals from midnight’ is enabled.

During the Stream Configuration, if user choose ’Yes’ when it is prompted "Do you want Files closed at scheduled intervals from midnight[NO]{NO YES}:" then user will be prompted for providng any of the following options for the Scehduled Time.

Options:

1) Close billing files every 24 hour

2) Close billing files every 12 hour

3) Close billing files every 6 hour

4) Close billing files every 2 hour

5) Close billing files every 1 hour

6) Close billing files every 30 minutes

5.13 Configuration Walkthrough

5.13.1 Scheduled Closure of Billing Files

Since the new functionality of ‘closure of billing Files at scheduled intervals from midnight’ is mutually exclusive with the existing functionality of File Closed based on a time limit, this feature can be availed only when the ’File Closed based on a time limit ’ is disabled. That can be achieved by giving ’NO’ when it prompts for " Do you want Files closed based on a time limit [NO] {NO YES } : " during the Stream Configuration

The ’Alternate Schedule Closure of billing File’ feature can be enabled/ activated by giving ‘YES’ when user will be prompted the following during the stream configuration:

Do you want Files closed at scheduled intervals from midnight [NO] {NO YES} :

On enabling this feature, user is prompted with the following time interval options for scheduling the file closure:

Options:

1) Close billing files every 24 hours

2) Close billing files every 12 hours

3) Close billing files every 6 hours

4) Close billing files every 2 hours

5) Close billing files every 1 hour

6) Close billing files every 30 minutes

7) Close billing files every 15 minutes

8) Closes billing files every 10 minutes

9) Close billing files every 5 minutes

Scheduled File Closure time option [5] {1 - 9}:

By default, the files will be rotated an hourly (1 Hr) basis. Users can set any one of the options prompted depending on their requirement

5.13.2 Reset DIRP Sequence Number at Midnight

During the Stream Configuration, if user chooses the DIRP file format and if user is not choosing the functionality of renaming the file based on close date. That means if user is choosing 'NO' to the prompt

'Do you want the files renamed with close date [NO] {NO YES } :' then user will be prompted the following.

"Do you want to reset DIRP Sequence Number at Midnight[NO]{NO YES}:"

If the answer to the above prompt is 'YES' then the functionality will be enabled.

Figure 6 SBA Stream Configuration (Reset DIRP Sequence Number at Midnight)

Stream Name [] {} : ama

Is this a Filter Stream [NO] {NO YES } :

Stream Record Format [] {SMDR BC CDR300 CDR250 } : BC

File Format Type [] {DNS DIRP } : DIRP

Please specify the logical Volume [/sba/ama] {} :

File Transfer Mode [OUTBOUND] {INBOUND OUTBOUND } :

Do you want the files renamed with close date [NO] {NO YES } :

Do you want to reset DIRP Sequence Number at Midnight[NO]{NO YES}:YES

Do you want the files closed for file transfer and writetape [YES] {NO YES } :

Do you want DIRP blocks closed based on time [NO] {NO YES } : NO

Do you want Files closed based on time [NO] {NO YES } : NO

Do you want Files closed at scheduled intervals from midnight[NO]{NO YES}: YES

Figure 7 SBA Stream Configuration (Reset DIRP Sequence Number at Midnight) contd...

Options:

1) Close billing files every 24 hours

2) Close billing files every 12 hours

3) Close billing files every 6 hours

4) Close billing files every 2 hours

5) Close billing files every 1 hour

6) Close billing files every 30 minutes

7) Close billing files every 15 minutes

8) Close billing files every 10 minutes

9) Close billing files every 5 minutes

Scheduled File Closure time option [5] {1 - 9}:

Number of records per day [0] {} :

Maximum Number of records per file [500000] {10000 - 500000} :

Maximum Number of bytes per file [20000000] {1000000 - 20000000} :

6: Configuration (CN): A00008522

6.1 Feature Name

SESM Support for SIP Lines

6.2 Hardware and Software Requirements

This feature requires the 905-240 GWC card, pec code NTRX51DL. It also requires that the CM, GWC SESM and MCS gateways are on a SN09 load.

6.3 Initial Configuration

6.3.1 SESM-CS2K Prov Mgr EM Server Configuraion

In the SESM, the /opt/nortel/NTsesm/admin/bin/configure tool should be used to configure SESM access to the Session Server Element Manager (SS-EM).

The configuration tool will prompt the user to enter the following:

- Transport protocol to SS-EM server (http/https - default is https). In SN09, only HTTPS is supported by the SS-EM, however flexibilty to choose HTTP is provided to meet possible future needs.
- IP address / host name of primary SS-EM server
- IP address / host name of secondary SS-EM server. Some configurations may not include a secondary SS EM server. If so, configure the same information provided for the primary server (by default this should be the case).
- HTTP/HTTPS communication port to SS EM server (default 8080 for http, 8443 for https).
- The OPIClient version. This is mapped to the SS EM load version. In SN09, the appropriate value will be “9.0”. The OPIClient version should be incremented each release in steps of 1.0 i.e, 9.0, 10.0...15.0
- SS-EM Provisioning Manager administrator user name
- SS-EM Provisioning Manager administrator password

The IP address and port will be used to generate the SS-EM Provisioning Manager URL which in turn will be added to sesm.properties file.

As part of the configuration, the IP address will be validated for format, range and reachability. Other user entered data will be validated for format, range, values etc.

The user name will be added to sesm.properties as clear text.

The password will be stored separately and accessible only to the root user.

All configuration information (url, username, etc.) except password can be displayed by using the SESM "/opt/nortel/NTsesm/admin/bin/configure" tool.

6.4 Office/Subnet parameters (OP/SP) (CM & SESM)

Not Applicable.

6.5 Upgrade Considerations

TBD.

6.5.1 Dump and Restore (CM)

Not Applicable.

6.5.2 Element Management Upgrade

The MSM gateway is new to SN09. Upgrading from SN08 or fresh install of SN09 will add the required fields necessary to support the MSM Gateway.

6.5.3 Downgrade impact

No impact - works as per current process.

6.6 Data schema (DS) (CM, MIBS, RDB)

6.6.1 New/modified tables, MIBs, or Database Schema

Table 1 New or modified tables

MIB name	NEW/CHANGED/ or DELETED/	Table Control (NEW/ OLD/UNCHANGED)
SERVRINV	CHANGED	N/A
LGRPINV	CHANGED	N/A
LNINV	CHANGED	N/A
GWC-PROFILE_MIB	CHANGED	N/A
NORTEL-GWC-COMMON-TC	CHANGED	N/A

6.6.2 Table/MIB/Remote Database Schema information

6.6.2.1 Name: SERVRINV

Server Inventory

6.6.2.1.1 Functional description

In SN09, the field TERM_EXEC_TC_TAB of the table SERVRINV includes DPLEX with a DLP termtype for GWCs defined with Large_LineNA_v2 and Large_LineINTL_v2 GWC profiles.

6.6.2.1.2 Usage sequence and implications (CM Only)

The table SERVRINV is provisioned by the SESM. No manual datafill or change is allowed. Manual changes to this table will cause data corruption.

6.6.2.1.3 Size

Not applicable.

6.6.2.1.4 Fields/OIDs

Not applicable. This feature will use an already defined and supported field.

6.6.2.1.5 Datafill example

The following example shows sample datafill for table SERVRINV:

GWC 167 IP 47 4 4 4 DPL DPLEX POTS POTSEX KEYSET KSETEX $ NORTHAA $ NET_IP Y $ $

6.6.2.1.6 Table release history update

Not applicable.

6.6.2.1.7 Supplementary information

Not applicable.

6.6.2.1.8 Translation verification other tools

Not applicable.

6.6.2.2 Name: LGRPINV

Logical Group Inventory

6.6.2.2.1 Functional description

In SN09, the field GRPTYPE of the table LGRPINV is set to “SSDPL” for SIP; logical groups will be used to indicate that the logical group is assigned to a CS2K SS gateway.

6.6.2.2.2 Usage sequence and implications (CM Only)

The table LGRPINV is provisioned by the SESM. No manual datafill or change is allowed. Manual changes to this table will cause data corruption.

6.6.2.2.3 Size

Not applicable.

6.6.2.2.4 Fields/OIDs

Not applicable. This feature will use an already defined and supported field.

6.6.2.2.5 Datafill example

The following example shows sample datafill for table LGRPINV.

Preprovisioned SIP Lines : SITE 00 0 GWC 3 DPL_GRP $

Where SITE represents an entry from the table SITE in the CM.

6.6.2.2.6 Table release history update
Not applicable.

6.6.2.2.7 Supplementary information
Not applicable.

6.6.2.2.8 Translation verification other tools
Not applicable.

6.6.2.3 Name: LNINV
Line Inventory

6.6.2.3.1 Functional description
There are no software/functional changes to table LNINV. This section will describe the datafill.

```
(GRPTYPE SITE)  SITE                        4 char name

(GRPTYPE DPL_GRP) FRAME NUMBER              {0 TO 511}

(GRPTYPE DPL_GRP) LINE SUBGROUP             {0 TO 9}

(GRPTYPE DPL_GRP) SLOT                      {00 TO 10}

(GRPTYPE DPL_GRP) CIRCUIT                   {00 TO 99}*

*00 - 23 when SLOT = 10
```

6.6.2.3.2 Usage sequence and implications (CM Only)
Entries will be automatically configured by SESM at MSM gateway provisioning time.

6.6.2.3.3 Size
Not applicable.

6.6.2.3.4 Fields
Not Applicable.

6.6.2.3.5 Datafill example
The following example shows sample datafill for table LNINV.

Preprovisioned SIP line (North American):

SITE 00 0 21 31 RDTLSG PKLNL HASU N NL N NIL

Preprovisioned SIP line (International):

SITE 00 0 21 31 GWLPOT PKLNL HASU N NL N NIL

6.6.2.3.6 Table release history update
Not applicable.

6.6.2.3.7 Supplementary information
Not applicable.

6.6.2.3.8 Translation verification other tools
Not applicable.

6.7 Service Orders (SO) (CM & SESM)
No new service orders are created under this activity, however several new options are defined which can be used in NEW/CHF commands applicable to SIP lines hosted off of MSM VMGs.

All listed may also be used via the Bulk Provisioning Tool.

6.7.1 Service order change details
LCC and options

(SESM)
A new SIP_DATA option is introduced by this feature. The SIP_DATA option is a SERVORD+ option which is not presented to XACore SERVORD (it is removed from the command prior to XACore SERVORD command processing).

6.7.1.1 Option Format:
SIP_DATA sub-options-and-values $

where

sub-options = SIP_CLIENT_TYPE, SIP_URI, SIP_PASSWD, SIP_PACKAGE, SIP_LOCATION

The SIP_DATA option and sub-option **tags** (but not their values, see later restrictions) may be entered in either lower or upper case transparently.

> ***Note:*** sub-option values have external case restrictions. See "Usage/ Format Validation and Rules" in a subsequent section.

6.7.1.2 Sub-option value formats:
SIP_CLIENT_TYPE option value format = {one or more token_string_values}

SIP_URI option value format = {token_string_value, format uservalue@domainnamevalue}

SIP_PASSWD option value format = {token_string_value}

SIP_PACKAGE option value format = {one or more token_string_values}

SIP_LOCATION option value format = {one or more token_string_values}

6.7.1.3 SIP_DATA Sub-option and Value Examples:

"SIP_DATA SIP_PACKAGE test package $"

"SIP_DATA SIP_PACKAGE test package SIP_URI someone@somecompany.com $"

"SIP_DATA SIP_CLIENT_TYPE SIP Line SIP_LOCATION Nortel Networks.RTP.NC0 SIP_PASSWD test1password $"

6.7.1.4 Usage/Format Validation and Rules

OSSGate/SERVORD+ SIP_DATA validation will be limited. SessionServer-EM will be responsible for validating the actual value contents.

6.7.1.4.1 Rules Enforced for SIP Data by OSSGate/SERVORD+

Breaking these rules causes immediate command failure/rejection by OSSGate/SERVORD+:

- One or more sub-options are REQUIRED when the SIP_DATA option is specified.
- Sub-option tags are reserved words and may not be used as values for other sub-options or for any non-related types (eg. CM customer group, gateway names, etc.). For example, “SIP_PASSWORD sip_password” is an invalid option and value pair. “sip_password” may not be used as the value specified for the SIP_PASSWORD sub-option. “sip_password” may not be used as a part or whole value for any other sub-option (e.g. “SIP_LOCATION sip_passwd” will be rejected).
- The SIP_DATA terminator, “$”, is a reserved token and may not be used as a value of any SIP_DATA sub-option. If a sub-option is present in the SIP_DATA options list, then it must have a valid value other than “$”.
- The tag-value pair relationship for the options/sub-options will be enforced from a simple format perspective. All sub-options must have associated values. The overall SIP_DATA option must be terminated by a “$”.
- Multiple/extraneous SIP_DATA options or sub-options found in a single NEW/CHF/etc command, will result in rejection of the command by OSSGate/SERVORD+.
- SIP_URI must be of the format user@domain. The domain information is parsed from the URI value. A missing domain (e.g. missing @ delimiter or domain information) will cause immediate command failure. An invalid

domain name specified will be rejected by the Session Server Provisioning Manager.

- SIP_LOCATION must be included in the SIP_DATA option when the command issued results in the creation of a new user on the Session Server. In SN09, this applies only to the NEW command.

6.7.1.4.2 Rules NOT Explicitly Enforced for SIP Data by OSSGate/SERVORD+

These rules are not explicitly enforced by OSSGate/SERVORD+. Breaking these rules may cause command failures or other unintended consquences:

- SIP_DATA and the associated sub-option tags are reserved words and may not be used as values for any non-related types (eg. CM customer group, gateway names, etc.). Use of the reserved keywords in this manner may cause unexpected problems when attempting to use OSSGate/SERVORD+ for provisioning ANY type of line.
- CHF commands affecting SIP_DATA on SIP lines requires that gateway/termination names (or associated LEN) be used in the command instead of DN. Use of DN will result in the command being processed only by the CM, which is undesirable when SIP_DATA is present in the command.
- Use of the SIP_DATA option is not supported in commands which do not affect SIP lines or in commands which are not supported for flowthrough **for** SIP lines. Use of the SIP_DATA option in these commands may cause unintended command failures.
- The SIP_DATA option may fall anywhere in the command string except as the first token (which is reserved for the command name), however it is ***highly recommended*** that the SIP_DATA option be placed in the normal option field range of the command.
- The values assigned to sub-options SIP_CLIENT_TYPE, SIP_PACKAGE, and SIP_LOCATION are ***automatically normalized to lower case by OSSGate/SERVORD+*** (e.g. SIP_CLIENT_TYPE value “SIP Line” received at OSSGate will be normalized to “sip line” prior to transfer to the Session Server Provisioning Manager). **When commissioning these associated values on the Session Server Provisioning Manager, you MUST use lower case text.** Failure to commission these values in the Session Server Provisioning Manager using lower case text will result in command failures at OSSGate/SERVORD+.
- SIP_URI is normalized to lower case by the Session Server Provisioning Manager when received from OSSGate/SERVORD+. Caseless comparisons are performed by the Session Server Provisioning Manager when determining if a URI entered at OSSGate is already in use (e.g. “Slynch@Nortel.com” is considered identicle to “slynch@nortel.com” from the Session Server Provisioning Manager’s perspective). Only the normalized/lower-case URI is stored by the Session Server Provisioning

Manager (e.g. “USERname1@Domain1.net” received from OSSGate/ SERVORD+ would be stored as “username1@domain1.net” in the Session Server Provisioning Manager).

6.7.1.5 Data Mapping Example

In the following command,

LEN: MSM1 00 0 00 00

is mapped to

VMG: TestMSMVMG.1

termination/endpoint: MSM1/000/0/0000

OSSGate command:

NEW $ 9195200500 IBN PRADEFAULT 0 0 LATA1 0 MSM1 00 0 00 00 + DPL Y 10 SIP_DATA SIP_PACKAGE test package SIP_PASSWD + test1Password SIP_URI someone@somecompany.com + SIP_CLIENT_TYPE SIP Line SIP_LOCATION Nortel Networks.RTP $ $

XACore SERVORD command derived from OSSGate command:

NEW $ 9195200500 IBN PRADEFAULT 0 0 LATA1 0 MSM1 00 0 00 00 + DPL Y 10 $

Data sent to SS-EM:

VMG: TestMSMVMG.1

termination: MSM1/000/0/0000

Domain: somecompany.com

User: someone

Password: test1Password

firstName: SIPLineUser (default value)

lastName: SIPLineUser (default value)

Package: test package

locale: English (default value)

timezone: Eastern Standard Time (default value)

clientType: SIP Line

DN: 9195200500

location: Nortel Networks.RTP

status: ACTIVE (default value)

6.7.2 New commands

Not Applicable.

6.7.3 Line equipment format changes

6.7.3.1 LEN

No LEN format changes are introduced by this feature. Typical LEN format for SS LENs:

SITE FFF G TT tt

SITE = SITE name

FFF = frame number, 0-511

G = group number, 0-9

TT tt = terminal, 00 00 - 10 23

6.7.3.2 Media gateway endpoint format

No gateway/endpoint format changes are introduced by this feature. Typical SS VMG and endpoint formats:

VMG = 64 character free-form string (eg. TestSSVMG.1)

endpoint/termination = SITE/FFF/G/TTtt

where SITE, FFF, G, and TTtt value are as specified in the SS LEN format.

- The LEN's individual TT tt values will always be zero-padded to 2 digits when converted to an endpoint/termination name (e.g. TT tt value "2 7" would be converted to an endpoint/termination TTtt value of "0207").
- The LEN's FFF value will always be zero-padded to 3 digits (e.g. FFF value "6" would be converted to endpoint/termination FFF value "006").

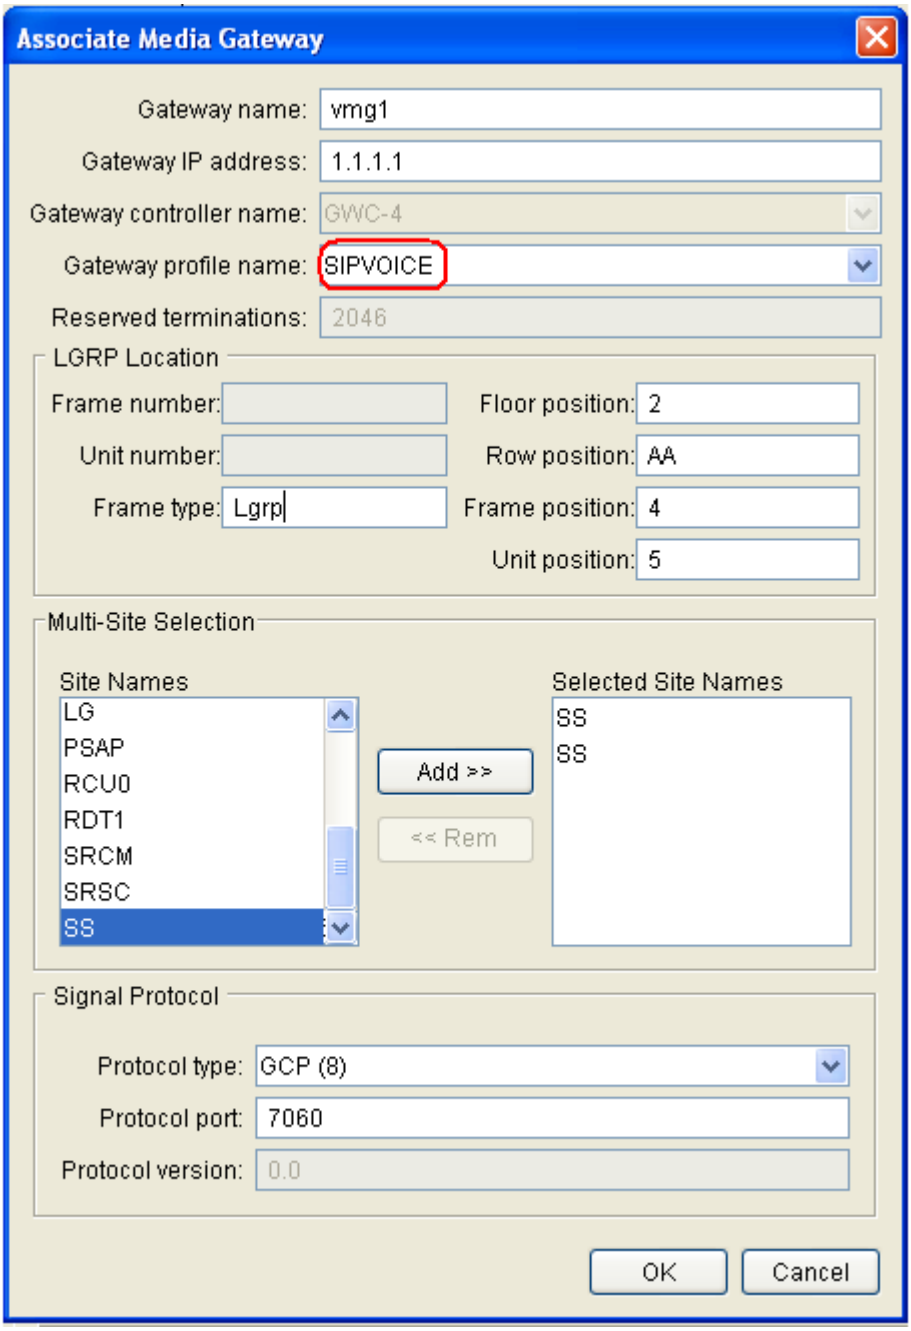
1
GWC Bearer Networks and Codec Profile Information
Bearer networks: NET_IP(IP)
GWC codec profile: Default_Network_Codec
OK
Cancel

6.9.2.2 GUI name: Associate Gateway



6.9.2.2.1 Functional description

Adding a GW involves identifying a gateway name, IP address and selecting the MSM profile from the Gateway profile name list. The MSM selection causes a Multi-Site Selection panel to appear.

The LGRP Location panel is used to provide the physical equipment location of the GW. LGRP_type is a string. Floor position, frame position and unit positions are all integers while row position is a char ‘A’ - ‘Z’, ‘AA’ or ‘AB’.

Below the LGRP Location panel is the Multi-Site Selection panel. Within this panel is a Site Names list and a Selected Site Names list. The Site Names list consists of all of the site names from table SITE in the CM. Site names are selected (placed in the Selected Site Name list) by simply clicking on the site name and selecting Add.

For SN09, a maximum of 12 site names can be selected.

Each site name represents one LGRP as defined by:

<site>/frame/group

Each LGRP is provisioned in table LGRPINV (CM) and represents 1023 endpoints. Each endpoint is added to table LNINV as:

<site> frame group terminal

where the terminal number ranges from 00 00 to 10 22.

The Root Zone Selection panel is used to provision middleboxes.

The reserved termination field is updated once the OK button is selected. The entries in the Signal Protocol panel are fixed (cannot be changed).

Note: Adding a fully provisioned CS2KSS GW will take about 45 mins (12 LGRPs).

Note: Provisioning SIP GWs can only be performed one at a time. Attempts to provision multiple SIP GWs at the same time may cause all provisioning sessions to fail.

6.9.2.2.2 GUI usage and implications

This GUI is used only to add an MSM gateway.

6.9.2.2.3 GUI size

Not applicable.

6.9.2.2.4 GUI fields

The Multi site Selection panel is only visible if the MSM profile is selected from the Gateway Profile list.

Table 3 GUI field descriptions

Field	New or Changed	Subfield	Entry	Explanation and action	Associated MIB entry
Site Names	New	none	Site name values from the CM	Site Names	None
Selected Site Names	New	none	Site names selected from the Site Name list	Selected Site Names	None

6.9.2.2.5 Usage example

There are two ways to access the above Associate Gateway GUI:

- From the CS2000 Management Tools GUI, select Configuration from the top menu and select Associate Media Gateway from the pull down
- From the Gateway tab, in the lower portion of the GUI, select the "Associate.." button

From the Associate Gateway panel:

1. Add the gateway name - up to 64 characters, can be "." or "/" delineated,
2. Input the IP address of the MSM Service Manager,
3. If the Associate Gateway panel was opened via the CS2000 Management Tools menu bar then the Gateway Controller name will need to be entered,
4. Select MSM from the Gateway profile name. The Site name box will disappear and will be replaced with a Multi Site Selection panel.
5. From the list of Site Names on the left, select a site name then clich on the "Add" button. This will add the site name to the Selected Site Name list on the right. For SN09, a maximum of 6 entries can be on the right side. These entries can be the same or different (same site name can be used multiple times). These site names will be used to name the line groups (LGRPs).
6. If a site name was selected in error, from the list on the right, select the site name and the "Rem" button. This will remove the site name from the list on the right.
7. The protocol, version and port have been defaulted, no changes are needed

8. Select OK to start the process. The association process may take up to 15 minutes. This process includes adding a GW to the GWC, adding a LGRP to table LGRPINV in the CM, adding the endpoints to the GWC, then adding the LENs to LNINV in the CM. The LGRP addition process is repeated until all selected LGRPs have been added.

6.9.2.2.6 GUI release history update
Modification to the Associate Gateway GUI

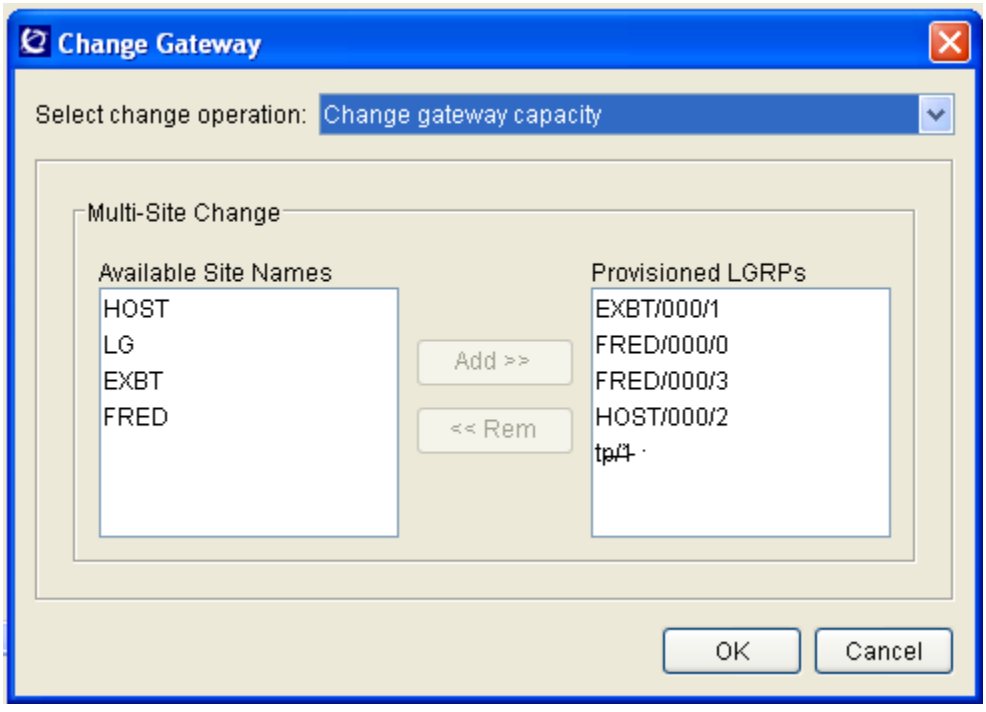
6.9.2.2.7 Context sensitive launching information
Not impacted, no changes

6.9.2.2.8 Supplementary information
None

6.9.2.2.9 CLUI Interface
No impact.

6.9.2.3 GUI name: Change Gateway

6.9.2.3.1 Functional description
This GUI allows the user to change the capacity of a gateway - this capability currently exists. Should the gateway be a MSM, a different Change Gateway GUI is presented.



A gateway using the MSM profile will have a dialog box in displayed. Similar to the AssocGW dialog box, this box contains two lists, Available Site Names on the left, which is a list of site names from the table SITE in the CM.

The second list, “Provisioned LGRPs”, is a list of site names already used and assigned. These site names have LGRPs and LENs assigned to it, therefore they show up with there respective frame and group numbers.

From this dialog box, the user can add additional site names (a maximum of 6 LGRP/Site names) are permitted in the Provisioned LGRPs list.

Additionally, the user can select to remove LGRP/Site names from the provisioned list simply by selecting them and the remove button.

Once the site names have been added, and OK selected, this diialog box will close and another panel will appear to display the progress and responses. The first item to display is the timeout value.

Cancel will close the box without executing any operation.

> ***Note:*** currently only single operations may be performed from thie Change Gateway dialog; in other words, the user cannot add one site and remove another site in the same operation.

6.9.2.3.2 GUI usage and implications

6.9.2.3.3 GUI fields

Table 4 GUI field descriptions

Field	New or Changed	Subfield	Entry	Explanation and action	Associated MIB entry
Site Names	New	none	Site name values from the CM	Site Names	None
Selected Site Names	New	none	Site names selected from the Site Name list	Selected Site Names	None

6.9.2.3.4 Usage example - Removing an LGRP

Reference the above figure, if the user wishes to remove HOST/000/2 from the currently configured, the following steps are performed:

1. From the Provisioning panel, Gateway Tab, click on the MSM gateway (there should only be one).

2. Select the Change button from the bottom of the Gateway Tab. A Change dialog box opens.
3. From the Change Dialog, the pull down, select Change Gateway Capacity
4. The above dialog box opens.
5. The user selects HOST/000/2 from the Provisioned LGRPs List, then selects the Rem. This will remove the HOST/000/2 from the Provisioned LGRPs List and place in the Available Site Names List.
6. Click on the OK and the operation will begin.
7. A Status box will open and indicate the expected time that the operation may take. This box will also indicate any success or error encountered during this operation.

6.9.2.3.5 Usage example - Adding an LGRP

Reference the above figure, if the user wishes to add another FRED LGRP/site name, the following steps are performed:

1. From the Provisioning panel, Gateway Tab, click on the MSM gateway (there should only be one).
2. Select the Change button from the bottom of the Gateway Tab. A Change dialog box opens.
3. From the Change Dialog, the pull down, select Change Gateway Capacity
4. The above dialog box opens.
5. The user selects FRED from the Available Site Names List, then selects the Add. This will add FRED from the Provisioned LGRPs List.
6. Click on the OK and the operation will begin.
7. A Status box will open and indicate the expected time that the operation may take. This box will also indicate any success or error encountered during this operation.

6.9.2.3.6 Usage example - Cancel

At any time, the user may cancel the pending operation without executing the operation. Simply select Cancel.

6.9.2.3.7 GUI release history update

Not Applicable.

6.9.2.3.8 Context sensitive launching information

Not impacted, no changes.

6.9.2.3.9 Supplementary information

Not Applicable.

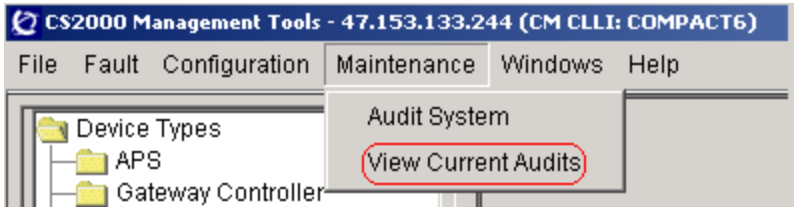
6.9.2.3.10 CLUI Interface

No Impact.

6.9.2.4 GUI name: View Current Audits

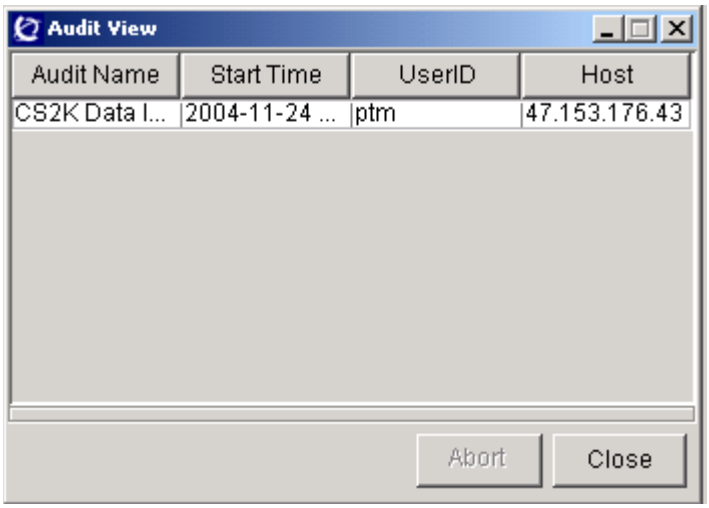
6.9.2.4.1 Functional description

- Add a new menu in Maintenance of Cs2kmt to provide the new function “Abort Audit”.



When user selected the menu “View Current Audits”, another new gui will be displayed. Detail info refer to the following gui.

- Add a new gui to provide the new function “Abort Audit”.



The running audits will be displayed in this gui. The datas of the audits include: Audit Name, Start Time, UserID, Host.

User can selected a running sudit and press the “Abort” button to abort the audit.

6.9.2.4.2 GUI usage and implications

This GUI is used only to view and abort the running audits.

6.9.2.4.3 GUI size

Not applicable

6.9.2.4.4 GUI fields

Not applicable

6.9.2.4.5 Usage example

From the CS2000 Management Tools GUI, select Maintenance from the top menu and select Audit System from the pull down.

6.9.2.4.6 GUI release history update

Add a new gui to view and abort the running audits.

6.9.2.4.7 Context sensitive launching information

Not impacted.

6.9.2.4.8 Supplementary information

None

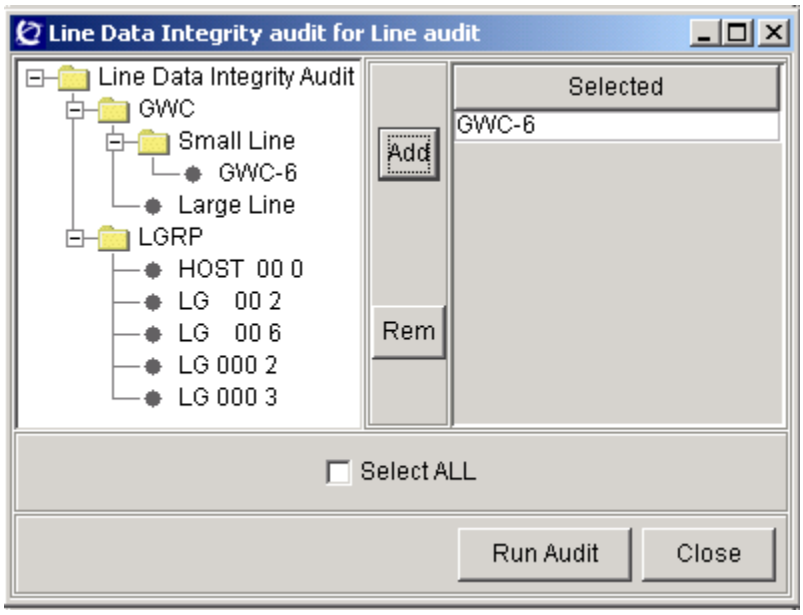
6.9.2.4.9 CLUI Interface Not Impacted

6.9.2.5 GUI name: Line Data Integrity Audit

6.9.2.5.1 Functional description

- Add a new gui to provide support for audit by GWCs, GWs or LGRPs. Only support Line Data Integrity audit now.

When user select “Line Data Integrity Audit” and press the “Run Audit” button in Audit System gui, the following gui will be displayed.



User can selected the GWCs, GWs or LGRPs in the left tree and add them to the right table by press the “->” button.

The button “<-” is used to delete the data that user selected in the right table.

User can select all datas to do audit by select checkbox “Select All”.

After user selected the data and press “Run Audit” button, the audit will be run as before.

6.9.2.5.2 GUI usage and implications
This GUI is used only to provide support for running line audit per GWCs, GWs, or LGRPs.

6.9.2.5.3 GUI size
Not Applicable.

6.9.2.5.4 GUI fields
Not Applicable.

6.9.2.5.5 Usage example
From the CS2000 Management Tools GUI, select Maintenance from the top menu and select Audit System from the pull down.

6.9.2.5.6 GUI release history update
Add a new gui to provide support for running line audit per GWCs, GWs, or LGRPs.

6.9.2.5.7 Context sensitive launching information
Not impacted.

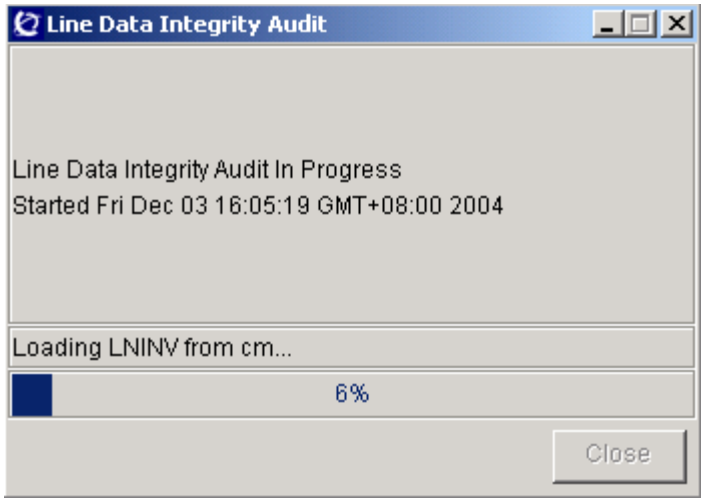
6.9.2.5.8 Supplementary information
None

6.9.2.5.9 CLUI Interface Not Impacted

6.9.2.6 GUI name: Run Audit

6.9.2.6.1 Functional description

6.9.2.6.2 GUI usage and implications
This GUI is used only to provide support for indicating process of running audit.



The progress bar was used to indicate the progress of the running audit.

The label was used to show the current operation.

6.9.2.6.3 GUI size
Not Applicable

6.9.2.6.4 GUI fields
Not Applicable

6.9.2.6.5 Usage example
From the CS2000 Management Tools GUI, select Maintenance from the top menu and select Audit System from the pull down.

6.9.2.6.6 GUI release history update
Add a new gui to provide support for indicating process of running audit.

6.9.2.6.7 Context sensitive launching information
Not impacted.

6.9.2.6.8 Supplementary information
None

6.9.2.7 CLUI Interface
Not Impacted

6.10 User interface changes
Not Applicable

7: Configuration (CN): A00008601

7.1 Feature Name

IW-SPM-IP Fully Provisionable Codec Lists for G.711/G.729

7.2 Hardware and Software Requirements

This functionality requires SN09 load in the Call Server, IW-IP CEM and GEM RM.

7.3 Initial Configuration

Not Applicable

7.4 Office/Subnet parameters (OP/SP) (CM & SESM)

Not Applicable

7.5 Upgrade Considerations

7.5.1 Dump and Restore (CM)

During the upgrade[ONP] from SN07/SN08 to SN09, in the following two cases the DFCODEC and PRFCODEC values will convert as shown:

Figure 1 Case1: DFCODEC-G711ULAW, PRFCODEC-NONE, RFC2833-

```
Before upgrade [SN07/SN08]:

7.6 Data schema (DS) (CM, MIBS, RDB)

7.6.1 New/modified tables, MIBs, or Database Schema

Table 1 New or modified tables

Table name	NEW/CHANGED/ or DELETED/	Table Control (NEW/ OLD/UNCHANGED)
MNIPPARM	CHANGED	UNCHANGED

7.6.2 Table/MIB/Remote Database Schema information

7.6.2.1 Name: MNIPPARM

Multiservice Node Internet Protocol PARaMeters.

7.6.2.1.1 Functional description

Table MNIPPARM contains customer provisionable parameters applicable to the IW IP SPM peripheral. This table has no logical dependencies on other tables and each tuple is applicable to all SPMs of the specified type (i.e. all parameters in the tuple for IWSPM apply to every IW IP SPM configured as a BRIDGE ONLY SPM in the office).

7.6.2.1.2 Usage sequence and implications (CM Only)

There are no requirement to datafill tables in a specific order. However, the values specified in MNIPPARM will have no meaning unless an SPM of the IWIPBRG type is datafilled and operational in the office.

7.6.2.1.3 Size

Table 2 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
MNIPPARM	Unchanged	Unchanged	Unchanged

7.6.2.1.4 Fields

The following table lists fields for table MNIPPARM.

Table 3 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
MNKEY	Unchanged	None	IWSPM, DPTSPM	T_MNPARM_KEY. This is the tuple key, no default value provided.
DFCODEC	**Changed**	**None**	**G711ALAW, G711ULAW, G729**	**DEFAULT_CODEC. This specifies the default codec to be used in call processing. The default offered is G711ULAW.** **As part of this feature G729 can be provisioned as DFCODEC**
PRFCODEC	**Changed**	**None**	**NONE, G729, G711ALAW, G711ULAW**	**PREFERRED_CODEC. This specifies the preferred codec to be used in call processing. The default offered is NONE.** **As part of this feature G711ALAW or G711ULAW can be provisioned as PRFCODEC**
PKTRATE	Unchanged	None	10, 20	PACKETIZATION_RATE. This specifies the packetization rate in milliseconds to be used for voice packets. The default offered is 10.

Table 3 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
INGRESS	Unchanged	None	-6 TO 6	GAIN. This specifies the gain to be applied to the ingress side of the call. The default offered is 0.
EGRESS	Unchanged	None	-6 TO 6	GAIN. This specifies the gain to be applied to the egress side of the call. The default offered is 0.
JITMIN	Unchanged	None	0 TO 300	JITTER. This specifies the minimum jitter setting in milliseconds. The default offered is 100.
JITMAX	Unchanged	None	0 TO 300	JITTER. This specifies the maximum jitter setting in milliseconds. The default offered is 100.
JITTARG	Unchanged	None	0 TO 300	JITTER. This specifies the target jitter setting in milliseconds. The default offered is 100.
ECAN	Unchanged	ECHOLOSS, ECHOTAIL	ENABLE, DISABLE	STATUS. This specifies if Echo Cancellation is active or inactive. The default offered is DISABLE. The following subfields are given when ENABLE is specified.
		ECHOLOSS	0, 3, 6	ECHO_RETURN_LOSS. This subfield specifies the loss on the echo return signal.
		ECHOTAIL	16, 24, 32, 64, 96, 128	ECHO_TAIL_LENGTH. This subfield specifies the echo tail length in milliseconds.
VOICE	Unchanged	None	OFF, CONSERV, AGGRESS	VOICE_DETECTION. This specifies the level of voice detection. The default offered is OFF.
CMFNOISE	Unchanged	None	ENABLE, DISABLE	CMFNOISE. This specifies if comfort noise is provided. The default offered is DISABLE.
T38	Unchanged	None	ENABLE, DISABLE	T38. This specifies if T38 fax is supported. The default offered is DISABLE.

Table 3 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
RFC2833	Unchanged	None	ENABLE, DISABLE	RFC2833. This specifies if RFC2833 is supported. The default offered is DISABLE.
RTCP	Unchanged	INTERVAL	N,Y	RTCP. This specifies if RTCP is active. The default offered is N.
		INTERVAL	1 TO 60	INTERVAL. This subfield specifies the RTCP interval when field RTCP is set to Y.
TONESET	Unchanged	None	NORTHAMERICA,SPAIN,UK,FRANCE,PORTUGAL,BELGIUM,GERMANY,NETHERLANDS,SWEDEN,AUSTRIA,ITALY,SWITZERLAND,AUSTRALIA,BRAZIL,IRELAND,MEXICO,ISRAEL,ROMANIA,TURKEY,CZECH,CHINA,TAIWAN,KOREA,JAPAN,PANAMA,ARGENTINA,GREECE,POLAND,NEWZEALAND,SINGAPORE,VENEZUELA,CHILE,HONGKONG,MALAYSIA,PHILIPPINES,THAILAND,INDIA	TONESET. This specifies the unique tonset to be utilized based on the resident country. The default offered in NORTHAMERICA.
LOGINT	Unchanged	None	1 TO 120	LOGINT. This specifies the log interval. The default offered is 5.
CRCERROR	Unchanged	RISE, FALL	0 TO 100	MNPARM_THRESHOLD. This specifies the settings for CRC error logs. The default offered is 20, 10.
USIZEPKT	Unchanged	RISE, FALL	0 TO 100	MNPARM_THRESHOLD. This specifies the settings for the undersize packet logs. The default offered is 20, 10.
OSIZEPKT	Unchanged	RISE, FALL	0 TO 100	MNPARM_THRESHOLD. This specifies the settings for the oversized packet logs. The default offered is 20, 10.

Table 3 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
FRAGMENT	Unchanged	RISE, FALL	0 TO 100	MNPARM_THRESHOLD. This specifies the settings for the fragments logs. The default offered is 20, 10.
JABBER	Unchanged	RISE, FALL	0 TO 100	MNPARM_THRESHOLD. This specifies the settings for the jabber logs. The default offered is 20, 10.
DROPEVNT	Unchanged	RISE, FALL	0 TO 100	MNPARM_THRESHOLD. This specifies the settings for the drop event logs. The default offered is 20, 10.
BRDCAST	Unchanged	RISE, FALL	0 T0 100	MNPARM_THRESHOLD. This specifies the settings for the broadcast logs. The default offered is 20, 10.
JITTER	Unchanged	RISE, FALL	0 TO 100	MNPARM_THRESHOLD. This specifies the settings for the jitter logs. The default offered is 20, 10.
LATENCY	Unchanged	RISE, FALL	0 TO 100	MNPARM_THRESHOLD. This specifies the settings for the latency logs. The default offered is 20, 10.
VPKTLOST	Unchanged	RISE, FALL	0 TO 100	MNPARM_THRESHOLD. This specifies the settings for the voice packets lost logs. The default offered is 20, 10.
MINLOG	Unchanged	None	0 TO 1000000	LOG_REPORT_MIN_VOLUME. This specifies the minimum packet volume for log reporting. The default offered is 1000.

Table 3 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
OMPARMS	Unchanged	RTPLOSTE, JTREXC, LATEXC	1 TO 100, 1 TO 3000, 1 TO 3000	OMPARMS. This specifies operational measurement parameters. RTPLOSTE specifies the threshold value of RTP packets lost for pegging a particular OM. JTREXC specifies the threshold jitter value for pegging a particular OM. LATEXC specifies the threshold latency value for pegging a particular OM.
DIFFSERV	Unchanged	EF_CODEPOINT	6-bits as ASCII, prefixed by “CP” for CodePoint, ie:CP101110	The codepoint for voice band defaults to CP101110
	Unchanged	EF_PRIORITY	0 TO 7	The priority for voice defaults to 6
	Unchanged	CS5_CODEPOINT	6-bits as ASCII, prefixed by “CP” for CodePoint, ie: CP101000	The codepoint for signalling data defaults to CP101000
	Unchanged	CS5_PRIORITY	0 TO 7	The priority for signalling defaults to 6
MEDINTEG	Unchanged	None	ENABLE or DISABLE	Indicates the state of Media Integrity on this GEM card, defaults to DISABLE

7.6.2.1.5 Datafill example

The following example shows sample datafill for table MNIPPARM.

Figure 3 Datafill for table MNIPPARM

```

Preferred codec	Default codec
None	G711ALAW
None	G711ULAW
None	G729
G711ALAW	G729
G711ULAW	G729
G729	G711ALAW
G729	G711ULAW

7.6.2.1.6 Table release history update

Table MNIPPARM was created in the SN06 software release.

7.6.2.1.7 Supplementary information

None.

7.6.2.1.8 Translation verification and other tools

MNIPPARM does not use translation verification tools.

8: Configuration (CN): A00008629

8.1 Feature Name

GEM-II AAL2 IW-SPM SN09 Core Preparation Work

8.2 Hardware and Software Requirements

Since AAL2 IW-SPM is a new product introduction, there will be no discussion of how to upgrade an AAL1 or IP IW-SPM to AAL2.

8.3 Initial Configuration

1. To initially configure an AAL2 IW-SPM, first equip an IW-SPM with two NTLX82BA or later CEM packs in slots 7 and 8, and NTLZ20DA GEM-II packs in slots 9 and 10. Only the lower shelf will be used; no other cards should appear on the lower shelf (e.g. No DSP cards since GEM-II has built-in DSP). The upper shelf should be empty.
2. Equip 4 ENET links to each CEM. Four will be needed to realize a capacity 2016 bridges on the IW-SPM (less than 2016 if ECAN used).
3. Plug in OC3 SFP (Small Form Pluggable) connector into the front of each GEM-II card, then connect the SONET TX/RX fibers to this connector. Other end of fiber will connect to AAL2 port on a Passport.
4. Datafill following tables in the order given:
5. Insure network is mu-law as used in North America. A-law (for International) is not currently supported for ATM AAL2.
6. Office parm ECAN_EDGE_STRATEGY in OFCENG should be set to "Y" (same as needed for IP) so DPT GWCs, MG4Ks, and line GWCs will request ECAN on the IW-SPM.
7. Office parm AAL2_ATM_ENABLE in OFCENG should be set to "Y" so NTLZ20DA ATM RM can be added to an AAL2 IW-SPM.
8. CLLI: add ENET_TO_AAL2 tuple with ADMININF ENET_TO_AAL2_POOL.
9. BEARNETS: add an AAL2 network fabric.
10. NETBRDGE: add an ENET_TO_AAL2 BRDGCLLI that connects TDM_ENET to ATM_AAL2 with DISPLAY of E_A2.
11. NETPATH: specify path that will use the desired bridge by adding this tuple: "2 (ENET_TO_AAL2) $"
12. NET2NET: show that ENET and AAL2 can connect by changing CONNNETS of NET_AAL2 tuple to: "(TDM_ENET 2) $".
13. MNNODE: add an IW class SPM that is BRDG_ONLY with BRDGCLLI of ENET_TO_AAL2.

14. MNSHELF: add lower and upper NTLX51BA shelves to a NTLX91BA frame; the lower shelf will house the CEM and ATM packs for the IW-SPM, while the upper shelf will remain empty.

15. MNPRTGRP: add ATM_GRP and STS3L_GRP protection groups with revertive N+1 sparing for the IW-SPM.

16. PMLOADS: add AL2xxx load for the AAL2 NTLZ20DA. Insure IWSxxx load available for CEM cards on the IW-SPM.

17. MNCKTPAK: add two NTLX82BA (or later) CEMs in slots 8 and 9. Add two NTLZ20DA GEM-II packs in slots 7 and 8 with AL2xxx load name.

18. ENCDINV: add four ENET crosspoints for the IW-SPM.

19. MNLINK: add four C-side ENET links for the IW-SPM.

20. MNATMIF: add AAL1 and AAL2 parameters by adding a new tuple for IW-SPM.

21. MNMGPIP: add IP over AAL5 signalling info by adding a new tuple for IW-SPM.

22. MNIPPARM: add DIFFSERV for IP over AAL5 signalling by addiing a new tuple for IW-SPM.

23. MNHSCARR: add the 5 ATM carriers to the IW-SPM: two OC3S, two STS3L, and one STS3cP.

24. MAPCI;MTC;NET;SHELF <nn>;CARD <nn> BSY/RTS front and back of the ENET card, then BSY/RTS the 4 ENET links to the IW-SPM.

25. MAPCI;MTC;PM;POST SPM <nn>;SELECT CEM 0: BSY/ LOADMOD/RTS each CEM card.

26. MAPCI;MTC;PM;POST SPM <nn>;SELECT ATM 0; BSY/ LOADMOD/RTS each ATM RM.

27. MAPCI;MTC;TRKS;CARRIER;POST SPM <nn>;BSY/RTS the five ATM carriers on the IW-SPM, finishing with the STS3cP carriers which will create the bridges.

28. MAPCI;MTC;APPL;BRGMTCE;POST SPM <nn>;BSY ALL;RTS ALL to RTS the bridges on the 4 C-side ENET links and make the bridges available for CallP.

8.4 Office/Subnet parameters (OP/SP) (CM & SESM)

CM

8.4.1 New/modified office/subnet parameters

Table 1 New or modified parameter

Parm table	Parameter name	NEW/ CHANGED/ DELETED/ RELOCATED	Domain (CM or Subnet Management
OFCENG	AAL2_ATM_ENABLE	New	CM

8.4.2 Parameter information

8.4.2.1 AAL2_ATM_ENABLE

Enable AAL2 ATM bearer fabric over IW-SPM with NTLZ20DA GEM-II card.

8.4.2.1.1 Functional description

The AAL2_ATM_ENABLE parameter is required to enable the AAL2 ATM IW-SPM feature, which utilizes the new NTLZ20DA GEM-II card. The parameter is disabled by default. While disabled, the user will not be allowed to datafill an ATM RM with NTLZ20DA PEC code. When enabled, the datafill is allowed.

Here's the warning message shown when user enables this parm:

WARNING: Ensure that production IWSxxx and AL2xxx local loads'

are available for AAL2 IW-SPM before LoadMod/RTS.'

and here's the info message shown when parm is disabled:

INFO: Will no longer be able to datafill AAL2 IW-SPM.

Reason for parm is to control introduction of this new feature where the Core part will be available first in SN09, followed by the Local part in SN10. Once the production IWSxxx AL2xxx loads are available in SN10, this parameter can be enabled by customers wanting to deploy ATM AAL2 traffic.

8.4.2.1.2 Provisioning rules

User should insure that a working/verified AL2xxx load is available before enabling this parameter. Should only be enabled for mu-law networks (i.e. North America). The AAL2 IW-SPM feature does not currently support A-law (e.g. for International).

8.4.2.1.3 Range information

Table 2 Range Information

Minimum	Maximum	Default
N	Y	N

8.4.2.1.4 Activation
Immediate activation. No restart required.

8.4.2.1.5 Dependencies
MNCKTPAK: will not be allowed to datafill NTLZ20DA as ATM RM until this parameter is enabled.

8.4.2.1.6 Consequences
None.

8.4.2.1.7 Verification
Confirm NTLZ20DA can be datafilled as ATM RM.

8.4.2.1.8 Memory requirements
No memory impact.

8.4.2.1.9 Parameter release history update
None.

8.5 Upgrade Impact

8.5.1 Dump and Restore
None. Parameter will default to “N” when dumping from pre-SN09 loads to SN09 or later loads.

8.5.2 Element Management Upgrade
None

8.6 Data schema (DS) (CM, MIBS, RDB)

8.6.2.1.1 Functional description

Existing table.

8.6.2.1.2 Usage sequence and implications (CM Only)

Tables must be datafilled in the following sequence:

BEARNETS

NETBRDGE

NETPATH

NET2NET

MNNODE

8.6.2.1.3 Size

Table 4 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
NETBRDGE	0	15	Memory is automatically allocated for 16 tuples.

8.6.2.1.4 Fields/OIDs

The following table lists fields/OIDs for NETBRDGE.

Table 5 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
BEARNETS	Changed	none	Select two tuples from table BEARNETS.	Allows selection of the two interfacing network types. For AAL2 IW-SPM, this would be TDM_ENET to NET_AAL2.

8.6.2.1.5 Datafill example

The following example shows sample datafill for table NETBRDGE, NETPATH, and NET2NET:

```
TOP
         BRDGCLLI    BRDGTYPE DISPLAY           BEARNETS
-----------------------------------------------------------
     ENET_TO_AAL2 CORE_BRDGE     E_A2 TDM_ENET NET_AAL2
       ENET_TO_IP CORE_BRDGE     E_IP TDM_ENET   NET_IP
BOTTOM

TOP

                                                  (  NET_IP    1) (NET_AAL2    2)$
  NET_IP
                                                                  (TDM_ENET    1)$
NET_AAL2
                                                                  (TDM_ENET    2)$
BOTTOM
```

8.6.2.1.6 Table release history update

Modify NETBRDGE to allow AAL2 network type.

8.6.2.1.7 Supplementary information

Cannot delete a tuple in NETBRDGE until all references to it in MNNODE have been deleted.

Cannot change a tuple network type to/from AAL2 until all references to in MNNODE have been deleted.

8.6.2.1.8 Translation verification other tools

The following example shows the output from MAPCI when it is used to verify Table NETBRDGE.

mapci;mtc;pm;post spm <nn>

8.6.2.2 Name: MNCKTPAK

SPM Circuit Pack

8.6.2.2.1 Functional description

Existing table.

8.6.2.2.2 Usage sequence and implications (CM Only)

Tables must be datafilled in the following sequence:

MNNODE

MNCKTPAK

ENCDINV

8.6.2.2.3 Size

Table 6 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
MNCKTPAK	0	?	Memory is dynamically allocated.

8.6.2.2.4 Fields/OIDs

The following table lists fields/OIDs for MNCKTPAK.

Table 7 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
PEC	Changed	none	NTLZ20DA	Specifies the new GEM-II pack that can operate as AAL2 (for ATM RM) or IP (for GEM RM)
LOAD	Changed	none	AL2nnnn GM2nnnn	Select valid tuple from table PMLOADS. New AL2nnnn load for AAL2 ATM, or new GM2nnnn load for IP GEM.

8.6.2.2.5 Datafill example

The following example shows sample AAL2 datafill for table MNCTKPAK.

```
        CPKKEY                                                    CPKINFO
                        PEC  RELEASE       LOAD
SPM  8 0  9 ATM 0 1 WORKING (SYSB CR RPT) (MANB MJ RPT)
              (ISTB MN RPT) (PROTFAIL CR RPT) (PATCHFAIL MJ RPT) $
              NTLZ20DA       01    AL220AD
SPM  8 0 10 ATM 1 1 SPARE (SYSB CR RPT) (MANB MJ RPT) (ISTB MN RPT)
              (PROTFAIL CR RPT) (PATCHFAIL MJ RPT) $
              NTLZ20DA       01    AL220AD
```

and this shows sample of NTLZ20DA configured a IP GEM:

```
TOP
        CPKKEY                                                    CPKINFO
                        PEC  RELEASE       LOAD
-------------------------------------------------------------------------
SPM  0 0  9 GEM 0 1 WORKING (SYSB CR RPT) (MANB MJ RPT)
              (ISTB MN RPT) (PROTFAIL CR RPT) (PATCHFAIL MJ RPT) $
              NTLZ20DA       01    GM221BG
SPM  0 0 10 GEM 1 1 SPARE (SYSB CR RPT) (MANB MJ RPT) (ISTB MN RPT)
              (PROTFAIL CR RPT) (PATCHFAIL MJ RPT) $
              NTLZ20DA       01    GM221BG
```

8.6.2.2.6 Table release history update

Modify MNCKTPAK to allow NTLZ20DA GEM-II pack for GEM (IP) and ATM (AAL2) RM types.

8.6.2.2.7 Supplementary information

For GEM RMs, the NTLZ20DA acts as a replacement for the earlier NTLZ20BA and NTLZ20CA packs which are being discontinued due to parts obsolesence. Standard upgrade practice is used to go from NTLZ20BA/CA to the newer DA: BSY GEM, change PECCODE to NTLZ20DA and LOAD to GM2xxxx, LoadMod, RTS GEM.

For ATM RMs, the NTLZ20DA is allowed on IW-SPM class node assigned as BRDG_ONLY with BEARNETS field (in MNNODE) that supports AAL2 fabric. OFCENG parameter AAL2_ATM_ENABLE must be enabled before NTLZ20DA can be assigned as an AAL2 ATM RM.

8.6.2.2.8 Translation verification other tools

The following example shows the output from MAPCI when it is used to verify Table MNCKTPAK.

mapci;mtc;pm;post spm <nn>;select atm <n>

```
            XAC      MS     IOD     Net      PM     CCS     Lns     Trks    Ext     APPL

8.6.2.3 Name: MNATMIF

SPM ATM Protocol Interface Parameters

8.6.2.3.1 Functional description

Existing table that specified AAL1 ATM protocol parameters. Adding AAL2 ATM protocol parameters. An AAL2 RM will need both the AAL1 and AAL2 protocol parameters.

8.6.2.3.2 Usage sequence and implications (CM Only)

Tables must be datafilled in the following sequence:

MNLINK

MNATMIF

MNMGPIP

8.6.2.3.3 Size

Table 8 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
MNATMIF	0	86	Memory is dynamically allocated as each ATM node is added.

8.6.2.3.4 Fields/OIDs

The following table lists fields/OIDs added to table MNATMIF for AAL2 IW-SPMs.

Table 9 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
CIDPRSVC	New	none	1..247	Specifies the maximum number of AAL2 CIDs that may be allocated on an AAL2 SVC. The local node may allocate no more than this number of trunks. Default value is 10. Note: value used in IW-SPM will be 10 (despite setting here) till a follow-up notice issued indicated IW-SPM will follow this table value.
PRECREAT	New	none	Y or N	Specifies whether Pre-creation of SVCs is enabled. If svcPreCreation is enabled, then an SVC set up is initiated when the bandwidth available in existing VCCs (between two NSAP addresses) is such that a new SVC would be required for the next call. Default Y for enabled.
TIMERCU	New	none	0..15875 nsec in 125 usec steps	Maximum period of time in usec (micro seconds) before a partially filled AAL2 packet is scheduled for transmission. Default 0 usec. Note 1000 usec = 1 msec.

Table 9 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
SVCHOLD	New	none	0..600 sec in 1 sec steps	Length of time that an AAL2 SVC is kept up after the last narrowband call to use it has been deleted. This attribute is used to modify the SVC caching system. Longer values result in larger caches of SVCs. Default 180 sec to match PVG.
SRVCAT	New	none	CBR (Constant Bit Rate) or VBR (Variable Bit Rate)	ATM Service Category for SVC. Default is VBR.
PKCLRT	New	none	0..353207	Peak cell rate of the ATM connection on a per SVC basis. Default is 800 cells per sec.
SUSTCR	New	none	0..353207	Sustained cell rate of the ATM connection on a per SVC basis. Default is 800 cells per sec
MAXBURSZ	New	none	0..353207	Maximum burst size of the ATM connection on a per SVC basis. This “burst” defines how far beyond PKCLRT the connection will go before cells are dropped. Default is 0 cells
REMADDR	New	none	40 character address	ATM address of the node that may be reached.

Table 9 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
CODEC	New	none	G711 (other values to be added in future)	Type of on-board CODEC in-use. Allows up to 16 different CODECs to be specified. Default is G711.
SILSUP	New	none	Y or N	Whether silence suppression is enabled or not. Default is Y for enabled.
MAXBRI	New	none	0..2016	Max number of bridges provided by an AAL2 IW. If silence suppression (SILSUP) is disabled, the max bridges possible is 1865. Allows telco to limit the traffic over an AAL2 IW-SPM. Default is 2016.

8.6.2.3.5 Datafill example

The following example shows sample datafill for table MNATMIF.

ATMKEY

8.6.2.3.6 Table release history update
Modify MNATMIF to add AAL2 protocol parameters.

8.6.2.3.7 Supplementary information

Cannot CHAnge or DELete a tuple for AAL2 IW-SPM unless that node is OOS.

8.6.2.3.8 Translation verification other tools

None

8.6.2.4 Name: MNMGPIP
SPM IP Protocol Parameters

8.6.2.4.1 Functional description
Existing table. Normally applies to IP nodes, but AAL2 IW-SPM needs it to specify parameters for IP over AAL5 signalling.

8.6.2.4.2 Usage sequence and implications (CM Only)
Tables must be datafilled in the following sequence:

MNATMIF

MNMGPIP

MNHSCARR

8.6.2.4.3 Size

Table 10 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
MNMGPIP	0	86	Memory is dynamically allocated as each IP/AAL2 node is added.

8.6.2.4.4 Fields/OIDs
The following table lists fields/OIDs for MNMGPIP.

Table 11 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
GEMSIGIP	Changed	none	same	Change to allow this field for AAL2 IW-SPM.
SIGMASK	Changed	none	same	Change to allow this field for AAL2 IW-SPM.
SIGGWIP	Change	none	same	Change to allow this field for AAL2 IW-SPM.

8.6.2.4.5 Datafill example

The following example shows sample datafill for table MNMGPIP.

```
            MGPKEY
          GEMSIGIP           SIGMASK           SIGGWIP

   172  16 121  11  255 255 255   0  172  16 121   1
       SPM  0 0 10
   172  16 121  11  255 255 255   0  172  16 121   1
```

8.6.2.4.6 Table release history update

Modify MNMGPIP to add AAL2 parameters.

8.6.2.4.7 Supplementary information

Cannot CHAnge or DELete a tuple for AAL2 IW-SPM unless that node is OOS.

8.6.2.4.8 Translation verification other tools

None.

8.6.2.5 Name: MNIPPARM

SPM IP Protocol Parameters

8.6.2.5.1 Functional description

Existing table. Normally applies to IP nodes, but AAL2 IW-SPM needs it to specify parameters for IP over AAL5 signalling.

8.6.2.5.2 Usage sequence and implications (CM Only)

Tables must be datafilled in the following sequence:

MNMGPIP

MNIPPARM

MNHSCARR

8.6.2.5.3 Size

Table 12 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
MNIPARM	0	86	Memory is dynamically allocated once when first .

8.6.2.5.4 Fields/OIDs

The following table lists fields/OIDs for MNIPPARM.

Table 13 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
DIFFSERV	Changed	none	same	Change to allow this field for AAL2 IW-SPM.

8.6.2.5.5 Datafill example

The following example shows sample datafill for table MNIPPARM.

```
MNKEY  DFCODEC PRFCODEC PKTRATE INGRESS EGRESS JITMIN JITMAX JITTARG

```

8.6.2.5.6 Table release history update

Modify MNIPPARM for AAL2 IW-SPM.

8.6.2.5.7 Supplementary information

Cannot CHAnge or DEL ete an IW-SPM tuple unless all IW-SPM nodes are OOS.

8.6.2.5.8 Translation verification other tools

None.

8.7 Service Orders (SO) (CM & SESM)

None.

8.8 Software optionality control (SOC)

No SOC. Feature activation will be controlled thru AAL2_ATM_ENABLE office parameter in OFCENG.

8.9 Element Management

None

8.10 Command interface changes

IWCOMMCI is the only user tool changed by this feature. Two designer-only tools are also impacted (IWBMCI and IWSELCI), but they will not be covered in this user section.

8.10.1 Directory: IWCOMMCI

8.10.1.1 Directory description

Resident tool for commissioning and IW-SPM.

8.10.1.2 Accessing directory: IWCOMMISSION

8.10.1.2.1 Access to directory or MAP level and return to CI

To access IWCOMMISSION from the CI environment, enter IWCOMMCI.

To return to the CI environment, enter QUIT.

8.10.2 Command: BSY_IW

8.10.2.1 Command type: NON-MENU

8.10.2.2 Command target: All

8.10.2.3 Command availability: RES

8.10.2.4 Command description

Manually Busy bridges on a select ENET link on the IW-SPM.

8.10.2.5 Command syntax

Table 14 BSY_IW command parameters and variables

Command	Parameters and variables
BSY_IW	<SPM number> (0..85) ~~<Bridging type> (ATM, IP)~~ <Link number> (0..3) <Keep CPB calls up> (KEEP, KILL)
Parameters and variables	Description
Link number	The ENET link on the IW-SPM
Keep CPB calls up	Whether bridges with CPB calls should remain up or busied out. Optional parameter that defaults to KILL

The only change to the BSY_IW command is removal of the “Bridging type” parameter. The system will now rely on the setting in MNNODE’s BEARCLLI field to determine if the IW-SPM is ATM AAL1, ATM AAL2, or IP.

No change to the output of these commands, so no further info needs to be provided.

8.10.3 Command: RTS_IW

8.10.3.1 Command type: NON-MENU

8.10.3.2 Command target: All

8.10.3.3 Command availability: RES

8.10.3.4 Command description

Manually Return-to-Service bridges on a select ENET link on the IW-SPM.

8.10.3.5 Command syntax

Table 15 BSY_IW command parameters and variables

Command	Parameters and variables
RTS_IW	<SPM number> (0..85) ~~<Bridging type> (ATM, IP)~~ <Link number> (0..3)

Table 15 BSY_IW command parameters and variables

Command	Parameters and variables
Parameters and variables	Description
Link number	The ENET link on the IW-SPM

The only change to the RTS_IW command is removal of the “Bridging type” parameter. The system will now rely on the setting in MNNODE’s BEARCLLI field to determine if the IW-SPM is ATM AAL1, ATM AAL2, or IP.

No change to the output of this command, so no further info needs to be provided.

8.11 SECURITY

None.

8.12 Configuration Walkthrough

Earlier section on “Initial Configuration” describes the equipment and provisioning required to setup this feature. Setting up CallP to route calls over IW-SPM bridges has not changed (same as IP and AAL1 ATM), so it will not be covered here.

9: Configuration (CN): A00009011

9.1 Feature Name

TOPS Internet Protocol (IP) Security Enhancements

9.2 Hardware and Software Requirements

This feature does not introduce any new hardware requirements.

This feature requires new loads in the IP-XPM (SX05DA) and in the NT7X07AA. These loads interpret and act on the SNMP and Telnet configuration data downloaded from new datafill in the CM.

The applicable loads are as follows:

- IP-XPM (SX05DA): QTP22
- 7X07AA: TGWYM004

9.3 Initial Configuration

The new SNMP settings have default values such that behavior of the IP-XPM (SX05DA) and 7X07AA is unchanged following an upgrade from a pre-SN09 (TOPS22) load to an SN09 or higher load. For security, however, Telnet on a 7X07AA is always disabled following an upgrade from a pre-SN09 (TOPS22) load to an SN09 or higher load.

9.4 Office parameters (OP)

This feature adds four new office parameters. These office parameters affect 7X07AA cards defined in Table IPINV as TOPS IPGWs (`GW_TYPE` = `TOPS`). These parameters do not affect non-TOPS IPGWs.

When the craftsperson modifies these parameters, the Succession core displays the following warnings:

- This parameter applies to TOPS IPGWs only.
- All IPGWs must be reloaded for this change to take effect.

9.4.1 New/modified office parameters

Table 1 New or modified parameter

Parm table	Parameter name	NEW/ CHANGED/ DELETED/ RELOCATED	Domain (CM or Subnet Management)
OFCENG	IPGW_SNMP_COMMUNITY_NAME	New	CM
OFCENG	IPGW_SNMP_MANAGER	New	CM
OFCENG	IPGW_SNMP_ENABLED	New	CM
OFCENG	IPGW_TELNET_ENABLED	New	CM

9.4.2 Parameter information

9.4.2.1 IPGW_SNMP_COMMUNITY_NAME

Internet Protocol Gateway Simple Network Management Protocol Community Name

9.4.2.1.1 Functional description

This parameter allows the craftsperson to configure one SNMP community name for SNMP read, write, and trap operations on the 7X07AA.

9.4.2.1.2 Provisioning rules

The craftsperson defines the community name (up to 16 characters) then datafills it in Table OFCENG, using single quotes to allow entry of lowercase letters or non-alphanumeric symbols.

9.4.2.1.3 Range information

Table 2 Range Information

Minimum	Maximum	Default
One letter, digit, or non-alphanumeric symbol	Sixteen letters, digits, non-alphanumeric symbols, or any combination thereof	The string “public” (lowercase, and without the quotation marks) is the default. This is a customary default community name, and it is what currently deployed 7X07AAs use.

9.4.2.1.4 Activation

The new community name does not take effect on a 7X07AA until the card is PMRESET from the MAPCI;MTC;PM level. For all cards to be updated, all cards must be PMRESET. This should be done sequentially using the existing IPGW DRAIN command such that traffic is off-loaded (drained) from each 7X07AA before the card is PMRESET. This minimizes the effect on calls in progress.

9.4.2.1.5 Dependencies
None.

9.4.2.1.6 Consequences
This parameter should be set to a value other than “public.” If the parameter is set to “public” it is easier for a hacker to guess the community name and use SNMP to modify data on the 7X07.

9.4.2.1.7 Verification
To verify the change, the craftsperson can update the community name on their SNMP manager client, then attempt SNMP operations on the changed 7X07AAs. If the SNMP operations succeed, the new community name is in use by the 7X07AAs.

9.4.2.1.8 Memory requirements
20 bytes

9.4.2.1.9 Parameter release history update
SN09 (TOP22): Creation

9.4.2.2 IPGW_SNMP_MANAGER
Internet Protocol Gateway Simple Network Management Protocol Manager

9.4.2.2.1 Functional description
This parameter allows the craftsperson to configure the IP address of one SNMP manager (also known as a trap manager). The 7X07AA cards will send traps to this IP address.

Prior to SN09 (TOPS22), the 7X07AA allowed entry of up to four SNMP manager IP addresses. The default SNMP manager is obtained using DHCP, while up to three additional SNMP managers can optionally be defined using PMDEBUG on the 7X07AA. This feature allows a fifth SNMP manager IP address to be configured.

9.4.2.2.2 Provisioning rules
The craftsperson datafills the IPv4 address in Table OFCENG. The IPv4 address consists of four numbers, each in the range 0 to 255.

9.4.2.2.3 Range information

Table 3 Range Information

No SNMP manager	SNMP manager	Default
IPGW_SNMP_MANAGER set to N.	IPGW_SNMP_MANAGER set to Y. In this case a second field, IPADDR, appears. The craftsperson datafills the IP address of the SNMP manager. For example, IP address 47.142.225.193 would be datafilled as: Y 47 142 225 193	N (no manager datafilled)

9.4.2.2.4 Activation

The new SNMP manager does not take effect on a 7X07AA until the card is PMRESET from the MAPCI;MTC;PM level. See "9.4.2.1.4 Activation" on page 2324 for more information.

9.4.2.2.5 Dependencies

None.

9.4.2.2.6 Consequences

The telco should employ SNMP manager IP address validation to make it harder for a hacker to use SNMP to alter data on the 7X07.

9.4.2.2.7 Verification

To verify the change, the craftsperson can attempt SNMP write operations[1] using an SNMP manager client on a host whose IP address was not previously set on the 7X07AA using DHCP or PMDEBUG. If the write operations succeed, the new SNMP manager IP address is in use.

A subsequent security test would be to set the office parameter back to N, PMRESET the card, and try a second set of SNMP write operations using the same host as in the first test. The host is no longer in the valid SNMP manager list on the 7X07AA, so the 7X07AA should reject SNMP write attempts.

9.4.2.2.8 Memory requirements

8 bytes

9.4.2.2.9 Parameter release history update

SN09 (TOP22): Creation

[1]The SNMP manager IP address is only checked for write operations, not read operations.

9.4.2.3 IPGW_SNMP_ENABLED

Internet Protocol Gateway Simple Network Management Protocol Enabled

9.4.2.3.1 Functional description

This Y/N parameter allows the craftsperson to enable or disable SNMP on the 7X07AA.

9.4.2.3.2 Provisioning rules

No special provisioning rules.

9.4.2.3.3 Range information

Table 4 Range Information

Minimum	Maximum	Default
This is a Y/N field	This is a Y/N field	Defaults to N unless TOPS IPGWs are present in Table IPINV on the pre-SN09 dump side, in which case this parameter defaults to Y.

9.4.2.3.4 Activation

The SNMP enabled/disabled status does not take effect on a 7X07AA until the card is PMRESET from the MAPCI;MTC;PM level. See “9.4.2.1.4 Activation” on page 2324 for more information.

9.4.2.3.5 Dependencies

None.

9.4.2.3.6 Consequences

If the telco is not using SNMP on the 7X07, this parameter should be set to N. This will prevent a hacker from using SNMP to alter data on the 7X07.

9.4.2.3.7 Verification

To verify the change, the craftsperson can attempt SNMP operations on the changed 7X07AAs. If the operations succeed, SNMP is enabled. If the operations time out, SNMP is disabled.

9.4.2.3.8 Memory requirements

2 bytes

9.4.2.3.9 Parameter release history update

SN09 (TOP22): Creation

9.4.2.4 IPGW_TELNET_ENABLED

Internet Protocol Gateway Telnet Enabled

9.4.2.4.1 Functional description

This Y/N parameter allows the craftsperson to enable or disable Telnet on the 7X07AA.

9.4.2.4.2 Provisioning rules

No special provisioning rules.

9.4.2.4.3 Range information

Table 5 Range Information

Minimum	Maximum	Default
This is a Y/N field	This is a Y/N field	Defaults to N.

9.4.2.4.4 Activation

The Telnet enabled/disabled status does not take effect on a 7X07AA until the card is PMRESET from the MAPCI;MTC;PM level. See "9.4.2.1.4 Activation" on page 2324 for more information.

9.4.2.4.5 Dependencies

None.

9.4.2.4.6 Consequences

If the telco is not using Telnet on the 7X07, this parameter should be set to N. This will prevent a hacker from logging on to the card and causing problems. This will also prevent authorized personnel from inadvertently logging on to a heavily loaded card. A card can have up to 48 calls in progress, and Telnetting on to a heavily loaded card might cause it to crash, ending its calls.

9.4.2.4.7 Verification

To verify the change, the craftsperson can attempt to Telnet onto the changed 7X07AAs. If the craftsperson receives the login prompt, Telnet is enabled. If the attempt times out, Telnet is disabled.

9.4.2.4.8 Memory requirements

2 bytes

9.4.2.4.9 Parameter release history update

SN09 (TOP22): Creation

9.5 Upgrade Considerations

9.5.1 Dump and Restore (CM)

The following actions occur on dump and restore from a pre-SN09 load to an SN09 or higher load.

- IPGW_SNMP_COMMUNITY_NAME: This parameter is set to “public” (without quotation marks).
- IPGW_SNMP_MANAGER: This parameter is set to N.
- IPGW_SNMP_ENABLED: Table IPINV on the dump side is consulted. If any TOPS IPGWs are datafilled (GW_TYPE = TOPS), this parameter is set to Y. Otherwise this parameter is set to N.
- IPGW_TELNET_ENABLED: This parameter is set to N.

9.5.2 Element Management Upgrade

Not applicable.

9.5.3 Downgrade impact

If data has already been downloaded to the 7X07AAs and the core is downgraded to a pre-SN09 release, the 7X07AAs retain the last settings from the core prior to the downgrade.

If a 7X07AA is PMRESET at a later time, data download occurs again. The 7X07AA checks the release level of the downloaded information, and if it is prior to SN09, the 7X07AA reverts to pre-SN09 settings as follows:

- SNMP community name is “public”
- SNMP manager IP address from CM is removed from manager list
- SNMP is enabled
- Telnet is enabled

9.6 Data schema (DS)

9.6.1 New/modified tables

Table 6 New or modified tables

Table	NEW/CHANGED/ or DELETED/	Table Control (NEW/ OLD/UNCHANGED)
XPMIPMAP	Changed	Unchanged

9.6.2 Table information

9.6.2.1 Name: XPMIPMAP

eXtended Peripheral Module Internet Protocol Mapping

9.6.2.1.1 Functional description

This existing table defines the IP-XPMs and allows configuration of IP capabilities on the redundant SX05DA processor cards.

This feature adds a new field, SNMP, which indicates whether SNMP is enabled on the IP-XPM. If SNMP is enabled, the craftsperson must also datafill an SNMP community name in new subfield COMMNAME.

9.6.2.1.2 Usage sequence and implications

Unchanged.

9.6.2.1.3 Size

Table 7 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
XPMIPMAP	Unchanged	Unchanged	New SNMP datafill adds 20 bytes per tuple

9.6.2.1.4 Fields

Table 8 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
XPMNAME	Unchanged	N/A	N/A	N/A
AUTONEG	Unchanged	N/A	N/A	N/A
SUBNMASK	Unchanged	N/A	N/A	N/A
IPCONFIG	Unchanged	N/A	N/A	N/A
SNMP	New	This field is refined based on the value datafilled.	Y/N	If SNMP is Y, datafill the SNMP community name in the additional field COMMNAME. If SNMP is N, no additional fields can be datafilled.
COMMNAME	New	Subfield of field SNMP This field appears when field SNMP is set to Y.	Vector of one to sixteen characters Non-alpha-numeric symbols and lowercase letters can be entered using single quotes.	This field indicates the SNMP community name for SNMP read and write operations on the IP-XPM. The IP-XPM does not send traps so this community name is not currently used for SNMP traps.

9.6.2.1.5 Datafill example

The following example shows sample datafill for Table XPMIPMAP.

```
TABLE: XPMIPMAP
XPMNAME AUTONEG SUBNMASK IPCONFIG SNMP
--------------------------------------
DTC 11 AUTO 255 255 255 0 CM 95 64 10 164 95 64 10 165 95 64 10 166
95 64 10167 (4) (5) $ N N
DTC 12 AUTO 255 255 255 0 CM 95 92 9 132 95 92 9 133 95 92 9 134
95 92 9 135(3) (2) $ N Y public
```

9.6.2.1.6 Table release history update

TOPS13: Creation

SN09 (TOPS22): Addition of field SNMP

9.6.2.1.7 Supplementary information

On dump and restore from a pre-SN09 Succession core load to an SN09 or later load, new field SNMP is set to Y and new field COMMNAME is set to "public" (without quotation marks). These settings cause IP-XPM behavior to be unchanged from pre-SN09 loads.

9.6.2.1.8 Translation verification and other tools

Not applicable.

9.7 Service Orders (SO)

Not applicable.

9.12 Security

9.12.1 Network configuration

TOPS-IP network configuration recommendations are unchanged.

9.12.2 Key management

Not applicable.

9.12.3 Protocol

Not applicable.

9.12.4 Authentication

This feature allows the SNMP community name to be changed from “public” to a customer-specified name. This feature also allows the SNMP manager to be datafilled in the CM. The community name is used to authenticate incoming read and write requests on both the IP-XPM (SX05DA) and the 7X07AA. The

SNMP manager is used to authenticate incoming write requests on the 7X07AA.

This feature also allows SNMP to be completely disabled on the IP-XPM (SX05DA) and the 7X07AA. In addition, Telnet can be disabled on the 7X07AA. These measures provide additional security if the customer is not using SNMP and Telnet.

9.13 Configuration Walkthrough

To configure new SNMP settings on the IP-XPM (SX05DA):

- Set the appropriate fields in the Table XPMIPMAP tuple corresponding to the desired IP-XPM.
- Perform a LoadPM or Bsy/RTS to download the settings to the desired units of the IP-XPM.

To configure new SNMP and Telnet settings on the 7X07AA:

- Set the appropriate office parameters in the Table OFCENG.
- Perform a PMRESET on the desired cards to download the settings. The settings do not take affect on a card until it has been PMRESET.

10: Configuration (CN): A00009012

10.1 Feature Name

TOPS OSSAIN Service Enhancements

This section discusses the datafill changes, the SOC which controls the feature, and a brief discussion of the changes to the MAPCI command TST for SNs.

10.2 Data schema (DS) (CM)

10.2.1 Modified tables Schema

Table 1 Modified tables

Table/MIB name	NEW/CHANGED/ or DELETED/	Table Control (NEW/ OLD/UNCHANGED)

TOPSFTR	CHANGED	UNCHANGED

10.2.2 Table Schema information

10.2.2.1 Name: OAFUNDEF

OSSAIN Function Definitions

10.2.2.1.1 Functional description

The table's functionality is unchanged.

10.2.2.1.2 Size

Unchanged with a maximum tuple range of 1022.

10.2.2.1.3 Fields

The following table lists fields/OIDs for OAFUNDEF.

Table 2 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
FUNCAREA	FUNCAREA is unchanged but has two new subfields and a change to an existing subfield			
	New	USESERV	Y, N	**Use ORIGSERV** N means to allow the switch to change the DA service to TA when an operator transfers the call to an SN. All other transition scenarios will retain the service of the call. Y means to ensure the service datafilled in field ORIGSERV of OAFUNDEF is used when transferring or triggering to the function. If a service switch occurs, then other fields may be effected based on service switch rules defined in the OAP Specification document. This field is not needed to set the service with ORIGSERV for initial call processing. It is used for transitions only.

Table 2 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
	New	DARECALL	Y, N	**DA Recall** N is not a DA recall Y means the call going to the function is a DA recall and the switch will increment the DA recall counter and set operator indicators for recall if going to an operator. This field is not used for initial call processing.
	Changed	AUTOSYS	MCCS, DAS	**Automated Systems** MCCS will route the call to MCCS. If MCCS is not available for the call then it is routed to operator.

10.2.2.1.4 Datafill example

The following example shows sample datafill for table OAFUNDEF.

Table 3 New Table OAFUNDEF

FUNCID	FUNCNAME	FUNCAREA
1	DA_SN	SN DASERV Y N N N N N Y CQ17 N
2	DA_TOPSOPER	TOPSOPER N OSSAIN_TO_DA_OPR N
3	TA_AUTO	TOPSAUTO MCCS 0_PLUS
4	TA_SN	SN TASERV N N N N Y Y CQ0 N
5	DA_SN_RCL	SN DASERV Y Y N N N N Y CQ17 N
6	DA_TOPSOPER_RCL	TOPSOPER Y OSSAIN_TO_DA_OPR N
7	TA_AUTO_RCL	TOPSAUTO MCCS 0_PLUS
8	TA_SN_RCL	SN TASERV Y N N N Y Y CQ0 N

10.2.2.1.5 Table release history update

In SN09, table OAFUNDEF added fields USESERV, DARECALL, removed TOPSAUTO option AABS and added TOPSAUTO option MCCS.

10.2.2.1.6 OAFUNDEF error messages

New error messages for table OAFUNDEF are noted below:

Table 1 Error messages for table OAFUNDEF

Error message	Explanation
`MCCS and DAS are the only TOPS automated system that are currently supported for OSSAIN.`	The user tries to datafill the AUTOSYS refinement with an automated system other than MCCS or DAS.

10.2.2.1.7 ONP Processing

Over a pre-SN09 to SN09+ ONP, the following fields/sub-fields will be populated as shown:

- USESERV will be set to N.
- DARECALL will be set to N.
- AUTOSYS AABS functions will be changed to MCCS.

10.2.2.2 Name: TOPSFTR

TOPS Features

10.2.2.2.1 Functional description

The table's function has not changed.

10.2.2.2.2 Size

Increased by 1

10.2.2.2.3 Datafill example

The following example shows sample datafill for table TOPSFTR.

Table 4 Table TOPSFTR

FTRNAME	FTRENABL
OSSAIN_RELEASE_22	Y

10.2.2.2.4 Table release history update

In SN09, table TOPSFTR added OSSAIN_ENHANCEMENTS_22 to the range.

10.2.2.2.5 Supplementary Information

TOPSFTR entry, OSSAIN_RELEASE_22 is tied to SOC option OSAN0102 for OSSAIN Enhancements and activates the following portions of feature A00009012:

- Transfer to SN function service
- DA Recall function

Although the functionality is controlled by this parameter, the associated datafill can be entered prior to activation.

10.3 Software optionality control (SOC)

Portions of feature A00009012 are activated by SOC option OSAN0102 and TOPSFTR entry OSSAIN_ENHANCEMENTS_22.

10.4 User interface changes

10.4.1 Command: TST

10.4.1.1 Command type: unchanged

10.4.1.2 Command target: unchanged

10.4.1.3 Command availability: unchanged

10.4.1.4 Command description

TST is a command used for OSNM, OSN and OSAC nodes posted at the MAP. When a node is posted at the PM level of the MAP, the TST command is available. The TST command remains unchanged by this feature; however, the functionality of the command is changed and one new response message is provided.

- When TST is entered for a node, a ping is no longer sent. For OSN however, the Node Connectivity Test message is now sent to the OSN node in place of the ping to verify connectivity.
- When TST PING is entered for a node on a platform that does not support ping from SOS, the following new response message is provided: “Use TST without PING.”.

10.4.1.5 Command syntax

Unchanged

10.4.1.6 Qualifications and warnings

Unchanged

10.4.1.7 Responses

10.4.1.7.1 “Use TST without PING.”

Table 6 MAP outputs with associated meanings and actions

TST PING
“Use TST without PING.” **Meaning:** TST PING has been used on a switch which does not support pings from MAP. **System or user actions:** Use command TST without the PING option. Ping from another platform.

11: Configuration (CN): A00009013

11.1 Feature Name

TOPS announcements via UAS/AMS

11.2 Hardware and Software Requirements

This activity has the following prerequisite requirements:

- Hybrid Communication Server 2000 (CS 2000) with ENET and IP network fabrics
- Interworking Spectrum Peripheral Module(s) (IW SPM IP)

  Note: An interworking bridge is required for each connection of a TOPS call to a packet announcement.
- Gateway Controller(s) (GWC) configured with Audio Controller profile
- Media Server 2010 (MS 2010) or Universal Audio Server (UAS) media server(s)
- Succession element managers for maintenance of the above components. This includes the Announcement Provisioning Server (APS).
- TOPS equipment (such as operator positions)

In an office that is migrating from DRAM-based announcements to packet-based announcements for TOPS, datafill for the applications that use the announcements (for example, Branding or ACTS) will already be present when the migration begins. For new offices, that datafill will not be present, and it may be added after the announcements have been provisioned. This DDOC does not attempt to re-document the data schema for all of the TOPS applications that use announcements. Refer to your Translations Guide (297-nnnn-350) and Data Schema Reference Manual (297-nnnn-351) for more information about basic TOPS datafill.

The following documents include other important prerequisite configuration information.

NN10340-511	Media Server 2000 Series Configuration Management
See Helmsman for other related documentation.	

11.3 Initial Configuration

This section assumes, for the most part, that the office is already using DRAM-based announcements for TOPS and is migrating some or all of the TOPS applications to use packet-based announcements. For new TOPS offices, it is necessary to consult both this document and the NTPs that explain the TOPS applications.

11.3.1 Basic configuration steps

The steps for configuring packet-based announcements for TOPS are as follows:

1. Determine what audio segments will be needed for the TOPS applications, and what voice content you want the segments to have.

   For **standard announcements** (ANTYPE = STND in CM table ANNS) this is straightforward. If you are migrating from DRAM-based to packet announcements, you will want to identify and determine the content of the standard announcements already in use.

   The number of standard announcements in the office may be small enough that you can look at table ANNS and immediately know how each of the standard announcements is used. Otherwise, look in the following tables.

   — CLLIs for SPID-based branding announcements are datafilled in the TAANN and DAANN fields of CM table SPIDDB.

   — CLLIs for carrier-based and NBEC-based branding announcements are datafilled in the TAANN, DAANN, and CDANN fields of CM table BRANDANN.

   — Announcement CLLIs for Music and Announcement in Queue are datafilled with the ANN selector in the route lists of tuples in CM table TOPAUDIO.

   — TOPS-specific treatment announcement CLLIs are datafilled in subtable TREAT of the TOPSTKGP tuple of CM table TMTCNTL. Depending on the office configuration, the OFFTREAT tuple may be used for TOPS calls, or tuples for other trunk group types may be used.

   Once the announcement CLLIs are known, determine the external phrase names that are associated with them. To do this in an existing TOPS office, consult table ANNMEMS for the DRAM track number(s), and then look

in table ANNPHLST for the mapping from CLLI + track number to a list of external phrase names. Each of these phrase names must have a segment provisioned on the packet media servers.

Note: Packet-based announcement members cannot have multiple tracks datafilled in the CM. Refer to the Configuration Guide for your media server for information about configuring the media server itself to play announcements in multiple languages.

If you want to hear the content that a DRAM plays for a phrase, look in table DRAMPHRS to determine where the phrase is stored on the DRAM. Then use the DRAMREC utility to listen to the recording that is currently in use.

For **custom announcements** (ANTYPE other than STND in table ANNS), determining what segments need to be recorded for the media servers can be a little harder. This is partly because some of the announcement numbers and phrase names for custom announcement applications are pre-determined by Nortel, while others may be defined by the operating company. Also, custom announcements can use placeholder phrase names, and these are handled differently for packet-based announcements than for DRAM announcements. Refer to "TOPS custom announcement considerations" on page 2347 for specific information about determining the segments that must be provisioned on the media servers for ACTS and MCCS.

2. Record the phrases that were determined in step 1 to be needed, or have them professionally recorded. Refer to the Configuration Management document for your media server for information about the required format.
3. Upload the audio files to the Announcement Provisioning Server (APS), and import corresponding physical segments into the APS database. Note the segment ID associated with each. Refer to "Media Server 2000 Series Configuration Management" for more information.
4. Ensure that the segments are made available to all appropriate media servers.

   Note: You must provision the same set of audio segments for all media servers controlled by the same GWC.
5. In CM table ANNAUDID, associate the MS 2000 / UAS audio segment ID with each external announcement phrase name that will be used with this feature.
6. Ensure that CM tables CLLI, ANNS, ANNMEMS, and ANNPHLST are correctly datafilled for the announcements that will use this feature. They should be datafilled in that order.
   — CLLI - Datafill the CLLI codes for the announcements.

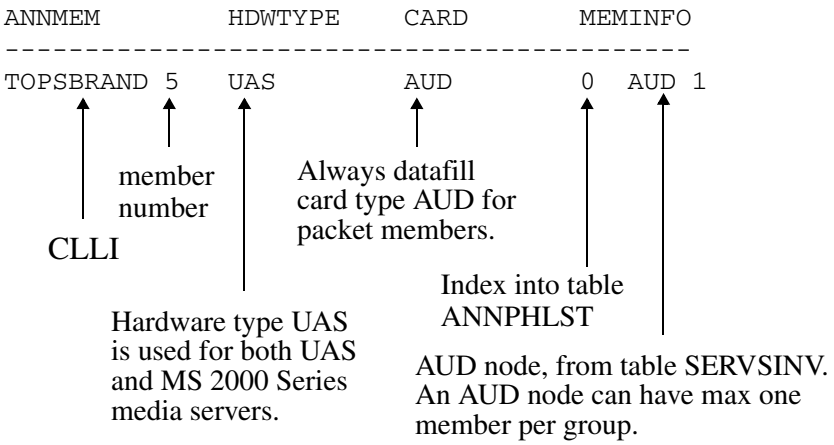
This table will already be datafilled if you are migrating from DRAM to packet announcements. In that case, no changes are needed.

— ANNS - Specify the characteristics of the announcement groups.

This table will already be datafilled if you are migrating from DRAM to packet announcements. In that case, no changes are needed.

— ANNMEMS - Specify the announcement members.

Add member tuples for all the announcements that will use packet-based media servers. The following figure shows an example.



The index into table ANNPHLST applies only to standard announcements type. It is present but ignored for custom announcement types.

Normally, all packet members of a standard announcement group are datafilled with the same index into table ANNPHLST. If the group also has DRAM members, the index for the packet members may or may not be the same as one of the track numbers of a DRAM member tuple. If it is the same, then the DRAM and AUD members will share a tuple in table ANNPHLST. If it is different, a tuple for the new index must be added to table ANNPHLST.

Note: For custom announcements, it is not possible for DRAM and packet members to use different tuples in table ANNPHLST.

— ANNPHLST - Specify the list of external phrase names that make up the announcement.

For custom announcement types, table ANNPHLST is indexed by the announcement CLLI and the application-specific custom announcement number. For standard DRAM announcements, it is indexed by the CLLI and track number. For standard packet announcements, it is indexed by the CLLI and the phrase list index from table ANNMEMS.

If you are migrating from DRAM-based to packet announcements for TOPS, and if you datafilled table ANNMEMS so that packet and DRAM members of standard announcement groups share the same ANNPHLST tuple, then table ANNPHLST needs no additional datafill.

If you are datafilling TOPS announcement applications from scratch, or if you are migrating but datafilled table ANNMEMS so that packet and DRAM members of a standard announcement group would not share the same ANNPHLST tuple, then datafill must be added to table ANNPHLST. A tuple is needed for each standard announcement member that has its own phrase list index, and for each custom announcement used by supported custom announcement applications (ACTS, MCCS).

Refer to your Translations Guide, Customer Data Schema Reference Manual, and later sections of this document for more information about datafilling table ANNPHLST.

7. Run TABAUDIT on tables ANNS, ANNMEMS, ANNPHLST, and ANNAUDID, and correct any errors found.
8. Ensure that the TOPS applications that are to use packet announcements are fully datafilled, if you are adding new applications rather than migrating existing ones. Refer to your Translation Guide and Customer Data Schema Reference Manual for more information about TOPS application datafill.
9. Bring new packet announcement members into service. This is done at the TTP level of the Maintenance and Administration Position (MAP) in the CM. If the Gateway Controller and/or the media servers are not in service, they must first be returned to service using CS 2000 OAM&P tools.

   Note: It is strongly recommended that test calls be made using the packet announcement members. See “Verifying provisioning” on page 2346 for more information.
10. For at least several days, monitor the applications carefully. Look for the following switch logs, which may indicate provisioning problems: XPKT340, TOPS104, and TOPS113. Also monitor logs and alarms on the media servers themselves. Procedures for doing that are described in the Fault Management document (NNnnnnn-911) for your media server.

11.3.2 Verifying provisioning

When commissioning new TOPS applications that use only packet-based announcements, it is strongly recommended that test calls be made before general TOPS traffic is routed to the announcements.

Test calls should also be made when migrating from DRAM-based to packet-based announcements for TOPS. To minimize the impact of the testing on live calls, the testing must be done at a time of very low traffic. The only way to ensure that a test call will get a packet announcement member is to busy out all DRAM members of the announcement group.

Specific provisioning problems that can cause trouble include (a) failure to provision all of the required phrases on some or all of the media servers, (b) mismatches between the segment identifiers provisioned on the media servers and the ones datafilled in CM table ANNAUDID, (c) failure to add an ANNAUDID tuple for some phrase name that the application uses, (d) failure to add an ANNPHLST tuple for an announcement member that the application uses, and (e) failure to provision the announcement ports on the media server.

Because of the potential disruptiveness of making test calls in a live office that is migrating from DRAM-based to packet-based announcements, it is important to check and double-check the provisioning before bringing packet members into service.

11.3.3 TOPS custom announcement considerations

To plan the audio segments that will be provisioned on the media servers for custom announcement applications such as MCCS and ACTS, it is useful to think backwards from the order in which the provisioning is actually done.

1. First, identify the announcements (announcement numbers) that the application uses. Both MCCS and ACTS predefine most of their announcement numbers, but both allow the operating company to define additional announcement numbers.
2. Second, determine the list of external phrase names that the CM uses (if migrating), or will use (if configuring the new application from scratch), for each of these announcement numbers. Nortel provides detailed recommendations on external phrase name lists to use for the pre-defined MCCS and ACTS announcement numbers. The operating company determines the phrase names for announcement numbers that the operating company defines. Also, the operating company may want to define some of its own phrase names to use with some of the pre-defined MCCS and/or ACTS announcement numbers, rather then using only the phrase names that Nortel suggests. If both legacy and packet members are used for the application, bear in mind that the CM uses the same external phrase name lists for both legacy and packet members.
3. Third, determine the content that will correspond to each phrase name. Nortel provides specific content suggestions for the phrase names that we recommend for the pre-defined announcement numbers. The operating company may choose to record different content, and in any case, the

operating company must determine the content for MCCS and ACTS announcements that the operating company defines.

4. Plan the provisioning of audio segments on the media servers. As described in the subsections below, there may not be a one-to-one relationship between physical audio segments on the media servers and phrase names datafilled in the CM. For ACTS, you must take into account the way variable substitution works for placeholder phrases.

When the above steps have been completed, configuration continues as described in "Basic configuration steps" on page 2343. The following subsections provide more detail about MCCS and ACTS.

11.3.3.1 MCCS

Refer to Table 3 on page 2358 for a concise summary of the pre-defined MCCS announcement numbers. For each pre-defined announcement number, the table shows suggested phrase names and content for the phrases.

The operating company can define additional MCCS announcement numbers that are used to brand the "thank-you" acknowledgment for correct card number entry. These operating company defined MCCS announcement numbers are datafilled in CM tables EAMCCSAN and MCCSNBEC.

If you are migrating from DRAM-based to packet-based announcements for MCCS, the easiest way to determine all the phrase names used for MCCS is to consult the MCCS tuples already datafilled in table ANNPHLST. If MCCS is being initially commissioned in the office, however, table ANNPHLST will be datafilled only after the audio segments have been provisioned on the media servers and datafilled in table ANNAUDID and other announcement tables.

MCCS does not use placeholder phrase names. Every phrase name in an MCCS tuple of table ANNPHLST must be mapped in table ANNAUDID to a segment identifier that will be sent to the media server when the corresponding announcement is to be played. MCCS has no requirement for media server provisioning for variable substitution.

The most straightforward way—but not necessarily the best way—to provision the media servers for MCCS is with a single, separate audio file for each MCCS phrase defined in the CM. This would mirror the way MCCS works with DRAMs. Alternatively, it is possible to save space on the media servers by decomposing some of the MCCS announcements into sub-phrases. Each sub-phrase would be a separate voice file on the media servers, and would have its own physical segment ID. A sequence type segment would then be defined in the APS to identify the sequence of physical segments that constitute the announcement. The segment ID of the sequence would be the one datafilled in CM table ANNAUDID against the MCCS external phrase name. The fact that the media server constructs the announcement from a sequence of physical

segments would be transparent to the CM. For more information about using audio sequences, refer to "Media Server 2000 Series Configuration Management."

11.3.3.2 ACTS

Table 5 on page 2362 summarizes the pre-defined ACTS announcement numbers. For each pre-defined announcement number, the table explains when the announcement is used and shows a list of suggested phrase names for the announcement. Content for the non-variable phrase names is suggested in Table 6 on page 2366.

The operating company can define additional ACTS announcement numbers that are used to brand the initial correct deposit and initial overdeposit "thank-you" acknowledgments for coin calls. These operating company defined ACTS announcement numbers are datafilled in CM tables SPIDDB, EAACTSAN and ACTSNBEC.

Because ACTS uses placeholder phrases, it is not possible for migrating offices to determine all the phrase names that ACTS uses simply by consulting existing datafill in table ANNPHLST. The remainder of this section is primarily concerned with how placeholder variable substitution works for ACTS, and the implications for provisioning the media servers. Provisioning the media servers is compared and contrasted to provisioning DRAMs for ACTS.

ACTS pre-defines four placeholder, or variable, phrase names in the CM. These are used for

- monetary amounts (ACTS_VAR_CHARGE and ACTS_VAR_CREDIT),
- time durations (ACTS_VAR_PERIOD), and
- coin denominations (ACTS_VAR_COIN).

The placeholder phrase names are not datafilled in table DRAMPHRS (legacy) or ANNAUDID (packet), and they do not directly correspond to recordings provisioned on DRAMs or media servers.

During call processing, the placeholder phrase names are resolved using call-specific information. For coin denominations (used only by the ACTS Coin Tone Generation Test feature), variable substitution works in much the same way for packet and legacy announcement members. For monetary amounts and time durations, variable substitution works very differently for packet members.

Coin denominations

Placeholder phrases for the ACTS Coin Tone Generation Test feature are handled in much the same way for packet members as for DRAM members. Internal logic in the CM maps the placeholder phrase ACTS_VAR_COIN to one of the pre-defined phrase names shown below:

Phrase Name	Recommended Content
ACTS_NICKEL	“nickel”
ACTS_DIME	“dime”
ACTS_QUARTER	“quarter”
ACTS_DOLLAR	“dollar”

The CM then looks in table ANNAUDID (if a packet member was selected) or DRAMPHRS (if a legacy member was selected), and it expects to find a mapping from that pre-defined phrase name to an audio ID that it will send to the announcement server. Therefore, if the ACTS Coin Tone Generation Test feature is used, the media servers must be provisioned with segments that play the content shown in the table above.

Charges and credits

Resolution of placeholder phrases ACTS_VAR_CHARGE and ACTS_VAR_CREDIT is handled differently for packet members than for DRAM members. For DRAM members, the CM resolves a monetary amount to a phrase list such as, for example, ACTS_1, ACTS_DOLLAR, ACTS_AND, ACTS_15, ACTS_CENTS, and it sends the DRAM a list of internal phrase IDs corresponding to the pre-defined phrases in the list. Therefore, when DRAM members are used, the CM requires datafill in table DRAMPHRS for all of the pre-defined phrases to which it can resolve monetary placeholders.

For packet members, the CM does not resolve monetary amounts to their constituent phrases, and it does not require datafill in table ANNAUDID of audio IDs for the constituent phrases. Instead, the CM sends the media server a higher-level message specifying that it should play a monetary amount and providing the currency (U.S. dollars) and the amount.

The media server executes the logic to resolve the monetary amount into physical phrases. To do this, it requires that recordings for the constituent phrases it can use for money be placed in audio files with pre-defined names. The pre-defined file names are the same for MS 2000 and UAS, and they are

documented in “Media Server 2000 Series Configuration Management.” Only files for the default language need to be provisioned, as ACTS does not support sending language selectors to the media server.

Time durations

The placeholder phrase ACTS_VAR_PERIOD is also handled differently for packet members than for DRAM members. For DRAM members, the CM breaks down the time duration into a sequence of constituent phrases such as ACTS_3, ACTS_MINUTES, and it sends a list of internal phrase identifiers corresponding to these phrase names to the DRAM. Therefore, the CM requires datafill in table DRAMPHRS for all of the pre-defined phrases to which it can resolve ACTS_VAR_PERIOD.

For packet members, the CM does not resolve time durations to their constituent phrases, and it does not require datafill in table ANNAUDID of audio IDs for the constituent phrases. Instead, the CM sends the media server a higher-level message specifying that it should play a duration and specifying the amount of time.

The media server executes the logic to resolve the duration to a list of physical phrases. To do this, it requires that recordings for the constituent phrases it can use for durations be placed in audio files with pre-defined names. The pre-defined file names are the same for MS 2000 and UAS, and they are documented in “Media Server 2000 Series Configuration Management.” Only files for the default language need to be provisioned, as ACTS does not support sending language selectors to the media server.

Silence

With DRAMs, pauses in the announcement require audio files that contain silence. The phrase name ACTS_PAUSE is typically used for this, and it requires mapping in table DRAMPHRS to an internal phrase number that identifies a recording of silence on the DRAM.

ACTS_PAUSE is not a placeholder phrase name, and if it is used in a phrase list for ACTS, it requires datafill in table ANNAUDID. The CM sends the media server a segment ID the same way it does for most other phrases. However, it is possible to provision the media server in a way that avoids using space to store a recording of silence. Refer to “Media Server 2000 Series Configuration Management” for information about provisioning variable-type segments with provisioned values. A variable segment of type silence could be provisioned and associated with a selector that has a provisioned value that determines the duration of the silence. This would be transparent to the logic in the CM.

11.6.2.1.3 Size

Unchanged.

11.6.2.1.4 Fields

Unchanged, but note that for custom announcement members with hardware type UAS, the PHLSTIDX field is ignored. This field is present for all members datafilled with HDWTYPE UAS, but it is consulted only if the announcement CLLI is datafilled as STND in table ANNS.

11.6.2.1.5 Datafill example
Unchanged.

11.6.2.1.6 Table release history update
As of SN09, packet members cannot be datafilled for a custom announcements of type TOPSVR or MDS.

Also, documentation of the meaning of the PHLSTIDX field for custom announcement types with hardware type UAS is clarified. (This is not a functional change.)

11.6.2.1.7 Supplementary information
Packet announcement members (HDWTYPE = UAS) are not supported for custom announcements of type MDS or TOPSVR. If a UAS member is datafilled for an announcement that is datafilled in table ANNS with ANTYPE = MDS or TOPSVR, one of the following warning messages is displayed:

```
Packet members are not supported for ANNTYPE MDS
Packet members are not supported for ANNTYPE TOPSVR
```

11.6.2.2.6 Table release history update

The explanations and example datafill for custom announcement types MCCS and ACTS were updated in SN09, to correct errors and to document that these applications can use either DRAM or packet announcement resources.

The information about custom announcement type AOSSVR was removed in SN09. This application was specific to TOPS MP positions, which are no longer supported.

11.6.2.2.7 Supplementary information

Mechanized Calling Card Service

MCCS is a TOPS custom announcement type. Although the DMS250 also supports an MCCS application, that application uses standard announcements. This section applies to TOPS MCCS.

MCCS announcements can be provided by DRAMs or by packet-based media servers in a hybrid solution with IP and ENET fabrics. The Media Server 2010 (MS 2010) and the Universal Audio Server (UAS) are examples of media servers.

For DRAMs, MCCS announcements can take the form of prerecorded phrases on two NT1X76CA double density erasable programmable read-only memory (EPROM) cards. Alternatively, an operating company can record its own DRAM announcements for MCCS. Use the DRAMREC CI to define phrases on a DRAM. All MCCS announcements are single-track.

For packetized MCCS announcements, the operating company provides the recordings and provisions them on the media servers using the Announcement Provisioning Server (APS). After that, tables ANNAUDID, CLLI, ANNS, ANNMEMS, and ANNPHLST must also be datafilled in the CM.

MCCS provides no secondary language support in the CM. An operating company can provide bilingual MCCS announcements by recording the announcements in both languages. For DRAMs, since MCCS announcements are single-track, both languages must be recorded on the same track. For packet-based MCCS announcements, a sequence can be created using the APS.

In addition to basic calling card validation, the MCCS custom announcement type can be used for sequence call prompts and for the TOPS Authorization Code and Account Code Billing features.

MCCS pre-defines custom announcement numbers 1 through 9 and 15 through 23. It reserves 10 through 14 for future development. Through datafill in tables EAMCCSAN and/or MCCSNBEC, the operating company can specify that announcement numbers 24 and higher are to be used to brand the initial "thank-you" acknowledgment for correct card entry.

MCCS does not use any variable, or placeholder, phrase names. Nortel suggests, but does not require, that the operating company use phrase names shown in Table 3 for MCCS announcements. The table shows the pre-defined MCCS announcement numbers, the scenario in which each is used, the suggested phrase name for each (assuming the language is English), and suggested content for each. The table shows the announcement numbers in an order that is logical in terms of call flow, rather than listing them in order by announcement number. The table uses the following abbreviations:

CCV	Calling Card Validation
SEQ	Sequence calling
ACB	Account Code Billing
AUTH	Authorization Code

Table 3: Pre-defined MCCS Announcements with Suggested Content

Pre-defined Announce-ment Number	When this Announcement is Used	Suggested Phrase List	Suggested Content
17	Initial prompt for CCV and ACB if originating station treatment (OST) from table MCCSOST is TONE. Also used as the initial and retry prompt for AUTH.	MCCSENG17	Alert tone ("bong") for calling card dialing. This is a complex tone consisting of 60 ms DTMF #-tone (941/1477 Hz @ -10 dBm), followed immediately by 940 ms of exponentially decayed dial tone (440/ 350 Hz with time constant of 200 ms initially at -10 dBm)
18	Initial prompt for CCV and ACB if originating station treatment (OST) from table MCCSOST is TONEANN.	MCCSENG17	
1	Re-prompt for CCV and ACB when initial prompt was announcement 18 (OST = TONEANN) and timeout occurred.	MCCSENG1	Please dial your card number or zero for an operator now.
2	Re-prompt for CCV and ACB if caller entered an invalid card number (CCV) or invalid account code (ACB).	MCCSENG2	Please dial your card number again now. The card number you have dialed is not valid.

Table 3: Pre-defined MCCS Announcements with Suggested Content

Pre-defined Announce-ment Number	When this Announcement is Used	Suggested Phrase List	Suggested Content
19	Re-prompt when timeout occurs after caller has heard announcement 2.	MCCSENG17	
3	Re-prompt when timeout occurs after caller has heard announcement 19.	MCCSENG3	Please dial your card number.
9	Re-prompt when timeout occurs after caller has heard announcement 3.	MCCSENG9	Please hang up and dial zero plus the number you are calling.
4	Sign-off message for CCV when caller has entered too many invalid card numbers.	MCCSENG4	Please hang up and dial zero plus the number you are calling. (pause) The card number you have dialed is not valid.
16	Announcement played when card number (CCV) or account code (ACB) has been successfully validated.	MCCSENG16	Thank you.
The following MCCS announcements are used only for sequence calls.			
5	Prompt when # is entered, initiating a sequence call.	MCCSENG5	You may dial another call now.
23	Re-prompt when timeout occurs after announcement 5.	MCCSENG5	
20	Sign-off message when timeout occurs after announcement 23.	MCCSENG9	
6	Re-prompt when caller enters an incorrect number in response to announcement 5.	MCCSENG6	Please dial the number you are calling again now. The number you have dialed is not correct.
7	Re-prompt when timeout occurs after announcement 6.	MCCSENG7	Please dial the number you are calling.
21	Sign-off announcement when timeout occurs after announcement 7.	MCCSENG9	
8	Sign-off announcement when caller has entered too many incorrect numbers for a sequence call.	MCCSENG8	Please hang up and dial zero plus the number you are calling. The number you have dialed is not correct.

Table 3: Pre-defined MCCS Announcements with Suggested Content

Pre-defined Announce-ment Number	When this Announcement is Used	Suggested Phrase List	Suggested Content
15	The number dialed is restricted for sequence calling.	MCCSENG15	Please hang up and dial direct. This number cannot be dialed as a sequence call.
22	Announcement played when caller has entered a correct number for a sequence call.	MCCSENG16	
Note: MCCS announcement numbers 10 through 14 are reserved for future development. ***Note:*** MCCS announcement numbers higher than 23 may be used to brand the initial thank-you acknowledgment by carrier or NBEC. The datafill for that is in tables EAMCCSAN and MCCSNBEC.			

Note that for some phrases, Table 3 lists the same phrase name against several different announcement numbers or scenarios. The table shows the suggested content only once for each phrase name. The operating company can provision different phrases for some of the announcements that share the same phrase name in the table above. To do that,

- First record the new announcement on the DRAM(s) or provision it on the media servers.
- Then add datafill to table DRAMPHRS (using the DRAMREC CI) or ANNAUDID (manually) mapping a new phrase name defined by the operating company to the internal ID provisioned on the announcement server.
- Finally, datafill the new phrase in table ANNPHLST against the CLLI used for MCCS and the new MCCS announcement number.

Note also that Table 3 shows a relatively inefficient scheme for using announcement store. It is based on the pre-recorded announcements that Nortel provides for DRAMs. If you do not plan to use these pre-recorded announcements, you may want to break out some of the sub-phrases that appear multiple times into their own phrases. For example, the sub-phrase “Please hang up and dial zero plus” appears in several different phrases. A separate recording could be created for that, and it could be included in the phrase lists for all of the announcements that begin that way.

If packet announcements are used for MCCS, the scheme for phrase names shown is Table 3 can be efficient if the media server is provisioned with audio sequences for the announcements that contain common phrases. The sequence identifier is then the one datafilled in table ANNPHLST.

If both DRAM and packet members are used for MCCS (or for any other custom announcement type), be aware that the two kinds of members share the same tuple in table ANNPHLST.

Automatic Coin Toll Service

ACTS is a TOPS custom announcement type that can be used for coin call automation and also for the TOPS Time and Charges, Non-coin Notification, and TOPS Coin Tone Generation Test features.

ACTS announcements can be provided by DRAMs or by packet-based media servers in a hybrid solution with IP and ENET fabrics. The Media Server 2010 (MS 2010) and the Universal Audio Server (UAS) are examples of media servers.

For DRAMs, ACTS announcements can take the form of prerecorded phrases on circuit pack NT1X76AE. Alternatively, an operating company can record its own DRAM announcements for ACTS. Use the DRAMREC CI to define the phrases on a DRAM. All ACTS announcements are single-track.

For packetized ACTS announcements, the operating company provides the recordings and provisions them on the media servers using the Announcement Provisioning Server (APS). After that, tables ANNAUDID, CLLI, ANNS, ANNMEMS, and ANNPHLST must also be datafilled in the CM.

ACTS provides no secondary language support.

ACTS pre-defines custom announcement numbers 1 through 23. Through datafill in tables SPIDDB, EAACTSAN and/or ACTSNBEC, the operating company can specify that announcement numbers 24 and higher are to be used to customize the initial correct deposit and overdeposit “thank-you” acknowledgments for coin calls by Service Provider ID, interLATA carrier, or Non-Bell Exchange Company.

ACTS defines certain placeholder phrase names that are datafilled in table ANNPHLST but should not be datafilled in either DRAMPHRS or ANNAUDID. The following table shows the ACTS pre-defined placeholder phrase names.

Table 4: ACTS use of placeholder phrases

Placeholder Phrase Name	Meaning
ACTS_VAR_CHARGE	Amount of money due.
ACTS_VAR_CREDIT	Amount of credit from overdeposit.
ACTS_VAR_PERIOD	Time duration for charges or for notification.

Table 4: ACTS use of placeholder phrases

Placeholder Phrase Name	Meaning
ACTS_VAR_COIN	Denomination of coin to be deposited for coin test feature.

In addition to the placeholder phrases, Nortel recommends, but does not require, that the operating company use certain other phrase names for ACTS. These are shown in tables 5 and 6. Those phrase names are added to table DRAMPHRS (using the DRAMREC CI) or ANNAUDID (manually, after provisioning the media servers) before they are datafilled in table ANNPHLST.

The following table shows the pre-defined ACTS announcement numbers, the scenario in which each is used, and the suggested phrase list for each. The table shows the announcement numbers in an order that is logical in terms of call flow, rather than listing them in order by announcement number.

Note: Suggested content for the non-variable phrase names is shown in Table 6.

Table 5: Pre-defined ACTS announcements with suggested phrase lists

Pre-defined Announce-ment Number	When this Announcement is Used	Suggested Phrase List (PHLIST field of table ANNPHLST)
1	Initial deposit request	(ACTS_VAR_CHARGE) (ACTS_PLEASE) (ACTS_PAUSE) (ACTS_PLS_DEPOSIT) (ACTS_VAR_CHARGE) (ACTS_FOR_FIRST) (ACTS_VAR_PERIOD) $
2	Re-prompt on timeout after announcement 1, no coins entered	(ACTS_PLS_DEPOSIT) (ACTS_VAR_CHARGE) $
3	Inter-coin prompt - Re-prompt after inter-coin timeout for initial period	(ACTS_PLS_DEPOSIT) (ACTS_VAR_CHARGE) (ACTS_MORE) $
4	Acknowledgement of correct deposit for initial period	(ACTS_THANK_YOU) $
5	Acknowledgement of overdeposit for initial period	(ACTS_THANK_HAVE) (ACTS_VAR_CREDIT) (ACTS_CR_OVERTIME) $

Table 5: Pre-defined ACTS announcements with suggested phrase lists

Pre-defined Announce-ment Number	When this Announcement is Used	Suggested Phrase List (PHLIST field of table ANNPHLST)
6	Notification at end of initial period, for post-paid overtime	(ACTS_ALERT) (ACTS_VAR_PERIOD) (ACTS_END_SIGNAL) $
7	Charge due deposit request, post-pay, with no previous overdeposit	(ACTS_ALERT) (ACTS_VAR_CHARGE) (ACTS_PLEASE) (ACTS_PAUSE) (ACTS_PLS_DEPOSIT) (ACTS_VAR_CHARGE) (ACTS_FOR PAST) (ACTS_VAR_PERIOD) $
14	Re-prompt on timeout after announcement 7	(ACTS_PLS_DEPOSIT) (ACTS_VAR_CHARGE) $
8	Charge due deposit request, post-pay, with previous overdeposit	(ACTS_ALERT) (ACTS_VAR_CHARGE) (ACTS_PLEASE) (ACTS_PAUSE) (ACTS_YOU_HAVE) (ACTS_VAR_CREDIT) (ACTS_CREDIT) (ACTS_PLS_DEPOSIT) (ACTS_VAR_CHARGE) (ACTS_MORE) (ACTS_FOR_PAST) (ACTS_VAR_PERIOD) $
15	Re-prompt on timeout after prompt 8	(ACTS_PLS_DEPOSIT) (ACTS_VAR_CHARGE) $
20	Charge due deposit request, pre-pay, with no previous overdeposit	(ACTS_ALERT) (ACTS_VAR_CHARGE) (ACTS_PLEASE) (ACTS_PAUSE) (ACTS_PLS_DEPOSIT) (ACTS_VAR_CHARGE) (ACTS_FOR_NEXT) (ACTS_VAR_PERIOD) $
22	Re-prompt on timeout after prompt 20	(ACTS_PLS_DEPOSIT) (ACTS_VAR_CHARGE) $

Table 5: Pre-defined ACTS announcements with suggested phrase lists

Pre-defined Announce-ment Number	When this Announcement is Used	Suggested Phrase List (PHLIST field of table ANNPHLST)
21	First overtime charge prompt, pre-pay, with previous overdeposit	(ACTS_ALERT) (ACTS_VAR_CHARGE) (ACTS_PLEASE) (ACTS_PAUSE) (ACTS_YOU_HAVE) (ACTS_VAR_CREDIT) (ACTS_CREDIT) (ACTS_PLS_DEPOSIT) (ACTS_VAR_CHARGE) (ACTS_MORE) (ACTS_FOR_NEXT) (ACTS_VAR_PERIOD) $
23	Re-prompt on timeout after prompt 21	(ACTS_PLS_DEPOSIT) (ACTS_VAR_CHARGE) $
16	Overtime inter-coin prompt (pre-pay or post-pay)	(ACTS_PLS_DEPOSIT) (ACTS_VAR_CHARGE) (ACTS_MORE) $
17	Acknowledgement of correct deposit for overtime period (pre-pay or post-pay)	(ACTS_THANK_YOU) $
18	Acknowledgement of overdeposit for overtime period (pre-pay or post-pay)	(ACTS_THANK_HAVE) (ACTS_VAR_CREDIT) (ACTS_CR_OVERTIME) $
9	Time and charges quotation	(ACTS_ALERT) (ACTS_CHARGES_ARE) (ACTS_VAR_CHARGE) (ACTS_PLUS_TAX) (ACTS_VAR_PERIOD) $
19	Repeat time and charges quotation (timeout after announcement 9)	(ACTS_ALERT) (ACTS_CHARGES_ARE) (ACTS_VAR_CHARGE) (ACTS_PLUS_TAX) (ACTS_VAR_PERIOD) $
10	Non-coin, customer-requested notification of time.	(ACTS_ALERT) (ACTS_VAR_PERIOD) (ACTS_HAS_ENDED) $

Table 5: Pre-defined ACTS announcements with suggested phrase lists

Pre-defined Announce-ment Number	When this Announcement is Used	Suggested Phrase List (PHLIST field of table ANNPHLST)
11	Coin test prompt	(ACTS_PLS_DEPOSIT) (ACTS_1) (ACTS_VAR_COIN)
12	Coin test failure. Also coin test cycle done.	(ACTS_PAUSE) (ACTS_ALERT) $
13	Coin test success	(ACTS_THANK_YOU) (ACTS_VAR_COIN) (ACTS_TST_ENDED) $

You do not have to use the exact phrase lists that are suggested in the table above, but it is important that placeholder phrases be datafilled only for the announcements for which they make sense and are shown in the table. For example, it would be an error to datafill placeholder phrase ACTS_VAR_CREDIT in announcement 1, the initial deposit request.

One reason you might want to define your own phrase names would be to play a different “thank-you” acknowledgment for announcement 4 than for announcement 17. To provision different announcements:

- First record the new announcement on the DRAM(s) or provision it on the media servers.
- Then add datafill to table DRAMPHRS (using the DRAMREC CI) or ANNAUDID (manually) mapping a new phrase name defined by the operating company to the internal ID provisioned on the announcement server.
- Finally, datafill the new phrase in table ANNPHLST against the CLLI used for ACTS and the ACTS announcement number.

The following table shows the suggested content for the phrase names from Table 5. It does not include the placeholder phrase names, for which variable substitution occurs before the audio identifiers are determined. It also does not include the pre-defined phrase names that are substituted for placeholder phrases.

Table 6: Suggested content for ACTS phrases, other than those used for placeholder substitution

Phrase Name	Suggested Phrase Content
ACTS_ALERT	(alerting tone, recording as an announcement)
ACTS_PLEASE	“please”
ACTS_PAUSE	(2 s pause)
ACTS_PLS_DEPOSIT	“Please deposit”
ACTS_FOR_FIRST	“for the first”
ACTS_MORE	“more”
ACTS_THANK_YOU	“Thank you”
ACTS_THANK_HAVE	“Thank you. You have”
ACTS_CR_OVERTIME	“credit toward overtime”
ACTS_END_SIGNAL	“has ended. Please signal when through.”
ACTS_FOR_PAST	“for the past”
ACTS_YOU_HAVE	“You have”
ACTS_CREDIT	“credit”
ACTS_CHARGES_ARE	“The charges are”
ACTS_PLUS_TAX	“plus tax for”
ACTS_HAS_ENDED	“has ended.”
ACTS_1	“one”
ACTS_TST_ENDED	“test has ended.”

Note: The ACTS phrases shown in the tables in this section are not the complete list of phrases that must be present in table DRAMPHRS or ANNAUDID to support ACTS. Tables DRAMPHRS (legacy) and ANNAUDID (packet) must also include certain phrases to support variable substitution. Variable substitution is done differently for packet announcements than for DRAM announcements. Section “Automatic Coin Toll Service” in “DMS-100 Family NA100 Translations Guide” lists all the phrases that must be provisioned on DRAMS if legacy announcements are

used for ACTS, and these include the ones used for variable substitution. If packet announcements are used, refer to “ACTS” on page 2349 of this document.

Auxiliary Operator Service System

The AOSSVR custom announcement type is no longer supported. It was used with TOPS MP positions, which are no longer supported.

11.6.2.2.8 Translation verification and other tools

Unchanged.

11.7 Service Orders (SO) (CM & SESM)

No impact.

11.8 Software optionality control (SOC)

This feature is not controlled by SOC. Note however that some of its prerequisite configuration is SOC controlled. Refer to “Hardware and Software Requirements” on page 2342 for information about the feature’s prerequisites.

11.9 Element Management

No impact.

11.10 User interface changes

No impact.

11.11 OSSGate Interface Changes

No impact.

11.12 Security

No impact.

11.13 Configuration Walkthrough

See “Initial Configuration” on page 2343.

HOMELRN	CHANGED	UNCHANGED

12.6.2 Table/MIB/Remote Database Schema information

12.6.2.1 Name: HOMELRN

12.6.2.1.1 Functional description

Table HOMELRN Option SITE is increased to allow 256 SITE names per HOMELRN entry, the previous maximum was 10.

There are no other changes to Table HOMELRN by this activity other than the increased SITE option maximum.

12.6.2.1.2 Usage sequence and implications (CM Only)

No change to current implications

12.6.2.1.3 Size

Table HOMELRN Option SITE maximum limit increases to 256 SITE names per HOMELRN entry.

There is no additional allocation of store to accomodate the increase. The current Option SITE memory allocation is sufficient to handle the increase.

Table 2 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
HOMELRN	0	4000 - 8000	UNCHANGED by this activity

12.6.2.1.4 Fields/OIDs

The following table lists fields/OIDs for <abbreviated name of table.

<conditional information>

Table 3 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
OPTIONS	Changed	SITE		Option SITE can contain up to 256 site names (increased from 10)

12.6.2.1.5 Datafill example

No change

12.6.2.1.6 Table release history update

SN09 - Increased Numebr of SITEs that can be datafilled in table HOMELRN through option SITE from 10 to 256.

12.13 Configuration Walkthrough - *N/A*

13: Configuration (CN): A00009078

13.1 Feature Name

ICM Dual CTI

13.2 Hardware and Software Requirements

For DMS-100, at least two EIUs are needed it the customer wants each TCP/IP links to connect to different EIUs.

For CS2Kc, a primary and a backup 3PC card (Ethernet card) is needed.

13.3 Initial Configuration

Subscription to this feature has to be done according to the DS section. SOC for this feature needs to be turned on. EIU needs to be configured as in interface, if the customer wants each TCP/IP links to connect to different EIU's.

13.4 Upgrade Considerations

13.4.1 Dump and Restore (CM)

Al l of the existing TCP/IP linksets with one link will remain the same after a Dump and Restore.

All of the existing OMs for TCP/IP linksets will remain with a slight change of a link number of 0 appearing after the linkset name.

13.4.2 Element Management Upgrade

13.4.3 Downgrade impact

13.5 Data schema (DS) (CM, MIBS, RDB)

13.5.1 New/modified tables, MIBs, or Database Schema

Table 1 New or modified tables

Table/MIB name	NEW/CHANGED/ or DELETED/	Table Control (NEW/ OLD/UNCHANGED)
SCAICOMS	Changed	NEW

13.5.2 Table/MIB/Remote Database Schema information

13.5.2.1 Name: SCAICOMS

SCAI Communications Table

13.5.2.1.1 Functional description

The operating company uses table SCAICOMS to define the CompuCALL (X.25) and ICM (TCP/IP)links.

Changes will be made to support another TCP/IP link within an existing linkset.

13.5.2.1.2 Usage sequence and implications (CM Only)

To support another TCP/IP link within an existing linkset the following changes have to be made.

The datafill of this table is done in the following order for the TCP/IP linksets.

LINKSET: enter the linkset name.

LNKSEL: TCP

IPADDR: ### ### ### ###

Where # is a digit ranging from 0 to 9. Please note that the space should be present after entering each set of digits.

IPADDR: ### ### ### ###

MULTIMSG: Y/N

OPTION: CONTAUD

AUDIT: N

OPTION: $

ENTER Y TO CONFIRM, N TO REJECT OR E TO EDIT.

> Y

Everything above except the entry in bold exists now. A prompt for a second IP address will be provided. If a customer only wants a single IP address, this will be achieved by typing a $ at the prompt for second IP address.

IPADDR: $

Please look at secion 12.4.2.1.5 for the examples

13.5.2.1.3 Size

Table 2 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
SCAICOMS	0	256 (x.25) + 96 (TCP/IP) = 352	Protected

13.5.2.1.4 Fields/OIDs

The following table lists fields/OIDs for table SCAICOMS.

Table 3 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
IPADDR	Changed	Prompt for another IP address will be displayed	### ### ### ###	IP address. If only one IP address is needed the second prompt for IP address should be cancelled by typing in a $.

13.5.2.1.5 Datafill example

The following example shows sample datafill for table SCAICOMS.

LINKSET: TCP_AA

LNKSEL: TCP

IPADDR: 47 150 19 1

IPADDR: 47 102 3 4

MULTIMSG: N

OPTION: CONTAUD

AUDIT: N

OPTION: $

TUPLE TO BE ADDED

TCP_AA TCP (47 150 19 1) (47 102 3 4) N (CONTAUD N) $

ENTER Y TO CONFIRM, N TO REJECT OR E TO EDIT.

> Y

Another example for adding just one link.

LINKSET: TCP_BB

LNKSEL: TCP

IPADDR: 47 10 3 2

IPADDR: $

MULTIMSG: N

OPTION: CONTAUD

AUDIT: N

OPTION: $

TUPLE TO BE ADDED

TCP_BB TCP (47 10 3 2) $ N (CONTAUD N) $

ENTER Y TO CONFIRM, N TO REJECT OR E TO EDIT.

> Y

13.5.2.1.6 Table release history update

A prompt for another IPADDR field was added.

13.5.2.1.7 Supplementary information

N/A

13.5.2.1.8 Translation verification and other tools

SCAICOMS does not use translation verification tools.

13.6 Software optionality control (SOC)

Order code ICM00081, ICM Dual Link optionalizes the functionality of the

Table 4 SOC

SOC option name:	ICM
SOC option title:	ICM Dual Link

14.4.2 Parameter information

14.4.2.1 MAX_NUMBER_ACD_AGENTS_PER_SWITCH

Maximum Number of Automatic Call Distribution Agents Per Switch

14.4.2.1.1 Functional description

This is a pre-existing office parameter which specifies the maximum number of ACD agent positions that the operating company can provision in the switch.

The purpose of this parameter will not be changed by this activity.

The range of this parameter will be increased to have a maximum value of 99,999. The ability to assign a new value to this parameter is restricted. A new value can only be assigned by changing the limit of the ACD00101 SOC.

When the SOC usage limit is increased or decreased, the value stored in the office parameter is automatically updated to reflect the new limit.

14.4.2.1.2 Range information

Table 2 Range Information

Minimum	Maximum	Default
0	99,999	0

14.4.2.1.3 Memory requirements

No memory impact.

14.4.2.1.4 Parameter release history update

The maximum value is being increased from 30,000 to 99,999 for SN09.

14.5 Upgrade Considerations

The following example shows sample datafill for table ACDENLOG.

14.6.2.5.6 Table release history update

Table is expanded to accomodate a maximum of 99,999 tuples per partition.

14.6.2.5.7 Supplementary information

N/A

14.6.2.5.8 Translation verification and other tools

ACDENLOG does not use translation verification tools.

14.7 Service Orders (SO) (CM & SESM)

This activitty does not introduce any new Service Order commands, LCCs, or options.

14.7.1 Service order change details

When the ACD option is added to a line (ADO, NEW, NEWACD commands), or when ACD option data is changed (CHF command), one of the prompts offered by SERVORD is POSID. Currently, any value between 00001 and 30000 is accepted as valid input for the POSID. This activity will change the acceptable value of POSID to be in the range of 00001 to 99999.

14.7.1.1 How service order options are presented

14.7.1.1.1 Description

The range of valid input for the POSID prompt has been modified to be between 00001 and 99999.

14.7.1.1.2 Example

Figure 1 Example of the ADO command in prompt mode

```
SO:
>ado
SONUMBER:   NOW  3 11  6 AM
>
DN_OR_LEN:
>6218000
OPTKEY:
>1
OPTION:
>acd
ACDGRP:
>acdtest1
ACDSGRP:
>0
IDNUM:
>y
POSID:
>99999
OPTKEY:
>$
COMMAND AS ENTERED:
ADO NOW 3 11 6 AM 6218000 ( 1 ACD ACDTEST1 0 Y 99999 ()()) $
ENTER Y TO CONFIRM, N TO REJECT OR E TO EDIT
>y
```

Figure 2 Example of the ADO command in no-prompt mode

```
SO:
>ado $ 6218000 1 acd acdtest1 0 y 99999 $
```

The NEW, NEWACD, and CHF commands also offer the POSID prompt when used to manipulate ACD data. Examples of these commands are not provided because the effect of this change is identical to the ADO example shown above.

14.7.1.1.3 Option prompts

Table 14 System prompts for POSID

Prompt	Valid input	Description	Areas affected by prompt
POSID	00001 to 99999	ACD agent position ID	Affects SERVORD commands ADO, NEW, NEWACD, and CHF when used to manipulate ACD option data.

15.3 Initial Configuration

Not applicable.

15.4 Office/Subnet parameters (OP/SP) (CM & SESM)

Not Applicable.

15.5 Upgrade Considerations

None.

15.6 Data schema (DS) (CM, MIBS, RDB)

15.6.1 New/modified tables, MIBs, or Database Schema

Table 1 New or modified tables

Table/MIB name	NEW/CHANGED/ or DELETED/	Table Control (NEW/ OLD/UNCHANGED)
VEONAME	New	New
XLAPLAN	Changed	New
CXGRP	Changed	New
LPICPXLA	New	New

15.6.2 Table/MIB/Remote Database Schema information

15.6.2.1 Name : VEONAME

Virtual End Office Name

15.6.2.1.1 Functional description

New table VEONAME will contain the list of VEO names. Each VEO name represents a virtual end office that is partitioned on the DMS100/CS2000. The Virtual EO name will be provisioned as a string of up to 16 characters. Table VEONAME can provision upto a maximum of 1000 VEO names including the nil_veo_name as reserved value.

15.6.2.1.2 Usage sequence and implications (CM Only)

When intially configuring the switch, table VEONAME must be provisioned prior to adding option VEONAME in table XLAPLAN, and table CXGRP and adding a new privilege code in table LPICPXLA.

Table control would not allow deletion of a tuple in table VEONAME if it is being used in Table XLAPLAN or Table CXGRP or Table LPICPXLA.

15.6.2.1.3 Size

Table 2 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
VEONAME	1	1000	No memory allocation required since the only field in this tuple is of string range data type. The strings are added in data dictionary when a new tuple is added in this table.

15.6.2.1.4 Fields/OIDs

The following table lists fields/OIDs for table VEONAME

Table 3 Table field descriptions

Field	New or Changed	Entry	Explanation and action
VEONAME	New	CHAR VECTOR (16)	The table key specifies the Virtual End Office Name.

15.6.2.1.5 Datafill example

The following example shows sample datafill for tableVEONAME.

Table VEONAME:

```
VEONAME
--------------------
ENDOFFICE1
ENDOFFICE2
```

15.6.2.1.6 Table release history update

New table VEONAME is created.

15.6.2.1.7 Supplementary information

None.

15.6.2.1.8 Translation verification and other tools

Not applicable.

15.6.2.2 Name : XLAPLAN

Translation Plan.

15.6.2.2.1 Functional description

Table XLAPLAN contains the translation plans for all the line agents which are datafilled in table LINEATTR. Table LINEATTR contain a field indicating the translation plan for the agent and is key to the table XLAPLAN.

A new options VEONAME is added to table XLAPLAN. This option provides an association between the originating line/trunk agent and Virtual End Office (VEO) . This provides the flexibility to partition the DMS100/CS2000 into multiple virtual end offices. .

15.6.2.2.2 Usage sequence and implications (CM Only)

Table VEONAME must be provisioned prior to adding option VEONAME in table XLAPLAN.

The functionality provided by LPIC Privilege Routing is not provided until option VEONAME is provisioned for the line/trunk agent in table XLAPLAN.

15.6.2.2.3 Size

The size of table XLAPLAN is unchanged.

Table 4 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory

15.6.2.2.4 Fields/OIDs

The following table lists fields/OIDs for table XLAPLAN

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
OPTION	changed	refinement	VEONAME refinement	adding new option - VEO name

15.6.2.2.5 Datafill example

The following example shows sample datafill for table XLAPLAN.

```
Table XLAPLAN:

XLAPIDX  SCRNCLHSTS  PRTNMZEROMPOS RESINF  OPTIONS  ADMINF
-------------------------------------------------------------------------------------------
613_P621_0  FR01  613   P621  TSPS Y  RESGRP 0 2 VEONAME ENDOFFICE1   $
```

15.6.2.2.6 Table release history update

Option VEONAME is added in table XLAPLAN for LPIC Privilege Rouing Capability.

15.6.2.2.7 Supplementary information

None.

15.6.2.2.8 Translation verification and other tools

Refer to Figure 1 on page 100 for Traver of the call using new option VEONAME in table XLAPLAN.

15.6.2.3 Name : CXGRP

Customer Group Options.

15.6.2.3.1 Functional description

Table CXGRP (Customer Group Options) is required in local or combined local/toll switches to define the options associated with a PX digital trunk. The PX agent tuple in table TRKGRP contains the field for PX Customer Group to index into table CXGRP.

A new option VEONAME is added in Table CXGRP. Option VEONAME provides an association between the originating PX trunk agent and the Virtual End Office (VEO). This provides the flexibility to partition the DMS100/ CS2000 into multiple virtual end offices.

15.6.2.3.2 Usage sequence and implications (CM Only)

Table VEONAME must be provisioned prior to adding option VEONAME in table CXGRP.

The functionality provided by LPIC Privilege Routing is not provided until optionVEONAME is provisioned for the PX trunk agent in table CXGRP.

15.6.2.3.3 Size

The size of table CXGRP is unchanged.

Table 5 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory

15.6.2.3.4 Fields/OIDs

The following table lists fields/OIDs for table CXGRP

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
OPTION	changed	refinement	VEONAME refinement	adding new option - VEO name

15.6.2.3.5 Datafill example

The following example shows sample datafill for CXGRP.

```
Table CXGRP:

CUSTKEY SPB CTD FCTDNTER FCTDNTRA FCTDINT EWATS EWATSI
PXOPTION
-----------------------------------------------------------------------------------------
50 N Y (C544) $ N N N N N (LPIC C541 Y) VEONAME ENDOFFICE2 $
```

15.6.2.3.6 Table release history update

Option VEONAME is added in table CXGRP for LPIC Privilege Rouing Capability.

15.6.2.3.7 Supplementary information

None.

15.6.2.3.8 Translation verification and other tools

For example traver with table CXGRP datafilled, see Figure 2 .

15.6.2.4 Name : LPICPXLA

IntraLATA Primary InterExchange Carrier Privilege Translation

15.6.2.4.1 Functional description

A new table LPICPXLA is implemented to provision a list of NPANXX codes to be excluded from LPIC routing on per VEO basis.

Table LPICPXLA is accessed during call processing for originating agent when table XLAPLAN entry for the agent's pretranslator has option VEONAME assigned and the VEONAME option value is provisioned in table VEONAME amd the SOC, EQA00032 'LPIC Privilege Routing' is turned ON.

15.6.2.4.2 Usage sequence and implications (CM Only)

Table VEONAME must be provisioned prior to adding a new privilege code in table LPICPXLA.

15.6.2.4.3 Size

Table 6 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
LPICPXLA	0	n/a	The table will be using 1 digilator pool (32k-1 digit blocks) for storing NPANXX codes. Max size of this table depeneds upon the digits pattern used for NPANXX codes.

15.6.2.4.4 Fields/OIDs

The following table lists fields/OIDs for table LPICPXLA

Table 7 Table field descriptions

Field	New or Changed	Entry	Explanation and action
PRIVCODE	New	Key1 : VEONM VEO_NAME (String range 0-999) Key2 : DIGITS DIGIT_REGISTER	Key 1 specifies the originating subscriber's Virtual End Office Name. Key 2 specifies NPANXX codes provisioned for each VEONAME.

15.6.2.4.5 Datafill example

The following example shows sample datafill for table LPICPXLA.

Table LPICPXLA:

```
                    PRIVCODE
---------------------------------
ENDOFFICE1     919484
ENDOFFICE2     212782
```

15.6.2.4.6 Table release history update

New table LPICPXLA is created.

15.6.2.4.7 Supplementary information

None.

15.6.2.4.8 Translation verification and other tools

The following example shows the output from Traver when it is used to verify table LPICPXLA and table XLAPLAN.

Figure 1 EQA00032 is ON & LPICPXLA datafilled

Figure 2 PX trunks - EQA00032 is ON & LPICPXLA not datafilled

EXAMPLE of PX trunk datafilled for a different LPIC in table CXGRP:

Note that Table CXGRP does not show up in TRAVER
-- but since it is datafilled with LPIC option and carrier 288, the TRKGRP's choice of 212 is changed to carrier 288 during translations.

The trunk group is also datafilled for VEONAME option, so this call could be routed as a privilege call (non-EA), however, since table LPICPXLA is not datafilled, it is routed as an EA call.

15.7 Service Orders (SO) (CM & SESM)

Not Applicable.

15.8 Software optionality control (SOC)

Table 8 SOC

SOC option name:	VEO LPIC Privilege
SOC option title:	Yes
SOC option control type:	state
New SOC option?	Yes
SOC option order code	EQA00032
Option defined in DRU:	CNA
Affected products:	NA

15.9 Element Management

Not Applicable.

15.10 User interface changes

Not Applicable.

15.11 OSSGate Interface Changes

Not Applicable.

15.12 Security

Not Applicable.

15.13 Configuration Walkthrough

Following are the provisioning steps required in order to use the LPIC Privilege Routing feature:

1. Add the tuples in table VEONAME with valid VEO names.

2. Add the new option VEONAME in table XLAPLAN/CXGRP with valid VEO names from table VEONAME.

3. Add the tuple in table LPICPXLA containing combination of VEO name and NPANXX privilege codes.

4. Turn the SOC EQA00032 to state ON.

Now the switch is configured to use the new LPIC Privilege routing functionality.

To revert back to the existing LPIC privilege routing functionality, turn the SOC EQA00032 to IDLE state

16: Configuration (CN): A00009129

16.1 Feature Name

Controlled Hot Swact

16.2 Hardware and Software Requirements

This feature will require a cPCI SOS image based on CSP22 as well a linux ramdisk based on NCGL8.

16.3 User interface changes

16.3.1 Command: CMREXFUL

16.3.1.1 Command type:

NON-MENU

16.3.1.2 Command target:

3PC

16.3.1.3 Command availability:

RES

16.3.1.4 Command description

This command allows the crafts person to set the day of the full rex. The time of the REX test is still set via the NODEREXCONTROL tuple in table OFCVAR.

16.3.1.5 Command syntax

Table 1 CMREXFUL command parameters and variables

Command	Parameters and variables
CMREXFUL	set {MON,TUE,WED,THU,FRI,SAT,SUN} query
Parameters and variables	Description
set	Set the day of the week that full REX should be scheduled.
query	Displays the current setting for the full REX.

16.3.2 Command: CAPCI

16.3.2.1 Command type:

NON-MENU

16.3.2.2 Command target:

3PC

16.3.2.3 Command availability:

RES

16.3.2.4 Command description

This command allows the crafts person to view the CPU utilization of the call agent blade.

16.3.2.5 Changes to map output

16.3.2.5.1 Sync field change.

Table 2 MAP output from CAPCI command in CSP21

Command: CAPCI
CATMP/HR UTIL ENGCATMP ENGLEVEL SYNC CCOVRLD IDLE 1294680 63% 2032346 BELOW YES OFF NO SCHED FORE MAINT DNC AUXCP OM GTERM BKG NETM SNIP 132% 47% 3% 0% 1% 0% 0% 77% 0% 7%

The sync field will be modified to display one of the following values.

HOT/WARM/NO.

Table 3 MAP output from CAPCI command in CSP22

Command: CAPCI
CATMP/HR UTIL ENGCATMP ENGLEVEL SYNC CCOVRLD IDLE 1294680 63% 2032346 BELOW HOT OFF NO SCHED FORE MAINT DNC AUXCP OM GTERM BKG NETM SNIP 132% 47% 3% 0% 1% 0% 0% 77% 0% 7%

16.3.2.5.2 Sync field transition indicator.

If the sync state of the call agent blade has switched state within the last capci sample period, this transition was indicated by a ‘*’.

Table 4 MAP output from CAPCI command during sync transition in CSP21

Command: CAPCI

```
CATMP/HR UTIL ENGCATMP ENGLEVEL SYNC CCOVRLD IDLE
1294680  63%  2032346    BELOW  *YES     OFF   NO

SCHED  FORE MAINT   DNC AUXCP    OM GTERM   BKG  NETM  SNIP
 132%   47%    3%    0%    1%    0%    0%   77%    0%    7%
```

The transition indication will be changed to one of +/-. A '+' would indicate that the current sync state is higher than the preceding sync state. For example a '+' would be pre-pended on the sync state if the sync state transitioned from NO to WARM. A '-' would indicate that the current sync state is lower than the preceding sync state. For example a '-' would be pre-pended on the sync state if the sync state transitions from HOT to WARM.

Table 5 MAP output from CAPCI command during sync transition from NO to WARM in CSP22.

Command: CAPCI

```
CATMP/HR UTIL ENGCATMP ENGLEVEL SYNC  CCOVRLD IDLE
1294680  63%  2032346    BELOW  +WARM   OFF   NO

SCHED  FORE MAINT   DNC AUXCP    OM GTERM   BKG  NETM  SNIP
 132%   47%    3%    0%    1%    0%    0%   77%    0%    7%
```

16.3.3 Command: SWACT

16.3.3.1 Command type:

MENU

16.3.3.2 Command directory:

CCAMTC;COREMTC;CAMTC

16.3.3.3 Command target:

3PC

16.3.3.4 Command availability:

17.6.6 Database Schema: GWCEM.GATEWAY

17.6.6.1 Functional description
This table is used to store provisioned gateway entries, 2 fields will be impacted.

17.6.6.2 Fields

Table 2 Modified/Added fields

Field	New/ Changed	Entry	Explanation and action
GATEWAYNAME	Changed	VARCHAR2 (64) NOT NULL	Length will be extended to 64, used to store gateway hostname.
GATEWAYINDEX	New	INTEGER NOT NULL	Gateway index number.

17.6.6.3 Limitations
Field GATEWAYNAME is primary key, so gateway hostname must be completely unique across entire office.

17.6.7 Database Schema: GWCEM.GWDOMAIN

17.6.7.1 Functional description
This new table is used to store provisioned gateway domain name.

17.6.7.2 Fields

Table 3 Fields descriptions

Field	New/ Changed	Entry	Explanation and action
GWCID	New	VARCHAR2 (32) NOT NULL	Indicates which GWC this Gateway Domain Name belongs to. Refer to table “GWCEM.GWCNODE“.
DOMAINNAME	New	VARCHAR2 (64) NOT NULL	Gateway domain name.
DOMAININDEX	New	INTEGER NOT NULL	Gateway domain global index number.

17.6.8 Database Schema: GWCEM.GATEWAYPROFILE

17.6.8.1 Functional description

This table stores all data of gateway profiles, new column will be added into this table.

17.6.8.2 Fields

Table 4 New Field

Field	New/ Changed	Entry	Explanation and action
FQDN_SUPPORTED	New	VARCHAR2 (5)	Indicate whether the default gateway domain name is supported by this profile. Available values are “true” and “false”. String “false” indicates “not support”, string “true” indicates “support”. The default value is “false”.

17.6.9 Database Schema: GWCEM. GWROOTITRANSMIDDLEBOXES

17.6.9.1 Functional description

Expand gatewayname from 32 charaters to 64 characters.

17.6.9.2 Fields

Table 5 New Field

Field	New/ Changed	Entry	Explanation and action
GATEWAYNAME	Changed	VARCHAR2 (64)	To support 64 character FQDN.

17.6.10 Database Schema: GWCEM. GLOBALIDS

17.6.10.1 Functional description

This new added table stores global id of different device.

17.6.10.2 Fields

Table 6 New Field

Field	New/ Changed	Entry	Explanation and action
IDTYPE	New	NUMBER NOT NULL	Indicate 8 bits device type that the GID belongs to.
CALLAGENTID	New	NUMBER NOT NULL	Indicate 8 bits CallAgent ID.
KEY	New	NUMBER NOT NULL	Indicate 16 bits key which is unique on IDTYPE and CALLAGENTID.
GLOBALID	New	NUMBER NOT NULL	Indicate 32 bits GID which is unique accross all device type and call agent id.

17.7 Service Orders (SO) (CM & SESM)

None.

17.8 Software optionality control (SOC)

None.

17.9 Element Management

FQDN support was introduced in SN07/SN08, a “dummy” gateway need to be added which created the suffix or domain name for all the gateways on a GWC. The remaining gateways were provisioned using its unique prefix, or hostname. The domain of the ‘dummy’ gateway then could be appended to the end of all NCS and DNS signaling at call processing time.

In SN09, the procedure of domain name configuration is changed. Customer could set a default gateway domain name when adding GWC node. If provisioned, the default gateway domain name will be applied to all the gateways on this GWC (if the gateway profile supports FQDN). The name which customer filled when associating media gateway will be gateway hostname. The gateway FQDN will be concatenation of gateway hostname and default gateway domain name.

In SN09, if customer does not fill default gateway domain name when adding GWC node. No default gateway domain name will be used, customer can fill in FQDN-liked name when associating media gateway (if the gateway profile supports FQDN). The gateway hostname and FQDN will be the same, as the name user filled.

17.9.1 New/modified GUIs

Table 7 New or modified GUIs

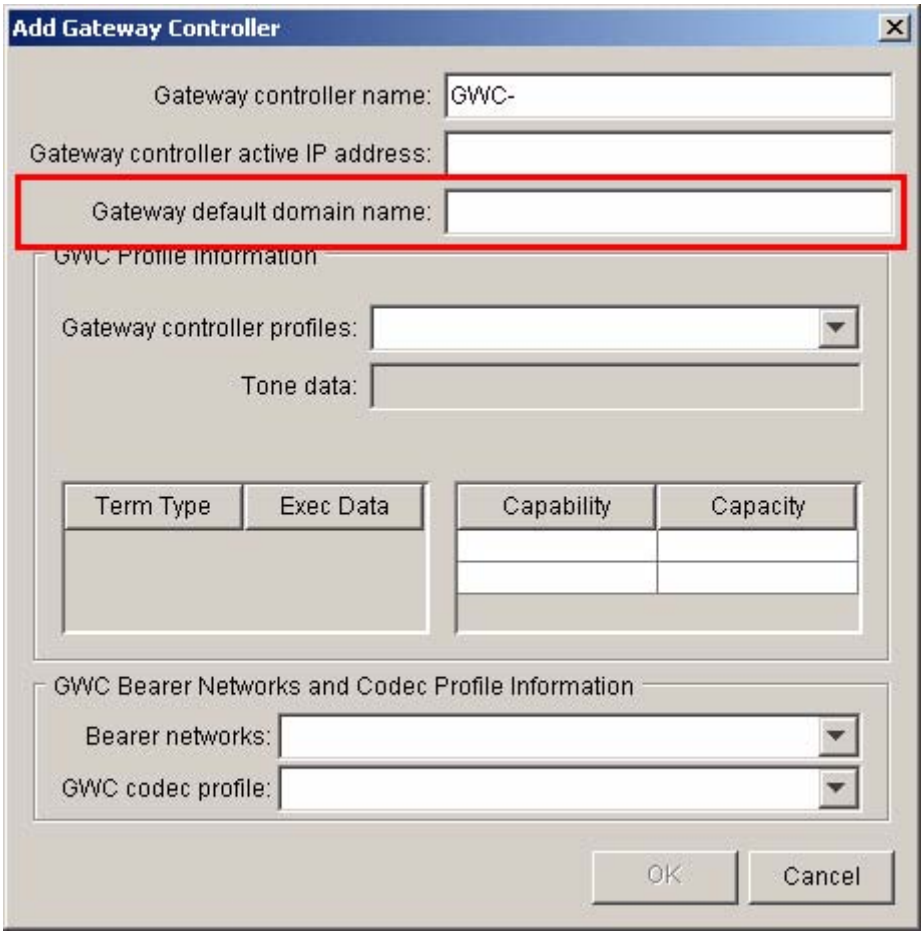
GUI name	NEW, CHANGED, or DELETED
GWCEM	Changed

17.9.2 GUI information

17.9.2.1 GUI name: Add GWC node

This dialog is used to add GWC node by customer. New field “Gateway default domain name” is added in SN09. This field is optional, customer could fill in if default gateway domain name is required. If customer does not fill it when adding GWC node, no default gateway domain name will be set.

Figure 1 Add GWC node GUI



17.9.2.2 GUI name: GWC provisioning panel

The GWC default gateway domain name will be displayed on right bottom corner of GWC provisioning panel. If no default gateway domain name provisioning on this GWC, it will be displayed as “<Not Configured>”.

17.11 OSSGate Interface Changes

17.11.1 XML Command Changes

When user specify a gateway operation, such as assocMG, disAssocMG, changeMG or addGWCtoCS, system will allow user to input either gateway host name only or the full FQDN name.

17.11.1.1 Command XML

17.11.1.1.1 Add GWC command

A new parameter, gwDefaultDomainName, will be added into the Add GWC xml command which is like the following:

Add GWC to CS XML command

```
<?xml version="1.0" encoding="UTF-8" ?>
<CommandList>
  <Command>
    <Interface>cs2kCfgMgrIf</Interface>
    <Methods>
      <addGWCtoCS usn="1" version="1.0">
        <Parameters>
          <csUIName>COMPACT6</csUIName>
          <gwcUIName>GWC-10</gwcUIName>
          <profileName>LARGE_LINENA</profileName>
          <gwcActvIp>47.128.142.156</gwcActvIp>
          <gwcSnmpPort>161</gwcSnmpPort>
          <bearerNetworkName>NET_IP</bearerNetworkName>
          <bearerFabricType>IP</bearerFabricType>
          <codecProfileName>Profile_IP</codecProfileName>
          <termType>POTS</termType>
          <termType>KEYSET</termType>
          <execLineup>POTSEX</execLineup>
          <execLineup>KSETEX</execLineup>
          <gwDefaultDomainName>nortel.com.cn</gwDefaultDomainName>
        </Parameters>
      </addGWCtoCS>
    </Methods>
  </Command>
</CommandList>
```

17.11.1.1.2 disAssocMG XML command

Both gateway hostname and gateway full FQDN name are allowed to input when user want to delete the gateway from system.

disAssocMG XML command with full FQDN name

```
<?xml version="1.0" encoding="UTF-8" ?>
<CommandList>
  <Command>
    <Interface>cs2kCfgMgrIf</Interface>
    <Methods>
      <disAssocMG usn="1" version="1.0">
        <Parameters>
          <mgUIName>test1.nortel.com.cn</mgUIName>
        </Parameters>
      </disAssocMG>
    </Methods>
  </Command>
</CommandList>
```

disAssocMG XML command with gateway host name

```
<?xml version="1.0" encoding="UTF-8" ?>
<CommandList>
  <Command>
    <Interface>cs2kCfgMgrIf</Interface>
    <Methods>
      <disAssocMG usn="1" version="1.0">
        <Parameters>
          <mgUIName>test1</mgUIName>
        </Parameters>
      </disAssocMG>
    </Methods>
  </Command>
</CommandList>
```

17.11.1.1.3 Change MG XML command

Similar with other OSSGate interface, the change gateway interface also changed to support both gateway hostname and full FQDN name.

The xml command is like the following:

Change MG XML command with full FQDN name

```
<?xml version="1.0" encoding="UTF-8" standalone="yes" ?>
<CommandList >
  <Command>
    <Interface>cs2kCfgMgrIf</Interface>
      <Methods>
        <changeMG usn="1" version="1.0">
          <Parameters>
            <mgUIName>test1.nortel.com.cn</mgUIName>
            <reservedTerminations>16</reservedTerminations>
          </Parameters>
      </changeMG>
    </Methods>
  </Command>
</CommandList>
```

Change MG XML command with only hostname

```
<?xml version="1.0" encoding="UTF-8" standalone="yes" ?>
<CommandList >
  <Command>
    <Interface>cs2kCfgMgrIf</Interface>
      <Methods>
        <changeMG usn="1" version="1.0">
          <Parameters>
            <mgUIName>test1</mgUIName>
            <reservedTerminations>16</reservedTerminations>
          </Parameters>
      </changeMG>
    </Methods>
  </Command>
</CommandList>
```

17.11.1.2 Response XML

17.11.1.2.1 QueryGWC response

The gateway domain name that is added with the GWC will be included in the response when user perform a QueryGWC request.

Example:

```
<?xml version="1.0" encoding="UTF-8" ?>
<CommandList>
 <Response>
 <Interface>cs2kCfgMgrIf</Interface>
  <Methods>
   <queryGWC usn="1" version="1.0">
   <ReturnData>
    <Row>
     <gwcUIList>GWC-10</gwcUIList>
     <gwcIpList>47.142.128.156</gwcIpList>
     <callServerId>COMPACT6</callServerId>
     <nodeName>GWC 10</nodeName>
     <typeList>1</typeList>
     <typeList>6</typeList>
     <typeList>7</typeList>
     <typeList>15</typeList>
     <typeList>16</typeList>
     <xacNodeNumber>27</xacNodeNumber>
     <actvIpAddress>47.142.128.156</actvIpAddress>
     <snmpPort>161</snmpPort>
     <mktTones>NORTHAA</mktTones>
     <termTypes>POTS</termTypes>
     <termTypes>KEYSET</termTypes>
     <pmExecs>POTSEX</pmExecs>
     <pmExecs>KSETEX</pmExecs>
     <capacity>6400</capacity>
     <externalIP>NOT_YET_SUPPORTED</externalIP>
     <externalPort>0</externalPort>
     <bearerNetworkName>NET_IP</bearerNetworkName>
     <bearerFabricType>IP</bearerFabricType>
     <codecProfileName>Profile_IP</codecProfileName>
     <gwDefaultDomainName>nortel.com.cn</gwDefaultDomainName>
    </Row>
    <RC>0</RC>
    <MsgTxt>Query of a Single GWC was successful</MsgTxt>
   </ReturnData>
   </queryGWC>
  </Methods>
 </Response>
</CommandList>
```

18.5 Upgrade Considerations

Currently, the XPM patch XIX20, is used to hardcode the ACM timer value to 20 secs for UCS trunks. When the switch is upgraded to SN09 core load, this patch XIX20 will be Obsoleted. New patch, XHW10 for DTC should be applied to support provisionable timers on a per trunk basis for UCP Trunks. When trunks hosted on DTCs are used, this patch will allow the datafilled ISUP timer value to be used during CallP.

After applying the patch perfom the following actions to set the ISUP Timers for ISUP UCP protocol trunks.

- Datafill table C7UPTMR for UCP Potocol with the required timer value.
- Datafill TRKSGRP to change the TMRNAME field to the datafilled C7UPTMR index.

18.5.1 Dump and Restore (CM)

18.13 Configuration Walkthrough

N/A

19: Configuration (CN): A00009200

19.1 Feature Name

Packet Trunking Trunk Test: Milli-watt Tone Swap

19.2 Hardware and Software Requirements

For the MWTSwap command to be usable there needs to be a third party test equipment box installed. In SN09 the only supported third party test box that can run MWTSwap is the AudioCodes Media Server (AMS) series products. Once the AMS is installed the office parameter "EXTERNAL_GATEWAY_TEST_LINES" in table OFCVAR should be set to "Y". If this office parameter is set to "N" then it is assumed that the MTM is being used for test equipment and the MWTSwap command will be rejected.

19.3 User interface changes

19.3.1 Directory: MAPCI;MTC;TRKS;TTP;MANUAL

19.3.1.1 Directory description

This MAP level contains the TTP commands for manual trunk test position tests like TGEN, LOSS, etc.

19.3.1.2 Accessing directory: LEVEL MAN

19.3.1.2.1 Access to directory or MAP level and return to CI

To access the MANUAL level of the MAP enter "MAPCI;MTC;TRKS;TTP;LEVEL MAN" at the CI.

To return to the CI level enter "QUIT ALL" or simply "QUIT" to move up to the next higher level (the TTP level in this case).

19.3.2 Command: MWTSwap

19.3.2.1 Command type: Listed MENU and Unlisted MENU

The MWTSwap command is available at the general TTP level command directory as soon as the TTP level is entered. At the TTP level the command is an Unlisted Menu command. The MWTSwap command is also a Listed Menu command at the MANUAL level under the TTP level. Once the MANUAL level is entered the MWTSwap command appears in the menu.

Note: The MWTSwap command visibility at the MANUAL level is conditional on the value of the office parameter EXTERNAL_GATEWAY_TEST_LINES in table OFCVAR. If this office parameter is "Y" (Yes) then the MWTSwap command will be visible in the

menu, and the commands “LOSS” and “TGEN” will be removed from the menu (although will still be Unlisted Commands). When the office parameter is “N” (No) then the MWTSwap command will not be visible in the menu, but will still be an Unlisted command at the MANUAL level.

19.3.2.2 Command target: All

19.3.2.3 Command availability: RES

19.3.2.4 Command description

MWTSwap is a new command implemented as a single command that combines the functionality of the TGEN and LOSS commands. The new command causes a 1004 Hz tone to be generated towards the far-end switch on the posted trunk, while at the same time measuring the loss on an incoming 1004 Hz tone from the far-end switch on the selected trunk. The command should be used in a coordinated fashion with a craftsperson on the far-end switch such that the far-end switch is also generating a 1004 Hz tone at the same time so that a valid loss measurement can be taken by the near-end switch. If no tone detectable on the incoming circuit then the MAP display will indicate this through the text “No Tn” in the results area of the MAP.

The MWTSwap command supports 3 command line parameters, a frequency between 0 and 4000 Hz, a power level between -60 dB and 0 dB (in increments of 1 dB), and a test duration between 1 and 240 seconds. If no command line parameters are present the defaults of 1004Hz, 0 dB, and 60 seconds are used.

Note: Although the frequency range allowed on the command line is between 0 and 4000 Hz, the only supported frequency at this time is 1004 Hz. If any other frequency is given on the command line the command will fail with an appropriate error message.

When the MWTSwap command is entered the MAP is updated to display the frequency of the tone being generated as well as loss measurement information. The loss measurement information is updated on a regular basis (every few seconds) based on data sent from the third party test equipment. The MWTSwap command acts slightly differently from the TGEN and LOSS commands in that it runs for a specified time limit, during which time the user does not have the ability to invoke any other commands. Once the test completes it will return control to the crafts person. The upper limit on the length of the test is 4 minutes (240 seconds), with the default being 60 seconds. The upper limit was considered to be sufficiently long to allow coordination between the near-end and far0end switches in starting the test and long enough to get a stable loss reading on the trunk.

19.3.2.5 Command syntax

Table 1 MWTSwap command parameters and variables

Command	Parameters and variables
MWTSwap	Frequency, Power Level, and Test Duration
MWTSwap	F <Frequency> (0 to 4000) P <Power Level> (-60 to 0) D <Test Duration> (1 to 240)
Parameters and variables	Description
Frequency	Optional parameter. The frequency in Hz of the tone to be generated. Default is 1004 if not present on the command line.
Power Level	Optional Parameter. The power level (in decibels) of the tone to be generated. Default is 0 dB if not present on the command line.
Test Duration	Optional Parameter. The length of the test in seconds, ranging from 1 to 240 seconds. Default duration is 60 seconds if not specified on the command line.

The following is the command syntax as displayed to the user at the MAP:

```
help mwtswap
MWTSWAP-- MILLIWATT TONESWAP - GEN TONE AND MEASURE LOSS
Parms: [<FREQUENCY> {F <Frequency in Hz> {0 TO 4000}}]
       [<POWER LEVEL> {P <Power in dB> {-60 TO 0}}]
       [<TEST DURATION> {D <Duration in seconds> {1 TO 240}}]
```

Note that each of the command line parameters must be prefaced with the appropriate letter to indicate which option is being specified. For example, to specify a frequency of 1004 Hz, a power level of -6 dB and a duration of 120 seconds the command would be as follows:

```
MWTSWAP F 1004 P -6 D 120
```

It is possible to specify as many or as few options as needed on the command line. The only restriction on the optional parameters is that they must appear in the order specified in the syntax specified above. For example, the following command would be invalid and would generate the error shown:

```
MWTSWAP P -6 F 1004 D 30
USING DEFAULT FREQUENCY (1004 HZ)
EITHER incorrect optional parameter(s) OR too many parameters.
```

This is invalid as the frequency option “F” must be the first command line option if it is to be specified. Once the command interpreter sees the power level option “P” it assumes that the frequency will be the default value of 1004

Hz, and the F option is then treated as being an additional unnecessary parameter on the command line.

If no options are specified on the command line then the command will be executed with all the default values. An example of this is:

```
MWTSwap
USING DEFAULT FREQUENCY (1004 HZ)
USING DEFAULT POWER LEVEL (0 DB)
USING DEFAULT DURATION (60 SECS)
```

19.3.2.6 Qualifications and warnings

As noted above, the frequency is restricted to only 1004 Hz tones in SN09. Even though the frequency can be specified on the command line, any entry other than 1004 Hz will be rejected with an appropriate error message as follows:

```
MWTSWAP F 1005
USING DEFAULT POWER LEVEL (0 DB)
USING DEFAULT DURATION (60 SECS)
Action not supported - invalid frequency entered.
Frequency is currently restricted to 1004 Hz for MWTSWAP command.
```

19.3.2.7 Responses

19.3.2.7.1 Responses

Table 2 MAP outputs with associated meanings and actions

Command MWTSwap
"NOT ALLOWED": Error response **Meaning:** This response informs users that this command is not allowed on the posted trunk. This will occur when the office parameter "EXTERNAL_GATEWAY_TEST_LINES" in table OFCVAR is set to "N" and the MWTSwap command is executed. **System or user actions:** Check the value of the office parameter. If it is "N" then the office is not setup to use third party test equipment that supports the MWTSwap command.
"MWTSwap f 4001 Out of range: <Frequency in Hz> {0 TO 4000} Enter: <Frequency in Hz> [<POWER LEVEL>] [<TEST DURATION>]": Error response **Meaning:** The frequency parameter was entered incorrectly on the command line. **System or user actions:** Ensure that a valid frequency is entered on the command line. The allowable range is "0 to 4000".

Table 2 MAP outputs with associated meanings and actions

Command MWTSwap
“MWTSwap f 1005 USING DEFAULT POWER LEVEL (0 DB) USING DEFAULT DURATION (60 SECS) Action not supported - invalid frequency entered. Frequency is currently restricted to 1004 Hz for MWTSWAP command.”: Error response **Meaning:** The frequency parameter was entered incorrectly on the command line. **System or user actions:** Ensure that a valid frequency is entered on the command line. In SN09 the only allowable frequency value is 1004 Hz even though the rage for the parameter is shown as 0 to 400 Hz.
“MWTSwap p 10 USING DEFAULT FREQUENCY (1004 HZ) Out of range: <Power in dB> {-60 TO 0} Enter: <Power in dB> [<TEST DURATION>]”: Error response **Meaning:** The power level parameter was entered incorrectly on the command line. **System or user actions:** Ensure that a valid power level is entered on the command line. The valid range for power level is between -60 and 0 dB in steps of 1 dB.
“MWTSwap d 250 Wrong type: <Power in dB> {-60 TO 0} Enter: <Power in dB> [<TEST DURATION>]”: Error response **Meaning:** The test duration parameter was entered incorrectly on the command line. **System or user actions:** Ensure that a valid test duration is entered on the command line. The valid range for test duration is between 1 and 240 seconds.
“POST A CIRCUIT AND TRY AGAIN”: Error response **Meaning:** The command was entered without a trunk circuit posted at the MAP. **System or user actions:** Ensure that a trunk circuit is posted at the MAP and re-execute the command.
“TESTTRKANN OOS”: Error response **Meaning:** The command was entered while the test trunk announcements are out of service.. **System or user actions:** Post the test trunk announcements at the MAP and take any corrective action required to bring the announcements to an IDL state.

Table 2 MAP outputs with associated meanings and actions

Command MWTSwap
"TEST COMPLETE": Valid response **Meaning:** The test has completed successfully with no errors. **System or user actions:** None.

19.3.2.8 Example

Table 3 Usage examples for MWTSwap command

Description of task:	Generate a 1004 Hz tone at 0 dB for 60 seconds and measure loss on a trunk circuit
Command: MAP response:	Example: MWTSwap Example: USING DEFAULT FREQUENCY (1004 HZ) USING DEFAULT POWER LEVEL (0 DB) USING DEFAULT DURATION (60 SECS) TEST COMPLETE
Description of task:	Generate a 1004 Hz tone at -6 dB for 60 seconds and measure loss on a trunk circuit
Command: MAP response:	Example: MWTSwap P -6 Example: USING DEFAULT FREQUENCY (1004 HZ) USING DEFAULT DURATION (60 SECS) TEST COMPLETE
Description of task:	Generate a 1004 Hz tone at 0 dB for 120 seconds and measure loss on a trunk circuit
Command: MAP response:	Example: MWTSwap D 120 Example: USING DEFAULT FREQUENCY (1004 HZ) USING DEFAULT POWER LEVEL (0 DB) TEST COMPLETE
Description of task:	Generate a 1004 Hz tone at -20 dB for 240 seconds and measure loss on a trunk circuit
Command: MAP response:	Example: MWTSwap P -20 D 240 Example: USING DEFAULT FREQUENCY (1004 HZ) TEST COMPLETE

20: Configuration (CN): A00009207

20.1 Feature Name

DPT Trunk Testing Support

20.2 Hardware and Software Requirements

This activity requires the following:

- SOC option BAS00050 56Kb/sTrk Tst prt must be turned on
- This activity provides interface support for a new Port Identification Number in the Digital ROTL maintenance dial plan. A third party test head is required to use this interface to perform testing on DPT terminals. An example test head is the SAGE Instruments 945RTS test unit.

20.3 Initial Configuration

- SOC option activation
- Third party test head initialization

20.4 Office/Subnet parameters (OP/SP) (CM & SESM)

20.4.1 New/modified office/subnet parameters

Table 1 New or modified parameter

Parm table	Parameter name	NEW/ CHANGED/ DELETED/ RELOCATED	Domain (CM or Subnet Management
OFCVAR	DPT_BICC_TEST_NODE	NEW	CM

20.4.2 Parameter information

20.4.2.1 DPT_BICC_TEST_NODE

DPT_BICC_TEST_NODE

20.4.2.1.1 Functional description

This parameter identifies the node to which incoming DPT test calls are moved to

The purpose of this feature is to provide an interface to third party test heads to permit testing of Dynamic Packet Trunks(DPT), if that DPT is hosted by a SPM or MG4K. This interface allows the user to generate a test call over a

desired DPT terminal to a remote switch. Since an incoming DPT call can be terminated on any available DPT node, provisioning of this parameter provides the node information to allow the test call to be terminated to a specified peripheral. This permits the customer to have a known path when conducting a test.

20.4.2.1.2 Provisioning rules

When an incoming DPT call is flagged as a test call from the data in the ISUP IAM message, if the user would like to specify which DPT node they would like to route call to, they can provision this information in this new parameter. The parameter accepts a node type and a node number. Currently, the node type will be limited to SPM and only for an SPM node type that supports DPT terminals.

20.4.2.1.3 Range information

Table 2 Range Information

Minimum	Maximum	Default

20.4.2.1.4 Activation

Enter a PMTYPE type of SPM and a valid node number within the range 0 to 85. If that SPM node exists and supports DPT terminals, then the parameter will be activated. The activation of this office parameter is immediate.

20.4.2.1.5 Dependencies

None.

20.4.2.1.6 Consequences

If the user enters an valid SPM node number but the SPM does not support DPT terminals, the following response will be provided:

‘This node does not have DPT terminals allocated.’

If the user enters a node number out of range, the following response will be provided:

‘Not a valid SPM number.’

20.4.2.1.7 Verification

A DPT group hosted by the SPM node provisioned in the office parameter can be posted at the DPTTRKS level and incoming DPT test calls will show active terminals.

20.4.2.1.8 Memory requirements

No memory impact.

20.4.2.1.9 Parameter release history update

Parameter DPT_BICC_TEST_NODE is new in this release.

20.5 Upgrade Considerations

20.5.1 Dump and Restore (CM)

No impact.

20.5.2 Element Management Upgrade

No impact.

20.5.3 Downgrade impact

No impact.

21: Configuration (CN): A00009218

21.1 Feature Name

MG9K Data Audit Robustness

21.2 Hardware and Software Requirements

This functionality is for MG9000 EM that has SN09 or higher software version.

21.3 Initial Configuration

No changes to the initial configuration.

21.4 Upgrade Impact

21.4.1 Dump and Restore

21.5 Element Management

21.5.1 GUI information

Table 1 New or modified GUIs

GUI name	New, Changed or Deleted
Audit View	Changed
Create Audit View	Deleted
Select VMG frame	New

21.5.1.1 Audit View -- Functional description

In release SN09, the Audit GUI gives the user the ability to run an audit at any time even though a scheduled audit exists for the particular NE. In previous releases the user had to delete an existing scheduled audit in order to run an immediate audit. Additionally, for immediate audits users have the option to specify which sub-system (or VMG) to run the audit on. For example the user might choose to audit just the line circuits in the system, or just a single problem VMG.

21.5.1.2 Audit view - GUI usage and implications

The “Add” and “Remove” buttons no longer exist in the gui. From MG9kEMS software UE9000 MG Element Manager View when the audit view is selected, a list of NEs in the subnet is shown in the NE list. This shows only those NEs that are discovered (and are thus auditable). The user chooses an NE of interest and schedules the audit directly in the properties panel. Two tabs exist, one for scheduled audits, and another for immediate ones.

21.5.1.3 Audit view - GUI size

Not Applicable

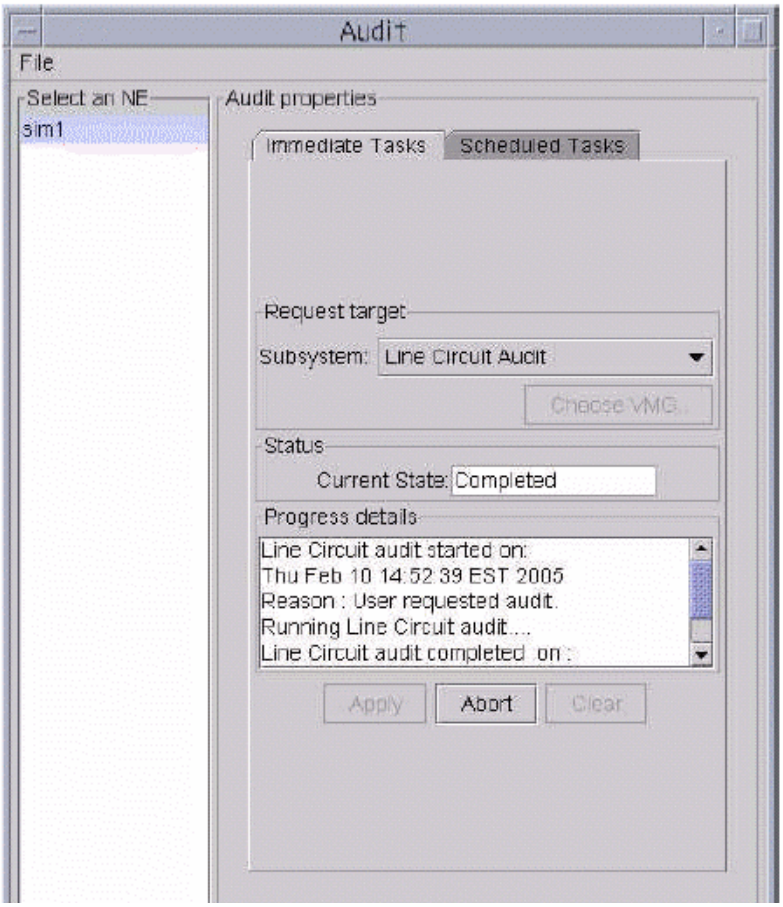
21.5.1.4 Audit view - GUI fields

Subsystem: A drop down menu for selecting a type of audit to run.

21.5.1.5 Audit view - Usage example 1

The following example shows a user selecting and running line circuit audit:

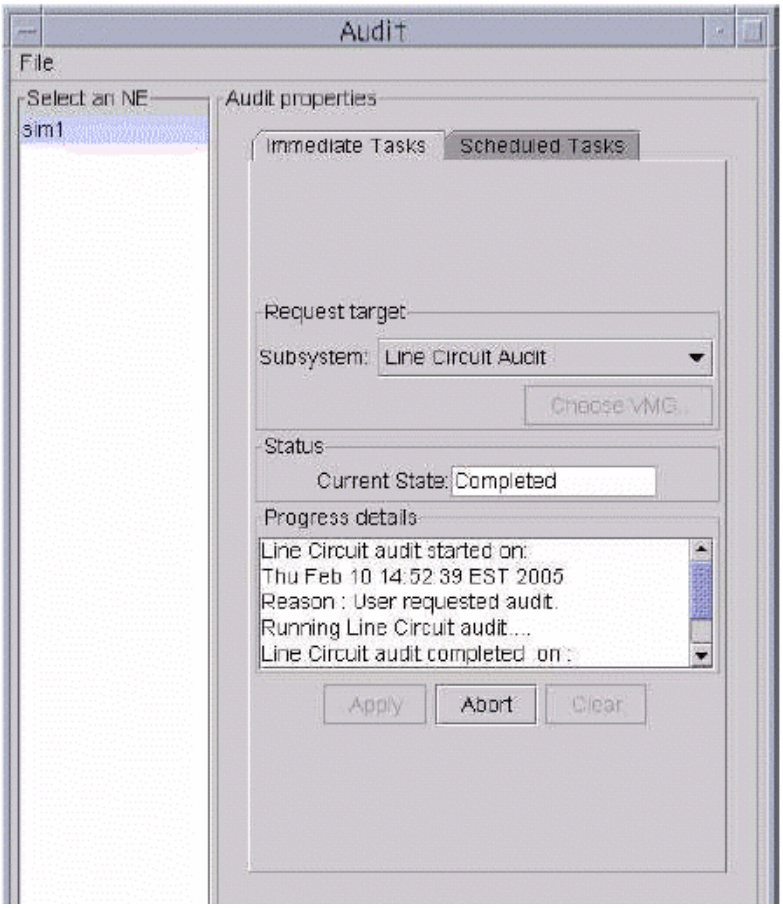
Figure 1 Running an immediate audit



21.5.1.6 Audit view - Usage example 2

The following example shows a user selecting to run a single VMG audit. The user has selected “VMG” from the subsystem drop down menu and clicked on the “Choose VMG” button. Clicking on the “Apply” button on the VMG selection frame will start an audit on the VMG named SLOA011-0-0:

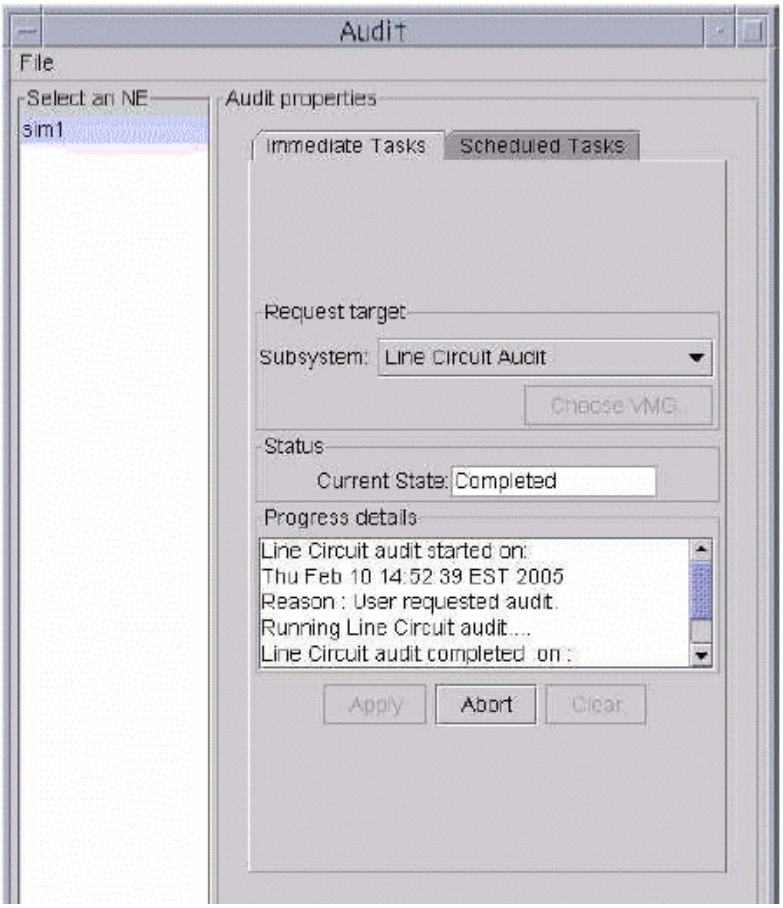
Figure 2 Running a VMG audit



21.5.1.7 Audit view - Usage example 3

The following example shows a user scheduling an audit to run in the future. This audit will run starting at 3:00PM on every Tuesday and Friday of the week, until it is aborted:

Figure 3 Scheduling an audit



22: Configuration (CN): A00009227

22.1 Feature Name

NPM Robustness

22.2 Hardware and Software Requirements

This feature requires an SN09 Network Patch Manager (NPM) and the SN09 SSPFS platform.

22.3 Network Patch Manager Server CLUI

22.3.1 CLUI Interface

The NPM CLUI has been modified to accept patchids and set names in lower case, upper case or a combination of thereof. In addition, several of the NPM CLUI commands have been changed to ensure command naming consistency for commands that provide similar types of functions. Below is a table that maps the old CLUI command to the new command.

Table 1:

Old Command	New Command
getassign	viewassign
ltabs	viewtabs or vtabs
qtask	viewtask or vt
qreps	viewreport all or vr all
qsets	viewset all or vs all
getplan	viewplan or vplan
alarminfo	viewalarm or va
display	viewpatch or vp
addalarm	newalarm or na
newset REPORT	newreport
newset SET	newset

Table 1:

Old Command	New Command
alarm	enablealarm (for the enable portion) disablealarm (for the disable portion) delalarm (for the delete portion) alarmmatches (for the match portion)
sched	modifyplan
updplan	updsched
query	runreport or rr (for executing a report) runset or rs (for executing a set)
getversion	viewversion
getprop	viewprop

In addition a new command: alarmshow has been added. The complete syntax of the new command and well as the changed commands is shown below:

22.3.1.1 The ALARMSHOW Command

The NPM command **alarmshow** is used to toggle the display of alarms as they are raised or cleared. The following syntax is used:

npm ‘alarmshow <ON/OFF>’

where:

npm	is the executable.
alarmshow	is the NPM command.
<ON|OFF>	is the switch to indicate whether to display alarms or not. ON indicates that as alarms are raised or cleared the message will be displayed at the CLUI. OFF indicates that the alarms will not be displayed.

22.3.1.2 The VIEWASSIGN Command

The NPM command **viewassign** is used to view the assign fields applicable for the assign command. The following syntax is used:

npm ‘viewassign’

where:

npm	is the executable.
viewassign	is the NPM command.

22.3.1.3 The VIEWTABS Command

The NPM command **viewtabs** is used to list all reportable tables and field names. The following syntax is used:

npm ‘viewtabs’

where:

npm	is the executable.
viewtabs	is the NPM command.

22.3.1.4 The VIEWTASK Command

The NPM command **viewtask** is used to display the specified task or all defined tasks. The following syntax is used:

npm ‘viewtask <taskname | all>’

where:

npm	is the executable.
viewtask	is the NPM command.
<taskname>	is the name of a specific task to be displayed.
<for all>	will display all tasks.

22.3.1.5 The VIEWREPORT Command

The NPM command **viewreport** is used to display the specified report or all defined reports in the database. The following syntax is used:

npm ‘viewreport <reportname | all>’

where:

npm	is the executable.
viewreport	is the NPM command.
<reportname>	is the name of a specific report to be displayed.
<for all>	will display all reports.

22.3.1.6 The VIEWSET Command

The NPM command **viewset** is used to view the specified set or all defined sets in the database. The following syntax is used:

npm ‘viewset <setname | all>’

where:

npm	is the executable.
viewset	is the NPM command.
<setname>	is the name of a specific set to be displayed.
<for all>	will display all sets.

22.3.1.7 The VIEWPLAN Command

The NPM command **viewplan** is used to view the specified plan or all defined plans in the database. The following syntax is used:

npm 'viewplan <setname | all>'

where:

npm	is the executable.
viewplan	is the NPM command.
<setname>	is the name of a specific plan to be displayed.
<for all>	will display all plans.

22.3.1.8 The VIEWALARM Command

The NPM command **viewalarm** is used to view the specified alarm or all defined alarms in the database. The following syntax is used:

npm 'viewalarm <setname | all>'

where:

npm	is the executable.
viewalarm	is the NPM command.
<setname>	is the name of a specific alarm to be displayed.
<for all>	will display all alarms.

22.3.1.9 The VIEWPATCH Command

The NPM command **viewpatch** is used to view the administrative information associated with a patch. The following syntax is used:

npm 'viewpatch <patchid>'

where:

npm	is the executable.
viewpatch	is the NPM command.
<patchid>	is the patchid to be displayed.

22.3.1.10 The NEWALARM Command

The NPM command **newalarm** is used to define a new alarmable condition. The following syntax is used:

npm ‘newalarm <name> <enable> <alarm> <patchinfo> <“Desc”>’

where:

npm	is the executable.
newalarm	is the NPM command.
<name>	is the name of the alarm being defined.
<enable>	indicates whether to enable (Y) or disable (N) the alarm.
<alarm>	is the severity level of the alarm. Valid values are “NONE”, “MINOR”, “MAJOR”, or “CRITICAL”.
<patchinfo>	is SQL criteria that defines the alarm and should be in the form "PATCH|DEVICE where [criteria]".
<“Desc”>	is a brief description of the alarm.

22.3.1.11 The NEWREPORT Command

The NPM command **newreport** is used to create a report. The following syntax is used:

npm ‘newreport <reportname> <“Description”> <“field1... fieldn [where <Criteria>]”>’

where:

npm	is the executable.
newreport	is the NPM command.
<reportname>	is the name of the report to be created.
<“Description”>	is a short description of the report.
<field1...fieldn	is the name of one or more fields to be included in the report.
where	keyword starting SQL statement
<Criteria>	is the SQL statement that identifies the criteria by which to search the NPM database.

22.3.1.12 The NEWSET Command

The NPM command **newset** is used to create a set definition. The following syntax is used:

npm ‘newset <type> <setname> <“Description”> <[“where <Criteria>”]>’

where:

npm	is the executable.
newset	is the NPM command.
<type>	is either PATCHSET (to create a set that will evaluate patches) or DEVICESET (to create a set that will evaluate devices).
<setname>	is the name of the set to be created.
<“Description”>	is a short description of the report.
where	keyword starting SQL statement
<Criteria>	is the SQL statement that identifies the criteria by which to search the NPM database.

22.3.1.13 The ENABLEALARM Command

The NPM command **enablealarm** is used to enable the specified alarm. The following syntax is used:

npm ‘enablealarm <alarmname>’

where:

npm	is the executable.
enablealarm	is the NPM command.
<alarmname>	is the name of the alarm.

22.3.1.14 The DISABLEALARM Command

The NPM command **disablealarm** is used to disable the specified alarm. The following syntax is used:

npm ‘enablealarm <alarmname>’

where:

npm	is the executable.
disablealarm	is the NPM command.
<alarmname>	is the name of the alarm.

22.3.1.15 The DELALARM Command

The NPM command **delalarm** is used to delete the specified alarm. Only user created alarms can be deleted. The following syntax is used:

npm ‘delalarm <alarmname>’

where:

npm	is the executable.
delalarm	is the NPM command.
<alarmname>	is the name of the alarm to be deleted.

22.3.1.16 The ALARMMATCHES Command

The NPM **alarmmatches** command is used to list either the patches or devices that caused the specified alarm to be raised. The following syntax is used:

npm ‘alarmmatches <alarmname>’

where:

npm	is the executable.
alarmmatches	is the NPM command.
<alarmname>	is the name of the alarm.

22.3.1.17 The MODIFYPLAN Command

The NPM command **modifyplan** is used to modify the scheduled activities of a plan. The modifyplan command may be used to add a specified task or report to a plan or delete a specified task or report from a plan.

Note: The order in which tasks and reports are added to a plan determines the order in which their execution will be requested.

: The following syntax is used

npm ‘modifyplan <plan name> <TASK|REPORT> <Task|Report name> <ADD|DELETE>’

where:

npm	is the executable.
modifyplan	is the NPM command.
<plan name>	is the name of the plan to be modified
<TASK|REPORT>	indicates whether the item being added to or deleted from the given plan is a task or a report.
<Task|Report name>	is the name of the task or report being added to or deleted from the given plan.

	Note: Prompted reports should not be added to plans. At execution time, prompted reports require a user to supply additional input. Plans run without a user being present and cannot provide the required information. The predefined prompted reports include: DEVICE, PATCH, PATCHES_SINCE, and PATCHINFO. Do not add any of these reports or any user defined prompted reports to any plans.
<ADD|DELTE>	indicates whether the specified task or report is to be added to or deleted from the given plan.

22.3.1.18 The UPDSCHED Command

The NPM command **updsched** is used to update the plan schedule in the database. The following syntax is used:

npm ‘updsched <plan name> <freq> <Date Time> <MaxTime> <“Desc”>’

where:

npm	is the executable.
updsched	is the NPM command.
<plan name>	is the name of the plan to be updated
<freq>	is how often the plan should execute. Valid values are “Once”, “Hourly”, “Daily”, “Weekly”, or “Monthly”.
<Date Time>	is the date and time plan is to be executed. Should be in “mm-dd-yy hh:mm” format.
<MaxTime>	is Maximum amount of time to execute plan defined as {No_Limit,15_min, 30_min, 1_Hr, 2_Hr, 4_Hr, 8_Hr, 16_Hr}.
<“Desc”>	is a brief description surrounded by quotes.

22.3.1.19 The RUNREPORT Command

The NPM command **runreport** is used to execute the specified report and display the results. The following syntax is used:

npm ‘runreport <reportname>’

where:

npm	is the executable.

runreport	is the NPM command. “rr”or “q” can be used as a shortcut for “runreport”.
<reportname>	is the name of the report to be executed.

22.3.1.20 The RUNSET Command

The NPM command **runrset** is used to execute the specified set and display the results. The following syntax is used:

npm ‘runset <setname>’

where:

npm	is the executable.
runset	is the NPM command. “rs” or “q” can be used as a shortcut for “runset”.
<setname>	is the name of the set to be executed.

22.3.1.21 The VIEWVERSION Command

The NPM command **viewversion** is used to view the version of the NPM software and database components. The following syntax is used:

npm ‘viewversion’

where:

npm	is the executable.
viewversion	is the NPM command.

22.3.1.22 The VIEWPROP Option

The NPM option **viewprop** is used to list the property value for a specified key or all keys. The following syntax is used:

npm ‘getprop <property_type>’

where:

npm	is the executable.
getprop	is the NPM option.
<property_type>	can be a specific key, or “all” to display all keys.

22.4 Network Patch Manager Reports

Six new system defined reports will be added to the NPM as a result of this feature. NPM CLUI examples follow of the reports to show what fields are in each report.

- DEVICEINFO - lists the devices in the office, the date the devices registered, the loadname in the device and the date the load was discovered in the device.

```
npm>q DEVICEINFO
deviceid,registered,hold,devicebornon,loadname,loaddiscoveredon
NC0S8_1_OC3_0_1_10,TRUE,FALSE,2005-03-17 12:05:12.397,SCOA09AH,2005-03-17 12:
05:57.994
NC0S8_1_OC3_0_1_11,TRUE,FALSE,2005-03-17 12:05:12.417,mdw,2005-03-17 12:05:59.804
NC0S8_1_ITP_0_1_12,TRUE,FALSE,2005-03-17 12:05:12.442,ITPA09AF,2005-03-17 12:
06:00.782
MG9KSERVER_09_wnc0s0mh,TRUE,FALSE,2005-03-17 12:04:20.897,NTMG9KS_9_11_0,2005
```

- LASTAPPLYACTION - A list of the patch, device, status and description of why the apply attempt failed for this patch device relationship.

```
npm>q LASTAPPLYACTION
patchid,deviceid,status,lastactionresults
```

- PFRSSETTINGS - Lists the PFRS Dropbox, PFRS userid and status of if the delete patches is turned on.

```
npm>q PFRSSETTINGS
ftpAddress,ftpUserid,deletePatches
wnc0s0kf,FIELD,FALSE
```

- SYSTEMPLANSETTINGS - Lists all the system plans in the office along with the tasks, enable status, and schedule for each plan.

```
npm>q SYSTEMPLANSETTINGS
name,enabled,status,frequency,extime,maxtime,description,tasks,systemDefined
SYSTEMPLAN,N,IDLE,Daily,2004-01-01 00:00:00.000,No_Limit,NPM System scheduled
 routine activities,[TASK:AUTOAPPLY, TASK:AUTORESTART],TRUE

```

- OFFICEINFOSETTINGS - Lists office information. Currently, only the GWC Auto imaging enabled setting is available in this report.

```
npm>q OFFICEINFO
gwcautoimage
Y
```

- GWCLOADIMAGEREPORT - Lists the imaged load, the patches contained in the load, the time the image was taken and a list of patches available in the office that are not contained in the image.

```
npm>q GWCLOADIMAGEREPORT
loadname,imagedtime,imagedpatchlist,missingpatches
GN090AP,2005-03-17 12:15:31.316,[None],[GWC01GAP, GWC02GAP]
```

All of these reports will be included in the inform report that is generated via the PFRSGENREPORT task in the NPM. The following is an example inform report.

23: Configuration (CN): A00009235

23.1 Feature Name

TLS for SIP

23.2 Hardware and Software Requirements

Nothing required outside of the normal SN09 software load on the appropriate hardware platform.

23.3 Initial Configuration

SN09

23.4 Office/Subnet parameters (OP/SP) (CM & SESM)

Not Applicable.

23.5 Upgrade Considerations

If a Session Server is to be placed in a Packet Cable environment, extra steps will be required after the upgrade is complete.

From 07 to 09 upgrade in the case of CA-signed certificate, the customer must execute the procedure “Prepare to validate” which is run on the 07 in order to ensure that cert_mgnt in 09 will be successful if the customer is importing a CA-signed certificate from 07 to 09. This is documented in the NTP. If the certificates are nearing expiry during the upgrade or shortly after the upgrade, the customer is recommended to replace the certificates prior to upgrade in order to avoid downtime once the system is running the 09 load.

From 07 to 09 upgrade in the case of self-signed certificates, the customer will have to generate new certificates.

From 08 to 09 upgrade, running cert_mgnt is not required. If the certificates are nearing expiry during the upgrade or shortly after the upgrade, the customer is recommended to replace the certificates prior to upgrade in order to avoid downtime once the system is running the 09 load.

23.5.1 Dump and Restore (CM)

None.

23.5.2 Element Management Upgrade

None.

23.5.3 Downgrade impact

None.

23.6 Data schema (DS) (CM, MIBS, RDB)

Not applicable.

23.7 Service Orders (SO) (CM & SESM)

Not Applicable.

23.8 Software optionality control (SOC)

Not Applicable.

23.9 Element Management

23.9.1 New/modified GUIs

Table 1 New or modified GUIs

GUI name	NEW, CHANGED, or DELETED
CS2000 Session Server Tomcat Web Server	Changed

23.9.2 GUI information

23.9.2.1 GUI name: Session Server Tomcat Web Server

This GUI is a CS2000 Session Server-specific management tool.

The changes made to this GUI consist of:

- Additions to the Security configuration parameters web page with new parameters
- Modification of an existing parameter to the security configuration parameters web page.

23.9.2.1.1 Functional description

Changes to the CS2000 Session Server Tomcat Web Server GUI are as follows:

CS2000 Session Server Tomcat Web server security configuration parameters:

Ciphers. This field existed in SN08 and is modified to include new ciphers:

- TLSAllowedCipherSuites

Alarm threshold provisioning. These fields are new:

- AlarmThresholdDroppedConnections - Dropped connections alarm per loop time of 60 seconds
- AlarmThresholdAuthenticationFailure - Certificate Authentication failure alarm - per loop time of 60 seconds
- AlarmThresholdCertExpiryDays - Local certificate expiry alarm in days
- AlarmThresholdLocalCertificatePolicy - remote certificate policy failure alarm per loop time of 60 seconds
- AlarmMinimumDisplayTimeMinutes - Minimum time an alarm should be raised

Secretary options. This field is new:

- ExitOnFailTLSInitialization - Exit application if TLS fails to initialize

Certificate Policy options. These fields are new:

- RequireLocalCertificatePolicy
- RequireauthorityKeyIdentifier
- RequirebasicConstraints
- RequireextKeyUsage
- RequireissuerAltName
- RequirekeyUsage
- RequireprivateKeyUsagePeriod
- RequiresubjectAltName
- RequiresubjectKeyIdentifier

Additions for throttling are:

- ThrottleBurstDurationinSecs
- ThrottleBurstEventThreshold
- ThrottleEnabled
- ThrottleSustainedDurationinSecs
- ThrottleSustainedEventThreshold

Other parameters that are new in SN09 are:

- TlsEnabled

Other parameters that are changed from SN08 to SN09:

- MaxTLSSessions
- SessionCachingEnabled
- SessionCacheSize
- SessionCacheValidDuration

23.9.2.1.2 GUI usage and implications

The purpose of the new configuration parameters is to provide new functionality as well as increased robustness to the security component of the CS2000 Session Server.

23.9.2.1.3 GUI size

Table 2 New or modified GUIs

Abbreviated GUI name	Minimum instances	Maximum instances	Information on memory
GUI			Not applicable

23.9.2.1.4 GUI fields

The following table lists fields for the CS2000 Session Server Tomcat Web server Security Parameters GUI that have been added or changed.

Table 3 Security Parameters in Tomcat Web Server

Parameter	AlarmThresholdDroppedConnections	Type	Integer
Description	Number of dropped connections - Minor/Major/Critical alarm threshold value within 60 seconds. Related to SIPS600 log and applies to SIPS300 alarm. Note: 0 < Minor threshold < Major Threshold < Critical Threshold < 32767 The value is applied immediately.	Default Value	Minor - 10 Major - 50 Critical - 100
Effect of Change	Changes the threshold for activating alarm for dropped connections in CS2000 Session Server	New or Changed	New
Adverse Effects			
Countering Adverse Effects			

Table 3 Security Parameters in Tomcat Web Server

Parameter	**AlarmThresholdAuthentica-tionFailure**	Type	Integer
Description	Number of certificate authentication failures - Minor Threshold. Related to SIPS 601 log and applies to SIPS301 alarm. Note: 0 < Minor threshold < Major Threshold < Critical Threshold < 32767 The value is applied immediately.	Default Value	Minor - 1 Major - 2 Critical - 5
Effect of Change	Changes the threshold for activating alarm for certificate authentication failures in CS2000 Session Server	New or Changed	New
Adverse Effects			
Countering Adverse Effects			

Table 3 Security Parameters in Tomcat Web Server

Parameter	**AlarmThresholdCertExpiry-Days**	Type	Integer
Description	Number of days until the local certificate expires. Applies to the SIPS302 alarm. Note: Modifying/replacing the local certificate requires a restart of the web services and the SIP application. Note: The SIPS604 log indicates the time and date from when and until when the local certificate is active. Note: This alarm remains raised until the event is no longer observed. Note: 32767 > Critical threshold > Major Threshold > Minor Threshold > 0 The value is applied immedi-ately.	Default Value	Minor - 31 days Major - 15 days Critical - 5 days
Effect of Change	Changes the threshold for acti-vating alarm for local certificate expiry in CS2000 Session Server	New or Changed	New
Adverse Effects			
Counter-ing Adverse Effects			

Table 3 Security Parameters in Tomcat Web Server

Parameter	**AlarmThresholdLocalCertificatePolicy**	Type	Integer
Description	Number of certificate policy violations in 60 seconds. Related to the SIPS608 log and applies to the SIPS308 alarm. Note: 0 < Minor threshold < Major Threshold < Critical Threshold < 32767 The value is applied immediately.	Default Value	Minor - 1 Major - 2 Critical - 5
Effect of Change	Changes the threshold for activating alarm for certificate policy violations.	New or Changed	New
Adverse Effects			
Countering Adverse Effects			

Table 3 Security Parameters in Tomcat Web Server

Parameter	**AlarmMinimumDisplay-TimeMinutes**	Type	Integer
Description	The following alarms will remain raised when the event persists. This value indicates the number of minutes that the following alarms should remain raised when the event is no longer continuously observed. AlarmThresholdLocalCertificatePolicy AlarmThresholdAuthenticationFailure AlarmThresholdDroppedConnections The value is applied immediately.	Default Value	60 minutes Minimum value: 1 minute Maximum value: 32767 minutes
Effect of Change		New or Changed	New
Adverse Effects			
Countering Adverse Effects			

Table 3 Security Parameters in Tomcat Web Server

Parameter	**ExitOnFailTLSInitialization**	Type	Boolean
Description	1) If the key file or certificate file is not present or corrupted, or 2) if the system is running out of memory and having trouble initializing TLS or 3) the certificate does not match the local policy, or 4) the key/certificate do not match, then this value indicates whether to exit the application or continue with the application initialization and attempt to service calls while the issue is resolved. Default is to exit the application because it may indicate issues with system memory or key/certificate files. Because the same key/certificate files are used to run the EM web servers, the recommended value for this parameters is Y. If the value is changed to 'N' (to allow application initialization), then TlsEnabled can be used to initialize TLS. This value is applied only on application restart.	Default Value	Y Recommended Value: Y
Effect of Change		new or changed	New
Adverse Effects			
Countering Adverse Effects			

Table 3 Security Parameters in Tomcat Web Server

Parameter	**RequireLocalCertificatePolicy**	Type	Boolean
Description	This parameter enables certificate policy checking. For Packet Cable conformance, this must be set to Y. The value is applied immediately.	Default Value	N
Effect of Change		New or Changed	New
Adverse Effects			
Countering Adverse Effects			

Table 3 Security Parameters in Tomcat Web Server

Parameter	**RequireauthorityKeyIdentifier**	Type	Boolean
Description	This value ensures whether the authority key identifier is present in the X.509 version 3 certificate extensions. For Packet Cable conformance, this must be set to Y. This value is applied immediately and requires RequireLocalCertificatePolicy to be set to “Y” to have effect.	Default value	N
Effect of Change		New or Changed	New
Adverse Effects			
Countering Adverse Effects			

Table 3 Security Parameters in Tomcat Web Server

Parameter	**RequirebasicConstraints**	Type	Boolean
Description	This value ensures whether the basic constraints is present in the X.509 version 3 certificate extensions. This value is applied immediately and requires RequireLocalCertificatePolicy to be set to “Y” to have effect.	Default Value	N
Effect of Change		New or Changed	New
Adverse Effects			
Countering Adverse Effects			

Table 3 Security Parameters in Tomcat Web Server

Parameter	**RequireextKeyUsage**	Type	Checklist
Description	This value ensures whether the individual key usage settings are present in the X.509 version 3 certificate extensions. Possible values are none of the following, or any combination of the following: serverAuth clientAuth codeSigning emailProtection timeStamping OCSPSigning For Packet Cable conformance, this must be set to (serverAuth and clientAuth). This value is applied immediately and requires RequireLocalCertificatePolicy to be set to “Y” to have effect.	Default Value	Empty set, See description.
Effect of Change		New or Changed	New
Adverse Effects			
Countering Adverse Effects			

Table 3 Security Parameters in Tomcat Web Server

Parameter	**RequireissuerAltName**	Type	Boolean
Description	This value ensures whether the issuer alternative name is present in the X.509 version 3 certificate extensions. This value is applied immediately and requires RequireLocalCertificatePolicy to be set to “Y” to have effect.	Default Value	N
Effect of Change		New or Changed	New
Adverse Effects			
Countering Adverse Effects			

Table 3 Security Parameters in Tomcat Web Server

Parameter	**RequirekeyUsage**	Type	Checklist
Description	This value ensures whether the key usage settings is present in the X.509 version 3 certificate extensions. Possible values are none of the following, or any combination of the following: digitalSignature nonRepudiation keyEncipherment dataEncipherment keyAgreement keyCertSign cRLSign encipherOnly decipherOnly For Packet Cable conformance, this must be set to (digitalSignature and keyEncipherment). This value is applied immediately and requires RequireLocalCertificatePolicy to be set to “Y” to have effect.	Default Value	Empty Set, see description
Effect of Change		New or Changed	New
Adverse Effects			
Countering Adverse Effects			

Table 3 Security Parameters in Tomcat Web Server

Parameter	**RequireprivateKeyUsagePeriod**	Type	Boolean
Description	This value ensures whether the private key usage field is present in the X.509 version 3 certificate extensions. This value is applied immediately and requires RequireLocalCertificatePolicy to be set to “Y” to have effect.	Default Value	N
Effect of Change		New or Changed	New
Adverse Effects			
Countering Adverse Effects			

Table 3 Security Parameters in Tomcat Web Server

Parameter	**RequiresubjectAltName**	Type	Boolean
Description	This value ensures whether the subject alternative name is present in the X.509 version 3 certificate extensions. This value is applied immediately and requires RequireLocalCertificatePolicy to be set to “Y” to have effect.	Default Value	N
Effect of Change		New or Changed	New
Adverse Effects			
Countering Adverse Effects			

Parameter	**RequiresubjectKeyIdentifier**	Type	Boolean
Description	This value ensures whether the subject key identifier is present in the X.509 version 3 certificate extensions. This value is applied immediately and requires RequireLocalCertificatePolicy to be set to “Y” to have effect.	Default Value	N
Effect of Change		New or Changed	New
Adverse Effects			
Countering Adverse Effects			

Table 3 Security Parameters in Tomcat Web Server

Parameter	**ThrottleBurstDurationinSecs**	Type	Integer
Description	The maximum number of TLS connections represented by ThrottleBurstEventThreshold that can be serviced in Throttle-BurstDurationinSecs seconds. ThrottleBurstDurationinSecs is recommended to be ThrottleSustainedDurationinSecs divided by 5. This value is applied immediately and requires ThrottleEnabled to be set to “Y” to have effect.	Default Value	1 Minimum 1 Maximum 10
Effect of Change		New or Changed	New
Adverse Effects			
Countering Adverse Effects			

Table 3 Security Parameters in Tomcat Web Server

Parameter	**ThrottleBurstEventThreshold**	Type	Integer
Description	The maximum of number of TLS connections that can be serviced in ThrottleBurstDurationinSecs seconds. Recommended value 30 This value is applied immediately and requires ThrottleEnabled to be set to “Y” to have effect.	Default Value	30
Effect of Change		New or Changed	New
Adverse Effects			
Countering Adverse Effects			

Parameter	**ThrottleEnabled**	Type	Boolean
Description	Enables or disables TLS connection throttling Recommended value Y.	Default Value	Y
Effect of Change		New or Changes	New
Adverse Effects			
Countering Adverse Effects			

Table 3 Security Parameters in Tomcat Web Server

Parameter	**ThrottleSustainedDurationin-Secs**	Type	Integer
Description	The maximum number of TLS connections represented by ThrottleSustainedEventThresh-old that can be serviced in Throt-tleSustainedDurationinSecs seconds. ThrottleSustainedDurationin-Secs is recommended to be ThrottleBurstDurationinSecs multiplied by 5. This value is applied immedi-ately and requires ThrottleEn-abled to be set to “Y” to have effect.	Default Value	5
Effect of Change		New or Changed	New
Adverse Effects			
Counter-ing Adverse Effects			

Table 3 Security Parameters in Tomcat Web Server

Parameter	**ThrottleSustainedEvent-Threshold**	Type	Integer
Description	The maximum of number of TLS connections that can be serviced in ThrottleSustainedDurationin-Secsseconds. Recommended value 100 This value is applied immediately and requires ThrottleEnabled to be set to “Y” to have effect.	Default Value	100
Effect of Change		New or Changed	New
Adverse Effects			
Countering Adverse Effects			

Table 3 Security Parameters in Tomcat Web Server

Parameter	**TlsEnabled**	Type	Boolean
Description	By default, TlsEnabled is “Y”. If the value is “Y” is cannot be modified. TlsEnabled is “N” in the following case: If ExitOnFailTLSInitialization is set to “N” and TLS fails to initialize. In that case, this boolean can be used to initialize TLS once the issue is resolved.	Default Value	Y
Effect of Change	The value cannot be changed if it is already set to Y. Changing this value from N to Y restarts TLS initialization. The key file and certificate file must be present in order for TLS initialization to be successful. Once successful, look for the SIPS 605 log. If memory allocation for TLS or the SIP application fails, then the SIP application will terminate.	New of Changed	New
Adverse Effects			
Countering Adverse Effects			

Table 3 Security Parameters in Tomcat Web Server

Parameter	**MaxTLSSessions**	Type	Integer
Description	The maximum number of TLS Sessions allowed. The default value is set to 256, maximum of 400.	Default value	Default 256, Minimum 10 Maximum 400.
Effect of Change	This is the maximum number of simultaneous TLS connections on the active unit.	New or Changed	Changed maximum value from SN08 to SN09.
Adverse Effects			
Counter-ing Adverse Effects			

Table 4 Cipher Suites

Parameter	**TLSAllowedCipherSuites**	Type	Checklist
Description	The cryptographic ciphers that are supported in the TLS connection. The value is applied immediately. AES128-SHA is the minimum. Any combination of the following is also allowed: AES256-SHA DHE-RSA-AES128-SHA DHE-RSA-AES256-SHA EDH-RSA-DES-CBC3-SHA DES-CBC3-SHA	Default Value	AES128-SHA at a minimum. See description.
Effect of Change	Selecting ciphers other than AES may cause performance degradation.	New or Changed	Changed from SN08
Adverse Effects			
Countering Adverse Effects			

All ciphers listed here support private key sizes of 1024, 1536, and 2048 bits, RSA authentication, and SHA (Secure Hash Algorith) as the HMAC (hashed message authentication code).

Cipher Name: TLS_RSA_WITH_AES_128_CBC_SHA
Short Name: AES128-SHA
Key Agreement: RSA
RSA/DSA Authentication: RSA
Encryption: AES_CBC, 128 bits

Cipher Name: TLS_RSA_WITH_AES_256_CBC_SHA
Short Name: AES256-SHA
Key Agreement: RSA
Encryption: AES_CBC, 256 bits

Cipher Name: TLS_RSA_WITH_3DES_EDE_CBC_SHA
Short Name: DES-CBC3-SHA
Key Agreement: RSA
RSA/DSA Authentication: RSA
Encryption: 3DES_EDE_CBC, 168 bits

Cipher Name: TLS_DHE_RSA_WITH_AES_128_CBC_SHA
Short Name: DHE-RSA-AES128-SHA
Key Agreement: DHE
RSA/DSA Authentication: RSA
Encryption: AES_CBC, 128 bits
DHE Prime Size: 1024

Cipher Name: TLS_DHE_RSA_WITH_AES_256_CBC_SHA
Short Name: DHE-RSA-AES256-SHA
Key Agreement: DHE
RSA/DSA Authentication: RSA
Encryption: AES_CBC, 256 bits
DHE Prime Size: 1024

Cipher Name: TLS_DHE_RSA_WITH_3DES_EDE_CBC_SHA
Short Name: EDH-RSA-DES-CBC3-SHA
Key Agreement: DHE
RSA/DSA Authentication: RSA
Encryption: 3DES_EDE_CBC, 168 bits
DHE Prime Size: 1024

Table 5 Session Caching Parameters

Parameter	**SessionCachingEnabled**	Type	Integer
Description	Defines whether session caching is enabled or disabled. Session caching improves performance over TLS connections where traffic is fairly low and over SWACT. It is recommended that all remote servers have TLS session caching functionality enabled. This value now enables or disables client side and server side session caching. Recommended value Y.	Default value	Y
Effect of Change	Turning off session caching does not clear the cache. Items are removed from the server side and client side cache when they are expired. Items may also be removed from the server cache when the server cache is full in order to make room for a new entry.	New or Changed	Changed scope to include client side caching in SN09.
Adverse Effects			
Countering Adverse Effects			

Parameter	**SessionCacheSize**	Type	Integer
Description	Defines the maximum size of the client and server side TLS session cache. Valid values: 10, 100, 1000, 2000, 3200 This recommended value is: (8 x the number of remote sip servers using TLS) <= NEW VALUE. This value should not normally be decreased.	Default value	10
Effect of Change	Increases or decreases the size of the client and server side TLS session cache.	New or Changed	Changed to include new values: 2000, 3200.
Adverse Effects			
Counter-ing Adverse Effects			

Parameter	**SessionCacheValidDuration**	Type	Integer
Description	Defines the length of time a TLS session can be cached. Valid values are 24_Hours, 7_Days, 3_Months. Recommended value: 7_Days	Default value	7_Days
Effect of Change	Changing the values impacts all future TLS sessions, but does not impact entries already in the cache.	New or Changed	Changed to include additional value 3_Months
Adverse Effects			
Countering Adverse Effects			

23.9.2.1.5 Usage example

The following example shows sample datafill or menu selection for the CS2000 Session Server Tomcat Security Parameters Configuration Web Page GUI:

Example:

1. Customer enters the Succession Communication Server 2000 web page.
2. Customer enters the Succession Communication Server 2000 Session Server Manager webpage.
3. Customer clicks on the Provisioning Tab on the Menu Frame
4. Customer clicks on the Security Tab.
5. Customer clicks on the SIP Gateway Tab.
6. Customer clicks on the Security Config Data link, which brings up the Security Configurable Parameters page.
7. All of the parameters listed in See “Security Parameters in Tomcat Web Server” on page 2457. are available.

23.9.2.1.6 GUI release history update

See “Security Parameters in Tomcat Web Server” on page 2457. for parameters that are changed or new in SN09.

23.9.2.1.7 Context sensitive launching information

This GUI is accessed from a series of links starting on the CS2000 Session Server main web page. The normal instructions for launching the CS2000 Session Server Application Web Server can be followed for the new web pages described herein.

23.9.2.1.8 Supplementary information

Not applicable.

23.9.3 CLUI Interface

The Certificate Management Tool has changed slightly from SN08 to SN09.

The tool in its entirety is documented here.

23.9.3.1 Certificate Management Tool (cert_mgnt or cert_mgmt)

The certificate management tool is a customer-visible tool that provides a common interface for provisioning certficates for use by Apache, Tomcat, and the NGSS SIP application.

As of SN08, all three applications use the same certificate.

The certificate management tool is located in /sbin/cert_mgnt or /sbin/cert_mgmt, and is executable only by the root user. Since /sbin is in the path, cert_mgnt can be executed from anywhere.

The certificate management tool provides three functions

- Create a new self-signed certificate for the host
- Create a certificate signing request. The craftsperson would manually send the signing request to the Certificate Authority (CA) where it will be signed.
- Import key and certificate (including CA signed certificate).

The tool makes permissions on private key files and the certificate keystore file to be read/write by the root user.

As described in the SN08 documentation (A00006893), the server.crt contains the local server certificate. The trusted.crt file contains the certificate chain (for CA-signed certificates only) for the local server certificate. Both these files are are read/write by the root user and readable by other users.

Anytime the certificate management tool is run to successful completion, the host must be rebooted, or the three applications that use the certificate must be stopped/ started.

To reboot the host as a root user: at the command prompt: reboot

If rebooting is not appropriate, then stopping/starting each application is necessary.

To stop/start Apache: locate the executable “apachectl” in the directory structure and type: apachectl stop. Once this is successful, type apachectl start

To stop/start Tomcat: local the executable “tomcatd” in the directory structure and type: tomcatd stop. Once this is successful, type tomcatd start.

To stop the NGSS SIP application, the application must be locked and disabled and then enabled and unlocked using the NGSS GUI.

23.9.3.1.1 Certificate Management

Upon installation of the NGSS, the customer can either furnish their own certificates or use the certificate management tool.

If the customer furnishes their own certificates, they will be required to perform their own certificate management.

23.9.3.1.2 Files used by the Certificate Management Tool

The directory /opt/base/share/ssl is the recommended directory to store all certificates, keys, and related files. The cert_mgnt tool performs this automatically.

The tool is run only on 1 host, and the files are not synced/reflected to the other mate host in SN09. Therefore, the files must be manually copied to the other mate host using a secure method such as scp after the tool runs successfully.

server.crt - Only the local server certificate is in this file. In the self-signed certificate option, this file is created automatically by the tool. In the CA-signed option, this file will be provided by the customer, and placed in a temporary directory for import by the tool.

trusted.crt - The certificate chain leading up to the root CA certificate is placed in this file. This file is provided by the customer, and placed in a temporary directory for import by the tool.

server.key - This file contains the private key corresponding to the certificate in server.crt

certificate.keystore - This file contains an encoded version of the server.crt, trusted.crt, and server.key file. This file is created automatically by the tool and is used by Tomcat.

The directory /opt/base/share/ssl should be backed up on a regular basis using a secure method in a physically and logically secure environment. This will help prevent unauthorized access to the private keys.

There are two files (cert_gen.txt and assign_cert.txt) that are placed in the /opt/base/share/ssl directory. These files are used by the tool and should not be removed.

23.9.3.1.3 Certificate and Key revocation

Not applicable.

23.9.3.1.4 Self Signed Certificates

In this case, the craftsperson has chosen to use self-signed certificates.

1. In the case of self-signed certificates, the craftsperson selects option 1 in Figure 1 ”Choose a Certificate Type” on page 2486.
2. In order to proceed, the craftsperson must accept the disclaimer and the notice as indicated in:
   - Figure 2 ”Disclaimer for Self-Signed Certificates (1 of 4)” on page 2487,
   - Figure 3 ”Disclaimer for Self-Signed Certificates (2 of 4)” on page 2487,
   - Figure 4 ”Disclaimer for Self-Signed Certificates (3 of 4)” on page 2488, and
   - Figure 5 ”Disclaimer for Self-Signed Certificates (4 of 4)” on page 2488..

   A customer log is generated logging the user’s acceptance of the disclaimer.

3. Going back at any time will display the previous panel. Selecting proceed will only work if the craftsperson has entered the required information.
4. The craftsperson selects an RSA key size Figure 6 ”Select Key Size” on page 2489. The key size can be 1024/1536/2048 bits. The higher the key size, the stronger the private key. There may be a performance impact to using higher key sizes due to additional encryption requirements.
   - If the key already exists in the /opt/base/share/ssl/ directory, the tool will prompt to reuse it or delete it and recreate a new key.
   - If the craftsperson wishes to reuse the key, the tool will always accept the key’s current size. This is illustrated in Figure 7 ”Key Already Exists” on page 2489
   - If in Figure 7 ”Key Already Exists” on page 2489, the craftsperson select ‘n’ that they do not want to proceed, then the tool prompts for key deletion in Figure 8 ”Remove Existing Key” on page 2490.
   - If in Figure 7 ”Key Already Exists” on page 2489 , the craftsperson select ‘y’ that they do want to proceed, then the tool will reuse the existing key and move on to step 5.
   - If in Figure 8 ”Remove Existing Key” on page 2490, the craftsperson selects ‘n’ that they do want to proceed, the tool will then abort the current operation and return to the top of this step.

- If in Figure 8 ”Remove Existing Key” on page 2490, the craftsperson selects ‘y’ that they do want to proceed, the tool will then make a backup of the existing key to another file in the same directory. A customer log is generated for this case.

5. The user must also select a length of time for which the certificate is valid. This is specified in Figure 9 ”Expiry Days” on page 2490. This is the number of days from the current date for which the certificate is valid.
6. The craftsperson selects a country, state, and city name in Figure 10 ”Country Name” on page 2491, Figure 11 ”State Name” on page 2491, Figure 12 ”Locality Name” on page 2492. These fields are optional. Although they are optional, they help to identify the NGSS to a remote entity.
7. The craftsperson selects an organizational name, and an organizational unit name in Figure 13 ”Organizational Name” on page 2492, and Figure 14 ”Organizational Unit Name” on page 2493. These fields optional. Although they are optional, they help to identify the NGSS to a remote entity.
8. In Figure 15 ”Common Name” on page 2493, the craftsperson identifies the mandatory common name. In the case of the NGSS, this must be the IP address of the active NGSS host. This is used for mutual authentication and is necessary for the correct operation of the NGSS. There is no validation at this stage of the common name.
9. In Figure 16 ”Email Address” on page 2494, the craftsperson identifies the optional email address of the local contact. There is no validation of the email address.
10. Once all the information is entered, the tool displays a summary in Figure 17 ”Summary for Self Signed Certificates” on page 2494. Selecting “proceed” will generate the self signed certificate. The following message will be displayed on success:

```
Exporting certificate/key pair to PKCS#12 keystore
Certificate/key pair has been successfully exported to PKCS#12 format
Changing permissions on key file
Changing permissions on keystore file
```

11. The user must then secure copy the necessary files from the unit where the cert_mgnt was executed to the mate unit.

For example:

```
cd /opt/base/share/ssl
scp * mtc@<mate host IP>:/users/mtc
```

12. The user log into the mate unit and change directory to the location where the certificate files are located. The user can then use the cert_mgnt tool option 3 to import the certificates and commit the files to /opt/base/share/ssl. This is documented in section 23.9.3.1.6 ”Import Certificates and Private Key” on page 2497.

23.9.3.1.5 Certificate Signing Request

1. In the case of a certificate signing request, the craftsperson selects option 2 in Figure 1 ”Choose a Certificate Type” on page 2486.
2. Going back at any time will display the previous panel. Selecting proceed will only work if the craftsperson has entered the required information.
3. The craftsperson selects an RSA key size in Figure 6 ”Select Key Size” on page 2489. The key size can be 1024/1536/2048 bits. The higher the key size, the stronger the private key. There may be a performance impact to using higher key sizes due to additional encryption requirements.
   - If the key already exists in the /opt/base/share/ssl/ directory, the tool will prompt to reuse it or delete it and recreate a new key.
   - If the craftsperson wishes to reuse the key, the tool will always accept the key’s current size. This is illustrated in Figure 7 ”Key Already Exists” on page 2489
   - If in Figure 7 ”Key Already Exists” on page 2489, the craftsperson select ‘n’ that they do not want to proceed, then the tool prompts for key deletion in Figure 8 ”Remove Existing Key” on page 2490.
   - If in Figure 7 ”Key Already Exists” on page 2489, the craftsperson select ‘y’ that they do want to proceed, then the tool will reuse the existing key and move on to step 4.
   - If in Figure 8 ”Remove Existing Key” on page 2490, the craftsperson selects ‘n’ that they do want to proceed, the tool will then abort the current operation and return to the top of this step 3.
   - If in Figure 8 ”Remove Existing Key” on page 2490, the craftsperson selects ‘y’ that they do want to proceed, the tool will then make a backup of the existing key to another file in the same directory. A customer log is generated for this case.
4. The craftsperson selects a country, state, and city name in Figure 10 ”Country Name” on page 2491, Figure 11 ”State Name” on page 2491, Figure 12 ”Locality Name” on page 2492. These fields are optional. Although they are optional, they help to identify the NGSS to a remote entity.
5. The craftsperson selects an organizational name, and an organizational unit name in Figure 13 ”Organizational Name” on page 2492, and Figure 14 ”Organizational Unit Name” on page 2493. These fields optional. Although they are optional, they help to identify the NGSS to a remote entity.
6. In Figure 15 ”Common Name” on page 2493, the craftsperson identifies the mandatory common name. In the case of the NGSS, this must be the IP address of the active NGSS host. This is used for mutual authentication and is necessary for the correct operation of the NGSS. There is no validation at this stage of the common name.
7. In Figure 16 ”Email Address” on page 2494, the craftsperson identifies the optional email address of the local contact. There is no validation of the email address.
8. In Figure 18 ”Challenge Password” on page 2496, the tool queries for a challenge password. This password is used by the tool only.

9. Once all the information is entered, the tool displays a summary Figure 19 ”Certificate Signing Request Summary” on page 2497. Selecting “proceed” will generate the self signed certificate. The following message will be displayed on success.
10. Certificate Management:

```
Generating Certificate Signing Request
Generating a RSA Key
RSA private key has been successfully generated
Creating Certificate Signing Request
Certificate Signing Request has been successfully generated
-----BEGIN CERTIFICATE REQUEST-----

-----END CERTIFICATE REQUEST-----
Changing permissions on key file
Changing permissions on keystore file
```

11. The certificate signing request between the <BEGIN> and <END> delimeters is sent to the Certificate Authority for signing and certificate generation. Once that is done, the certificate authority’s certificate and the signed certificate are used to perform the function in section 23.9.3.1.6 ”Import Certificates and Private Key” on page 2497.

Figure 18 Challenge Password

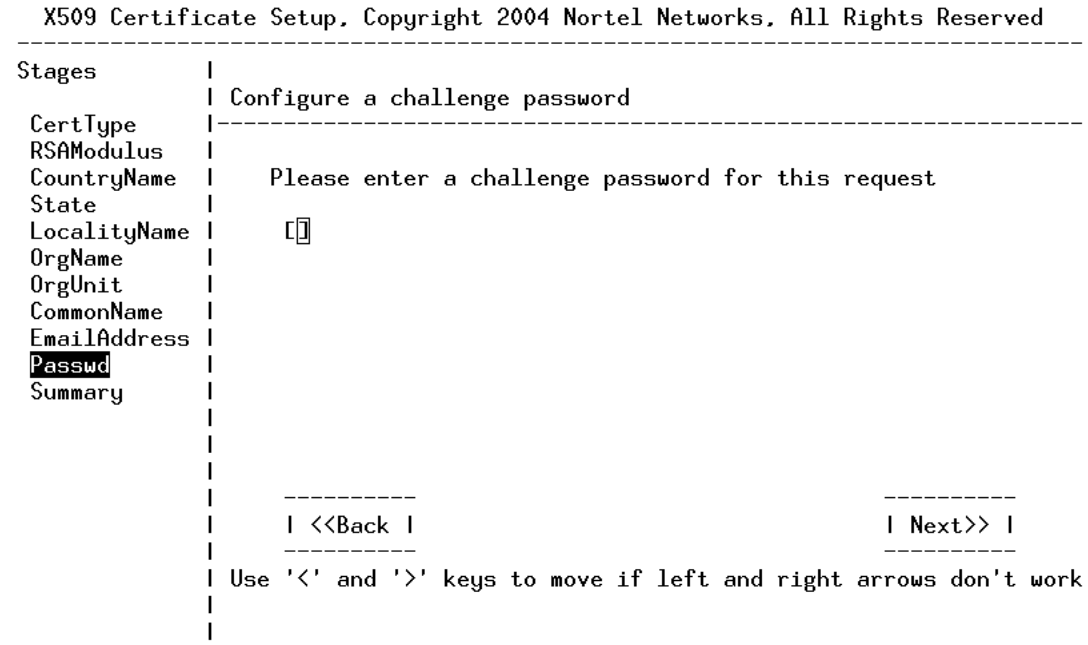

Figure 19 Certificate Signing Request Summary

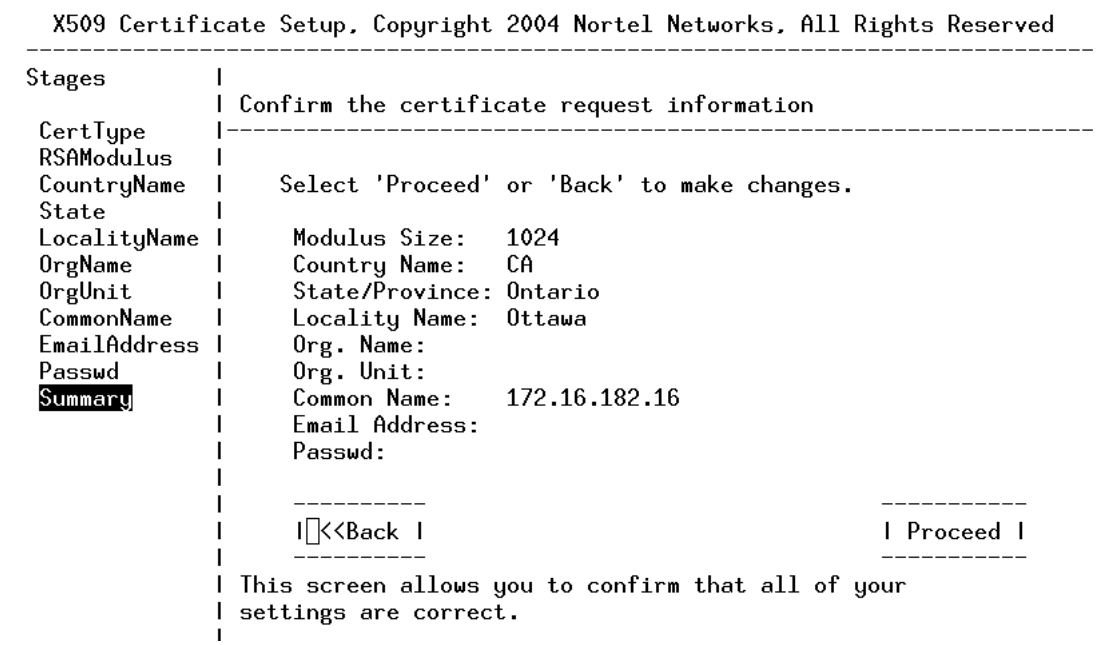

23.9.3.1.6 Import Certificates and Private Key

It is recommended that this procedure NOT be executed from /opt/base/share/ssl nor is it recommended that the files be copied there prior to the execution of this procedure.

This procedure can be used to:

- Provision the self-signed certificate on the mate unit, and commit the files to /opt/base/share/ssl.
- Provision the CA-signed certificate from the signing request in option 2. The same private key that was generated in option 2 must be available.

1. Provide the CA certificates:
   - If this procedure is being used to provision the self-signed certificate on the mate unit, then, In Figure 20 , the craftsperson supplies the full path and filename where the self-signed certificate can be found. The tool will not proceed unless the file exists.
   - If this procedure is being used to import the CA-signed certificates, then, In Figure 20, the craftsperson supplies the full path and filename where the CA chain certificates can be found. The tool will not proceed unless the file exists.
2. Provide the server CA-signed certificate:

- If this procedure is being used to provision the self-signed certificate on the mate unit, then, In Figure 21 ”Server Certificate - CA signed certificate” on page 2500, the craftsperson supplies the full path and filename where the self-signed certificate can be found. The tool will not proceed unless the file exists.
- If this procedure is being used to import the CA-signed certificates, then, In Figure 21 ”Server Certificate - CA signed certificate” on page 2500, the craftsperson supplies the full path and filename where the CA signed certificate can be found.. The tool will not proceed unless the file exists.

3. Provide the private key. The craftsperson supplies the full path and filename where the private exists in Figure 22 ”Provide the key” on page 2500.
4. Validation. In this step, the tool confirms the user input. By selecting “Proceed”, the tool completes the import in Figure 23 ”Import Summary” on page 2501.
5. If successful, the following messages are displayed (this example is for a self-signed certificate).

```
Provisioning CA Certificate
Verifying certificate/key pair
spawn openssl verify -CAfile server.crt server.crt
server.crt: OK
Certificate validation succeeded
Exporting certificate/key pair to PKCS#12 keystore
Committing trusted certificate to /opt/base/share/ssl
Committing server certificate to /opt/base/share/ssl
Committing private key to /opt/base/share/ssl
Certificate/key pair has been successfully exported to PKCS#12 format
Changing permissions on key file
Changing permissions on keystore file
```

Figure 20 CA Certificate - Trusted certificate

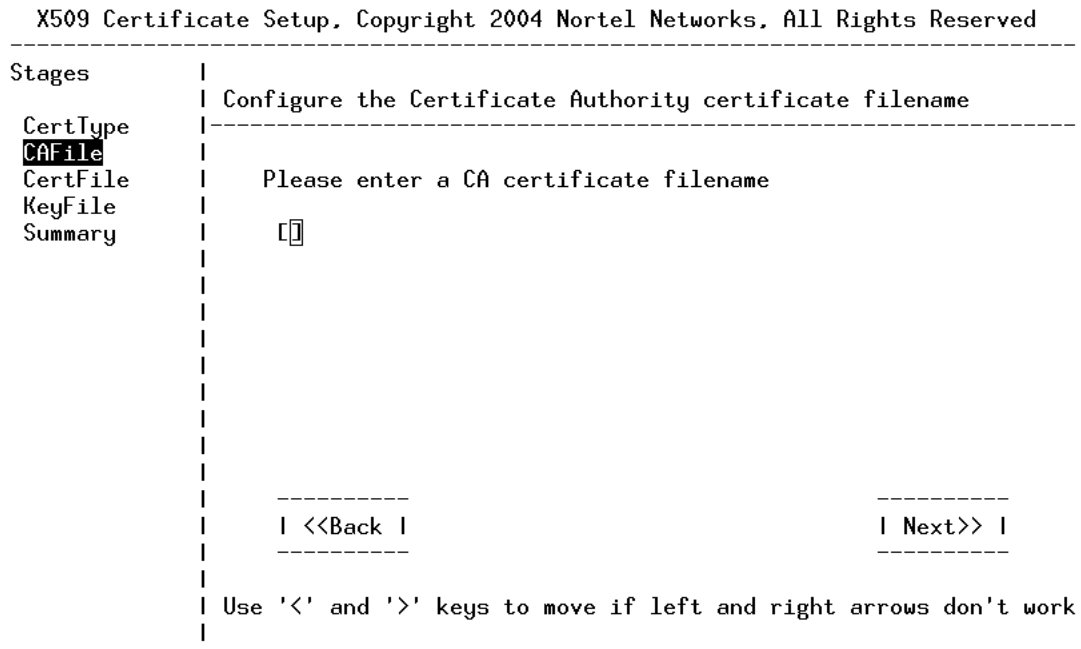

Figure 21 Server Certificate - CA signed certificate

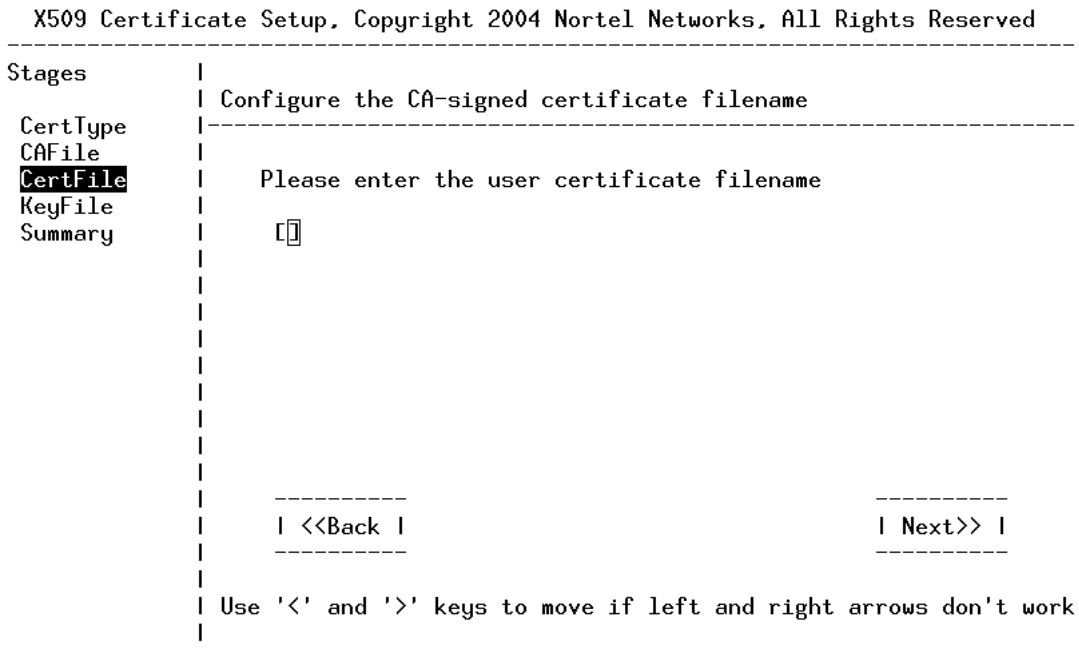

Figure 22 Provide the key

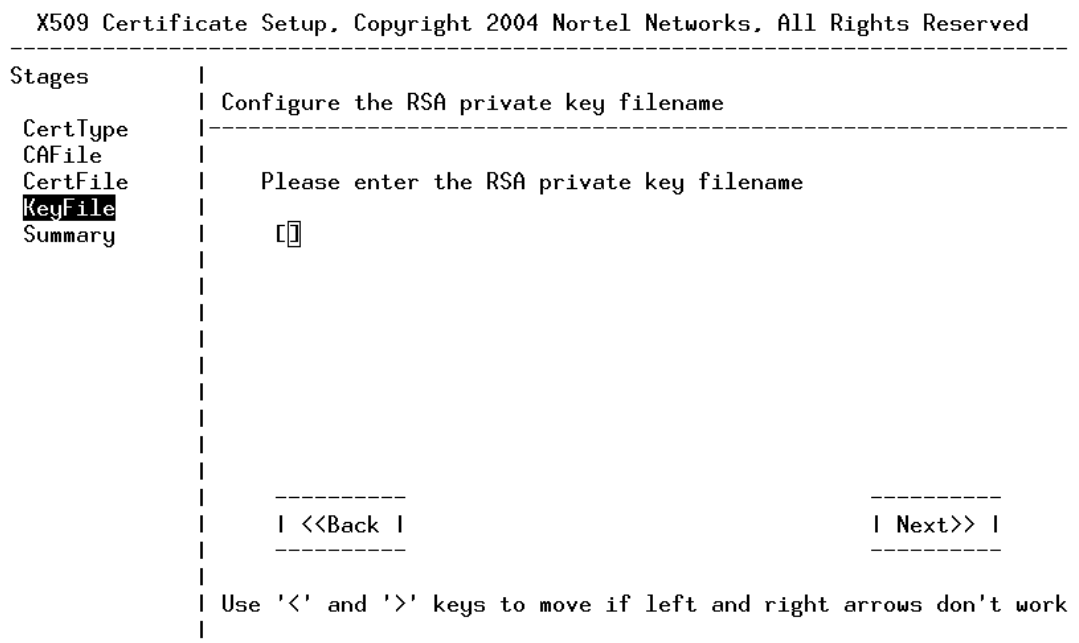

Figure 23 Import Summary

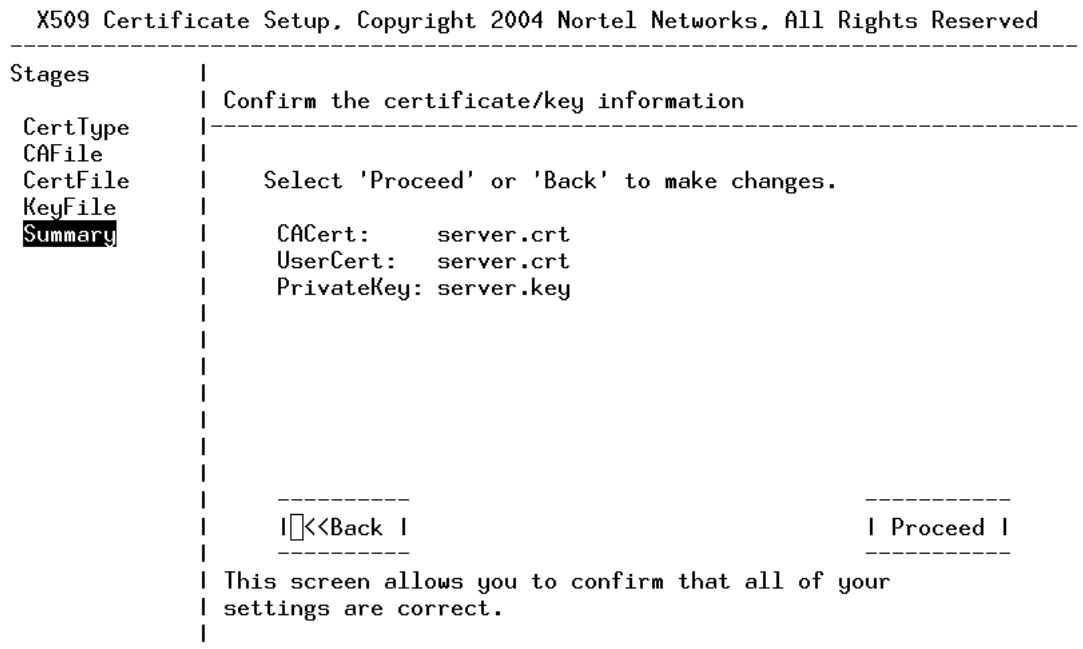

Import Summary shown above assuming a self-signed certificate import from the mate unit.

23.9.3.1.7 After provisioning a new certificate

Once the new certificate/key pair is in place, the Apache, Tomcat, and SIPGWYAPPLN applications must be restarted to ensure they are using the new certificate. This can be handled by rebooting the unit on which the new certificate was provisioned on, or by just stopping and starting the individual applications.

23.10 User interface changes

Not applicable.

23.11 OSSGate Interface Changes

Not applicable.

23.12 Security

23.12.1 Network configuration

Network configurations should not be changed as a result of this feature.

23.12.2 Key management

Key management will be done automatically as part of certificate management procedures. Keys will thus be managed internally by the CS2000 Session Server web server and/or CLI tools. No customer interface dealing with keys will be implemented.

23.12.3 Protocol

This activity is not making changes to protocols that are used to manage security.

23.12.4 Authentication

No change.

23.13 Configuration Walkthrough

See section 23.9 “Element Management” on page 2454.

24: Configuration (CN): A00009280

24.1 Feature Name

MG9K Line Circuit Enhancements

24.2 Hardware and Software Requirements

This functionality is for MG9000 EM that has SN09 or higher software version.

24.3 Initial Configuration

No changes for initial configuration

24.4 Upgrade Considerations

None.

24.5 Element Management

24.5.1 New/modified GUIs

Table 1 New or modified GUIs

GUI name	NEW, CHANGED, or DELETED
WLC View	CHANGED
GLC View	CHANGED
XDSL View	CHANGED
SAA View	CHANGED
LINE CIRCUIT View	CHANGED
FAULTY CIRCUIT LISTING	NEW

24.5.2 GUI information

24.5.2.1 GUI name: Line Card View (WLC, XDSL,GLC,SAA)

24.5.2.1.1 Functional description

From release SNO9, the line card view would display alarm color indication for the ports. A faulty port would be indicated with magenta color on the line card view. Display of only voice circuit ilogs changes on a XDSL view for faulty ports.

An example of WLC view is shown in Figure 1.

Figure 1 WLC View with faulty and alarm status indications on port ilogs

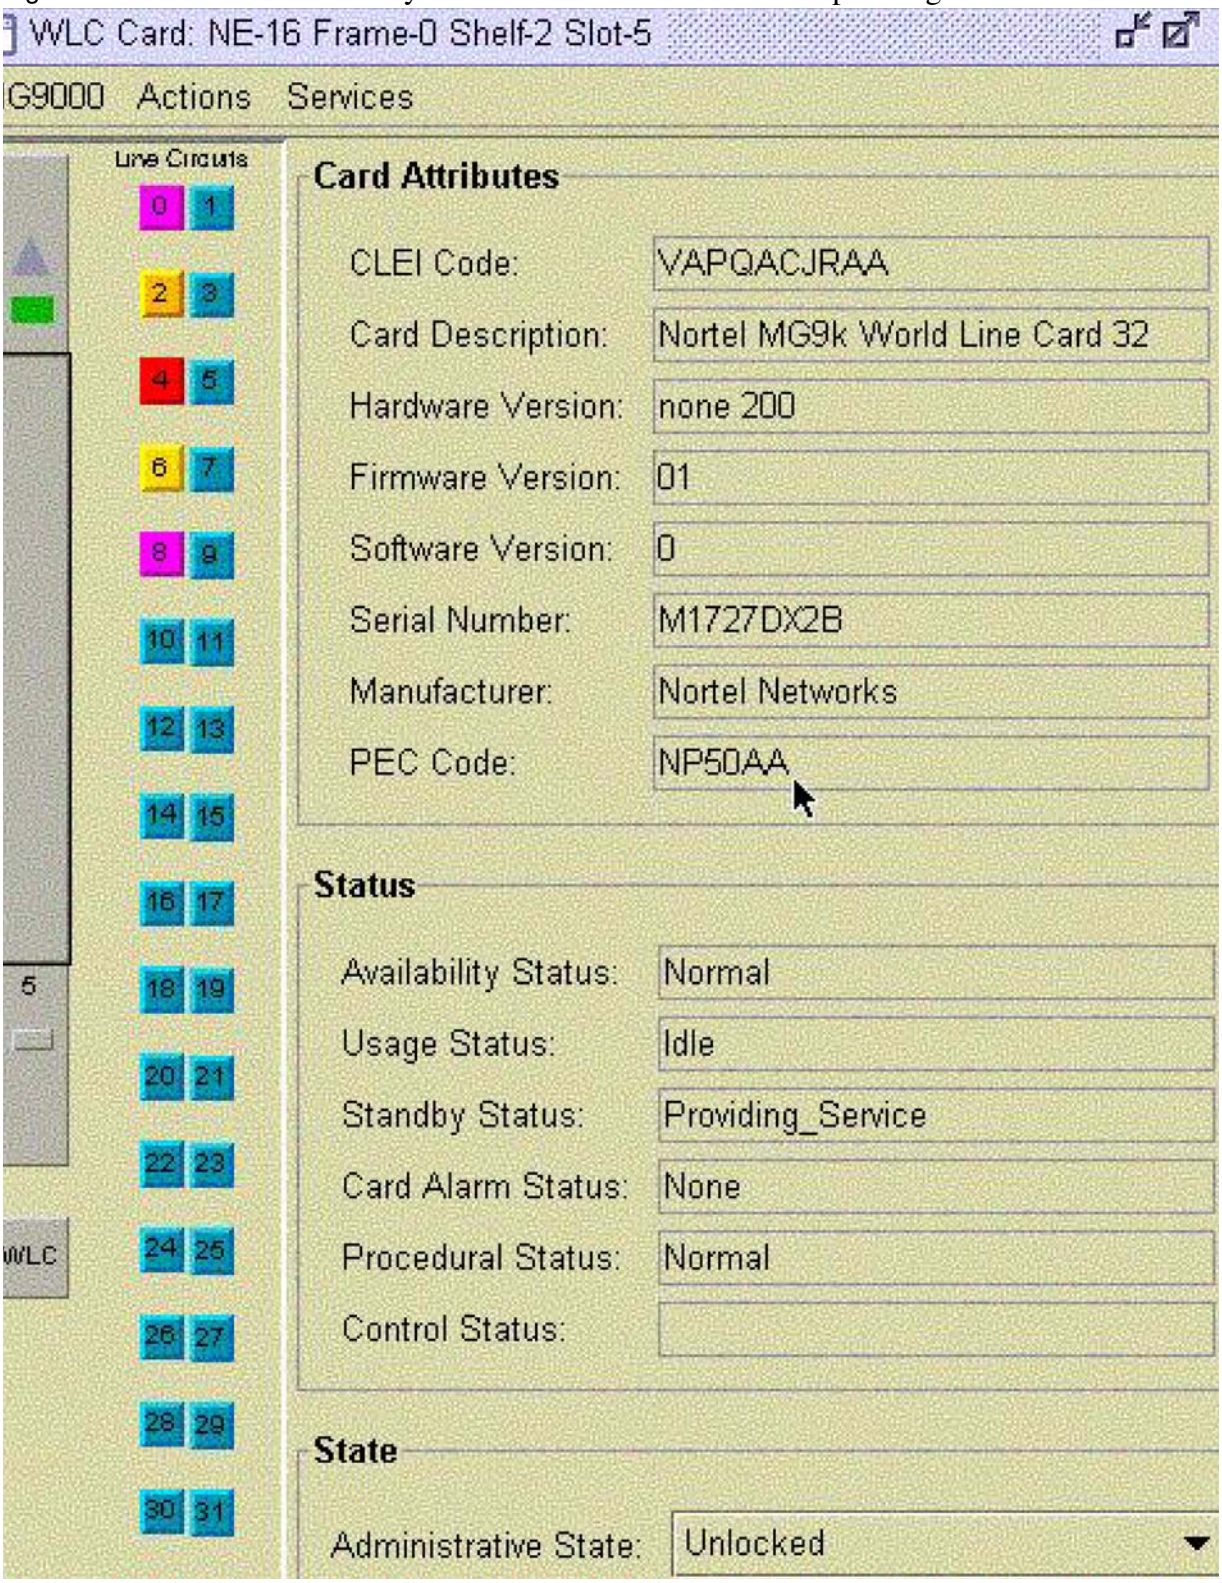

Figure 1 shows the WLC Card view with minor alarm on port 2, critical alarm on port 4, and warning on port 6. Also port 0 and port 8 are manually marked as faulty by the User

24.5.2.1.2 GUI fields

No new GUI fields are added.

Table 2 GUI field descriptions

Field	New or Changed	Subfield	Entry	Explanation and action	Associated MIB entry
Circuit Listing	Changed	NA	NA	Line Circuits listed on the WLC card view would be displayed with an appropriate alarm color or fault color. The default color of the port is blue	NA

24.5.2.2 GUI name: Line Circuit View

24.5.2.2.1 Functional description

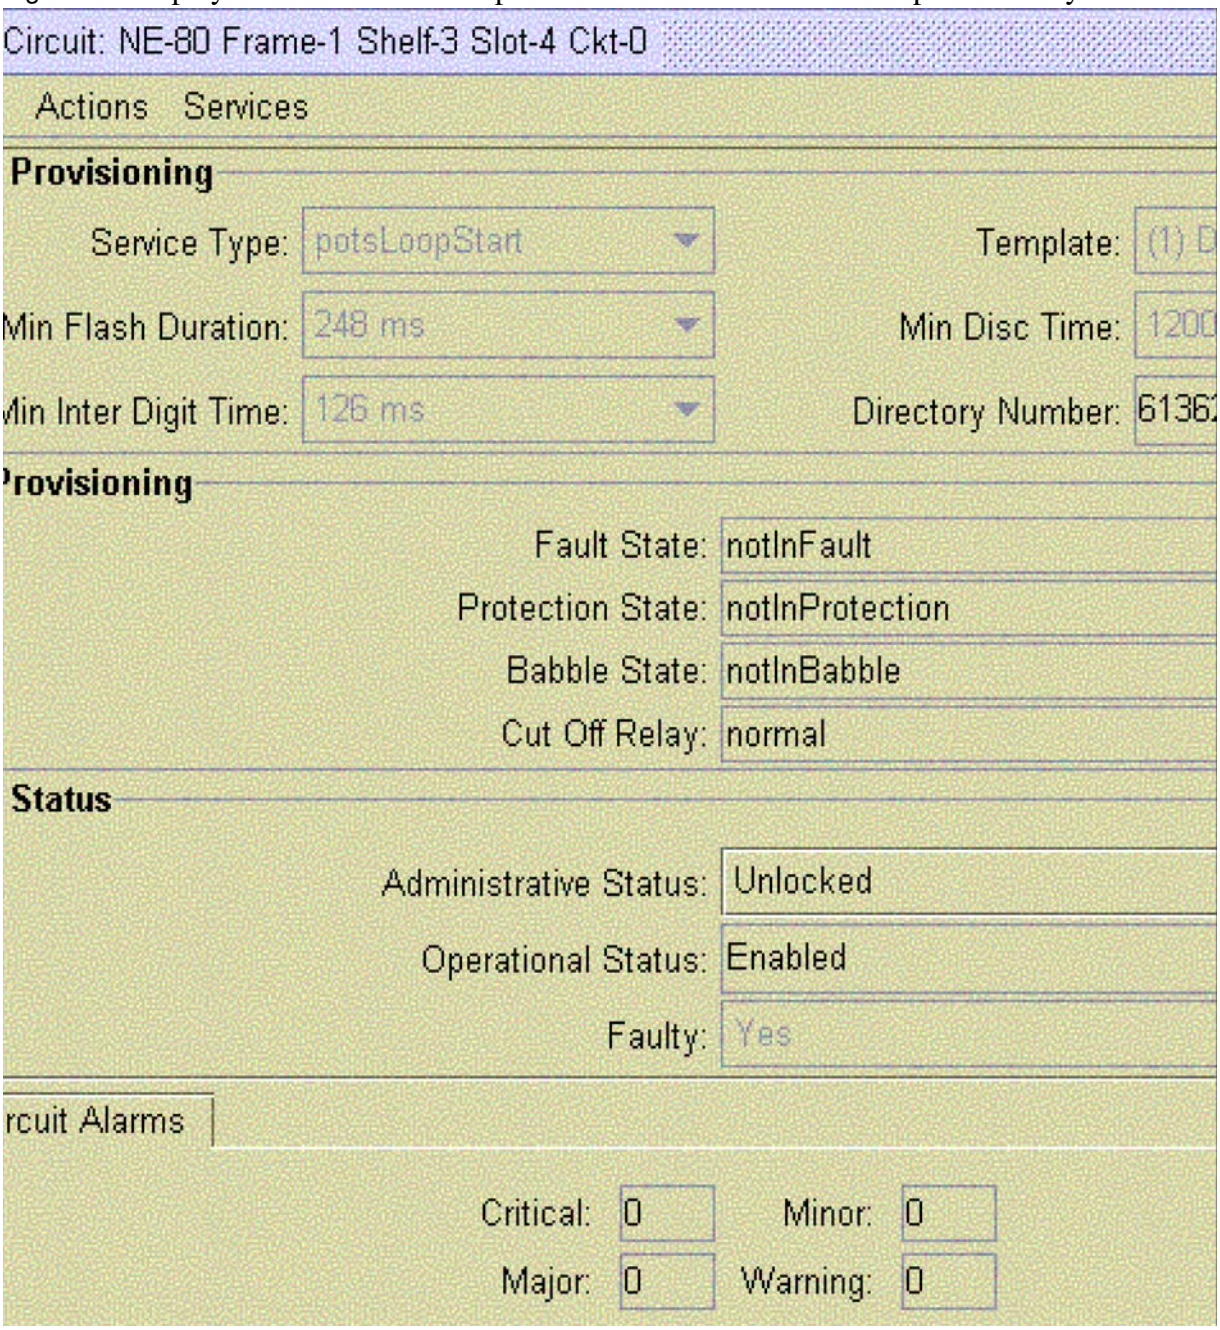
1> From release SNO9, the Line Circuit view would allow the User to mark a port as faulty with a prerequisite that the port should be locked.

The faulty combo box would be available in the 'Circuit Status' section of the Line Circuit View. This combo box would be disabled(greyed out) when the port is unlocked.

2> From release SNO9, the Line Circuit View would display the Directory Number (DN) associated with a termination point (line circuit). This information is displayed in the 'Circuit Provisioning' section of a Line Circuit View.

Figure 2 shows the display of Line Circuit view with associated DN Affected: 6136210202 displayed in Circuit Provisioning section. Also shown is the ability for the User to manullay mark the port as faulty when the port is locked from the Circuit Status section.

Figure 2 Displays associated DN and provision for the User to mark a port as faulty



User can select ‘No’ or ‘Yes’ from the ‘Faulty’ drop down to set the port as faulty or non faulty, accordingly. This dropdown is enabled only when the Administrative Status of the port is locked.

User can unlock the circuit which is marked as faulty. But he is displayed a warning message saying:

"The circuit is marked as faulty; the existing service may be degraded Are you sure?"

By selecting 'OK' option, he can submit the 'unlock' request to the Gateway.

By selecting 'Cancel' option, he would not submit the 'unlock' request to the Gateway.

24.5.2.2.2 GUI fields

24.5.2.3 GUI name: Faulty Circuit Listing View

Table 3 GUI field descriptions

Field	New or Changed	Subfield	Entry	Explanation and action	Associated MIB entry
Faulty - Combo Box	New	NA	1> No 2> Yes	The Faulty Port Status Combo box and label are displayed in the 'Circuit Status' section of Line Circuit View This field is enabled when the port is locked. By selecting combo item 'No', User removes the faulty bit set for the port By selecting combo item 'Yes', User marks manually a port as faulty.	NA
Directory Number TextBox	New	NA	1>None 2><Associated DN>	The Directory Number label and text box are displayed in the 'Circuit Provisioning' section of the Line Circuit View. This is a read-only field. If any DN is associated with the line circuit then it gets displayed, else the field displays 'None' in the text box.	NA

24.5.2.3.1 Functional description

From release SNO9, the Faulty Circuit Listing view would be added to a new menu item of the Services menu option, on the NE desktop view.

24.5.2.3.2 GUI usage and implications

From the NE desktop view, go to the 'Services' Menu list.

The drop down would list ‘Faulty Circuit Listing’ menu item. Clicking on this menu item would display the ‘Faulty Circuit Listing’ view.

This view would list all the ports manually marked as faulty by the User on an NE along with their location information.

The view would have a timestamp associate with the last refresh and a ‘Refresh’ button. Using ‘Refresh’ button user can view the latest faulty port information.

Figure 3 shows the new ‘Faulty Circuit Listing’ GUI when no faulty ports are available. The text above the table header would display ‘No Faulty circuits found’.

Figure 3 Faulty Circuit Listing GUI with no faulty ports

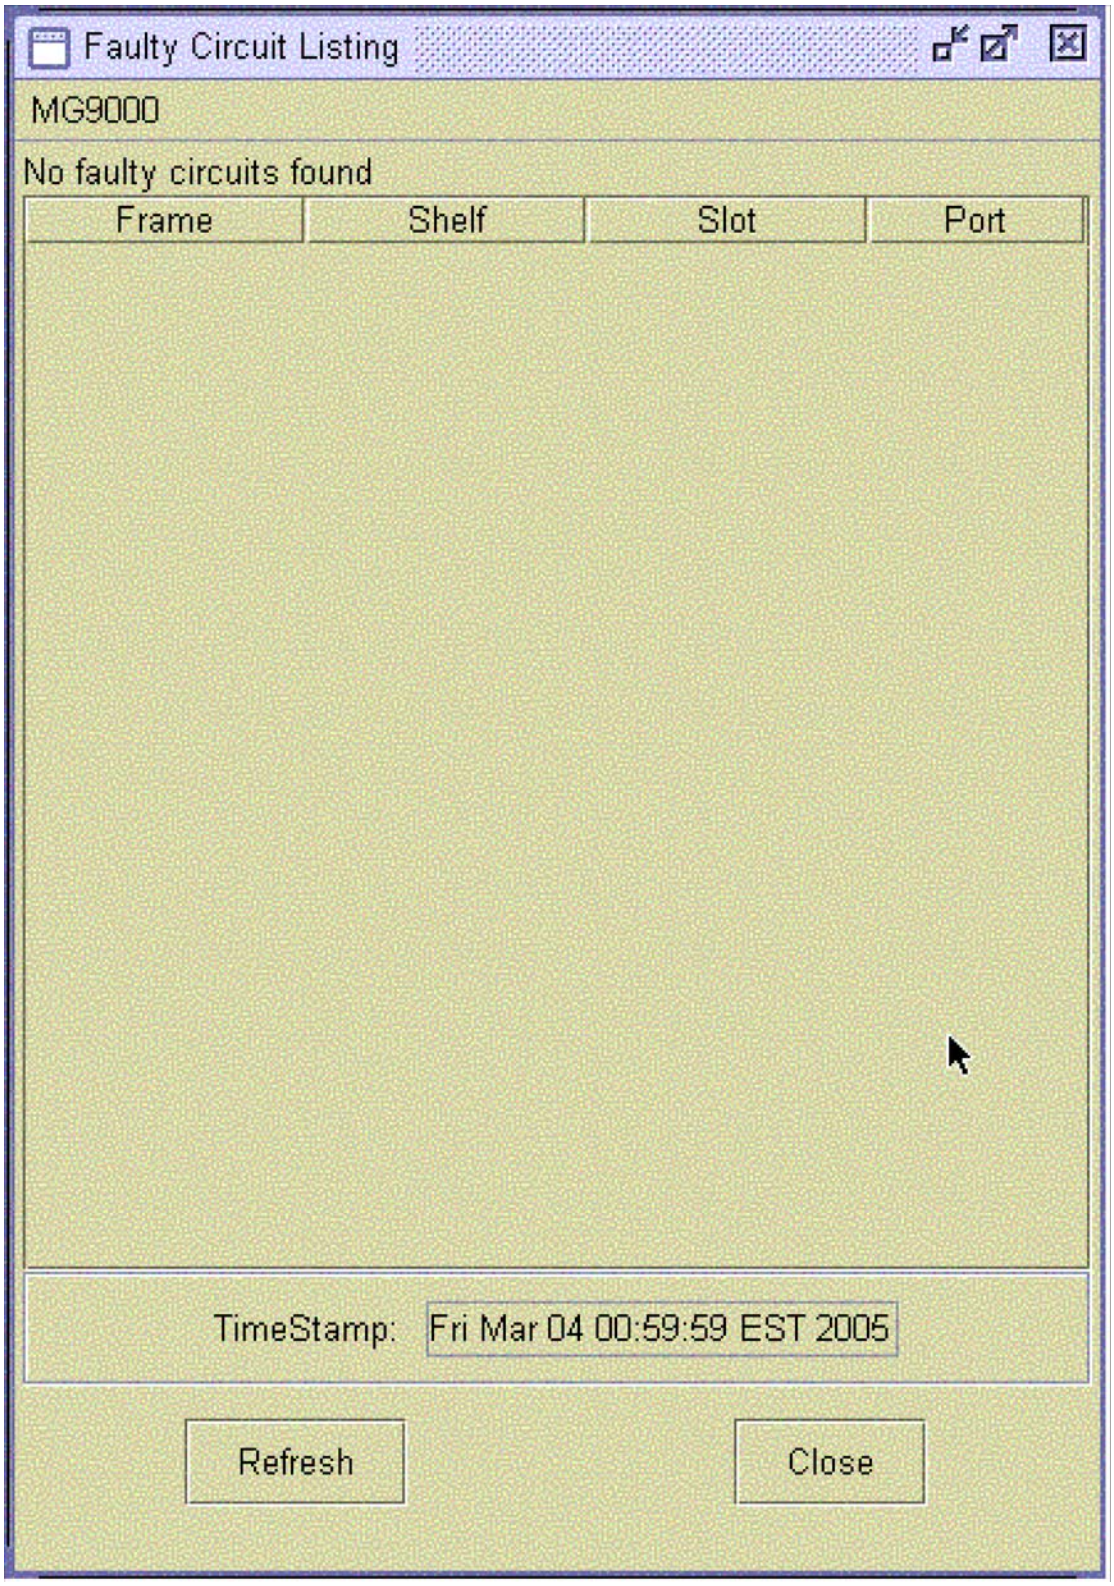


Figure 4 shows the ‘Faulty Circuit Listing’ gui when faulty ports exist. The Time Stamp field indicates the last time when the data was pulled from DB.

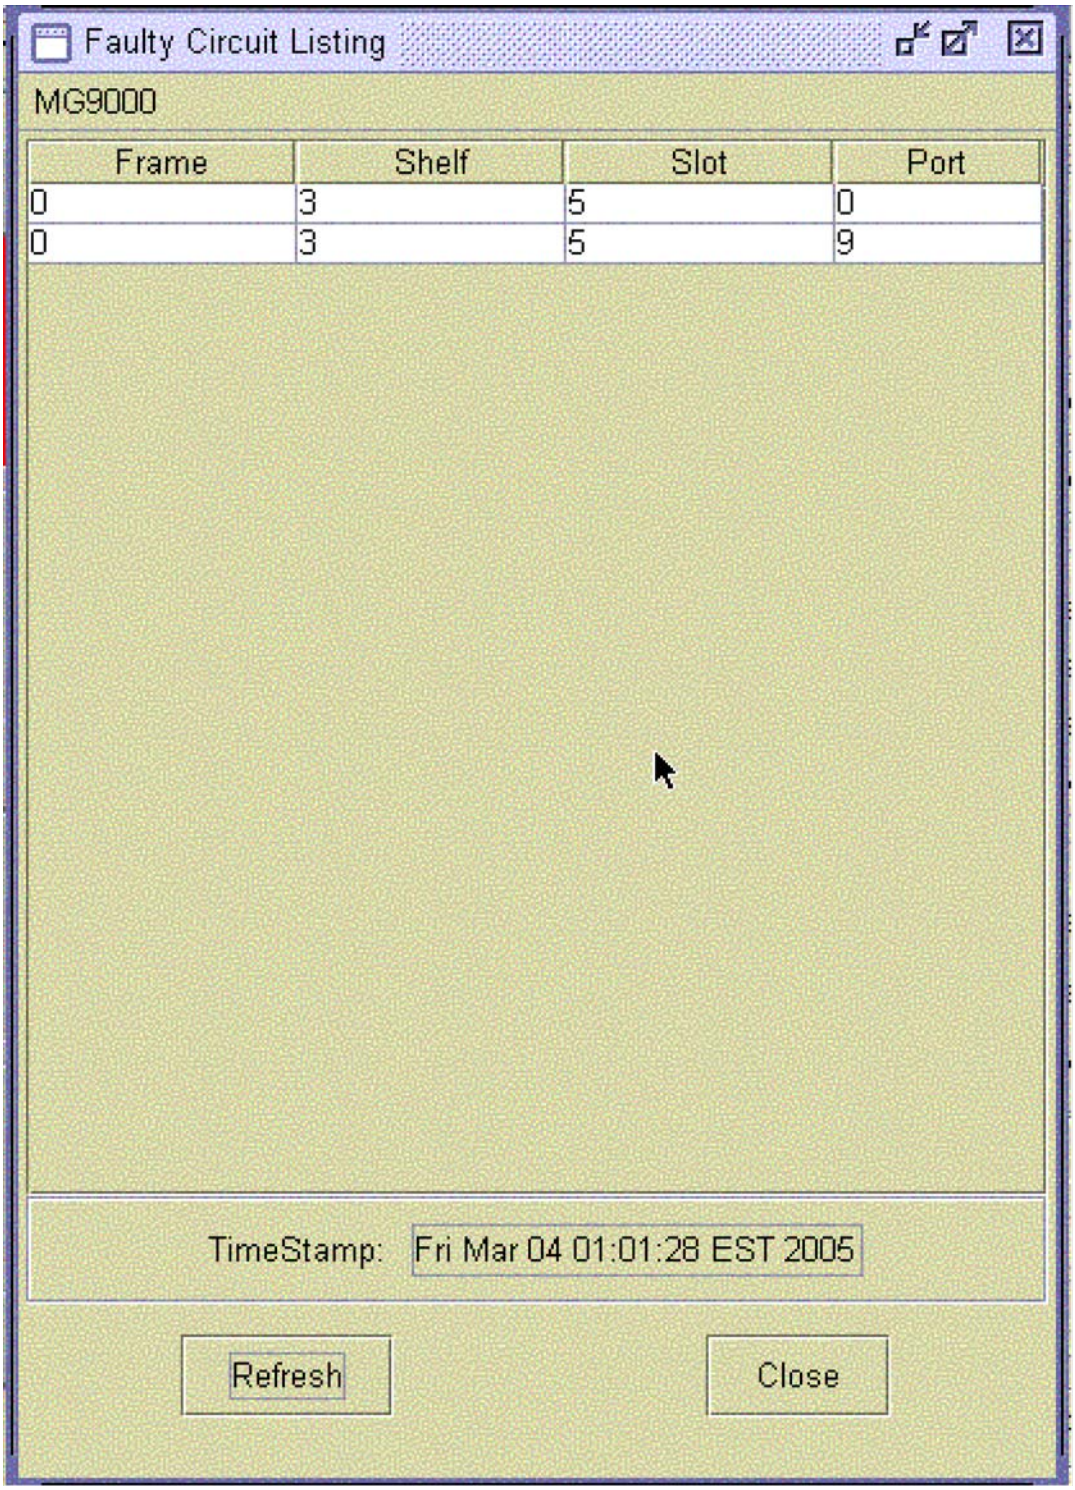
Figure 4 Faulty Circuit Listing



24.5.2.3.3 GUI size

NA

25: Configuration (CN): A00009282

25.1 Feature Name

Emergency Stand Alone (ESA) Multiple Level Precedence and Preemption (MLPP) for MG9KEM

25.2 Hardware and Software Requirements

None.

25.3 Initial Configuration

This document assumes that the reader is familiar with Emergency Stand-Alone(ESA). ESA allows intra-nodal calls to complete when the MG is cutoff from thecall server. Prior to SN08 only intra-nodal ESA was supported. With theintroduction of this feature, inter-nodal ESA is now supported as of SN08.Internodal ESA allows groupings of MG nodes into communities of interest(COI). All nodes in a community can communicate with each other during ESA,allowing calls to complete inside the community during ESA.The Passport Virtual Router must be configured before Internodal ESA willfunction. The Passport settings are located on the NE Properties GUI on the EM.Each node in the community must be configured with PVR settings before thecommunity is established.The customer should first determine how the nodes will be grouped together intocommunities. In addition each MG will need to be configured with a new ESAIP address. This IP address should be chosen from an available IP address fromthe call control subnet (the same subnet used for VMG configuration). Nodefault communites are provided so each community must be manuallyconfigured by the customer in order for inter-nodal ESA to function.

The high-level steps for adding a community of interest are as follows:

1) Load the MG9K, MG9KEM, and PVR with required software.

2) Launch the MG9K Element Manager.

3) Select a node to be added to community and configure PVR settings from the

NE Properties screen. Repeat for each node.

4) Select Configure Internodal ESA from the Configuration Menu.

5) Set the ESA IP address of the nodes that are being placed into communities.

6) Create a new community of interest.

7) Add desired nodes to the community of interest.

8) Click Apply button.

9) Repeat for each community of interest.

25.13 Configuration Walkthrough

Before initial configuration of inter-nodal ESA begins, the MG9K nodes must be configured to support ESA (see feature A00002020 for more details on configuring intra-nodal ESA). The customer should also determine how the nodes will be grouped into communities, i.e. which nodes go into which community of interest. In addition each MG9K that supports inter-nodal ESA will need to be configured with an ESA IP address. This IP address should be chosen from an available IP address from the call control subnet. This is the subnet of IP addresses used for VMG configuration. No default communites are provided so each community must be manually configured by the customer in order for intra-nodal ESA to function.

The high-level steps for adding a community of interest are as follows:

1) Load the MG9K, MG9KEM, and PVR with required software.

2) Launch the MG9K Element Manager.

3) Select a node to be added to community and configure PVR settings from the NE Properties screen. Repeat for each node.

4) Select Configure Internodal ESA from the Configuration Menu.

5) Set the ESA IP address of the nodes that are being placed into communities.

6) Create a new community of interest.

7) Add desired nodes to the community of interest.

8) Click Apply button.

9) Repeat for each community of interest.

When the user presses Apply a status window will display the status of NEs that are being updated. The status window will scroll as NEs are successfully updated or if there are any failures. A configuration alarm will be generated if there are any configuration failures. However, if the user exits the GUI and returns to the GUI, there is no way to determine if there were any previous failures, but the alarm will continue to be displayed in the alarm manager until the configuration is successful. If there is a failure, the user can trigger an audit to re-configure the COI or the user can press the Apply button on the GUI. The Apply button will cause the currently selected COI data to be sent to all affected nodes.

27: Configuration (CN): A00009375 & A00009376

27.1 Feature Name

CICM Third-party Corrective Content Patching & CICM Selective Binary Component Patching

27.2 Data schema (DS)/ MIBs

This feature will utilise two areas of the Windows Registry for the storage of information relating to status of installed patches and maintenance releases on this node.

Table 2: MIB entries

MIB name (registry key etc)	Description (including backwards compatibility)
hklm\system\currentcontrolset\services\cxipboot\data\patches	Storage area for patch information
hklm\system\currentcontrolset\services\cxipboot\data\upgrade	Storage area for maintenance release information

27.3 Operating system parameters (OP)

No Operating System Parameters will be changed by this feature, unless of course by the deployment of an OS patch. In which case details of the Operating System Parameters changed will be in the Release Notes of the patch concerned.

27.4 Alarms (AL)

No new alarms will be raised as part of this feature.

27.5 New/modified filesystem directories (FS)

Several new directories will be required for this feature.

Table 5: directories

Directory name	Location	Function
D:\CentrexIP\support\patches	CICM-EM	Location for patch files to be written ready for installation
D:\CentrexIP\support\upgrades	CICM-EM	Location for Maintenance Release files to be written ready for installation
C:\cxipinstall\???????	Node being Patched	Temporary area for unpacking patch and maintenance release data ready for installation

2.5 Command interface (CI)

A Command Line Interface will be provided for use by GNPS to assist in the removal of partially applied patches. However this interface will not be available for use by customers and as such the details of its functionality are beyond the scope of this document.

2.6 Software optionality control (SOC)

This feature is available on all CICM and CICM-EM platforms running SN09 or later.

2.7 Licensing

This feature will utilise MD5 checksums, which require no licensing. No other Third Party licensed software was used in the development of this feature.

2.8 References

A00005987 CxipRestore Tool

28: Configuration (CN): A00009463

28.1 Feature Name

CBM to Support Centralized User Authentication with IEMS

28.2 Hardware and Software Requirements

SN09 CBM standard hardware and software are required.

No new hardware is needed for this feature. However, the software for this feature needs to be installed on the CBM before feature configuration can take place.
For CBM deployment with IEMS centralized security server, IEMS and its hardware and software dependencies need to be available and configured.

28.3 Initial Configuration

- No initial hardware configuration is required for this feature.
- The initial software configuration for this feature is using local security server (i.e. native Solaris security system) for authentication and authorization. No user input is needed for initialization.

28.4 Office/Subnet parameters (OP/SP) (CM & SESM)

Not applicable to this feature.

28.5 Upgrade Considerations

28.5.1 Dump and Restore (CM)

Not applicable to this feature.

28.5.2 Element Management Upgrade

No impact to Element Management Upgrade when a CBM is deployed without external security server.

When a CBM is deployed with IEMS centralized security server in SN09, the CBM is changed from using Pre-SN09 local security system to external security server. Both CBM and IEMS server must be upgraded to the same release before CBM can be configured to use IEMS.

In order to migrate to central authentication and authorization, some of the existing local user accounts need to be created on the external security server - IEMS. CBM local user migration can only take place after CBM is changed to IEMS external server configuration.

28.5.3 Downgrade impact

No impact to downgrade if the CBM feature installation is aborted.

28.6 Data schema (DS) (CM, MIBS, RDB)

Not applicable to this feature.

28.7 Service Orders (SO) (CM & SESM)

Not applicable to this feature.

28.8 Software optionality control (SOC)

Not applicable to this feature.

28.13 Configuration Walkthrough

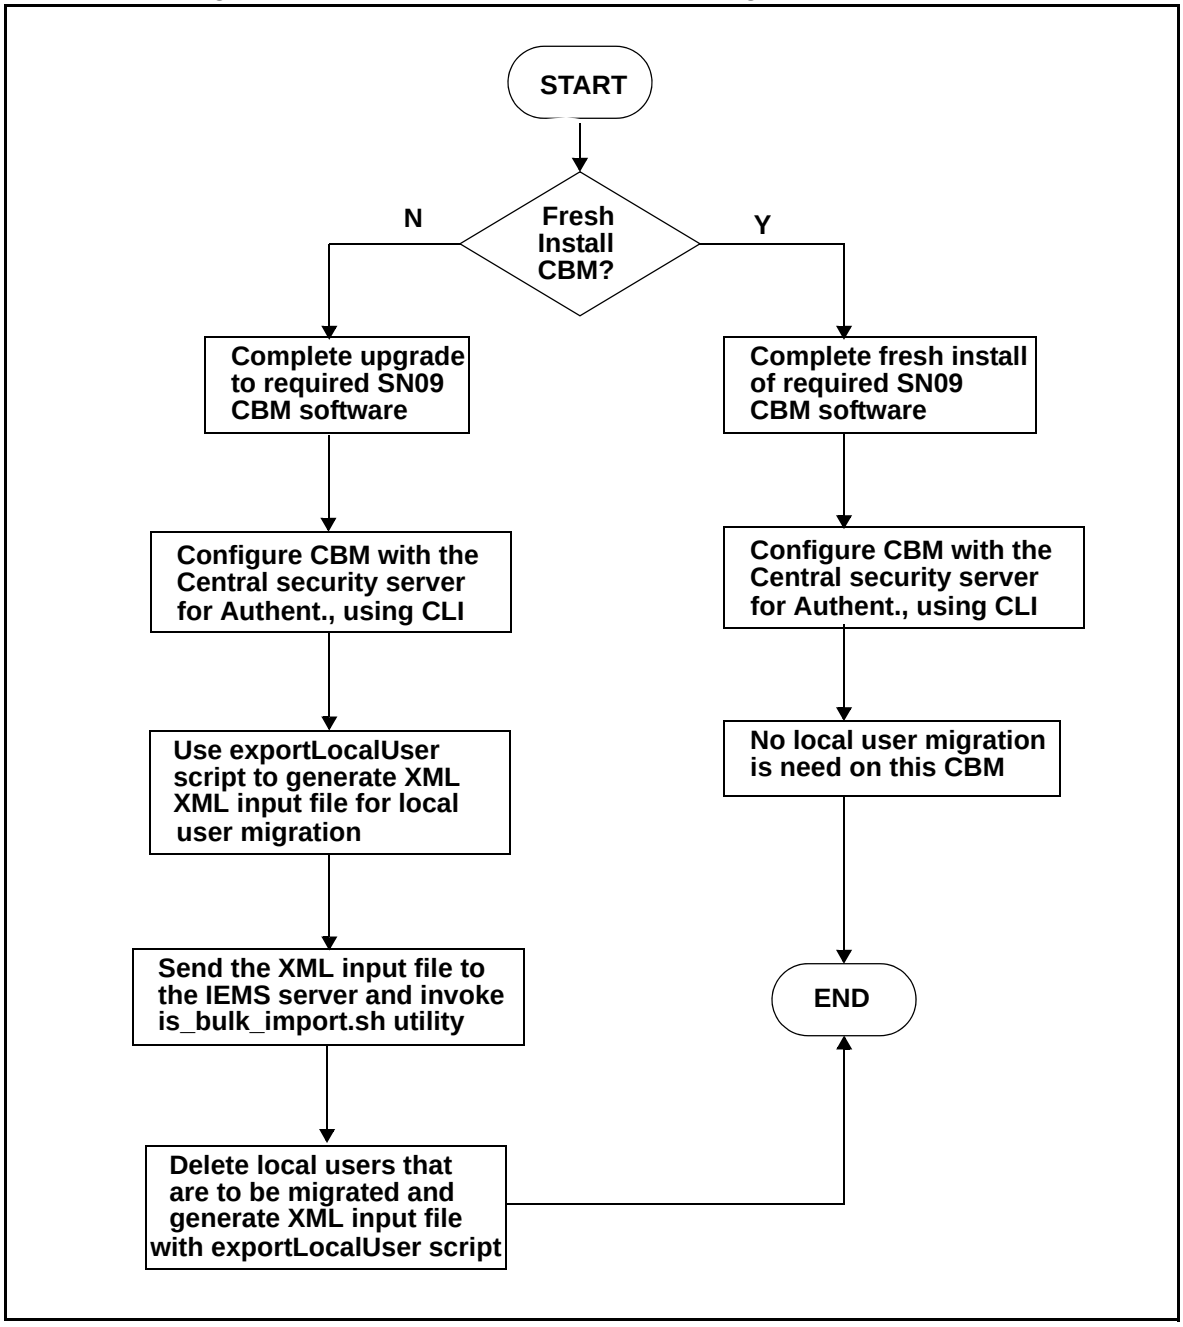
28.13.1 CBM Local User Migration to IEMS

CBM user migration to the IEMS needs to take place when the CBM settings are changed from the local security configuration (i.e. Standalone) to the IEMS central security server configuration.

A new CBM exportLocalUser script is introduced by this feature to generate the XML input file needed by the IEMS's is_bulk_import.sh utility for CBM local user migration.

The following figure shows the steps for CBM local user migration to IEMS:

Figure 1 Flow chart for CBM Local User Migration to IEMS



29: Configuration (CN): A00009470

29.1 Feature Name

SDM to support Security Assertion Markup Language (SAML) NSSwitch client

29.2 Hardware and Software Requirements

SDM standard hardware and software are required.

No new hardware is needed for this feature. However, the software for this feature needs to be installed on an SDM before feature configuration can take place.

For SDM deployment with IEMS centralized security server, IEMS and its hardware and software dependencies need to be available and configured.

29.3 Initial Configuration

- No hardware initial configuration for this feature.
- The initial software configuration for this feature is using local security server (i.e. native AIX security system) for authentication and authorization. No user input is needed for initialization.

29.4 Office/Subnet parameters (OP/SP) (CM & SESM)

Not applicable to this feature.

29.5 Upgrade Considerations

29.5.1 Dump and Restore (CM)

Not applicable to this feature.

29.5.2 Element Management Upgrade

No impact to Element Management Upgrade when an SDM is deployed without external security server.

IEMS central server must be upgraded to the same release as SDM before an SDM can be configured to use IEMS as the centralized security server.

Local user migration from SDM to IEMS should not take place during upgrade. It should take place after SDM and IEMS are upgraded to the same software release.

29.5.3 Downgrade impact

No impact to downgrade if the SDM feature installation is aborted.

29.6 Data schema (DS) (CM, MIBS, RDB)

Not applicable to this feature.

29.7 Service Orders (SO) (CM & SESM)

Not applicable to this feature.

29.8 Software optionality control (SOC)

Not applicable to this feature.

The same configuration steps should be used when any of the SAML client configuration values (IP Address, Fully Qualified Domain Name or System account password) need to be changed later.

NOTE: For network amAdmin system account password change, please refer to MFT's Security Services 1.1 Interface Definition Appendix G (IEMS amAdmin password change procedure).

http://knowledgeonline.ca.nortel.com/sws/livelink.exe/3747266/Security_Services_1.1_ID?func=doc.Fetch&nodeid=3747266

When SAML is selected for Authentication Naming Service, IEMS should be used for Authentication PAM Stack. This is the correct combination for using IEMS as the central security server on an SDM.

29.9.2 New command: deleteIEMSLocalEntry

A new command, deleteIEMSLocalEntry, is added so the administrator can clean up the /etc/passwd file after a SN08 SDM with IEMS as the central server is upgraded to SN09 SDM software. This command is not needed when an SDM with IEMS configuration is upgraded from SN09 or newer releases.

The synopsis of the command is:

```
deleteIEMSLocalEntry { "ALL" | user}
```

Where:

ALL will cause all IEMS user entries in /etc/passwd will be deleted

<user> is the UID of the IEMS user that will be deleted

29.9.2.1 Example

The following is the example command line for cleaning up /etc/passwd after an SDM with IEMS configuration is upgraded from SN08 to SN09:

```
deleteIEMSLocalEntry ALL
```

29.9.3 Deleted command: enableIEMSUser

SN08 SDM command, enableIEMSUser for allowing an IEMS user to logon to an SDM will be deleted.

29.9.4 Deleted command: disableIEMSUser

SN08 SDM command, disableIEMSUser to disallow an IEMS user to logon to an SDM will be deleted.

29.10 User interface changes

Not applicable to this feature.

29.11 OSSGate Interface Changes

Not applicable to this feature.

29.12 Security

The feature will enhance user authentication and authorization for SDM.

29.12.1 Network configuration

31: Configuration (CN): A00009532

31.1 Feature Name

Support host to host tunnels for all northbound OSS connections

31.2 Hardware and Software Requirements

SN09 or later software load for the SSPFS server (such as Integrated Element Manager System (IEMS)).

31.3 Initial Configuration

31.3.1 Security

From a high-level here are the steps to enable security for a northbound OSS.

1. Load SSPFS server (such as IEMS) with required SN09 or later software load.
2. Enable security on the OSS to secure the connection to the SSPFS server. Details of this step are beyond the scope of this document as each OSS provisioning mechanism is different.
3. The craftsperson will then use a web browser and connect to the SSPFS server machine's Server Security Manager (SSM). This is done using the item under the EMS Platforms, SSPFS menu at the top, or manually by entering the correct address information in a supported web browser. *Only users with the necessary security privileges can access to SSM . This is done using a separate Succession Login to SSM.*
4. After logging in, the craftsperson will enable security for communications with the OSS IP address.
5. This will complete securing the OSS link.

31.3.1.1 OSS

Details of OSS operation are beyond the scope of this document as each OSS provisioning mechanism is different.

IPSec and IKE configuration parameters that are provisioned on the OSS must match the corresponding IPSec and IKE parameters on the IEMS, provisioned via the Server Security Manager.

31.3.1.2 SSPFS Server System

IPSec and IKE configuration parameters that are provisioned, via the server security manager, must match the corresponding IPSec and IKE parameters on the OSS.

31.4 Office/Subnet parameters (OP/SP) (CM & SESM)

31.9 Integrated Element Manager System

31.9.1 Security Button

A new security item under the EMS Platforms, SSPFS menu at the top, is now available in IEMS to launch the Server Security Manager. The URL will be http://<SSPFS server ip address>/ipsec/security.html.

31.9.2 Server Security Manager

31.9.2.1 Functional description

This HTML webpage will be used to define security parameters to secure communications into and out from the SSPFS server machine. This includes IEMS to OSS communications.

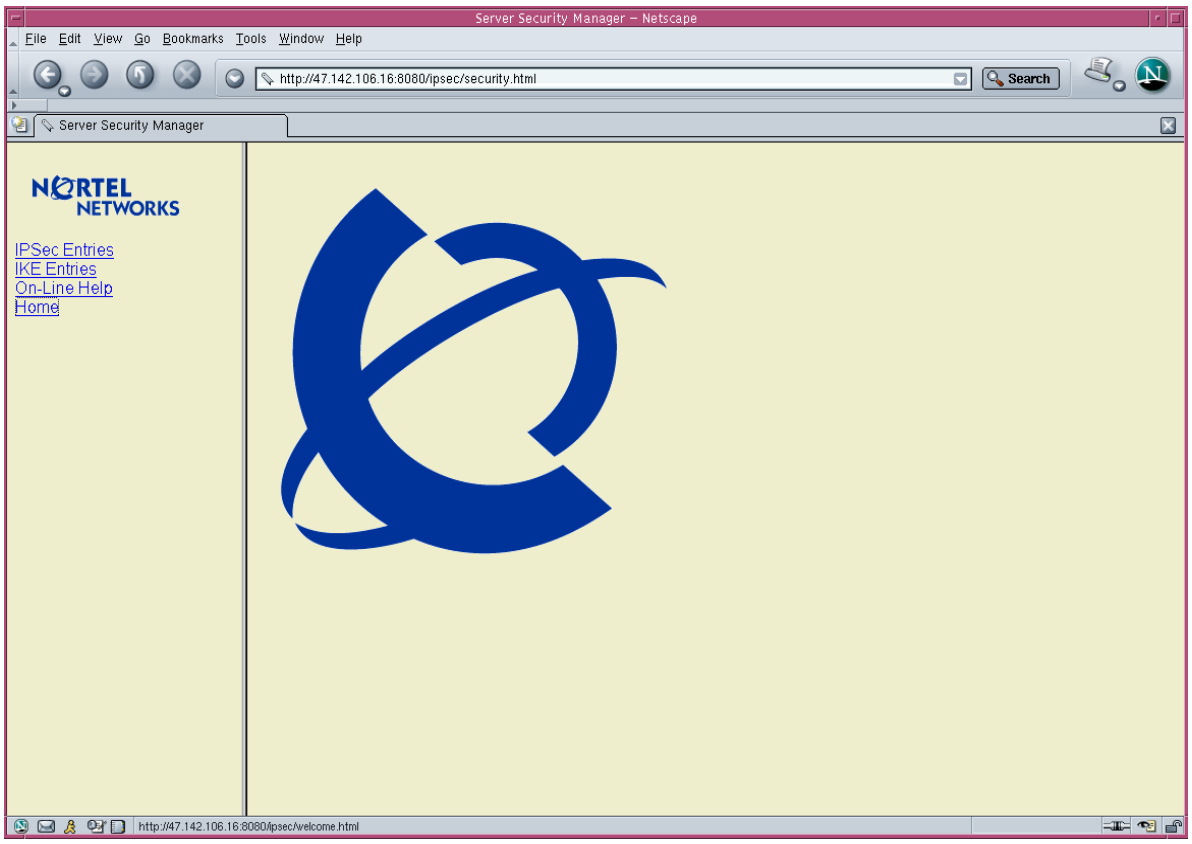
The craftsperson will be presented with two tables representing currently provisioned security parameters. One for IPSec parameters and one for IKE parameters. Options to add and delete entries are available. Adding entries will be performed using HTML forms.

The IPSec Entries page allows retrieval and manipulation of IPSec policies for a host server. Once the policies are configured, all outbound and inbound datagrams are subject to policy checks as they exit and enter the host server. If no entry is found, no policy checks will be made, and all the traffic will pass through unimpeded. Depending upon the match of the policy entry, a specific action will be taken.

The IKE Entries page allows retrieval and manipulation of Internet Key Exchange policies for a host server. Once a policy is configured, the IKE daemon running on the IEMS server can negotiate with a remote host to establish the actual IPSec keys used to secure messages between IEMS and the OSS host.

Note: Only users with the necessary security privileges can access SSM. This is done using a separate Succession Login to SSM.

The following is the first page presented to the craftsperson upon opening the Server Security Manager:



Navigation is performed using the links on the left frame. User input is performed or operation output is displayed in the right frame.

31.9.2.2 GUI usage and implications

Primary usage of this interface in SN09 is to secure the communications channel between SSPFS server application such as IEMS and an OSS.

First, IPSec entries are created using the desired parameters. If the craftsperson has chosen to use the “IPSec” action, the second step is to create a corresponding IKE entry using the desired parameters.

Note: This interface provides for securing all network communications and not just OSS communications. Care must be taken when provisioning or deleting the security parameters, so as not to effect other essential communications, such as telnet, ftp, etc.

31.9.2.3 IPSec fields

The following table lists the security fields for IPSec parameters.

Table 1 IPSec field descriptions

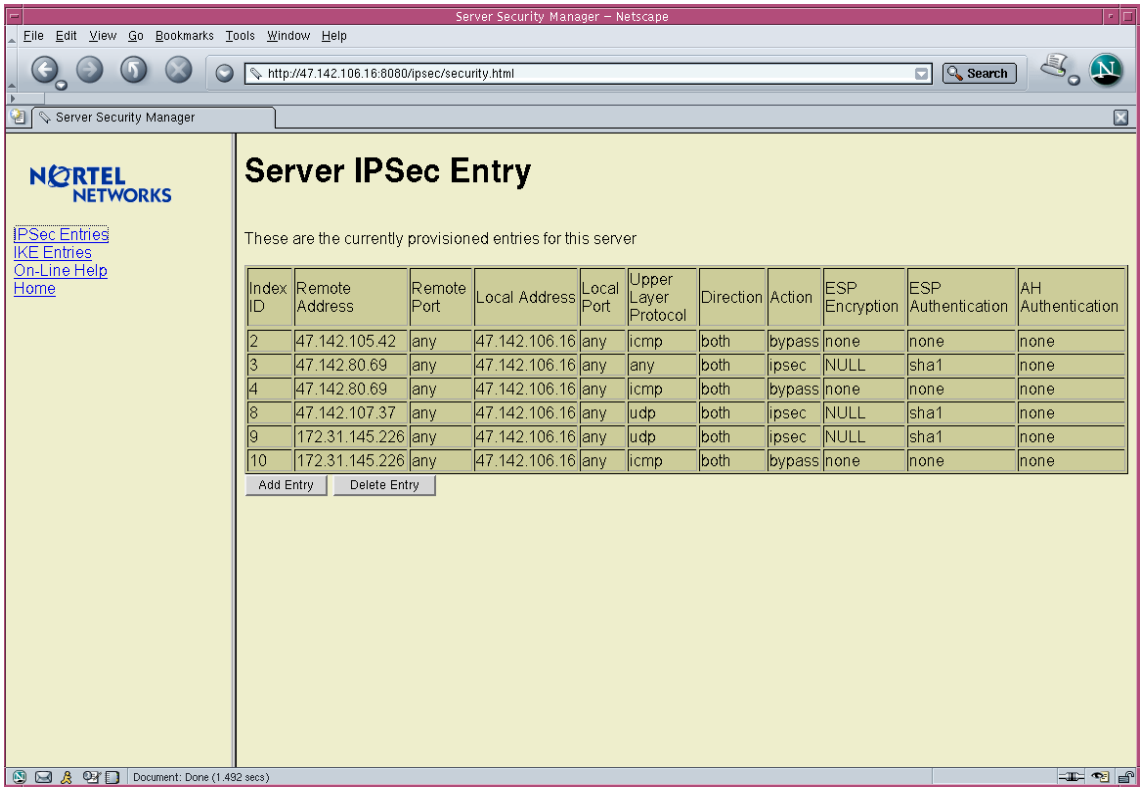
Field	New or Changed	Subfield	Entry	Explanation and action
Index ID	New	No	Integer	Internal index used by the server to track and reference IPSec entries.
Remote Address	New	No	A numeric internet IP address of the form: www.xxx.yyy.zzz	Remote Address means the source address on incoming packets and destination address on outgoing packets.
Remote Port	New	No	1 - 65535, any	IP port of the remote system communicating with this server.
Local Address	New	No	A numeric internet IP address of the form: www.xxx.yyy.zzz	Local Address means the destination address on incoming packets and source address on outgoing packets.
Local Port	New	No	1 - 65535, any	IP port of this server.
Upper Layer Protocol	New	No	any, icmp, tcp, and udp.	Determines which protocol traffic this entry is matched against.
Direction	New	No	in, out, and both.	Determines whether this entry is for inbound or outbound traffic.
Action	New	No	bypass, drop, and ipsec.	Determines the action to take when the traffic pattern is matched.

Table 1 IPSec field descriptions

Field	New or Changed	Subfield	Entry	Explanation and action
ESP Encryption	New	No	none, any, NULL, des, 3des.	Describes the encryption algorithm that will be used to apply the IPSec ESP protocol to outbound datagrams and verify it to be present on inbound datagrams. Only valid when action is set to “ipsec”.
ESP Authentication	New	No	none, any, sha1, and md5.	Describes the authentication algorithm that will be used to apply the IPSec ESP protocol to outbound datagrams and verify it to be present on inbound datagrams. Only valid when action is set to “ipsec”.
AH Authentication	New	No	none, any, sha1, and md5.	Describes the encryption algorithm that will be used to apply the IPSec AH header on outbound datagrams and verify it to be present on inbound datagrams. Only valid when action is set to “ipsec”.

31.9.2.4 IPSec provisioned entries example

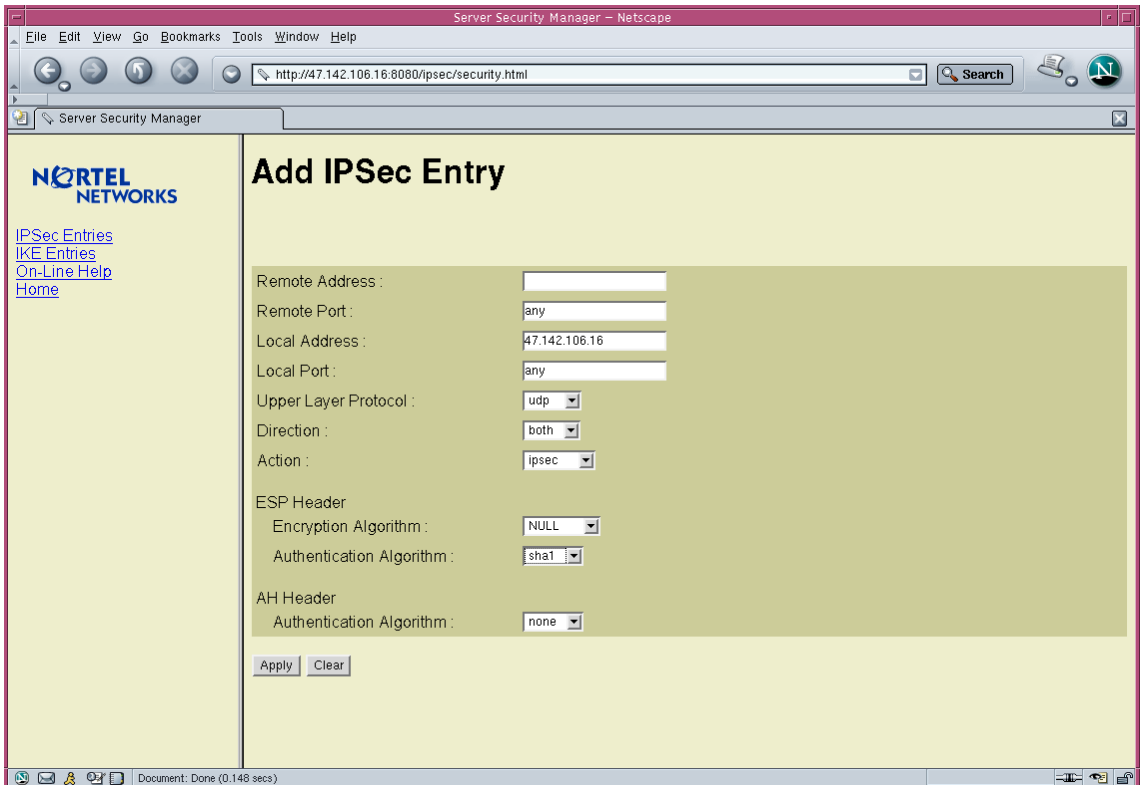
The following example shows a number of IPSec entries for an IEMS server:



Index ID	Remote Address	Remote Port	Local Address	Local Port	Upper Layer Protocol	Direction	Action	ESP Encryption	ESP Authentication	AH Authentication
2	47.142.105.42	any	47.142.106.16	any	icmp	both	bypass	none	none	none
3	47.142.80.69	any	47.142.106.16	any	any	both	ipsec	NULL	sha1	none
4	47.142.80.69	any	47.142.106.16	any	icmp	both	bypass	none	none	none
8	47.142.107.37	any	47.142.106.16	any	udp	both	ipsec	NULL	sha1	none
9	172.31.145.226	any	47.142.106.16	any	udp	both	ipsec	NULL	sha1	none
10	172.31.145.226	any	47.142.106.16	any	icmp	both	bypass	none	none	none

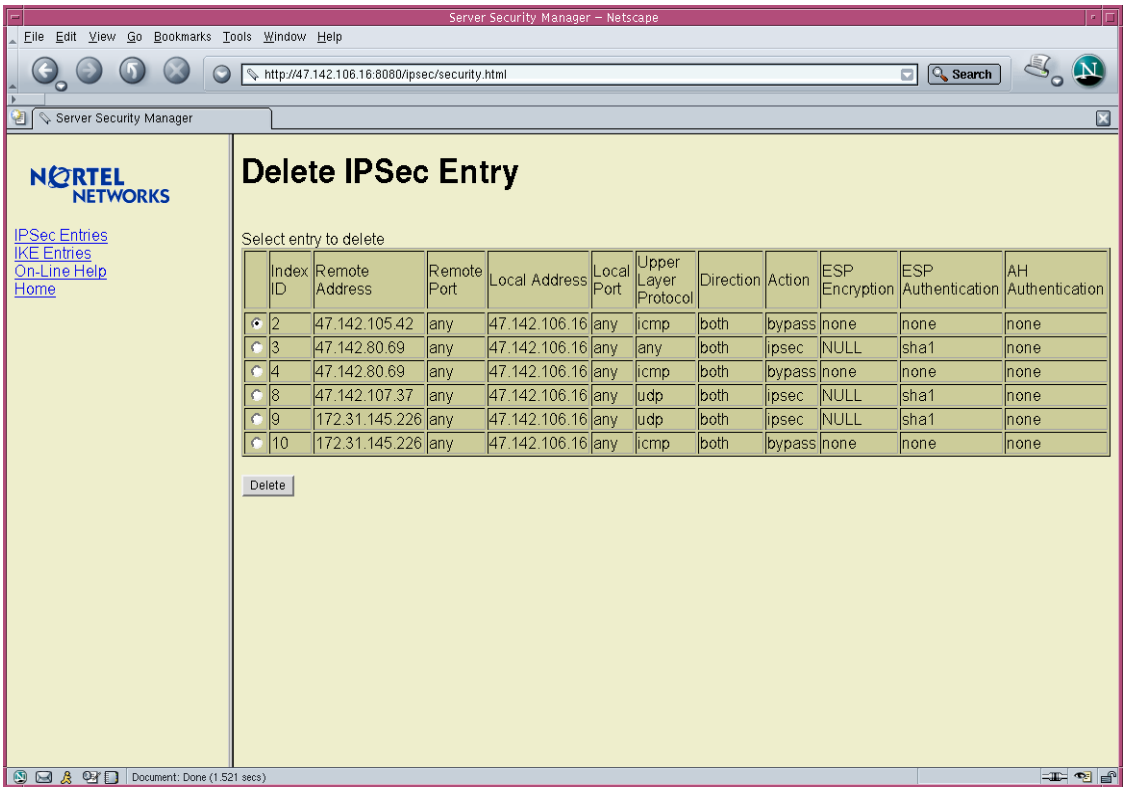
31.9.2.5 IPSec entry form example

The following example shows a form for creating IPSec entries for an IEMS server:



31.9.2.6 IPSec entry deletion example

The following example shows a table for deleting IPSec entries for an IEMS server:



31.9.2.7 Recommended Parameter settings

******This section will need to be verified.******

The following are the recommended parameters to be used when connecting to an OSS

1. Remote Address is the address of the OSS as seen by SSPFS server application, such as IEMS.
2. Remote Port is “any”.
3. Local Address is the address of the SSPFS server as seen by the OSS.
4. Local Port is “any”.
5. Upper Layer Protocol is “any”.
6. Direction is “both”.
7. Action is “ipsec”.
8. ESP Encryption Algorithm is “3des”. (if encryption of data is required)

9 ESP Authentication Algorithm is “sha1”.

10 AH Authentication Algorithm is “none”.

31.9.2.8 IKE fields

The following table lists the security fields for IKE parameters.

Table 2 IKE field descriptions

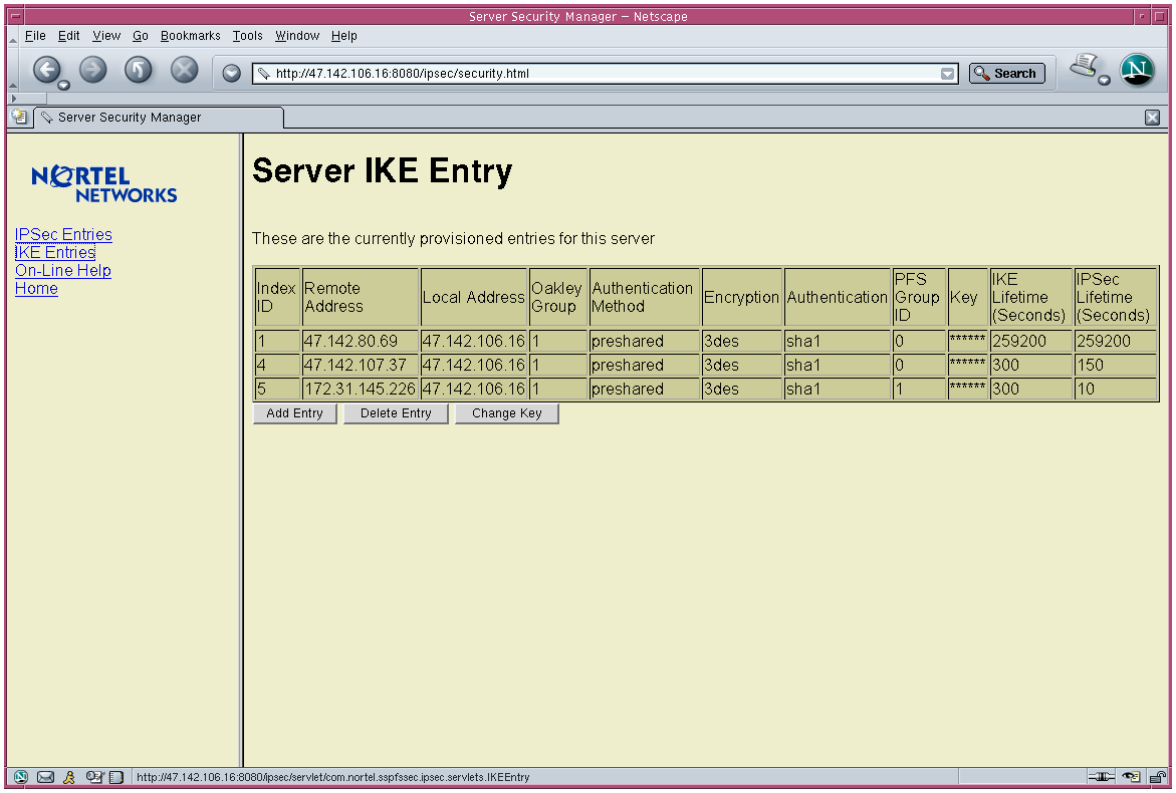
Field	New or Changed	Subfield	Entry	Explanation and action
Index ID	New	No	Integer	Internal index used by the server to track and reference IKE entries.
Remote Address	New	No	A numeric internet IP address of the form: www.xxx.yyy.zzz	IP address of the remote system communicating with this server.
Local Address	New	No	A numeric internet IP address of the form: www.xxx.yyy.zzz	IP address of this server.
Oakley Group	New	No	1 (768-bit), 2 (1024-bit), or 5 (1536-bit).	The Oakley Diffie-Hellman group used for IKE Security Association key derivation.
Authentication Method	New	No	Preshared is the only supported option.	The authentication method used for IKE phase 1.
Encryption	New	No	des and 3des	Specifies the encryption algorithm for a Security Association.
Authentication	New	No	sha1 and md5.	Specifies the authentication algorithm for a Security Association.
PFS Group ID	New	No	0 (do not use Perfect Forward Secrecy for IPsec SAs), 1 (768-bit), 2 (1024-bit), and 5 (1536-bit).	The Oakley Diffie-Hellman group used for IPsec Security Association key derivation.
Key	New	No	20 - 120 character ASCII string	Specifies the preshared key for this Security Association.

Table 2 IKE field descriptions

Field	New or Changed	Subfield	Entry	Explanation and action
IKE Lifetime	New	No	Maximum allowed value is 2,419,200 seconds, 40,320 minutes, 672 hours or 28 days.	Specifies the lifetime for a IKE phase 1 Security Association.
IPSec Lifetime	New	No	Maximum allowed value is 2,419,200 seconds, 40,320 minutes, 672 hours or 28 days.	Specifies the lifetime for an IPSec Security Association.

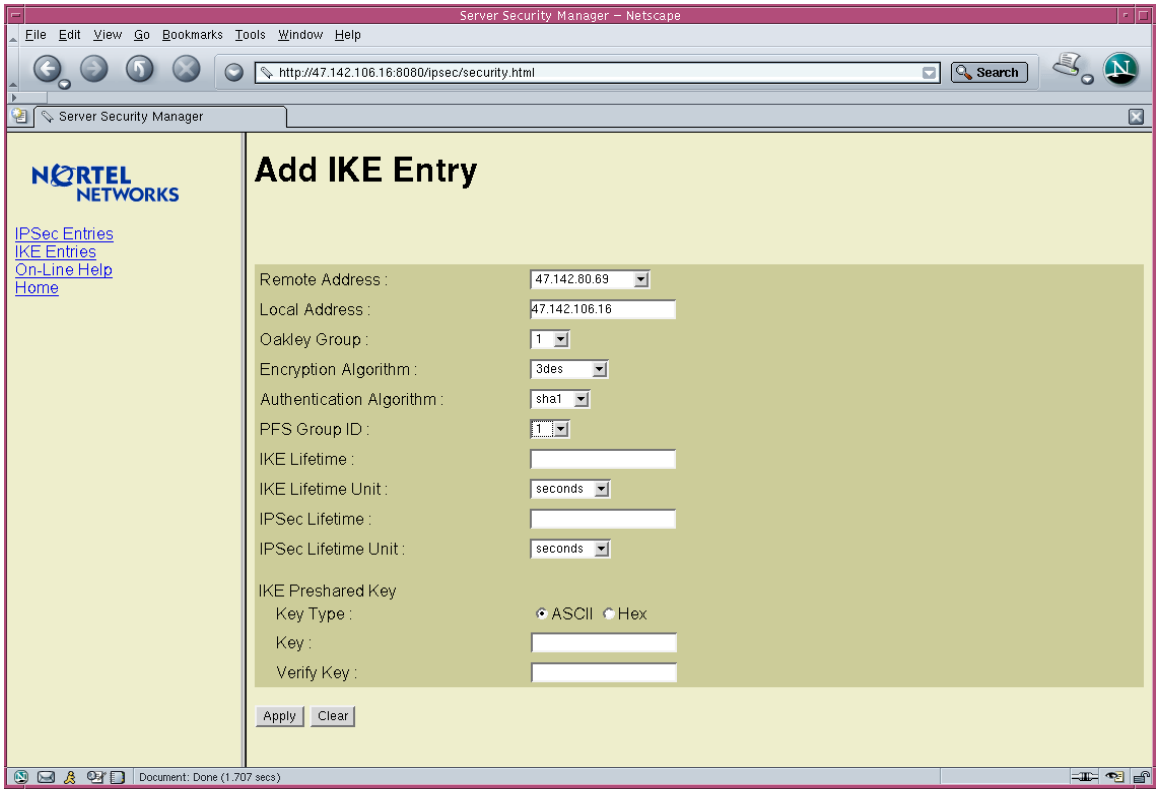
31.9.2.9 IKE provisioned entries example

The following example shows a number of IKE entries for an IEMS server:



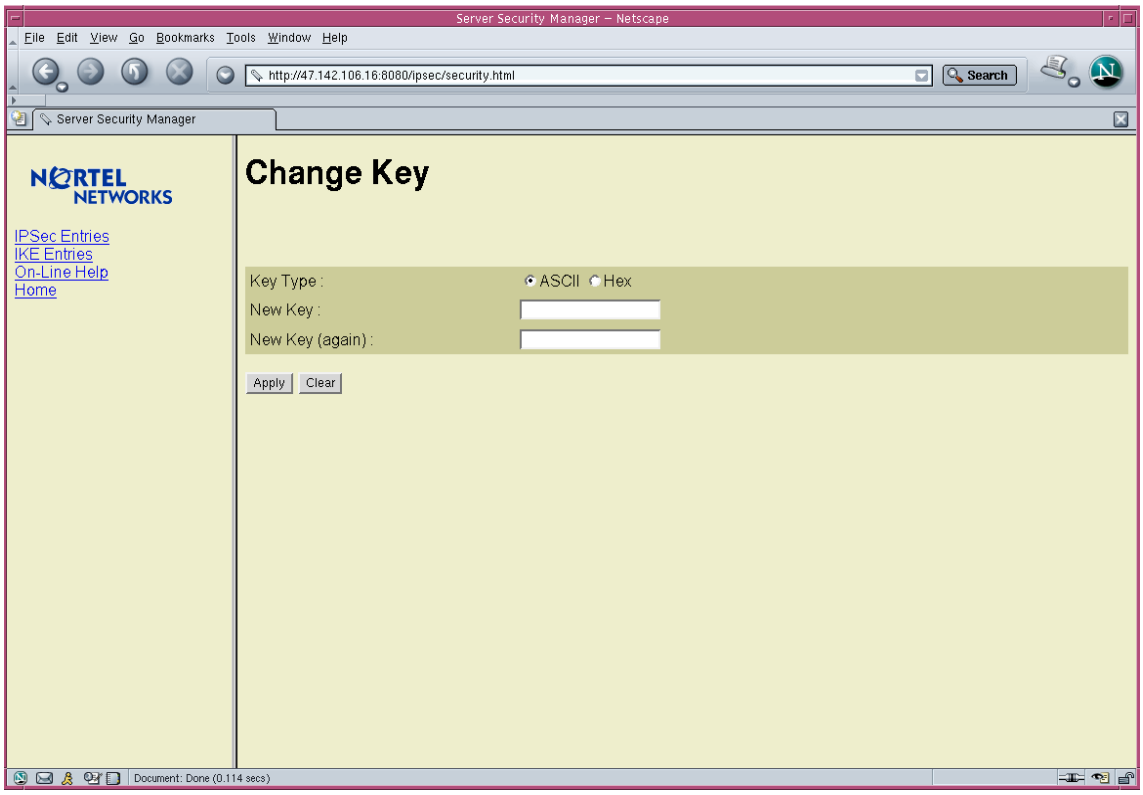
31.9.2.10 IKE entry form example

The following example shows a form for creating IKE entries for an IEMS server:



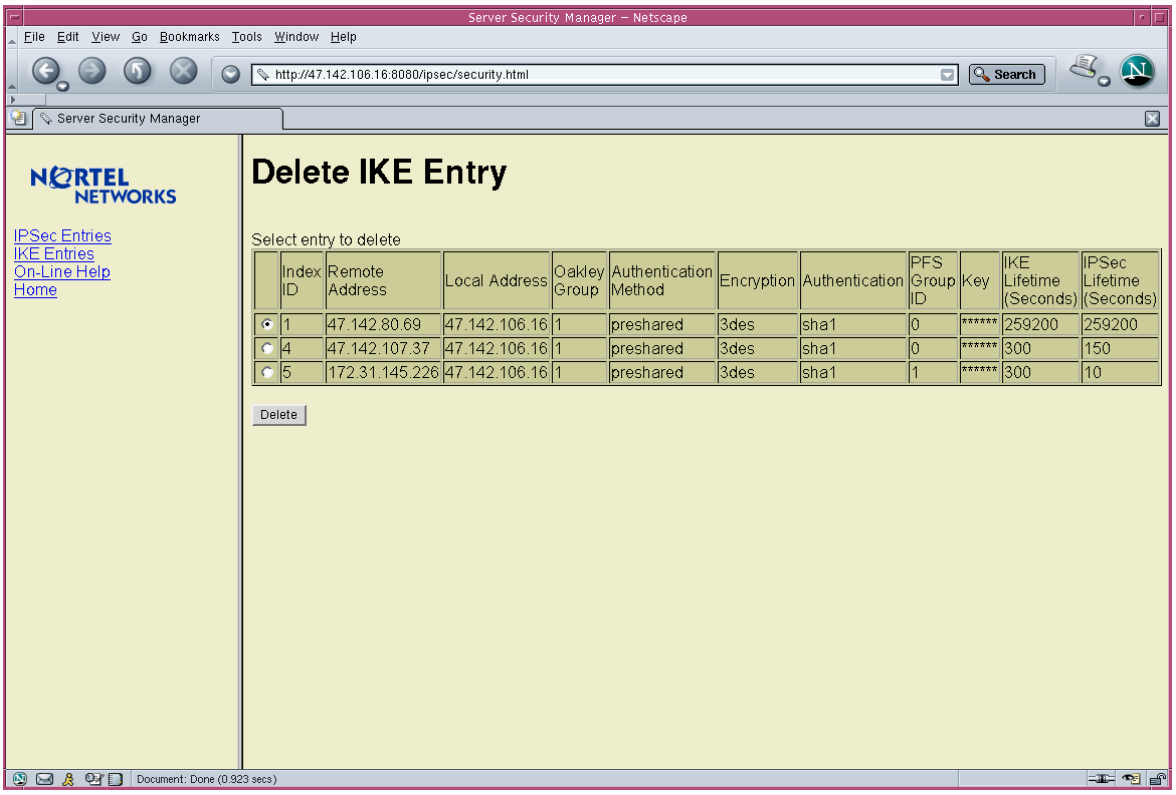
31.9.2.11 IKE change key form example

The following example shows a form for changing an IKE key entry for an IEMS server:



31.9.2.12 IKE entry deletion example

The following example shows a table for deleting IKE entries for an IEMS server:



31.9.2.13 OSS Parameter settings

******This section will need to be verified.******

For each OSS provisioned and requiring IPSec security, one IPSec entry must be created. For each “ipsec” entry there must be a corresponding IKE entry.

The IKE entry must be provisioned as follows:

1. Remote Address is the address of the OSS as seen by SSPFS based application, such as IEMS.
2. Local Address is the address of the OSS as seen by SSPFS based application, such as IEMS.
3. Oakley Group is “1”.
4. Encryption Algorithm is “3des”.
5. Authentication Algorithm is “sha1”.
6. PFS Group ID is “1”.
7. IKE Lifetime is “8”.

8. IKE Lifetime Unit is “hours”.

9. IPSec Lifetime is “8”.

10. IPSec LIfetime Unit is “hours”.

11. Key Type is “ASCII”.

12. Enter the same key that is entered at the OSS. Twice for verification.

31.9.2.14 GUI release history update

The following information was added:

Initial availability.

31.9.2.15 Supplementary information

None

31.9.2.16 CLUI Interface

Not applicable

31.10 Command interface changes

Not applicable

31.11 Security

31.11.1 Network configuration

UDP Port 500 needs to be open on any firewall for IKE.

UDP Port 500 needs to be open on any firewall for IPSec.

31.11.2 Key management

31.11.2.1 IKE Preshared key

The IKE preshared key is input by the user in the Server Security Manager. This key is secured by the use of secure http, if configured, from the browser to the server.

Note: Solaris stores all keys in a hidden system file not accessible by common users but is available to the ROOT user.

31.11.3 Protocol

IPSec is being used on the Solaris machine.

31.11.4 Authentication

A separate Succession Login will be used for Server Security Manager.

31.12 Configuration Walkthrough

31.12.1 OSS Security

From a high-level here are the steps to enable security on the northbound OSS.

1. Load SSPFS server with required SN09 or later software load.
2. Enable security on the OSS to secure the connection to the SSPFS server. Details of this step are beyond the scope of this document as each OSS provisioning mechanism is different.
3. The craftsperson will then use a web browser and connect to the SSPFS server machine's Server Security Manager (SSM). This is done using the item under the EMS Platforms, SSPFS menu at the top, or manually by entering the correct address information in a supported web browser.
4. After logging in, the craftsperson will enable security on communications with the OSS IP address.
5. This will complete securing the OSS link.

32: Configuration (CN): A00009576

32.1 Feature Name

H.323 RASLess Provisioning

The SN09FF RASLess H.323 Provisioning feature provides the ability to explicitly configure H.323 gateways/gatekeepers on the Succession CS2K (Communication Server 2000) with the “RAS-less” functionality.

32.2 Hardware and Software Requirements

This feature is being delivered as part of the Succession release SN09FF.

32.3 Initial Configuration

This activity enables a craftperson to explicitly provision the RAS-less functionality against a H.323 gateway/gatekeeper on the CS2K. The associate media gateway operation processed on the CS2K Management Tools server has been updated with the ability to accept optional device data via the GUI or OSSGate XML interface. The RASLess option is part of the new optional application data. The new optional data, including RASLess, can be queried and viewed via the GUI or XML interface of the CMT (CS2K Management Tools) server.

The CS2K Management Tools server and GWC(s) (Gateway Controllers) must be configured with the SN09FF software.

32.4 Subnet parameters (SESM)

The RAS-less capability is configured during gateway association via the CS2K Management Tools server.

H.225 defines RAS (Registration, Admission and Status) messages and procedures for controlling access to the network. These messages allow H.323 endpoints to discover and register with a H.323 gatekeeper, to provide information about their capabilities and to request the allocation of appropriate amounts of bandwidth. For some applications, H225/H245 signaling should be used between the CS2K and another entity (e.g. softswitch, gatekeeper, or gateway) for setting up calls, but with no RAS messages. This mode of operation is deemed “RAS-less”.

32.4.1 New/modified subnet parameters

Table 1 New RAS-less parameter

Parameter name	NEW/ CHANGED/ DELETED/ RELOCATED	Domain (CM or Subnet Management
RASLess	New	associate media gateway, query media gateway

32.4.2 Parameter information

The optional RASLess boolean configures a H.323 gateway/gatekeeper on the CS2K with the RAS-less capability.

32.4.2.1 RASLess

RASLess

32.4.2.1.1 Functional description

The optional RASless boolean configuration signifies to the CS2K H.323 Gatekeeper application that the respective gateway/gatekeeper will function in a “RAS-less” mode.

32.4.2.1.2 Provisioning rules Range information

Only H.323 gateways/gatekeepers can be configured with the RASLess option.

32.4.2.1.3 Range information

Table 2 Range Information

Minimum	Maximum	Default
boolean option (True or False)	boolean option (True or False)	False

32.4.2.1.4 Activation

The parameter is activated once a H.323 gateway/gatekeeper with the RASLess option set to “True” is provisioned.

32.4.2.1.5 Dependencies

There are no table dependencies.

32.4.2.1.6 Consequences

The RASLess option is a boolean.

32.4.2.1.7 Verification

A craftperson can verify that the RASLess option is working if a H.323 gateway/gatekeeper can successfully register without sending RAS messages to a CS2K H.323 gatekeeper.

32.5 Upgrade Considerations

The RASLess functionality was added to the H.323 GWC in the SN08 release. The functionality was configured by setting the gateway's protocol port value to "1720". During an upgrade from SN08/SN09 to SN09FF, all H.323 gateways/gatekeepers with a provisioned port value of "1720" will have the RASLess boolean set to "True".

32.5.1 Element Management Upgrade

If an attempt is made to provision a H.323 gateway/gatekeeper with the RASLess functionality on a pre-SN09FF H.323 GWC, an error message will be generated and presented to the craftperson via the CS2K Management Tools GUI or XML interface.

32.5.2 Downgrade impact

If a downgrade is executed the RASLess option will be deleted from the respective H.323 gateways/gatekeepers.

32.6 Data schema (DS) (CM, MIBS, RDB)

32.6.1 New GWC-APP-DATA-MIB

Table 3 New or modified tables

MIB name	NEW/CHANGED/ or DELETED/
GWC-APP-DATA-MIB	New

32.6.2 Table/MIB/Remote Database Schema information

A new optional GWC-APP-DATA-MIB has been created to convey optional application specific data to the GWC.

32.6.2.1 Name: GWC-APP-DATA-MIB

32.6.2.1.1 Functional description

The new GWC-APP-DATA-MIB is a generic structure to provide the ability of the GWC EM to convey optional application data to the GWC.

32.6.2.1.2 OIDs

The following table lists OIDs for the new GWC-APP-DATA-MIB.

Table 4 OID descriptions

OID	New or Changed	Subfield or refinement	Entry	Explanation and action
appDataGlobalId	New	N/A	GWCDeviceGID	global identifier
appDataTag	New	N/A	Integer	name
appDataValue	New	N/A	String	value
appDataEntryStatus	New	N/A	RowStatus	status column for row entry

32.6.2.1.3 Datafill example

The following example shows sample datafill for table Optional Device Data.

globalID, RASLESS, true

32.7 Element Management

32.7.1 New/modified GUIs and Functionality

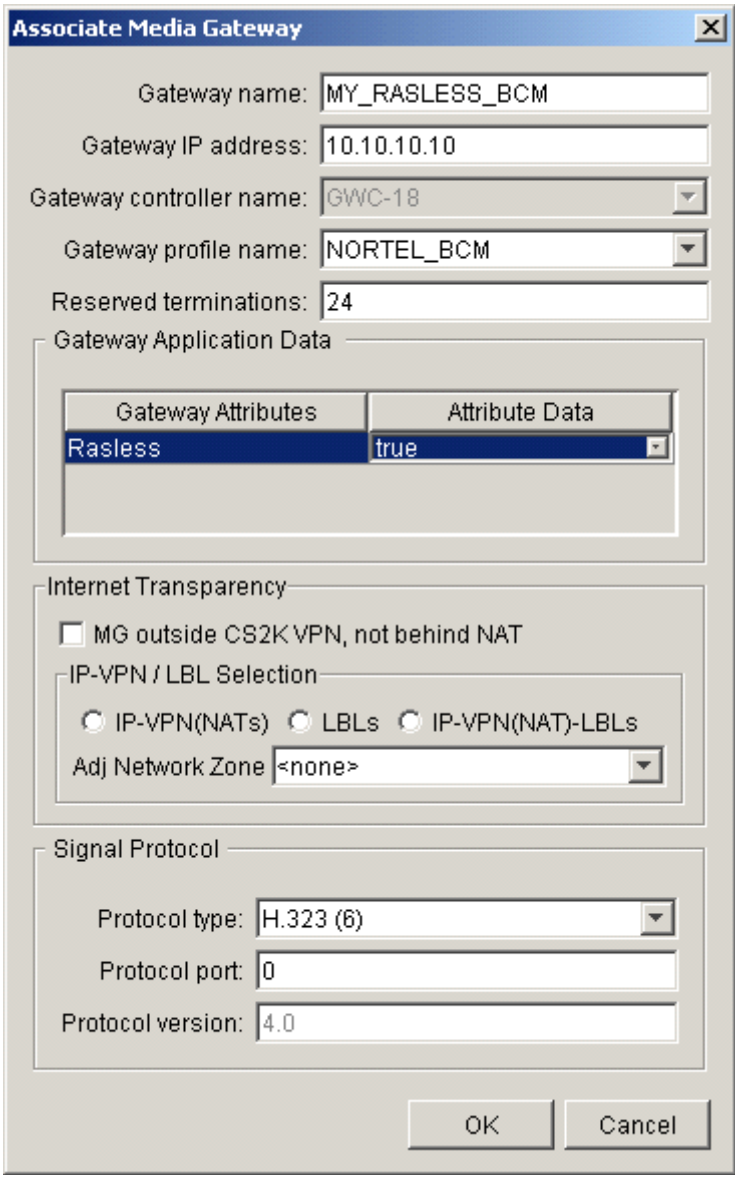
This section describes the changes to GUI of the CS2K Management Tools server affected as a result of this activity.

Table 5 Modified GUI

GUI name	NEW, CHANGED, or DELETED
Associate Media Gateway	Changed by adding optional application data in SN09FF
Details dialog box of the Gateway tab component	Changed by adding optional application data in SN09FF

32.7.2 GUI information

32.7.2.1 GUI name: Associate Media Gateway



Please note that GUI snapshot above displays the RASLess option for a H.323 gateway during an associate gateway operation.

32.7.2.1.1 Functional description

The Associate Media GW dialog box is displayed by using the configuration menu from the main CMT (CS2K Management Tools) GUI or by selecting the "Associate" button from the Gateway panel of a GWC. This dialog box is used to add gateways to the CMT, which in turn populates the respective GWC device. The fields that are available with this dialog have not been updated. An optional data component has been added.

32.7.2.1.2 GUI usage and implications

The associate gateway operation has been updated with the ability to configure the optional RAS-less capability. The RASLess option is displayed as part of the GWC Provisioning Panel of the CMT GUI. The Gateway Tab of the GWC Provisioning Panel has been updated to display the RASLess option.

Once the associate media gateway operation is invoked, the corresponding associate media gateway dialog is launched. To configure the RAS-less functionality, a craftperson must choose a H.323 gateway profile from the "Gateway profile name" pull down menu of the associate media gateway dialog box.

If a H.323 gateway profile is chosen, specific H.323 configuration data options are presented. The new optional data panel has been added to the associate gateway dialog box. The optional "RAS-less" data is presented as part of the new optional data choices. A craftperson can enable the RAS-less capability by setting the option to "true". The default value is "false".

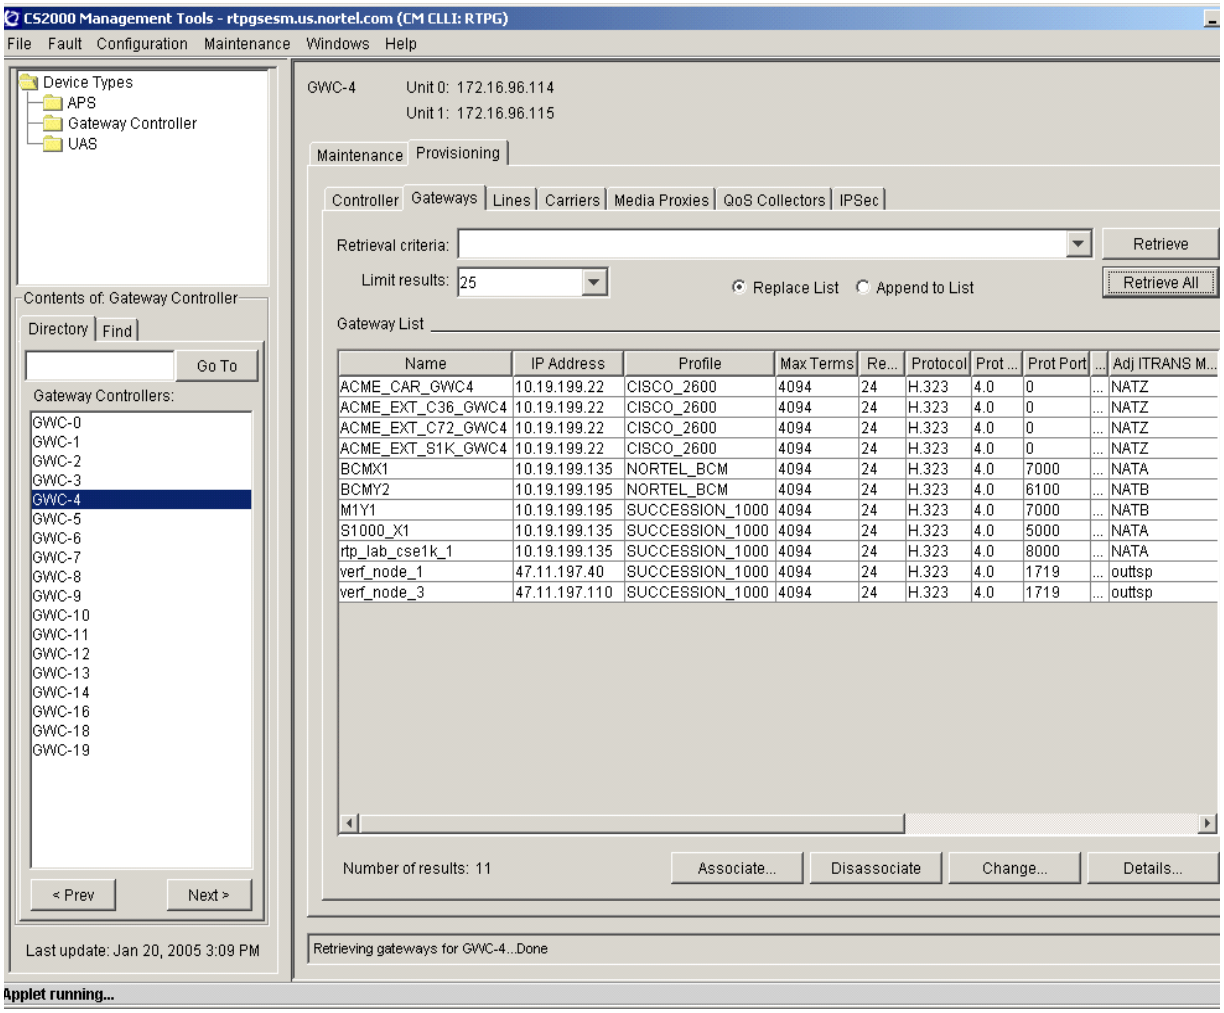
Once all the required data is entered, the "OK" button of the associate media gateway dialog box will be enabled. By clicking on the "OK" button, the GWC EM will process the operation and generate the required SNMP messages. The SNMP messages are sent to the respective GWC. The craftperson will receive a successful or failure response from the GWC EM upon completion of the operation.

The "Details" button of the Gateway tab of the GUI will display the new optional data if supported by the specific gateway profile. A craftperson can click on the Details button to launch a gateway's Details dialog box. The optional gateway data will be displayed for the respective gateway. The RASLess option is listed in the dialog box if the selected gateway is H.323. If there isn't any gateway application data defined for the selected gateway, a dialog box will be launched indicating the respective gateway profile does not have any optional data defined.

The Details button is also used to display the associated "root middleboxes" of a respective gateway. Currently, H.323 gateways do not support root middleboxes.

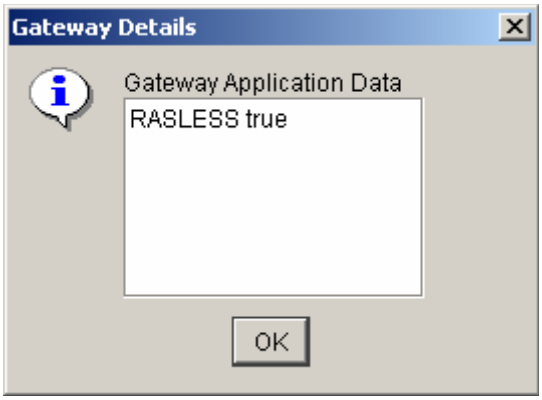
Note: *All current H.323 gateway profiles support the new optional RASLess configuration except for the H323_PROXY gateway profile.*

32.7.2.2 GUI name: Gateway tab of the GWC Provisioning Panel



To display the gateway optional data, a craftperson must click on the “Details” button in the lower right corner of the Gateway tab. The Gateway tab is a component of the GWC Provisioning Panel.

The GUI snapshot below displays the details of a H.323 RAS-less configured gateway.



32.7.2.2.1 Functional description

The “Details” button of the Gateway tab of the GUI will display the new optional data if supported by the specific gateway profile. A craftperson can click on the Details button to launch a gateway’s Details dialog box. The optional gateway data will be displayed for the respective gateway. The RASLess option is listed in the dialog box if the selected gateway is H.323. If there isn’t any gateway application data defined for the selected gateway, a dialog box will be launched indicating the respective gateway profile does not have any optional data defined.

32.8 User interface changes

32.8.1 OSSGate User Interface

This activity modifies support for the operations listed below:

- **associateMG (updated functionality for H.323)**
- **queryMG response (updated functionality for H.323)**

32.8.2 Terminology & Description of New Method Parameters

32.8.2.1 assocMG

The Associate MG command is the OSSGate XML interface used to datafill media gateways. This interface has been modified by adding the optional device data, which includes the RASLess option.

32.8.2.2 queryMG

The Query MG command is the OSSGate XML interface used to retrieve media gateways provisioned on the CS2K. The query interface will return the new RASLess boolean if the query MG operation was invoked against a RAS-less H.323 gateway/gatekeeper.

32.8.3 H.323 Gateway Certificate Changes

H.323 Nortel BCM Certificate changes example

```
<?xml version="1.0" encoding="UTF-8" ?>
<certificate>

 <MaxEndpoints>4094</MaxEndpoints>
 <Category>LARGE</Category>
 <EndpointType>nocarrierTrkGwcNN</EndpointType>
 <GenerateLGRP>true</GenerateLGRP>
 <ResvTermMandatory>true</ResvTermMandatory>
 <ChangeIPAvailable>true</ChangeIPAvailable>
 <DispPhyLocation>false</DispPhyLocation>
 <InventoryType>H.323 Gateway</InventoryType>
 <InventoryRole>Media Gateway</InventoryRole>
 <SupportedProtocol>
  <protocolName>h323</protocolName>
  <version>4.0</version>
 </SupportedProtocol>
 <GWCProfileNumber>61</GWCProfileNumber>
 <EPIDGenDesc>auto1</EPIDGenDesc>
 <ServiceTypeList>H323</ServiceTypeList>
 <ServiceTypeList>ITRANS</ServiceTypeList>
  <CompatibleGWProfileList>NORTEL_BCM</CompatibleGWProfileList>
  <GwAppData name="Rasless" values="false,true" pattern="true|false"/>

 <GatewayNameFormatList>
    <nameFormat formatKey="GATEWAY.H323" enabled="true">
      <delimiters>`</delimiters>
      <maxTokens>1</maxTokens>
      <name>H323 Gateway</name>
      <tokenFormats>
        <tokenFormat tokenKey="GW">
          <pattern><![CDATA[[^"`'<>=]* ]]></pattern>
          <name>Name</name>
        </tokenFormat>
      </tokenFormats>
    </nameFormat>
    <nameFormat formatKey="GATEWAY.ALL" enabled="true">
      <template>gatewayName</template>
      <delimiters>none</delimiters>
      <minLength>1</minLength>
      <maxLength>32</maxLength>
      <name>Generic For All Gateways</name>
      <tokenFormats>
```

Please note that all the existing H.323 certificates except "H323_PROXY" were updated to include the new RASLess option.

32.8.4 XML - Example Commands and Responses

Listed below are syntax examples of the XML commands affected by the H.323 work in this activity. For some cases, new functionality is introduced. For others, new optional tags in reference to H.323 are highlighted. The XML in these examples are formatted for ease of understanding.

32.8.4.1 Command Examples for Associate MG command

The command syntax for assocMG command has changed from prior releases in reference to adding optional data for H.323 gateways. The syntax is listed here as a convenience.

Example format of an **assocMG** command with RASLess

```
<?xml version="1.0" encoding="UTF-8"  ?>
<CommandList>
  <Command>
    <Interface>cs2kCfgMgrIf</Interface>
    <Methods>
    <assocMG usn="1" version="1.0">
        <Parameters>
              <mgUIName>MY_RASLESS_BCM</mgUIName>
              <mgProfileName>NORTEL_BCM</mgProfileName>
              <mgIpAddr>47.142.10.10</mgIpAddr>
              <mgProtocolType>6</mgProtocolType>
              <mgProtocolVersion>4.0</mgProtocolVersion>
              <mgProtocolPort>1720</mgProtocolPort>
              <gwcUIName>GWC-18</gwcUIName>
              <reservedTerminations>24</reservedTerminations>
                <gwAppDataList>
                   <gwAppData>
                      <gwAppTag>Rasless</gwAppTag>
                        <gwAppValue>true</gwAppValue>
                    </gwAppData>
                 </gwAppDataList>
        </Parameters>
    </assocMG>
   </Methods>
  </Command>
</CommandList>
```

32.8.4.2 Command Examples for queryMG command

The command syntax for queryMG command has not changed from prior releases in reference to querying H.323 gateways. The response has changed and now includes the optional data RASLess for H.323 gateways. The syntax is listed here as a convenience.

Example format of a query**MG** command

```
<?xml version="1.0" encoding="UTF-8" ?>
  <CommandList>
    <Command>
      <Interface>cs2kCfgMgrIf</Interface>
      <Methods>
        <queryMG usn="1" version="1.0">
         <Parameters>
           <mgUIName>MY_RASLESS_BCM</mgUIName>
         </Parameters>
        </queryMG>
      </Methods>
   </Command>
</CommandList>
```

Example format of a queryMG response with the RASLess option

```
<?xml version="1.0" encoding="UTF-8" ?>
 <CommandList>
  <Response><Interface>cs2kCfgMgrIf</Interface>
   <Methods><queryMG usn="1" version="1.0">
    <ReturnData>
     <Row>
      <mgUIList>MY_RASLESS_BCM</mgUIList>
      <mgIpList>47.142.10.10</mgIpList>
      <callServerId>MY_CS2K</callServerId>
      <gwcUIName>GWC-18</gwcUIName>
      <svcTypeList>6</svcTypeList>
      <svcTypeList>5</svcTypeList>
      <nodeName>GWC 18</nodeName>
      <itransMiddleboxName>NOT_SET</itransMiddleboxName>
      <algName>NOT_SET</algName>
      <engrEndPoints>24</engrEndPoints>
      <protType>h323</protType>
      <protVersion>4.0</protVersion>
      <protPort>1720</protPort>
      <profileName>NORTEL_BCM</profileName>
      <maxEngrEndPoints>4094</maxEngrEndPoints>
      <frameNumber>not_set</frameNumber>
      <unitNumber>not_set</unitNumber>
      <frameType>not_set</frameType>
      <floorPos>not_set</floorPos>
      <rowPos>not_set</rowPos>
      <framePos>not_set</framePos>
      <unitPos>not_set</unitPos>
      <gwAppDataList>
        <gwAppData>
          <gwAppTag>RASLESS</gwAppTag>
          <gwAppValue>true</gwAppValue>
        </gwAppData>
      </gwAppDataList>
     </Row><RC>0</RC>
     <MsgTxt>Query of a Single MG was successful</MsgTxt>
    </ReturnData>
   </queryMG>
  </Methods>
 </Response>
</CommandList>
```

32.8.5 XML Schema Listings for affected RASLess H.323 commands

32.8.5.1 Assoc MG

The AssocMG schema has been updated to include the optional application data.

```
<xsd:schema xmlns:xsd="http://www.w3.org/2001/XMLSchema"
            version="1.0"
            xml:lang="en" >
```

32.8.5.2 Query MG

No changes have been made to the QueryMG schema. The response for H.323 gateways will include the gateway optional data.

32.9 Limitations and Restrictions

• The optional RAS-less feature can only be provisioned against H.323 gateways/gatekeepers on the CS2K.
• The optional RAS-less feature is not supported with a NAT configuration of N:1. The N:1 NAT configuration is when multiple gateways behind a NAT share the same “NAT’d” IP address and the gateways are uniquely identified by the port value.
• The gateway profile “H323_PROXY” does not support the RAS-less functionality.

32.10 Configuration Walkthrough

32.10.1 Adding a H.323 GW with RASLess option

- SN09FF
  - — Add a H.323 GWC to the system
  - — Associate GW with the GWC including the RASLess option set to “true”
    - Adds GW to GWC
  - — Add a H.323 Carrier
    - Adds EPG to GW

33: Configuration (CN): A00009611

33.1 Feature Name

IEMS Keymile Integration

33.2 UNEM GUI Launch

- Launch UNEM Network browser
- UMUX shelf Configuration GUI

33.2.1 Launch UNEM Network Browser

While adding the UNEM, an additional parameter is provided to specify if the SSH is enabled or not in the device

33.2.2 SSH Enabled

Linux
While launching the UNEM Network browser / UMUX Shelf Configuration a dialog will come up to provide the username/password, IEMS will use the X11 port forwarding and bring up the appropriate GUI.

Windows
While launching the UNEM Network browser/UMUX Shelf Configuration, a dialog box with provision to provide Exceed file path and the login/password using which the appropriate GUI will be brought up.

33.2.3 SSH Disabled

Linux
For solaris clients IEMS will invoke the default Telnet prompt. User has to do the rest manually for invoking the GUI.

Windows
While invoking the UNEM Network Browser / UMUX Shelf Configuration, IEMS client will use the xstart.exe(Exceed tool) to launch the GUI in non-encryption mode.

33.2.4 Launching from the UMUX

The SSH enabled (true/false) value provided for the UNEM while addition will be updated for all the UMUX (NEs). If the SSH is enabled in the UNEM, the launch UMUX shelf configuration from the UMUX devices will try to launch through SSH. If SSH is not enabled in the UNEM device, the launch will fail and the user can subsequently modify the SSH property to disable and proceed with the launch.

33.2.5 Commands used for launch

UNEM Network Browser -- **/usr/local/bin/nocslogin -e ec**

UMUX Shelf Configuration -- **/usr/local/bin/nocslogin -e ne -i**

Windows NON SSH Mode

UNEM Network Browser -- **/usr/local/bin/nocrlogin -e ec -s auto -d**

UMUX Shelf configuration -- **/usr/local/bin/nocrlogin -e ne -i**

33.3 Launching UNEM Browser for UNEM

The UNEM browser for UNEM version 9.0 can be launched from Integrated EMS Java Web Start Client. This procedure describes how to launch the UNEM browser from Integrated EMS Java Web Start Client.

Note: The launching of UNEM Browser works only if the Patch Collection 1 is installed on the UNEM Server.

33.3.1 To launch UNEM browser for UNEM version 9.0, follow these steps:

At Integrated EMS workstation

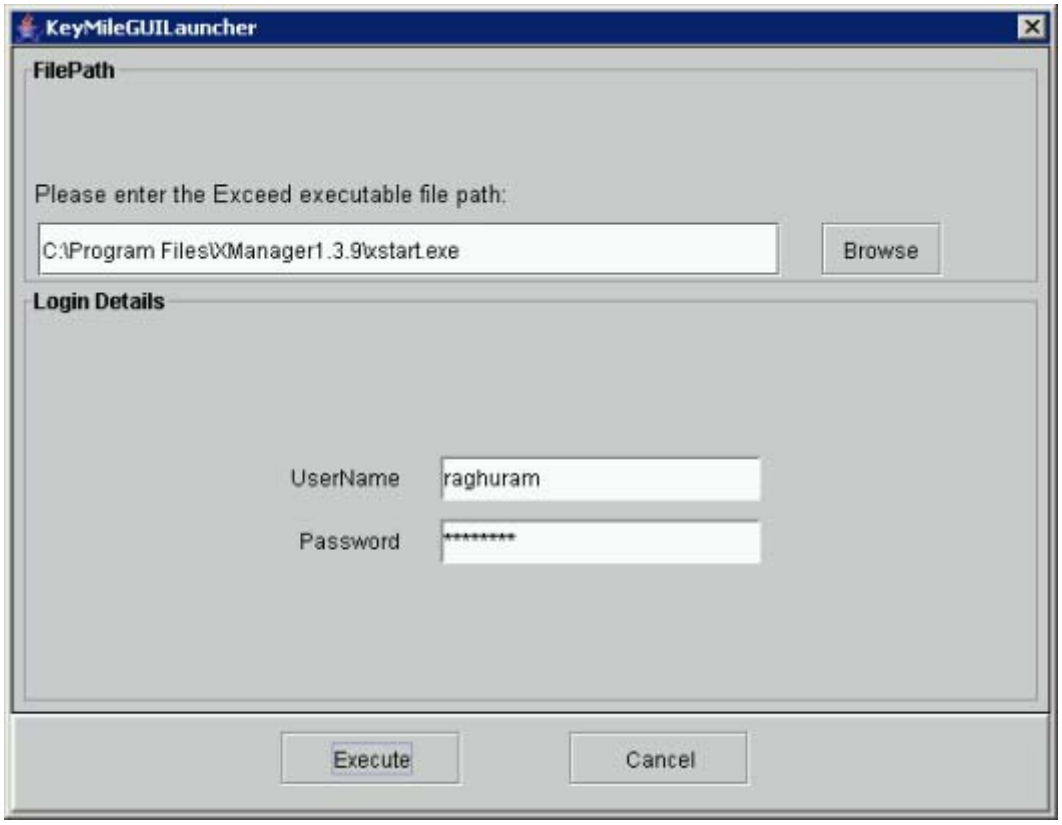
1 Launch the Integrated EMS Java Web Start Client (refer to "Launching the Integrated EMS Java Web Start Client.")

2 Go to the **Element Managers** topology in the Integrated EMS tree.

3 Select an UNEM map symbol.

4 Right-click the map symbol and select the **Launch UNEM Browser** menu item.

The system displays a window similar to the following screen shot for the Integrated EMS Client in Microsoft Windows platform.



5 For Microsoft Windows-based client, click the **Browse** button to select the Exceed application executable file path. This step is not applicable for Solaris-based clients as this field is not present.

Note: For launching the application without SSH, "xstart.exe" must be selected and "exceed.exe" must be selected for launching the application with SSH enabled.

6 Type the user name and password in the respective fields.

7 Click the **Execute** button to execute the specified command.

Note: Integrated EMS saves the location of the script or the executable file and commands in the client system from which the Integrated EMS Java Web Start Client is launched.

33.4 Launching applications for UMUX NEs

The UNEM browser and UMUX Shelf Configuration GUI for UMUX NEs (UMUX 1500, UMUX 1200, and UMUX 900 NEs) version 9.0 can be launched from Integrated EMS Java Web Start Client. This procedure

describes how to launch the UNEM browser from Integrated EMS Java Web Start Client

Note: The launching of UNEM Browser or UMUX Shelf Configuration works only if the Patch Collection 1 is installed on the UNEM Server.

33.4.1 To launch UNEM browser or UMUX Shelf Configuration GUI for UMUX NEs version 9.0, follow these steps:

At Integrated EMS workstation

1 Launch the Integrated EMS Java Web Start Client (refer to "Launching the Integrated EMS Java Web Start Client.")

2 Go to the **Element Managers** topology in the Integrated EMS tree.

3 Select an UMUX NE map symbol.

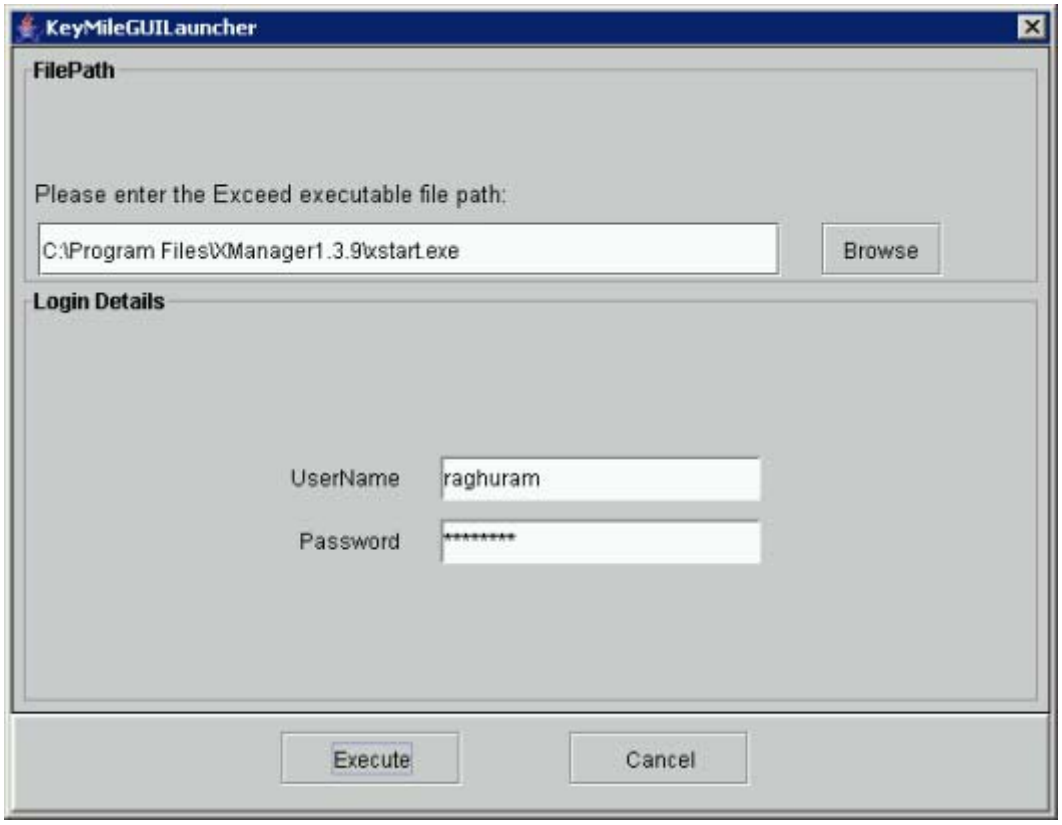
4 Right-click the map symbol and select the **Launch UNEM Browser** menu item.

The system displays a window similar to the following screen shot for the Integrated EMS Client in Microsoft Window platform.

OR

Right-click the map symbol and select the **Launch UMUX Shelf Configuration** menu item.

The system displays a window similar to the following screen shot for the Integrated EMS Client in Microsoft Windows platform.



5 For Microsoft Windows-based client, click the **Browse** button to select the Exceed application executable file path. This step is not applicable for Solaris-based clients as this field is not present.

Note: For launching the application without SSH, "xstart.exe" must be selected and "exceed.exe" must be selected for launching the application with SSH enabled.

6 Type the user name and password in the respective fields.

7 Click the **Execute** button to execute the specified command.

Note: Integrated EMS saves the location of the script or the executable file and commands in the client system from which the Integrated EMS Java Web Start Client is launched.

33.5 Adding a UMUX Network Element Manager (UNEM)

UNEM manages UMUX 1500, UMUX 1200, and UMUX 900 NEs in the UMUX network. The UMUX stands for Universal Multiplexer. When you add an UNEM, these NEs are added as a map symbol under the **Network Elements** topology and **UMUX-1500**, **UMUX-1200**, and **UMUX-900** topology (under **Network Elements** node) respectively. The UNEM is added

as a map symbol in the **Element Managers** topology. Also, the UNEM is added as map symbols in the **EMS-UNEM-Mgr** topology (with added UNEM display name in brackets). This procedure describes how to add the UNEM to the Integrated EMS topology using Integrated EMS Java Web Start Client.

The following list provides the operations available for UNEM in Integrated EMS.

Tasks Supported in Integrated EMS for UNEM

Task in Integrated EMS	Availability	
	Java Web Start Client	Web Client
Configuration Management		
Editing object properties	Yes	Yes
Updating status	Yes	No
Managing or unmanaging the object	Yes	Yes
Fault Management		
Viewing associated events or alarms	Yes	Yes
Clearing alarms	Yes	Yes
Deleting alarms	Yes	Yes
Resynchronizing alarms	Yes	No
Resynchronizing inventory	Yes	No
Performance Management		
Data collection job	No	No
Report job	No	No
Transfer job	No	No
Configuring thresholds	No	No
Security		
Centralized authentication and authorization (RADIUS client)	No	No

Tasks Supported in Integrated EMS for UNEM

Task in Integrated EMS	Availability	
	Java Web Start Client	Web Client
Other operations		
Launching corresponding applications	Yes	No

33.5.1 To add the UNEM to the topology, follow these steps:

At Integrated EMS workstation

1 Launch the Integrated EMS Java Web Start Client (refer to "Launching Integrated EMS Java Web Start Client").

2 Select the **Tools**-->**Add**-->**EMS/NE** menu command to invoke the **Add EMS/NE** dialog.

3 Enter the values for the Host Name/IP Address, Time Zone, and Display Name fields in the wizard. For details on these fields, refer to the following table:

Description of fields in Add EMS/NE Wizard

Field	Description
Host Name/IP Address	The field for the host name or IP address of the element manager.
Time Zone	A list box to select the time zone associated with the object.
Display Name	The name that must be displayed in the topology for the map symbol.

4 Select "EMS" from the **Type** list box.

5 Select "UNEM" from the **Device Type** list box.

6 Select the **SSH enabled** field if the SSH is enabled in the UNEM device.

Note: If the SSH enabled field is selected and the UNEM server does not have SSH installed, the launching of UNEM Browser from UNEM and UMUX NEs and launching of UMUX Shelf Configuration fails. For procedure to launch UNEM Browser for UNEM, refer to "Launching UNEM browser for UNEM"

7 Click the **Next** button.

8 In the **Port** field, enter the port value (in which the EMS communicates with Integrated EMS).

9 Enter the community in the **Community** field.

10 Select the SNMP version "v1" from the **Version** list box.

Note: The port value and the SNMP version are dependent on the UNEM configuration that is added.

11 Click the **Next** button.

12 Click the **Finish** button to add the UNEM.

Once the UNEM is added, a message appears in the status bar of the wizard as in the following screen shot:

The UNEM with the specified name is added to the **Element Managers** topology panel. Also, the UNEM is added as map symbols in the topology node named **EMS-UNEM-Mgr** (with the specified display name in brackets).

33.6 Adding UMUX NEs

UNEM manages UMUX 1500, UMUX 1200 and UMUX 900 NEs in the UMUX network. Refer to “Adding a UMUX Network Element Manager (UNEM)” on page 2589 procedure to add a UNEM. When you add an UNEM, these NEs are automatically discovered and added as map symbols under the **Network Elements** topology. Also they are added as map symbols under the **UMUX-1500**, **UMUX-1200**, and **UMUX-900** topology (under **Network Elements** node) respectively.

The following list provides the operations available for UNEM NEs in Integrated EMS.

Tasks Supported in Integrated EMS for UNEM NEs

Task in Integrated EMS	Availability	
	Java Web Start Client	Web Client
Configuration Management		
Editing object properties	Yes	Yes
Updating status	No	No
Managing or unmanaging the object	No	No

Tasks Supported in Integrated EMS for UNEM NEs

Task in Integrated EMS	Availability	
	Java Web Start Client	Web Client
Fault Management		
Viewing associated events or alarms	Yes	Yes
Clearing alarms	No	No
Deleting alarms	No	No
Resynchronizing alarms	No	No
Resynchronizing inventory	No	No
Performance Management		
Data collection job	No	No
Report job	No	No
Transfer job	No	No
Configuring thresholds	No	No
Security		
Centralized authentication and authorization (RADIUS client)	No	No
Other operations		
Launching corresponding applications	Yes	No

34.1 Feature Name

BladeCenter-T RTP Media Portal

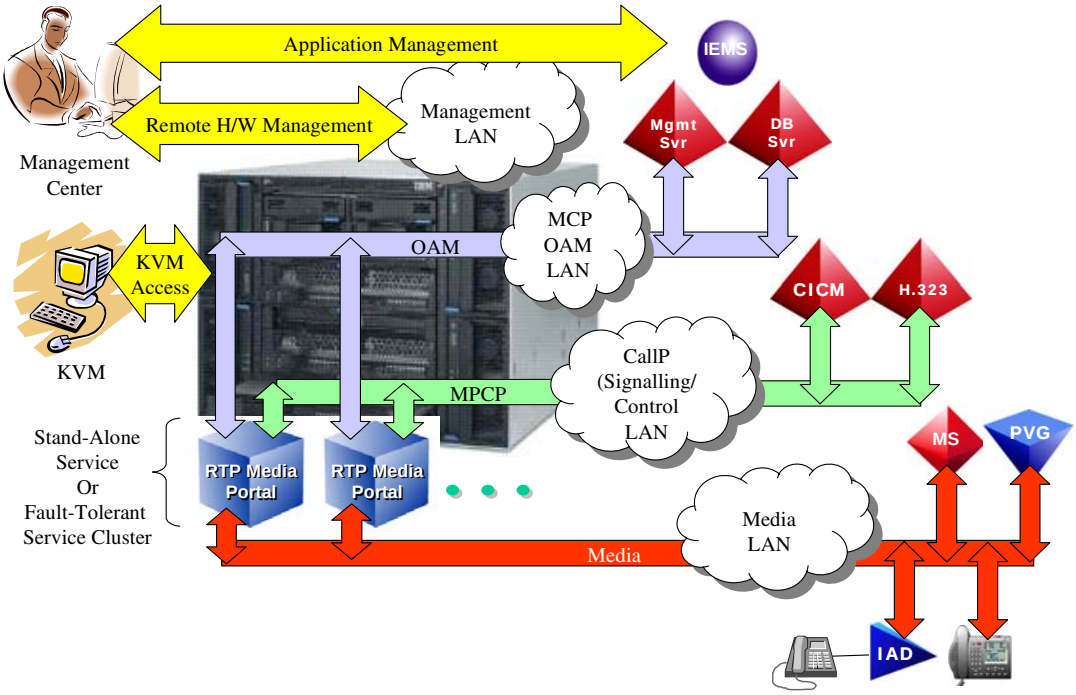
34.2 Overview

The introduction of the BladeCenter-T RTP Media Portal introduces: new hardware components, a new software architecture with new capabilities (Fault Tolerant Service Clusters), and new network connectivity configurables that enable management of the platform and execution of the service (refer to the following figure).

As a result the new BladeCenter-T RTP Media Portal introduces configuration requirements in the following areas:

- Hardware Configuration: (beyond the scope of this document.)
- Network Configuration: describes the network connectivity – this is used to define connectivity of the BladeCenter-T RTP Media Portal into the broader solution (and connections into Service Provider network[s]). The BladeCenter-T RTP MP can connect to a myriad of networks that provide: management access to the hardware components, OAM access to the product, control channel service capabilities, and access to the media streams upon which the service operates. Configuring the BladeCenter-T RTP Media Portal for connection in to a network is executed as part of the initial installation and commissioning procedures – and as part of maintenance/repair activities – that are described in detail in the appropriate methods and procedures.
- Service Configuration: describes the configuration of the stand-alone RTP Media Portal service instance, and the N+1 Fault Tolerant RTP Media Portal service cluster. Service configuration is established and can be easily modified as required to adapt to usage patterns, meet new needs, etc.

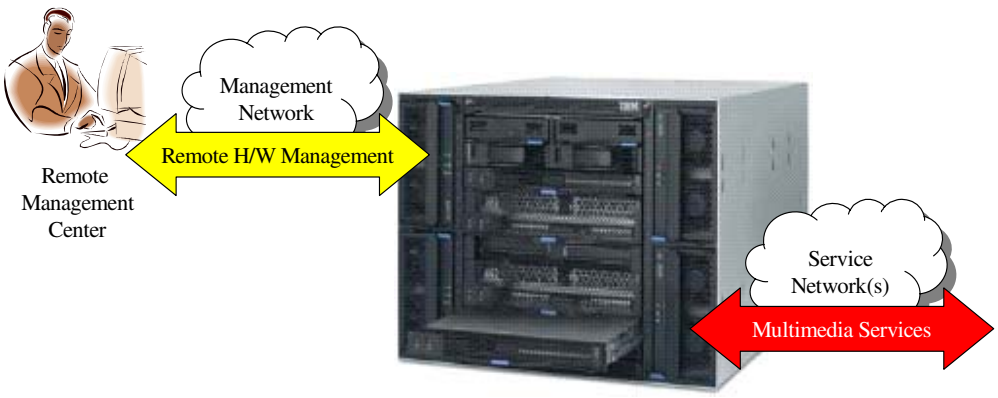
Figure 1 BladeCenter-T RTP Media Portal Configuration Overview



34.3 Network Configuration

The BladeCenter-T RTP Media Portal network configuration is partitioned between two network-spaces: one for management operations (a Management Network), and one for service execution (one or more Service Networks). Refer to the following figure. Certain subcomponents of the BladeCenter-T RTP Media Portal reside in the dedicated Management Network and others reside in the Service Network(s). Subcomponents with presence in the Management Network enable administrative access to the BladeCenter-T platform. Those subcomponents that reside in the Service Network(s) participate in the following aspects of the RTP Media Portal service: Operations/Administration/Maintenance (OAM), service control (MPCP), and execution of media processing functions.

Figure 2 BladeCenter-T RTP Media Portal Network Spaces



The Management Module and the Ethernet Switch Module are configured with IP addresses to provide them presence in the Management Network. The Management Network provides remote administrative and maintenance access to the BladeCenter-T platform.

The Blade Servers are configured with presence (an IP address) in the Service Network(s). The RTP Media Portal service instance that resides on the Blade Servers is also configured with presence in the Service Network(s). This positions both the BladeCenter-T platform and the RTP Media Portal in the service-space – where they can execute the RTP Media Portal service.

This distribution of subcomponents across different network-spaces enables the BladeCenter-T Management Modules reside on a secure management subnet, while the Blade Servers reside on a generally accessible service network in which they can participate in multimedia service delivery. That is, the management functions of the BladeCenter-T chassis are not accessible from outside the Management Network.

The following assumptions apply to the recommended network configuration of this product:

- •The BladeCenter-T Management Module (MM) and Alteon Ethernet Switch Modules (ESMs) must reside on the same subnet. The actual IP addresses and subnet mask are subnet-specific and are outside the scope of this document.
- •The Blade Servers and RTP Media Portal service instances reside on a different subnet from the BladeCenter-T Management Modules. The actual IP addresses and subnet mask for the Blade Servers are subnet-specific and are outside the scope of this document.

- Prior to network configuration of the BladeCenter-T, a sufficient number of IP addresses must be available. The IP address requirements for the various BladeCenter-T subcomponents are listed below):

  Total IPaddrs =

  [(2xIPaddr)] {for Management Module internal/external ports}

  + [(1xIPaddr) x (Number_of_ESM)]

  + (1xIPaddr) {Multicast IPaddr for Fault Tolerant Service Cluster}

  + [(4xIPaddr) x (Number_of_Blade Servers)]

Table 1: BladeCenter-T RTP Media Portal: Overall IP Address Requirements

Network	Subcomponent	IPaddr Requirements	IPaddr Count
Management Network	Management Module (only one set required)	1xIPaddr (external)	3-4
		1xIPaddr (internal)	
	Ethernet Switch Module 1	1xIPaddr (internal)	
	Ethernet Switch Module 2	1xIPaddr (internal)	
Service Network (per Blade Server)	Blade Server (OAM)	1xIPaddr (external)	4-33
(per Service Instance)	MPCP (Control)	1xIPaddr (external)	
	Media1 (Net1)	1xIPaddr (external)	
	Media2 (Net2)	1xIPaddr (external)	
(per Service Cluster)	Fault Tolerant Service Cluster (for Service Clusters only)	1xIPaddr (multicast)	
		Total	**Up to 37 IPaddrs**

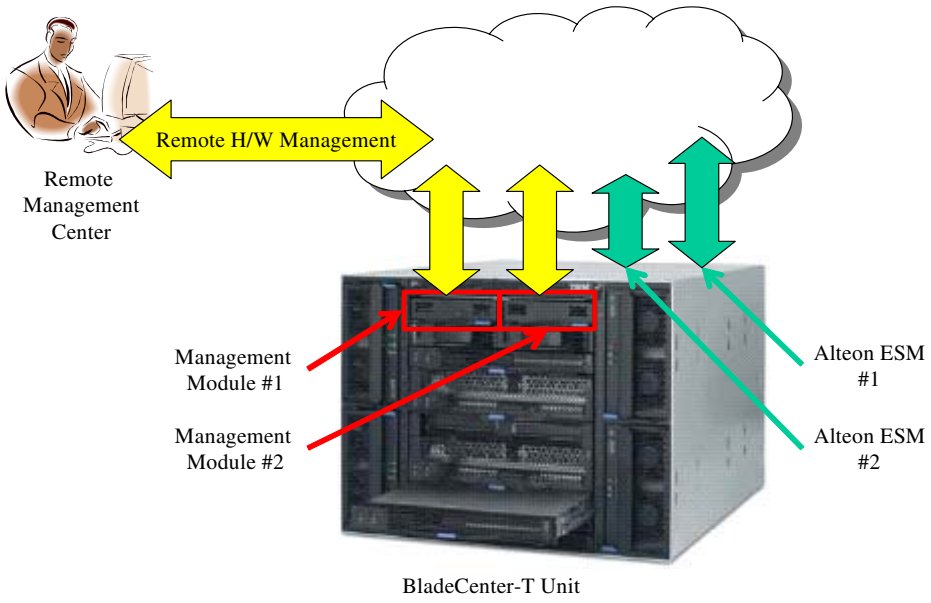
34.3.1 Management Network

34.3.1.1 Overview

The BladeCenter-T RTP Media Portal requires IP Addresses in the Managed Network. In order to provide ubiquitous remote management capabilities, the remote management client IP addresses, the Management Module IP

addresses, and the Alteon ESM management IP addresses all reside in the same subnet. Refer to the following figure.

Figure 3 BladeCenter-T RTP Media Portal: Management Network Overview



The physical relationship of these IP address assignments to the Management Module and the Alteon ESM are represented in the following figure. The actual network topology created by these IP Address assignments is described in the subsequent figure.

Figure 4 Management Network Connections: Physical View (Layer-2 and Layer-3)

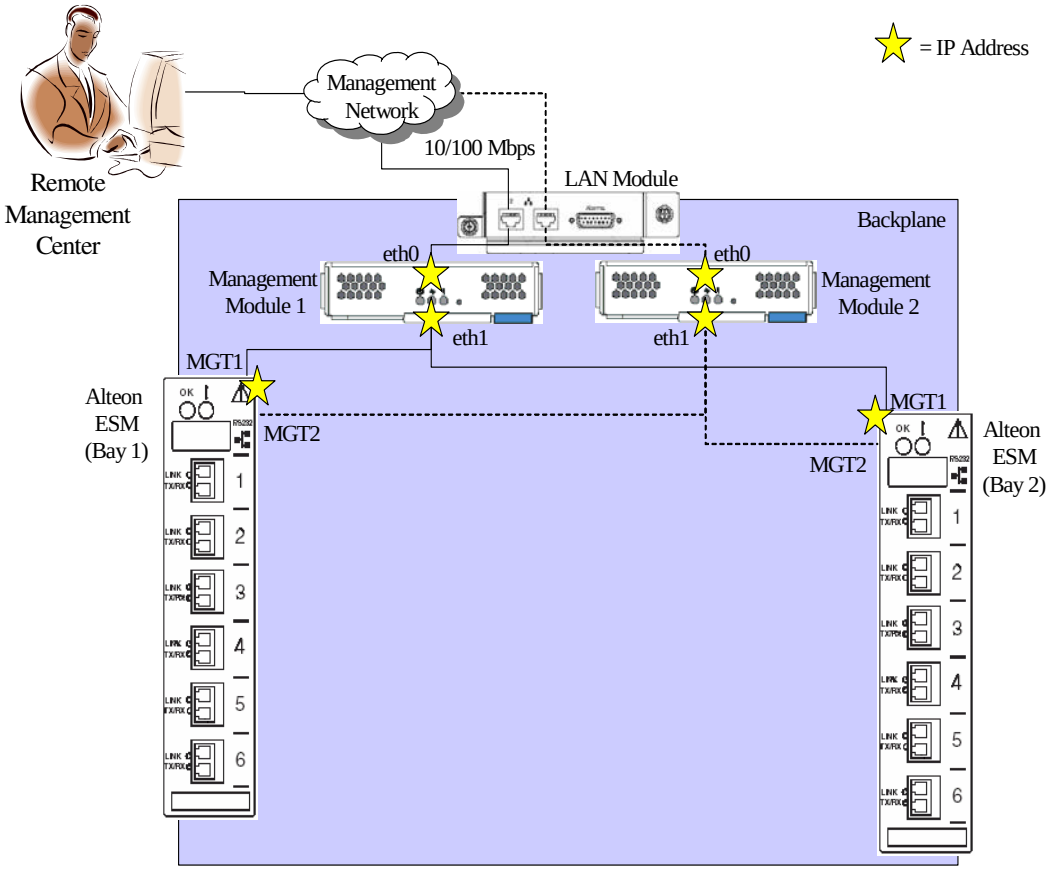


Figure 5 Management Network Connections: Logical View (Layer-3)

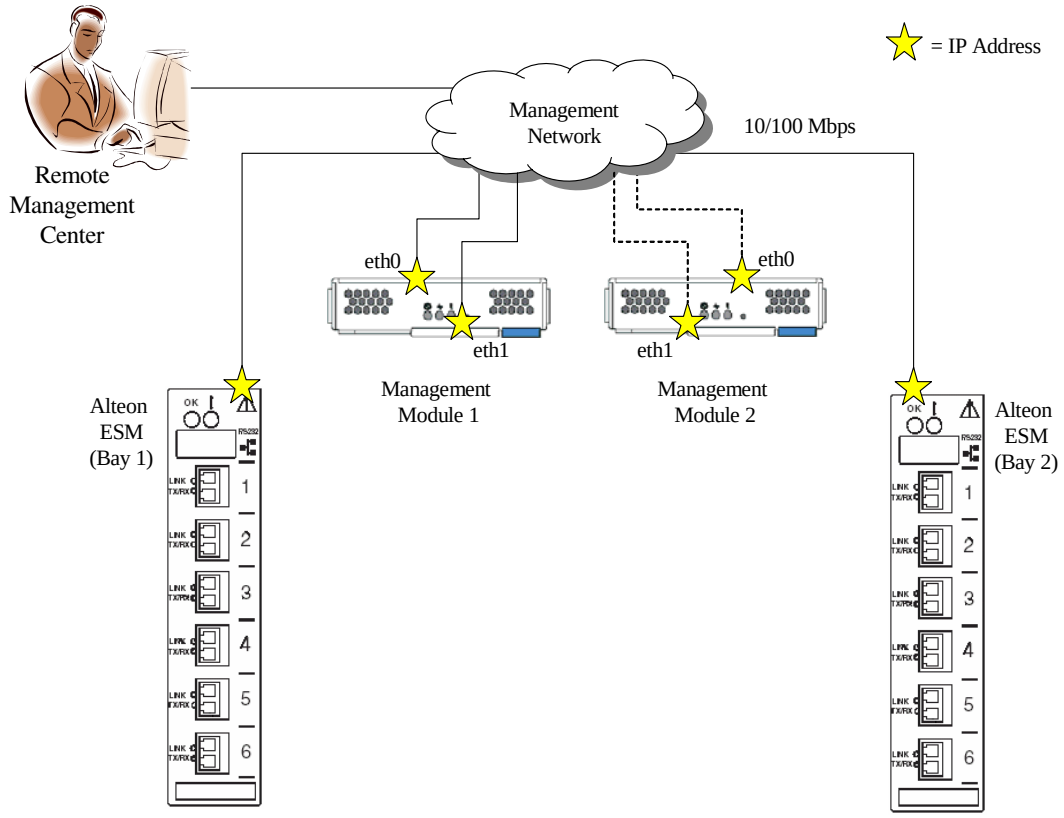


34.3.1.2 Configuration of the BCT Management Module

The Management Module provides access to the maintenance and control functions of the IBM BladeCenter-T chassis and its sub-components. Access to these functions is facilitated over the Management Network which connects the remote management center to the Management Modules (via Ethernet connections to the LAN Module which then connect over the back-plane to the Management Modules external interface – eth0).

The LAN Module bridges the external physical Ethernet connection to the Management Network over the backplane to the Management Module (eth0). It is through this path that the Management Module (through eth0), the Alteon Ethernet Switch Modules (accessed through relay between Management Module eth0 and eth1), and other chassis subcomponents can be reached for administrative activities.

There are two new IP Addresses required on the Management Network in order to configure the Management Modules for a given BladeCenter-T (the Management Modules run active/standby so the same settings are shared). These new Management Network IP Addresses overwrite the default factory

settings for each of the Management Modules interfaces (refer to the following table).

Note: It is only necessary to configure the primary Management Module (with IP addresses, etc.); the secondary Management Module does not need to be explicitly configured. In the event that the primary Management Module fails, the secondary Management Module will automatically inherit the settings from the primary Management Module. It is only necessary that both Management Modules be connected to the same network subnet.

Table 2: Management Module: Default IP Addresses.

Interface	Default IP address
eth0	192.168.70.125 / 255.255.255.0
eth1	192.168.70.126 / 255.255.255.0

34.3.1.3 Configuration of the Alteon Ethernet Switch Module (ESM)

The Alteon ESM is configured so that it is only manageable through the BladeCenter-T Management Module. In order to establish this capability the default IP address configured on the Alteon ESM must be overwritten with a valid IP address on the Management Network.

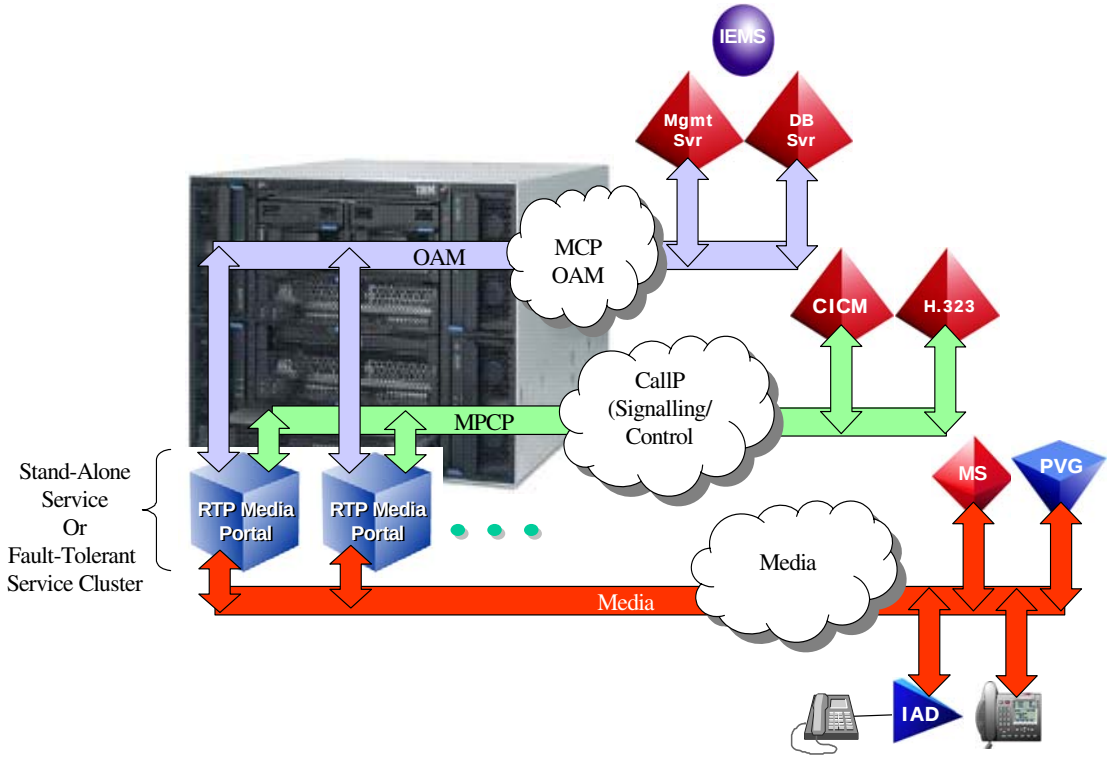
Table 3: Alteon ESM: Default IP Addresses.

Interface	Default IP address
1	10.90.90.91

34.3.2 Service Network

The Service Network is the network-space within which the services are provided and consumed. In fact, this network-space may exist as multiple Service Networks (as depicted in the following figure).
In order to provide the RTP Media Portal service, both the hosting BladeServer and the resident service instance must have presence in the Service Network(s) in order to connect: Service OAM, Service control (MPCP), and Service access (media). Refer to the following figure.

Figure 6 BladeCenter-T RTP Media Portal: Service Network Overview



The physical relationship of these IP address assignments to the Management Module and the Alteon ESM are represented in the following figure. The actual network topology created by these IP Address assignments is described in the subsequent figure.

Figure 7 Service Network Connections: Physical View (Layer-2 and Layer-3)

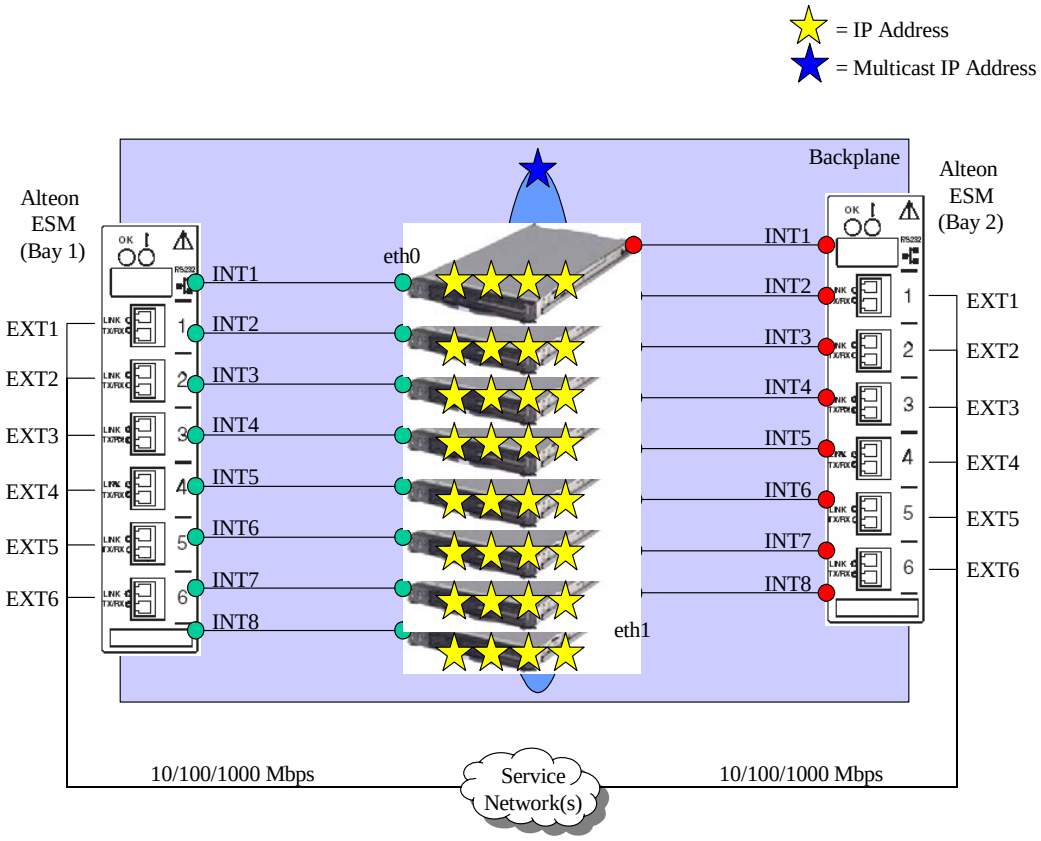


Figure 8 Service Network Connections: Logical View (Layer-3)

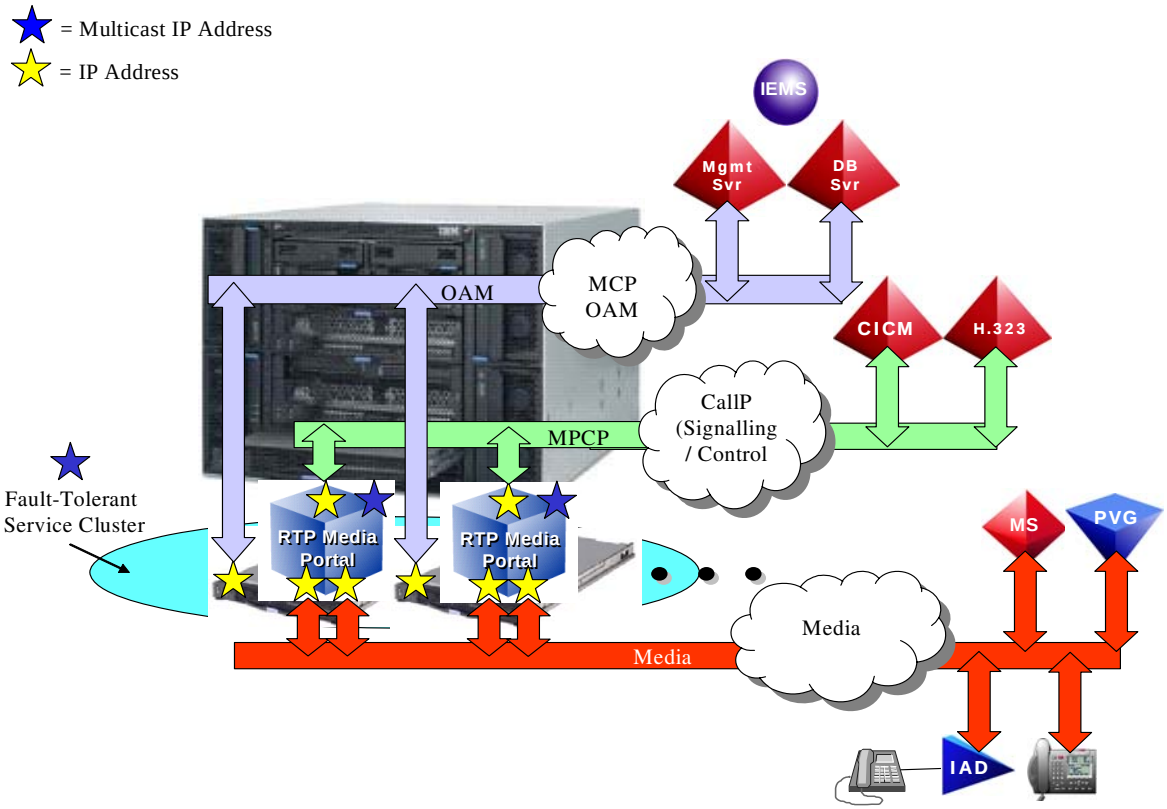


34.4 Service Configuration

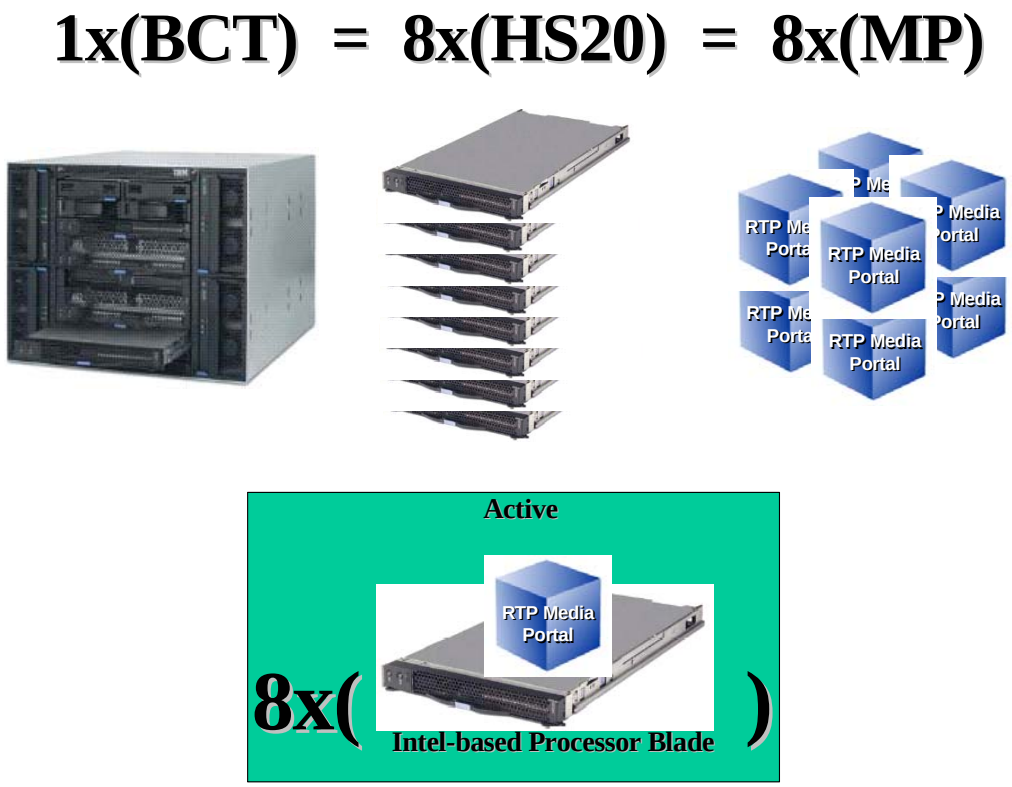
34.4.1 Overview

The introduction of the BladeCenter-T RTP Media Portal represents a major change in how the RTP Media Portal is viewed. The software re-architecture required by the BladeCenter-T RTP Media Portal essentially abstracted the functionality provided by the RTP Media Portal from the underlying platform – effectively establishing the RTP Media Portal as a service that is independent of a fixed relationship with its supporting hardware. Further, the introduction of the N+1 fault tolerance framework adds yet another dimension to the RTP Media Portal. As a result, this feature introduces more than a new hardware platform into the product, it introduces a major new configuration of the RTP Media Portal Service.

The BladeCenter-T RTP Media Portal can be configured to operate as either a collection of independent service instances (“Stand-Alone”), or as an N+1 fault tolerant service cluster (“Clustered”).

When configured as a collection of stand-alone service instances, the BladeCenter-T can support the execution of up to eight (8) independent non-redundant instances of the RTP Media Portal Service (refer to the following figure).

Figure 9 Stand-Alone RTP Media Portal Service Instances (Chassis View)



When configured as a redundant N+1 fault-tolerant service cluster, the BladeCenter-T can support the execution of up to seven (7) active instances of the RTP Media Portal Service and one (1) hot standby instance that is ready to assume the active sessions for any of the active instances (refer to the figure that follows on the next page).

These advances required adaptations to RTP Media Portal configuration to accommodate the new paradigms: RTP Media Portal as a service, and the N+1 fault tolerant RTP Media Portal Service Cluster. Adaptations were performed within the constraints of the capabilities and limitations of the MCP Management System. The resulting changes provide:

- The ability to configure the BladeCenter-T RTP Media Portal as a Stand-Alone Service Instance.

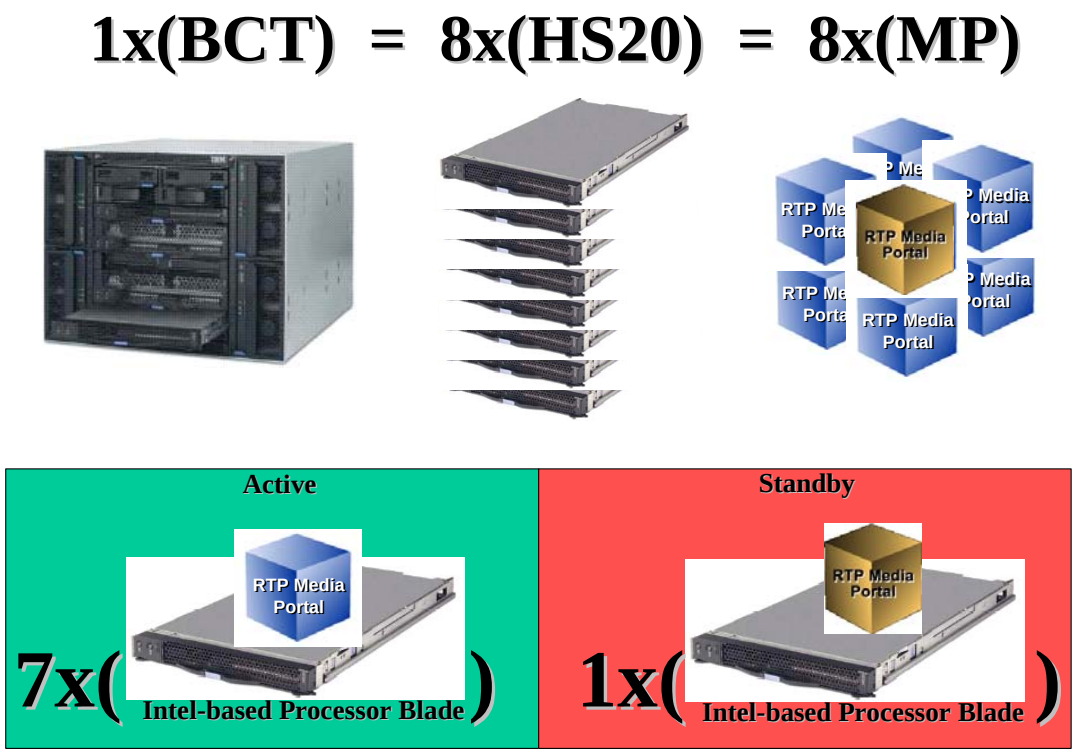
- The ability to configure the BladeCenter-T RTP Media Portal as an N+1 Fault Tolerant Service Cluster.
- The ability to manage the BladeCenter-T RTP Media Portal as a set of distinct network elements (unfortunately there are no Cluster-level management capabilities – management of the Cluster is achieved through the coordinated management of the individual Cluster members).

Fortunately, the configuration adaptations appear as minor changes to the configuration data as presented in the Management Console and so a consistent interface can be be presented for all varieties (the Motorola CPX8216-T introductory platform, and the new IBM BladeCenter-T platform) and configurations (Stand-alone, and Clustered) of the RTP Media Portal. In fact the configuration of the original Motorola CPX8216-T-based RTP Media Portals is unchanged (there is one new configuration parameter added to the RTP Portal Network Element, but for legacy CPX8216-T sites it is left set to its default value of “null”), while the new BladeCenter-T RTP Media Portal utilizes both pre-existing configuration structures (e.g. the RTP Portals Network Element for the conveyance of Engineering Parameters) and the adaptations made to configuration structures (e.g. the new “Clusters” entity in Network Data.

Additionally, both Stand-Alone and Clustered configurations of the BladeCenter-T RTP Media Portal are configured exactly the same – the differentiation being that the Stand-Alone is configured as a “1+0” (1 active instance, and no standby instances) Service Cluster. The real differences between the Stand-Alone and Clustered configurations is in their run-time characteristics and reaction to faults.

All of this is discussed in more detail in the following sections.

Figure 10 N+1 Fault Tolerant RTP Media Portal Service Cluster (Chassis View)



34.5 BladeCenter-T RTP Media Portal Configuration

34.5.1 Overview

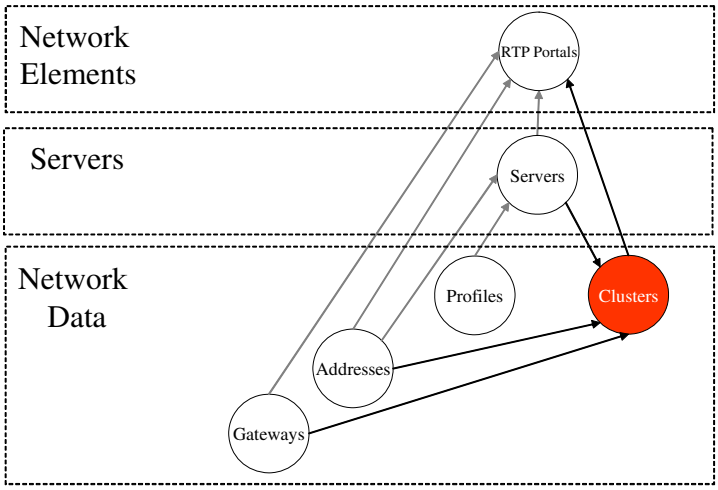
Pre-existing RTP Media Portal configuration structures remain intact for continued support of legacy Motorola CPX8216-T RTP Media Portal deployments. These pre-existing structures consisted of Network Data (specifically “Addresses”, “Gateways”, and “Profiles”), Servers, and Network Elements (where all data constituting an RTP Media Portal was combined together in the RTP Portal Network Element).

The BladeCenter-T RTP Media Portal builds on top of pre-existing configuration structures as follows (refer to the following figure):

- Network Data: the new “Clusters” entity is created in Network Data. The new “Clusters” entity contains all of the information required to configure a RTP Media Portal Service Cluster. As Network Data, “Clusters” is delivered over the MCP OAM Framework to all BladeCenter-T RTP Media Portal nodes.
- Servers: unaffected.
- Network Elements: The “RTP Portal” Network Element is enhanced with the addition of a new field “Cluster” that references a specific entry in the

new Network Data “Clusters” entity. The new “Cluster” field provides the means for identifying an RTP Media Portal’s membership in an N+1 Fault Tolerant Service Cluster.

Figure 11 RTP Media Portal Service: Data Relationahips



The new Network Data “Clusters” entity contains configuration information for RTP Media Portal Service Clusters. This configuration information includes the Common Service Data for the Cluster, the Service Instance Data, and the Fault Tolerant Framework Data (refer to the following table). The Common Service Data is a set of configuration parameters replicated from the RTP Portal Network Element’s “Bladerunner” information. The Service Instance Data defines the parameters that are unique to each active instance of the service. The Fault Tolerance Framework Data defines the parameters that define the Service Cluster.

Table 4: RTP Media Portal Service Cluster: Configuration Data

Data Type	Parameter Name	Parameter Type	Parameter Description
Common Service Data	Cluster Name		Cluster name or id or both - something unique for this cluster. Convention: <Cxx>+<name>
	Default Gateway		Pull-down of available Gateways (from Network Data) that overrides the "Default Gateway" specified in the RTP Portal NE data.
	CallLegs		Overrides "CallLegs" parameter present in the RTP Portal NE Config Parm Group "BladeRunner".
	CriticalPortUsageAlarmLevel		Overrides "CriticalPortUsageAlarmLevel" parameter present in the RTP Portal NE Config Parm Group "BladeRunner".
	IdleSessionAuditPeriod		Overrides "IdleSessionAuditPeriod" parameter present in the RTP Portal NE Config Parm Group "BladeRunner".
	LongCallDuration		Overrides "LongCallDuration" parameter present in the RTP Portal NE Config Parm Group "BladeRunner".
	LongIdleDuration		Overrides "LongIdleDuration" parameter present in the RTP Portal NE Config Parm Group "BladeRunner".
	MajorPortUsageAlarmLevel		Overrides "MajorPortUsageAlarmLevel" parameter present in the RTP Portal NE Config Parm Group "BladeRunner".
	MinorPortUsageAlarmLevel		Overrides "MinorPortUsageAlarmLevel" parameter present in the RTP Portal NE Config Parm Group "BladeRunner".
	PollTimerDelay		Overrides "PollTimerDelay" parameter present in the RTP Portal NE Config Parm Group "BladeRunner".
	LongCallDuration		Overrides "LongCallDuration" parameter present in the RTP Portal NE Config Parm Group "BladeRunner".
	StaticRTPPorts		Overrides "StaticRTPPorts" parameter present in the RTP Portal NE Config Parm Group "BladeRunner".
	Number of Port		Overrides "Number of Port" parameter present in the RTP Portal NE "Blade" Data.
	Min Port Value		Overrides "Min Port Value" parameter present in the RTP Portal NE "Blade" Data.
	Max Port Value		Overrides "Max Port Value" parameter present in the RTP Portal NE "Blade" Data.
	Session Manager		Pull-down of available Servers (from Servers) that overrides the "Session Manager" Data specified in the RTP Portal NE.*There can be multiple occurrences of this data*
	Discovery Probe Timer Period		Integer field specifying the frequency of the periodic MPCP RSIP to the controlling Call Servers. The value entered into this field overrides the value for the "Discovery Probe timer" field for each instance of "Session Manager" Data specified in the RTP Portal NE.

Fault Tolerance Framework Data	Multicast IPaddr		These two parameters uniquely define this Cluster. They represent the Peering Plane used by this Cluster for the establishment of the reliable messaging framework. The reliable messaging framework is used to carry the election protocol, checkpoint run-time service data to the Standby Service Instance, and to monitor member status.
	Multicast Port		
	Heartbeat Period		Frequency of heartbeat status check.
Service Instance Data	{N}		{implied} The number of instances of "Service Data" implies the value of "N". This correlates exactly to the expected number of servers (which is "N+1").
	Instance Name		Name of this Service Instance. Convention: <Cluster-Name>+<Ixx>+<Instance-Name>
	Controlipaddr		Pull-down of available IPaddrs (from Network Data:Addresses). This parameter provides a unique IPaddr for the RTP Media Portal Service that is different from the platform IPaddr. This is the result of abstracting the RTP Media Portal Service from the platform, and is used for conveyance of MPCP messages.
	ControlNetMask		Defines the Control-plane subnet for this Service Instance
	Net1MediaIP		Pull-down of available IPaddrs (from Network Data:Addresses) that overrides "Net1 Media IP" parameter present in the RTP Portal NE "Blade" Data. This defines one of the two media IPaddrs that establish presence for this service in the Media-Plane.
	Net1NetMask		Overrides "Net1NetMask" parameter present in the RTP Portal NE Config Parm Group "BladeRunner". Defines the Media-plane subnet for this Service Instance.
	Net2MediaIP		Pull-down of available IPaddrs (from Network Data:Addresses) that overrides "Net2 Media IP" parameter present in the RTP Portal NE "Blade" Data. This defines one of the two media IPaddrs that establish presence for this service in the Media-Plane.
	Net2NetMask		Overrides "Net2NetMask" parameter present in the RTP Portal NE Config Parm Group "BladeRunner". Defines the Media-plane subnet for this Service Instance

34.5.2 Procedural Overview

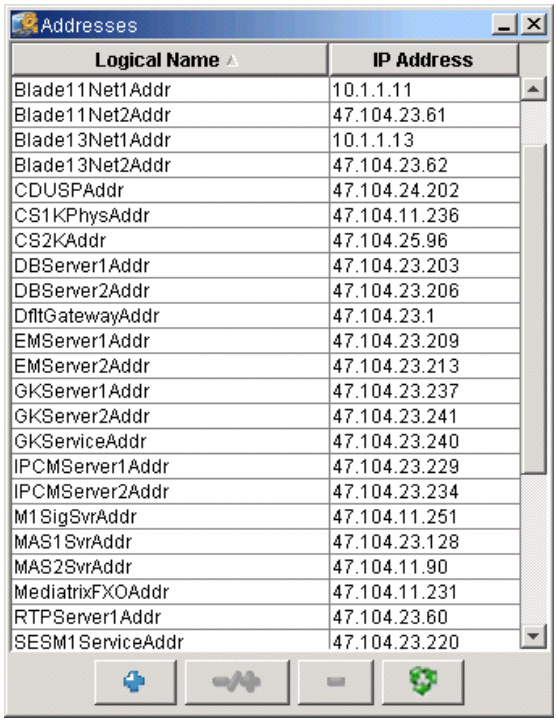
The BladeCenter-T RTP Media Portal is configured using the MCS System Management Console, and is accomplished through the use of the new “Clusters” entity in the Network Data, and a new field in the RTP Portals Network Elements (the new field references an entry in the “Clusters” Network Data to specify cluster membership). Refer to the following figure.

Figure 12 System Management Console: Affected Data Structures

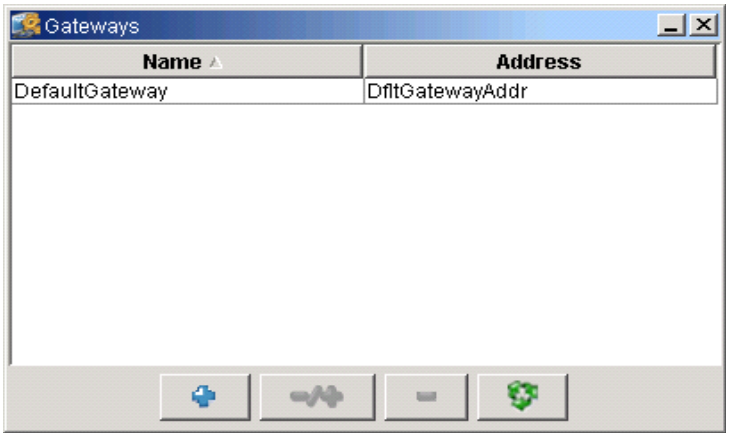
Procedurally, the BladeCenter-T RTP Media Portal is configured in a fashion similar to that used to datafill the CPX8126-T RTP Media Portal – with some additional steps that are necessary to include the creation/population of the new data structures:

Step 1: Datafill Supporting Parameters
At this initial stage all new referenced data must be entered into the system:

- Enter all new IP addresses into Network Data::Addresses.



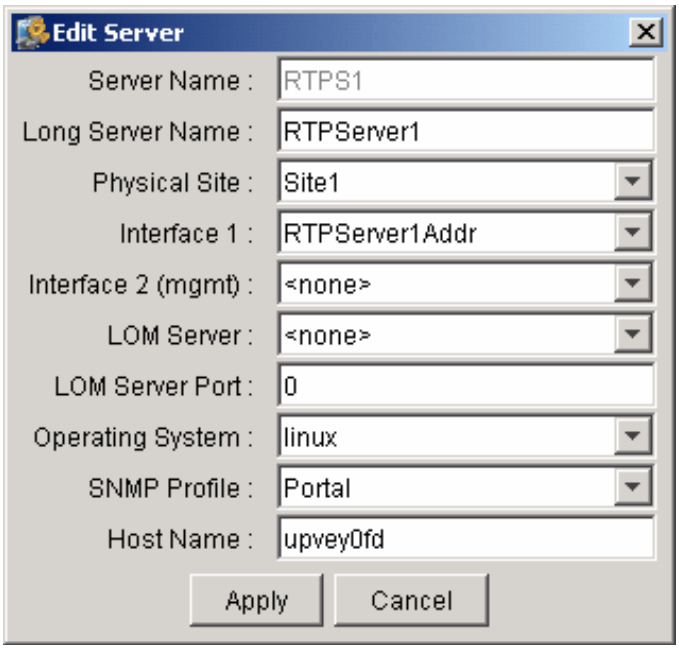
- Enter all new Gateways into Network Data::Gateways.



Note: There are no changes to the structure of this data.

Step 2: Datafill "Servers" Parameters
This stage of configuration creates a logical representation of a Server within which to group together all the data that defines a Server including physical IP address associations (the physical IP address was actually assigned during installation and commissioning):

- Datafill the “Interface1” field (pick-list of datafilled IP “Addresses”) with the intended physical IP address for each Blade Server in the BladeCenter-T chassis. This IP address is the bond0 physical address on the Blade Server – and is also used to represent the Blade Server and the RTP Media Portal Service Instance in the MCS OAM System.

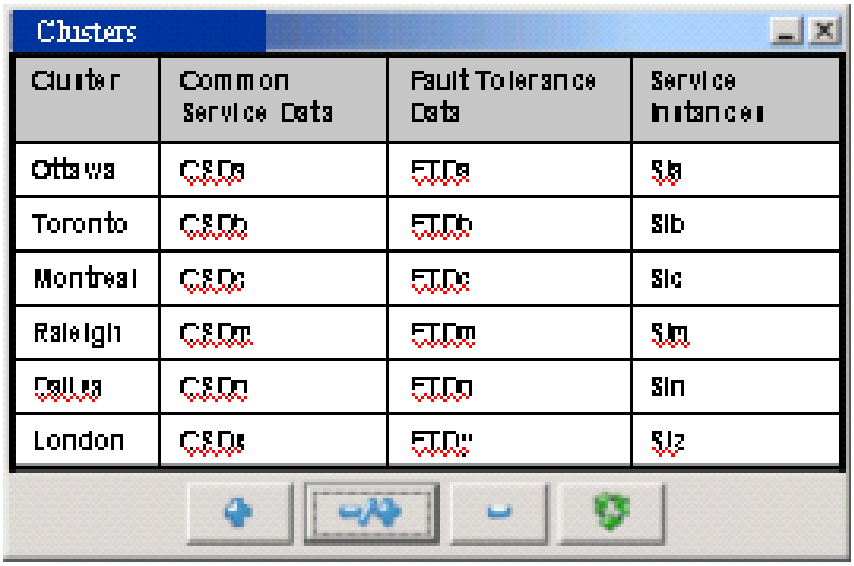


Note: There are no changes to the structure of this data.

Step 3: Datafill “Clusters” Entities
This stage of configuration creates a logical representation of the Service Cluster within which to group together all the data that defines the cluster.

The first step is to create a new Service Cluster:

- Open the “Clusters” window in Network Data, and then click the “+” button to create a new Service Cluster.



Once created the new Service Cluster can be populated with the parameters that uniquely identify this cluster as well as all of the parameters that define the service characteristics for this cluster (refer to the following figure):

- Common Service Data must be supplied that defines the operating parameters of the service instances (all service instances in a cluster run the same service configuration to maintain service consistency):
- Fault Tolerance Framework Data must be supplied to define the characteristics of the channel used for intra-cluster communication between all cluster members.
- Service Instance Data is where each of the RTP Media Portal Service Instances is defined (i.e. the MPCP control IP address, and up to two media IP addresses). There is one entry per Service Instance – this constitutes the “N” in the N+1 Fault Tolerance strategy. Refer to the second figure that follows for sample screenshots of adding a Service Instance.

Figure 13 New Network Data: Clusters

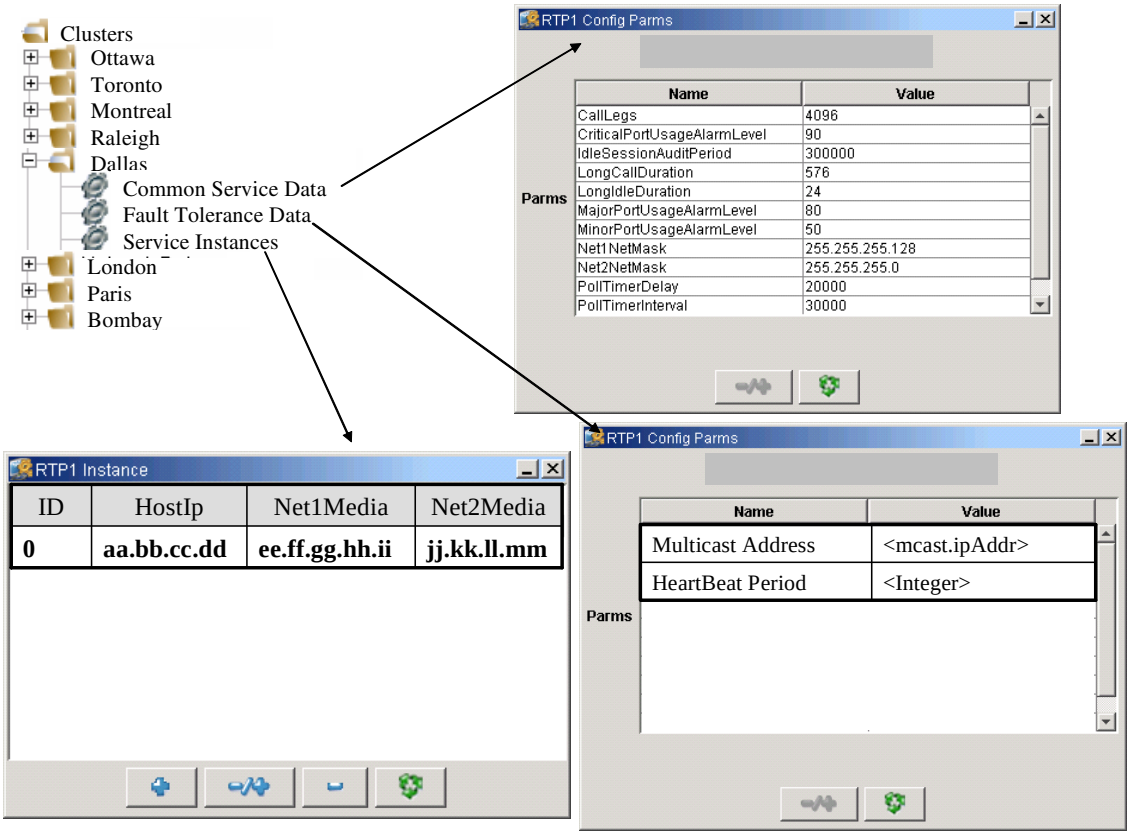


Figure 14 Clusters (Network Data): Adding a Service Instance

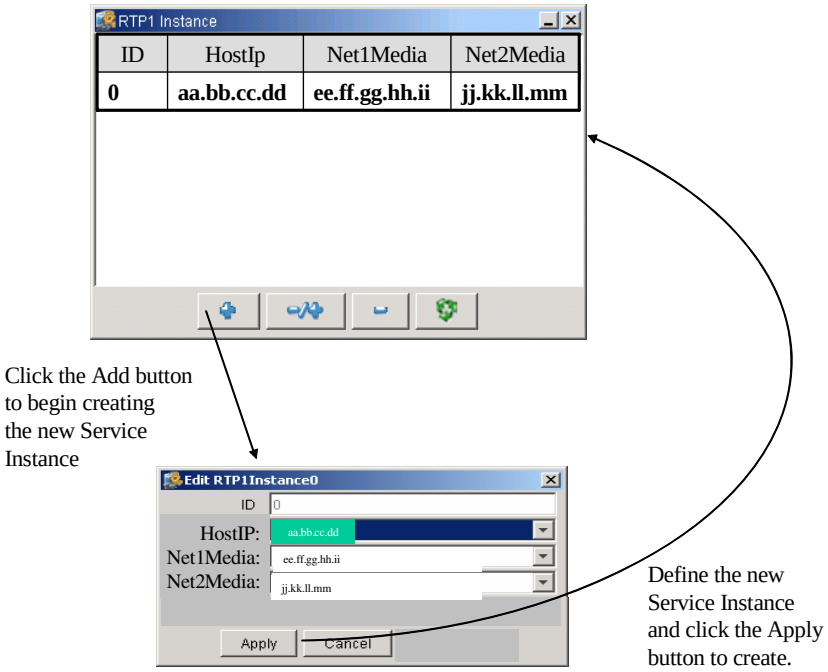


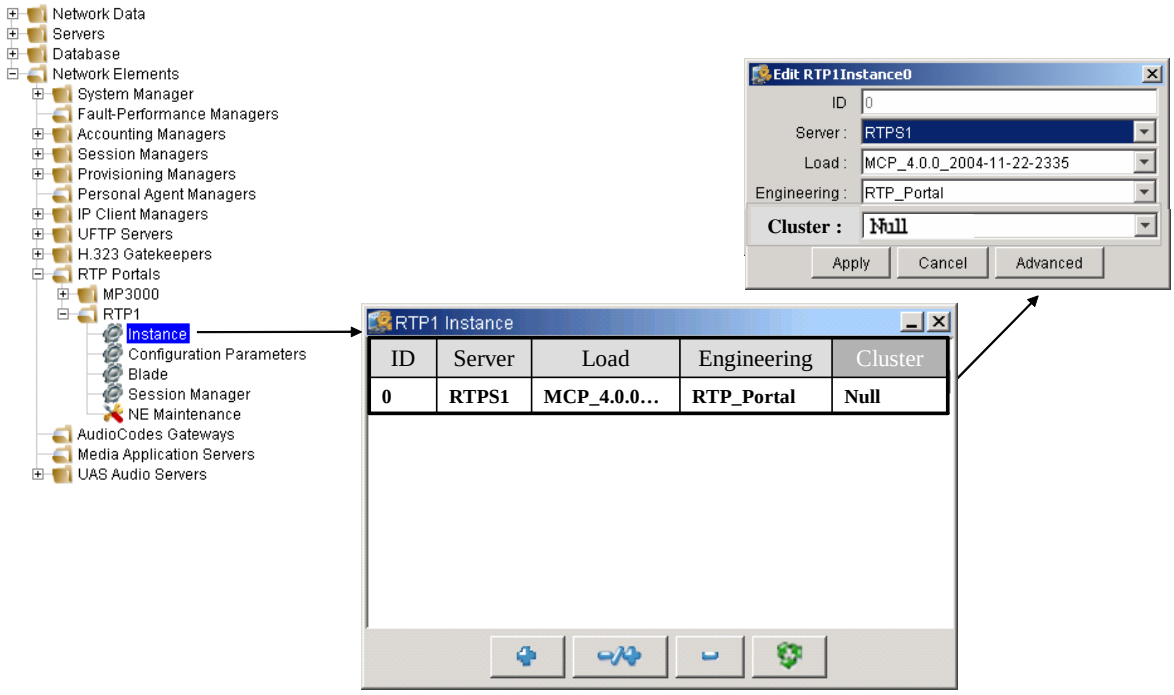
Step 4: Datafill "RTP Portals" Network Elements

As for the CPX8216-T based RTP Media Portal, the RTP Portal Network Element is the most fundamental configuration data structure. The RTP Portal Network Element provides the BladeCenter-T RTP Media Portal with: Engineering parameters, and a point of attachment into the MCS OAM Framework. It is the RTP Portal NE that: enables the deployment of the RTP Media Portal software, provides the channel for telemetry (Logs, Alarms, and Operational Measurements), and enables the maintenance events (Start, Stop, and Kill).

Also, in the context of the BladeCenter-T RTP Media Portal, each RTP Portal Network Element represents one Blade Server. This one-to-one mapping is due to the fact that the RTP Portals NE identifies the target server (through reference to an entry in the "Servers" Configuration Data).

This stage of configuration also provides the opportunity to specify membership in a BladeCenter-T RTP Media Portal Service Cluster through use of the new Cluster field in the RTP Portal NE data. Refer to the following figure.

Figure 15 RTP Portal NE: Specification of Cluster Membership



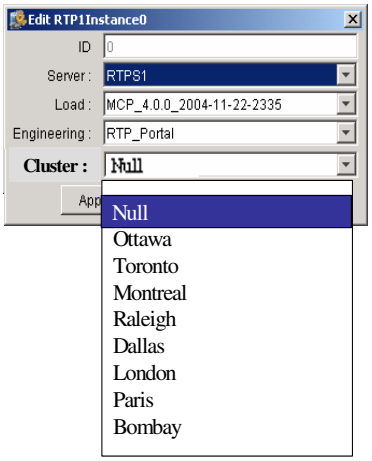
The new RTP Portal NE Cluster field is populated by selecting from a pick list. The pick-list contains an entry for each of the Clusters defined in the Network Data (and a “null” entry). Refer to Figure 62 on page 129. Each Server participating in a Service Cluster (identified within the RTP Portal Network Element data structure) is assigned Cluster membership in this manner – thuereby establishing the “N+1” servers hosting the Cluster.

Cluster membership is only available to the BladeCenter-T RTP Media Portal – the legacy CPX8216-T RTP Media Portal cannot be a member of a Service Cluster and must have “null” selected in the new “Cluster” field that appears in the Instance data of the RTP Portal NE.

Both BladeCenter-T RTP Media Portal configurations (the Stand-alone and the Service Cluster) must be configured as members of a Cluster. In the case of the BladeCenter-T RTP Media Portal Stand-alone, configuration is performed such that a “1+0” (1 Active Service Instance and 0 Standby Service Instances) cluster is created. All Clusters are uniquely defined by the combination of multicast IP Address and multicast port specified in the Fault Tolerance Data in the new “Clusters” Network Data, but what makes the Stand-Alone configuration unique is that there is onle one Service Instance configured.

Note: The legacy CPX8216-T RTP Media Portal will fail to start if it detects Cluster configuration in its datafill.

Figure 16 RTP Portal NE: Cluster Pick-List



35: Configuration (CN): A00009822

35.1 Feature Name

General Security Log When the User Logs Out

35.2 Hardware and Software Requirements

No new hardware dependencies has been introduced by this feature.

35.3 Hardware and Software Requirements

The server piece of this application at this time requires an oracle database server to be in place on the server machine.

35.4 Initial Configuration

SN09 IEMS Central SS software

Oracle

35.5 Memory Requirements

The statistics that follow were taken at a stressed state. The database was populated with 6000 session entries and a CSM Report Client was configured to pull this data every 10 seconds.

RAM Usage: 10 M (1 M with 200 records)

Note: CSMEngineNotifier & CSMEngineReport are servlets. They reside within the Tomcat process and therefore we are not adding in the existing JRE overhead calculations.

Application Code Disk Usage: 2066 K (du -s -k /opt/nortel/CSReport)

Application Data Disk Usage: 0

The CSM design heavily utilized the database for storage retention. We do not keep any custom CSM data in the /data partition.

Application Database Usage:

The CSMDB_TS - with 6000 entries - used 720,896 Bytes.

35.6 Upgrade Considerations

At this time, this feature will not impact upgrades.

35.7 Data schema

A new tablespace called CSM_TS will be added to the oracle database server on the authentication machine to support this feature. In this tablespace will reside two tables, Activity & Version.

35.8 Element Management

35.8.2.1.1 Functional description

The CSM GUI client provides a report that will give the security user the ability to view the historical client sessions for the users. The report will by default populate with the currently active sessions. However, the user has the ability to configure the display criteria. The report will refresh the displayed contents once every 60 seconds.

The CSM GUI client can be launched via a menu on IEMS or directly accessing the URL (jnlp) for the client. The CSM GUI is hooked into the common LoginServlet code. If a user has an authentication session active, the GUI will be displayed. However, if an authentication session is not active, the user will be prompted for user and password via the common login dialog.

Once logged in the users group levels will be checked - the GUI report can only be viewed by those users which are in the SEC* group. Any user not in that group will not be allowed entry to the report. Also, the ability to mark a client session as ended will only be accessible to those users of the group SECADM.

35.8.2.1.2 GUI usage and implications

This UI will be used to display current client application sessions as well as historical lifetime of client application sessions by user.

When the GUI first is displayed - the report shown will be for all current application sessions. This report will update every 60 seconds to maintain accuracy. The user has the ability to modify the filter (search) criteria for the report. If the users wishes to change a criteria they simply modify the filter parameters and hit the ‘Filter’ button. This will repopulate the list with the data matching the new filter criteria. The criteria the report is generated with - and the time of generation - are clearly displayed in the FilterString area.

In setting the filters, the user may choose either to use a predefined criteria or to create a custom criteria from the available attributes. The two predefined criteria filters available are ‘currently active sessions’ and ‘activity within the last <timeperiod>’.

The predefined filter ‘currently active sessions’ will populate the custom filter area with the correct settings to query on active sessions. The user then hits ‘Filter’ and the report will update with this criteria.

The predefined filter ‘activity within....’ allows the user to request the report display all activity that has occurred in an interval prior to the report generation. The user may enter the numeric value for the time interval and the period type from a choice option of “Seconds”,”Minutes”,”Hours”,”Days”. Once the user has selected their settings - they simply hit the “Filter” button and the report will update.

The “Custom Filter” area allows a user to build a custom criteria from the available attributes. For fields which are strings such as UserID, Activity, ClientApp, SourceIp and DestinationIp the criteria that can be used to match on are “Matches”, “Does not match”, “Contains”, “Does not contain”, “Starts with”.

For fields which are dates such as Start Activity and End Activity - the matching criteria are “Matches”, “Does not match”, “Before”, “After”, “Between”. The date requires the date format of YYYY-MM-DD HH:MM:SS. The exception is that the term “Current” can be entered in the field to indicate the current time and the turn “Null” can be entered to indicate the time is not yet set.

Once a user has decided a criteria is correct - they simply need hit “Filter” and the report will populate. The below snapshot shows a report that has criteria matching (and not matching) on user id - as well as Client Activity. The user simply selected the field to query upon - then the match criteria - entered the data in the text field that says “Click to enter new value” and hit return. The criteria is then added to the list of query items for that data element.

35.8.2.1.3 GUI size

Not Applicable

35.8.2.1.4 GUI fields

The following table lists fields for GUI:

Table 2 GUI field descriptions

Field	New or Changed	Entry	Explanation and action	Associated MIB entry
SessionID	New	String	This is the id that uniquely identifies a client activity session.	Table CSM_TS.Activity.SessionId
UserID	new	String - 8 char length	This is the login id of the user who initiated the session.	Table CSM_TS.Activity.UserId
Activity	new	String	Designates the type of activity - ex. Authentication or Client Session	Table CSM_TS.Activity.ActivityType
Client Application Name	new	String	The name of the client application that session denotes. (not applicable to authentication).	Table CSM_TS.Activity.AppName
Start Date	New	Date (YYYY-MM-DD HH:MM:SS)	This is the time the activity started.	Table CSM_TS.Activity.StartDate
End Date	New	Date (YYYY-MM-DD HH:MM:SS)	This is the time the activity ended. (Not applicable to authentication).	Table CSM_TS.Activity.EndDate
Source Ip	New	String [xxx.xxx.xxx.xxx]	This is the Ip Address of the machine from which the user launched the session. (Not applicable Authentication)	Table CSM_TS.Activity.SourceIp
Destination Ip	New	String [xxx.xxx.xxx.xxx]	This is the Ip of the machine from which the client application is loaded. (ex. MG9kEM Midtier)	Table CSM_TS.Activity.DestinationIp
End Reason	New	String	This is the reason the session ended. Reasons can be User Exited, Inactivity, etc.	Table CSM_TS.Activity.EndReason

35.8.2.1.5 Usage example

The Client Session Monitor will be initially displayed to the user populated with the entries indicating current active client sessions. The user has the ability to modify the report criteria by selecting new criteria and then hitting "Filter". Once "Filter" is hit the data list will repopulate with the results of the new query. The Query that the current data list applies to is displayed in the middle section of the form under "Filter String" and is timestamped with the last time the query was run.

In the case where a client session appears to still be active via the report - but the security user knows the session to no longer be active - the security user can mark that session as completed. The ability to mark a client session as ended will only be accessible to those users of the group SECADM. Marking a session as completed will not cause any actions outside the realm of this report. It will simply update the session activity in the database - it will not force a user off - end their session - etc. If a user is still active and their session is marked completed, when the user truly ends the session - the row will be updated with that actions end time.

The displayed report has the ability to sort by clicking on the column the user wishes to key the sort.

35.8.2.1.6 Context sensitive launching information

There are two methods of launching this client. The first will be from the IEMS security layer via a menu item.

The second will be via a url to the authentication machine. This url will be something along the lines of:

http://<ip>/ClientSessionManager.jnlp

If the user has already authenticated and that authentication session is still active, the CSM GUI will be immediately displayed. If there is not an authentication session currently active - the user will be prompted for their user name and password via the common login utility.

35.9 Security

35.9.1 Network configuration

None

35.9.2 Key management

None

35.9.3 Protocol

This CMS GUI will be a java client which is launched using the JavaWebStart client support software.

The messaging between the CMS GUI and the CMS Server will be via https.

35.9.4 Authentication

Access to the Client Session Monitor is for this feature will require the user to login and authenticate via the common login panel. The user must be a member of the sec* group.

35.10 Configuration Walkthrough

The CSMonitor Audit functionality keeps the session database from growing too large. All client monitor sessions, even after they are closed, are kept in the Client Session Monitor database to provide historical data of logins and logouts. The CSMonitor Audit functionality allows the user to configure when to poll the database for sessions to clean up and allows the criteria for clean up to be specified.The selection of sessions is strictly based on start time and may delete session which have not ended. Therefore, care must be taken to specify criteria so as not to delete any active sessions.

In order to configure the CSMonitor Audit and start the cleanup of sessions from the Client Session Monitor database, the following steps are performed:

1 - login to the IEMS security server as root

2 - enter the cli command

3 - select the Configuration option

4 - select the Succession Element Configuration option

5 - select the CSMCLEANUP Application Configuration option

6 - select the setCleanupTime option

7 - enter the amount of time for the CSMonitor Audit to poll the database for removal of sessions based on the criteria below, sessions are only removed when the CSMonitor wakes up after the time period specified. For example, if 24 hours is specified the CSMonitor Audit wakes up 24 hours from the time CSMonitor Audit is started and queries the database for sessions needing to be removed.

8 - select the setCleanupCriteria option

9 - select criteria for removal from the database. Max sessions per user criteria keeps the sessions based on start time for each user id. Time based criteria keeps sessions based on start time.

10 - if max criteria select above, skip to step 14

for time based criteria, enter the number of hours to keep sessions. For example, it 1 hour then any session started one hour prior to the audit polling are kept. If user x has two session one started at 10:00 and another started at 13:00 and the current time is 13:20 only the session started at 13:00 is maintained in the database. If user y has three sessions, first started at 12:21 and ended at 12:30. Second session started at 13:05 and the third session stared at 13:19. All three session for user y are kept. It is advisable to keep session at least 24 hours. Suggested is 7 days or 168 hours. Maximum is 30 days or 720 hours.

11 - select exit option, until no longer in CLI.

12 - restart CSMonitor_Audit for the changes to take affect (servrestart CSMonitor_Audit)

13 - done with configuration

14 - for max session per user based criteria, enter the maximum number of session to keep for each user. Go to step 11.

36: Configuration (CN): A00009839

36.1 Feature Name

Ability to apply patches during ESUP upgrade

36.2 Hardware and Software Requirements

No new hardware dependencies has been introduced by this feature.

With this feature ESUP will use the NTSimTool package to convert ".patch" files to ".tape" files.

36.10 User interface changes

This feature brings some changes in user interactions. This feature will intoduce a new screen at the begining just **before** the existing screen where ESUP asks for media type. This new screen will prompt user to enter "upgrade type". The options will be:

1) Upgrade to higher release

2) Patch only upgrade

Following figure shows the new screen:

Figure 1 :New screen prompting user to enter upgrade type

```
================================================================
=
===              Enhanced SDM Upgrade Procedure
===
================================================================
=
===
===  Please select the upgrade type
===     1) Upgrade to higher release
===     2) Patch only upgrade
===
===     type 'abort' to abort the upgrade
================================================================
=

Upgrade Type >
```

If user selects option 1, then the “select media” screen comes next. If user selects option 2, then “select media” is bypassed as patches will always be taken from DISK-media only.

During an upgrade to higher release, ESUP gives user another prompt asking - whether he wants to install patches or not? If the user enters ‘yes’, ESUP prompts the user to enter the location of the patch filesets. These prompts comes **after** the “select media” screen. Following figure explains this scenario:

Figure 2 : New prompt asking for patches location

```
================================================================

SN09 or later SSFPS load (with NTIpSec package) for the CBM.

OSS supporting IPSec communication.

37.3 Initial Configuration

37.3.1 Security

Following are the high-level steps to enable security between OSS and the CBM.

- Load the CBM with SN09 or later version of SSPFS
- After logging into the CBM, the craftsperson will then invoke the CLI tool available as part of SSPFS and proceed to the option of configuring the IPSec/IKE parameters with the OSS details.
    - The user should not log from the target OSS machine onto the CBM to perform the IPSec/IKE configuration.
- Enable security on the OSS to secure the connection from OSS to the CBM

37.3.2 OSS

IPSec and IKE configuration parameters which are provisioned on the OSS must match the corresponding parameters on the CBM provisioned through the configuration interface bundled under the CLI tool.

37.9.3.1 Functional Description

Figure 2 indicates the screen snapshot when the IPSec/IKE configuration interface menu option is exercised from the list of options displayed in the IP Configuration menu (option 3 as indicated in Figure 1).

Figure 2 : IPSec/IKE Configuration Interface

```
IPSec/IKE Configuration Menu
 1 - IPSec Configuration
 2 - IKE Configuration

 X - Exit

 Select -
```

37.9.3.2 CLUI usage and implications

This activity provides an easy to use IPSec configuration interface on the CBM for configuring IPSec/IKE parameters.

Initially, IPSec entries are created by entering the necessary parameters. If the craftsperson has chosen to use “ipsec” action,the next step would be to create a corresponding IKE entry using the necessary parameters.

37.9.3.3 IPSec configuration interface

The following figure (Figure 3) lists the screen snapshot when IPSec configuration option is chosen from the IPSec/IKE configuration menu initially displayed.

Figure 3 : IPSec Configuration Interface

```
IPSec Configuration Menu
 1  -  Add IPSec entry
 2  -  Delete IPSec entry
 3  -  List All IPSec entries

 X  -  Exit

Select -
```

37.9.3.3.1 IPSec fields

The following table lists the parameters which would accepted by the interface and the valid options for each of these parameters.

Table 1 : IPSec field descriptions

Field	Entry	Explanation and Action
Remote Address	A numeric internet IP address of the form : www.xxx.yyy.zzz	Source address on incoming packets and destination address on outgoing packets
Remote Port	1-65535,all	IP port of the remote system communicating with the server
Local Address[a]	A numeric internet IP address of the form : www.xxx.yyy.zzz	Destination address on incoming packets and source address on outgoing packets
Local Port	1-65535, all	IP Port of this server
Upper Layer Protocol	any, udp,tcp and icmp	Determines which protocol traffic this entry is matched against
Direction	in, out and both	Determines whether this entry is for inbound or outbound traffic
Action	bypass,drop and ipsec	Determines the action to be taken when the traffic pattern is matched
ESP Encryption	none, any, NULL, DES, 3DES	Encryption Algorithm that will be used to apply the IPSec ESP protocol to outbound datagrams and verify it to be present on inbound datagrams. Only valid when action is set to “ipsec”

Table 1 : IPSec field descriptions

Field	Entry	Explanation and Action
ESP Authenticaion	none,any, SHA1, MD5	Authentication Algorithm that will be used to apply the IPSec ESP protocol to outbound datagrams and verify it to be present on inbound datagrams. Only valid when action is set to “ipsec”
AH Authentication	none,any, SHA1, MD5	Authentication algorithm that will be used to apply the IPSec AH protocol to outbound datagrams and verify it to be present on inbound datagrams, Only valid when action is set to “ipsec”

a. The Local Address would be cluster IP address if the system is a HA configuration. If the system is having a simplex configuration, the local address would be the address of this node.

37.9.3.3.2 IPSec Add Entry Example

The following figure (Figure 4) shows screen snapshot for IPSec Add entry option.

Figure 4 : IPSec adding a new rule

```
Enter the Remote IP Address   : 47.135.214.62
Enter the Remote Port No [1-65535,all] : all
Enter the Local IP Address [47.135.214.127] :
Enter the Local Port No [1-65535,all] : all
Enter the Upper Layer Protocol [any,udp,tcp,icmp] : any
Enter the Direction [in,out,both] : both
Enter the Action [ipsec,drop,bypass] : ipsec
Enter the ESP Header
  Authentication Algorithm [md5,sha1,none,any] : sha1
  Encryption Algorithm [none,NULL,des,3des,aes,blowfish] : 3des
Enter the AH Header
  Authentication Algorithm [md5,sha1,none,any] : md5
```

The following figure (Figure 5) captures the screen snapshot of the confirmation prompt for IPSec add entry screen.

Figure 5 : IPSec add entry confirmation screen

Do you wish to add the following IPSec configuration Information

Remote IP Address : 47.135.214.62
Remote Port No. : all
Local IP Address : 47.135.214.127
Local Port No. : all
Upper Layer Protocol : any
Direction : both
Action : ipsec
ESP Encryption Algorithm : 3des
ESP Authentication Algorithm : sha1
AH Authentication Algorithm : md5

Select [save, edit, abort] -

The following figure (Figure 6) captures the screen snapshot when the values entered for a new IPSec rule through add option is being edited before committing to the database.

Figure 6 : IPSec Add entry - Edit option

```
Press ENTER to continue with the current option

Remote IP Address [47.135.214.62] :
Remote Port No. [all] :
Local IP Address [47.135.214.127] :
Local Port No. [all] :
Upper Layer Protocol [any] :
Direction [both] :
Action [ipsec] :
ESP Encryption Algorithm [3des] :
ESP Authentication Algorithm [sha1] : md5
AH Authentication Algorithm [md5] : sha1

Do you wish to add the following IPSec configuration Information

Remote IP Address              : 47.135.214.62
Remote Port No.                : all
Local IP Address               : 47.135.214.127
Local Port No.                 : all
Upper Layer Protocol           : any
Direction                      : both
Action                         : ipsec
ESP Encryption Algorithm       : 3des
ESP Authentication Algorithm : md5
AH Authentication Algorithm  : sha1

 Select [save, edit, abort] -  save

Configuration successfully completed

For downstream configuration refer to instructions placed
in downstream.ipsec file in /etc/inet/remotesystem/solaris directory
```

37.9.3.3.3 IPSec List Entry Example

The following figure (Figure 7) shows screen snapshot when the list option is exercised.

The rules will be listed in the order in which they are listed in the IPSec configuration file (ipsecinit.conf).

Figure 7 : IPSec List Entry Output

```
--------------------------------------------------------------------------------
indexID      raddr          laddr             lport    rport    dir  status
--------------------------------------------------------------------------------
 1       47.135.214.62  47.135.214.127   all      all      both  up
 2       47.135.214.63  47.135.214.127   all      all      both  down

Enter the indexID of rule to be detailed (x to exit) - 2

Remote IP Address              : 47.135.214.63
Remote Port No.                : all
Local IP Address               : 47.135.214.127
Local Port No.                 : all
Direction                      : both
Action                         : ipsec
ESP Encryption Algorithm       : 3des
ESP Authentication Algorithm : sha1
AH Authentication Algorithm  : sha1

Enter the indexID of rule to be detailed (x to exit) -
```

37.9.3.3.4 IPSec Delete Entry Example

The following figure (Figure 8) shows screen snapshot when the delete option is exercised from IPSec configuration interface.

Figure 8 : IPSec Delete Entry Output

```
-------------------------------------------------------------------------------
indexID     raddr           laddr           lport    rport    dir  status
-------------------------------------------------------------------------------
 1      47.135.214.127  47.135.214.62   all      all      both  up
 2      47.135.214.130  47.135.214.62   all      all      both  down

 Enter the indexID of rule to be deleted (x to exit) - 2

Remote IP Address             : 47.135.214.130
Remote Port No.               : all
Local IP Address              : 47.135.214.62
Local Port No.                : all
Direction                     : both
Action                        : ipsec
ESP Encryption Algorithm      : 3des
ESP Authentication Algorithm : sha1
AH Authentication Algorithm  : sha1

Do you wish to delete the above ipsec rule
Select [Yes, No, Exit(x)] :
```

37.9.3.4 IKE Configuration Interface

The following figure (Figure 9) lists the screen snapshot when IKE configuration option is chosen from the IPSec/IKE configuration menu initially displayed.

Figure 9 : IKE Configuration Interface

```
IKE Configuration Menu
 1  -  Add IKE entry
 2  -  Delete IKE entry
 3  -  List IKE entries
 4  -  Change Preshared key for IKE entry

 X  -  Exit

Select -
```

37.9.3.4.1 IKE Fields

The following table lists the parameters which would accepted by the interface and the valid options for each of these parameters.

Table 2 IKE Field Descriptions

Field	Entry	Explanation and Action
Remote Address	A numeric internet IP address of the form : www.xxx.yyy.zzz	IP Address of the remote system cmmunicating with this server
Local Address	A numeric internet IP address of the form : www.xxx.yyy.zzz	IP Address of this server
Oakley Group	1 (768 bit), 2 (1024 bit) or 5 (1536 bit)	The Oakley Diffie-Hellman group used for IKE Security Association key derivation
Authentication Method	Preshared	Authentication method used for IKE phase 1.
Encryption	DES, 3DES	Specifies the encryption algorithm for a security association
Authentication	SHA1, MD5	Specifies the authentication algorithm for a security association
PFS Group ID	0 (do not use Perfect Forward Secrecy for IPSec SAs), 1(768 bit), 2(1024 bit),5(1536 bit)	Oakley Diffie-Hellman group used for IPSec Security Association key derivation
Preshared Key File	String (file name with full path)	Specifies the file with complete path which would contain the preshared key. This file would contain the preshared key for this Security Association.

Table 2 IKE Field Descriptions

Field	Entry	Explanation and Action
IKE Lifetime	Maximum allowed value is 2,419,200 seconds, 40,320 minutes, 672 hours or 28 days	Specifies the lifetime for an IKE phase 1 Security Association
IPSec Lifetime	Maximum allowed value is 2,419,200 seconds, 40,320 minutes, 672 hours or 28 days	Specifies the lifetime for an IPSec Security Association

37.9.3.4.2 IKE Add Entry Example

The following figure (Figure 10) shows screen snapshot for IKE Add entry option.

Figure 10 : IKE adding a new rule

```
Enter the Remote IP Address : 47.135.214.62
Enter the Local IP Address [47.135.214.127] :
Enter the Oakley Group [1,2,5] : 2
Enter the Authentication Method [preshared] : preshared
Enter the Encryption Algorithm [des, 3des] : 3des
Enter the Authencation Algorithm [md5, sha1] : sha1
Enter the PFS Group ID [0,1,2,5] : 0
Enter the IKE Lifetime value : 14400
Enter the IKE Lifetime unit [secs,min,hrs] : secs
Enter the IPSec Lifetime Value : 14400
Enter the IPSec Lifetime unit [secs,min,hrs] : secs
Enter the IKE Preshared Key file location (full path) : /tmp/arun1
```

The following figure (Figure 11) captures the screen snapshot of the confirmation prompt for IKE add entry screen.

Figure 11 : IKE add entry confirmation screen

Do you wish to add the following IKE configuration Information

Remote IP Address : 47.135.214.62
Local IP Address : 47.135.214.127
Oakley Group : 2
Authentication Method : preshared
Encryption Algorithm : 3des
Authentication Algorithm : sha1
PFS Group ID : 0
IKE Lifetime : 14400
IKE Lifetime unit : secs
IPSec Lifetime : 14400
IPSec Lifetime unit : secs
IKE preshared key Location : /tmp/arun1

Select [save, edit, abort] - save

Configuration successfully completed

For downstream configuration refer to instructions placed
in downstream.ike file in /etc/inet/remotesystem/solaris directory

The following figure (Figure 12) captures the screen snapshot when the values entered for a new IKE entry through add option is being edited before committing to the database.

Figure 12 : IKE Add entry - Edit option

```
Press ENTER to continue with the current option
Remote IP Address [47.135.214.63] :
Local IP Address [47.135.214.127] :
Oakley Group [2] :
Authentication Method [preshared] :

indexID       raddr            laddr
-------------------------------------------------------
 1        47.135.214.62      47.135.214.127
 2        47.135.214.63      47.135.214.127

 Enter the indexID of rule whose key is to be changed (x to exit) - 2

Remote IP Address           : 47.135.214.63
Local IP Address            : 47.135.214.127
Oakley Group                : 2
Authentication Method       : preshared
Encryption Algorithm        : 3des
Authentication Algorithm    : sha1
PFS Group ID                : 0
IKE Lifetime                : 400
IPSec Lifetime              : 800
IKE preshared key           : ********
Do you wish to change key for above IKE rule
Select [Yes, No, Exit (x)] - yes

 Enter the preshared key file location (full path) : /tmp/arun2

Do you with to change key to the above
Select [Yes, No, Exit(x)] - yes

Configuration successfully completed

 Enter the indexID of rule whose key is to be changed (x to exit) -
```

37.9.3.5 OSS parameter settings

- The IPSec and IKE specific entries which needs to be configured at the downstream would be put into files (downstream.ipsec & downstream.ike) on the SSPFS box in /etc/inet/remotesystem/solaris directory
- Appropriate instructions would be provided as part of the interface to read from the static files so created, for configuring IPSec on the downstream

- The configuration information for the downstream machine would be limited to Solaris in this release.

Note : This static file contains confidential information (related to preshared key) and should be removed from the machine once its no longer needed.

37.9.3.6 CLUI release history update

Initial Availability

37.9.3.7 Supplementary Information

None

37.10 User interface changes

Not Applicable

37.11 OSSGate Interface Changes

Not Applicable

37.12 Security

37.12.1 Network configuration

None

37.12.2 Key management

Preshared keys would be used for IKE communication.

The IKE preshared key would be entered by the user as part of the IPSec/IKE configuration interface. Solaris stores all keys in a hidden system file not accessible by common users but is available to the root user.

37.12.3 Protocol

IPsec is being used on the solaris machine.

37.12.4 Authentication

Not Applicable

37.13 Configuration Walkthrough

37.13.1 CBM

Following lists the steps which needs to be carried out on the CBM.

The user should not log from target OSS machine onto the CBM to perform the IPSec/IKE configuration.

- Load the CBM with SN09 or later version of SSPFS
- Login as root into the CBM.

- Launch the CLI tool
- Select the IPSec/IKE Configuration option from the list of options listed by the CLI tool (available only as root user).
- In the IPSec/IKE Configuration menu, select the IPSec configuration option to add IPSec rules.
- Using the IKE configuration option in IPSec/IKE Configuration menu, add IKE rules.
- Exit the CLI tool.

37.13.2 OSS

- Make appropriate modifications to the configuration files on the downstream for enabling IPSec communication.

Note : This interface would generate configuration information for configuring IPSec on the downstream (for Sun and Linux boxes). This information would be make available on the CBM in the /tmp directory as static file. The downstream would require to be manually modified to reflect this configuration information.

37.14 Glossary

Term	Description
AH	Authentication Header
CBM	Core and Billing Manager
CLI	Command Line Interface (config tool of SSPFS)
IP	Internet Protocol
IPSec	Internet Protocol Security
ICMP	Internet Control Message Protocol
IKE	Internet Key Exchange
OSS	Operations Support System
PFS	Perfect Forward Secrecy
SA	Security Association
SSPFS	Succession Server Platform Foundation Software
TCP	Transmission Control Protocol
UDP	User Datagram Protocol

38: Configuration (CN): A00009890

38.1 Feature Name

Provisioning for Media Proxy insertion for SIP lines

38.2 Hardware and Software Requirements

The Session Server :MCS-EM OPI v9.0 or above provisioning interface.
The Session Server :MCS-EM Admin user name and password available to CS2K(SESM) configuration engineer.

38.3 Initial Configuration

See the Session Server(MCSEM) configuration that has been documented under activity A00008522.

As documented by the above acivity the SESM (CS2M) needs to be pre-configured to add connectivity information for the Session Server(MCSEM).

e.g. IP Address, Port, Username and Password for the Session Server(MCSEM).

38.4 Upgrade Considerations

38.4.1 Element Management Upgrade

For CS2M upgrade from versions 6.2 , 7.0 and 8.0 to SN09.

If there has been any IP-VPN(NAT)s provisioned in the CS2M configuration manager, these will need to be synchronised with the Session Server(MCSEM). Before the syncronisation can take place the Call Agent ID is required to be entered. If the Call Agent ID is not already provisioned a prompt will ask the user to enter the Call Agent ID, this should be a number that uniquly qualifies the call agent within the customer domain. e.g. If a carrier has 5 CS2Ks then they should be numbered 1..5 in each CS2K Configuration manager.

The CS2K Audit will attempt to perform a regular synchronisation. If the user wishes to commission this information prior to the scheduled audit, then a manual audit request will synchronise the data to allow correct Media Proxy insertion for SIP lines.

38.4.2 Downgrade impact

None

38.5 Element Management

The CS2M configuration manager :GWCEM has been modified to flow-through IP-VPN (NAT) Zone information to the Session Server(MCSEM). This is only visible to the user if there is an error condition. The error sent to the user may inform them that the Session Server(MCSEM) has failed to add the IP-VPN(NAT) Zone and therefore the current operation has failed.

The CS2K Audit GUIs have been modified to allow the user to audit the Session Server(MCSEM) provisioning data.

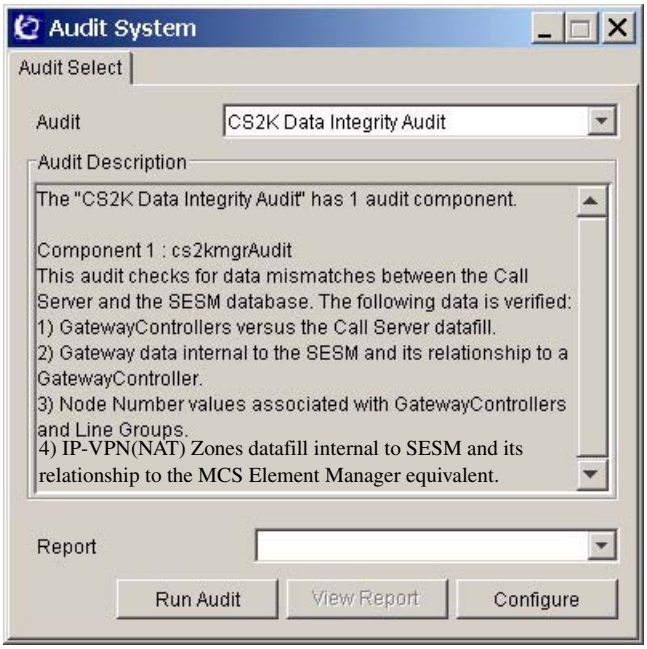
38.5.1 New/modified GUIs

Table 1 New or modified GUIs

GUI name	NEW, CHANGED, or DELETED
Audit System	Changed
CS2K Data Integrity Audit Configuration	New
CS2K Data Integrity Audit Report	Changed

38.5.2 GUI information

38.5.2.1 GUI name: Audit System



38.5.2.1.1 Functional description
Functionality is unchanged, however when selecting the “CS2K Data Integrity Audit” from the pull down selector, the Audit Description text is enhanced to describe the introduction of new audit functionality related to the audit of IP-VPN(NAT) Zones data fill against the Session Server(MCSEM).

38.5.2.1.2 GUI usage and implications
Unchanged.

38.5.2.1.3 GUI size
Table 2 New or modified GUIs

Abbreviated GUI name	Minimum instances	Maximum instances	Information on memory
Audit System	0	1	Minimal impact

38.5.2.1.4 GUI fields
Unchanged.

38.5.2.1.5 Usage example
No change in usage.

38.5.2.1.6 GUI release history update

38.5.2.1.7 Context sensitive launching information
None.

38.5.2.1.8 Supplementary information
None.

38.5.2.2 GUI name: CS2K Data Integrity Audit Configuration

38.5.2.2.1 Functional description
This GUI allows the user to selectively run the existing CS2K data integrity audit, the new CS2K SIP Media Proxy Data Integrity Audit or both audit components.

The GUI is accessed from the Audit System GUI upon selecting the “CS2K Data Integrity Audit” and pressing the “Run Audit” button.

38.5.2.2.2 GUI usage and implications

This GUI allows the user to select which sub components of the CS2K data integrity audit to run. This is done by selecting the check boxes for the 2 sub components.

The user is able to restrict the audit run to only those areas of interest. By selecting the “CS2K Call Server Data Integrity Audit” the exisiting audit functionality is exercised whereas by selecting the “CS2K SIP Media Proxy Data Integrity Audit”, the integrity of network zone datafill provisioned jointly at the CS2K and the MCS element manger is exercised.

Where the MCS element manager is not provisioned at the CS2M, the “CS2K SIP Media Proxy Data Integrity Audit” option will be disabled.

By selecting the “Run Audit” button, the required audit components will be run. Where no audit components have been selected, the “Run Audit” button will be disabled.

The “Close” button cancels the run of the audit components and closes the GUI.

38.5.2.2.3 GUI size

Table 3 New or modified GUIs

Abbreviated GUI name	Minimum instances	Maximum instances	Information on memory
CS2K Audit Config	0	1	Minimal

38.5.2.2.4 GUI fields

The following table lists fields for GUI CS2K Audit Config.

Table 4 GUI field descriptions

Field	New or Changed	Subfield	Entry	Explanation and action	Associated MIB entry
CS2K Call Server Data Integrity Audit	New	-	check box	Selects if the CS2K Call Server Data Integrity Audit will be executed	-
CS2K SIP Media Proxy Data Integrity Audit	New	-	Check box	Selects if the CS2K Media Proxy Data Integrity Audit should be executed	-

Table 4 GUI field descriptions

Field	New or Changed	Subfield	Entry	Explanation and action	Associated MIB entry
Run Audit	New	-	Button	Run the selected audit sub components	-
Close	New	-	Button	Close the GUI without running the selected audit sub components	-

38.5.2.2.5 Usage example

See Main screen shot for an example of both audit sub components selected.

38.5.2.2.6 GUI release history update

New functionality

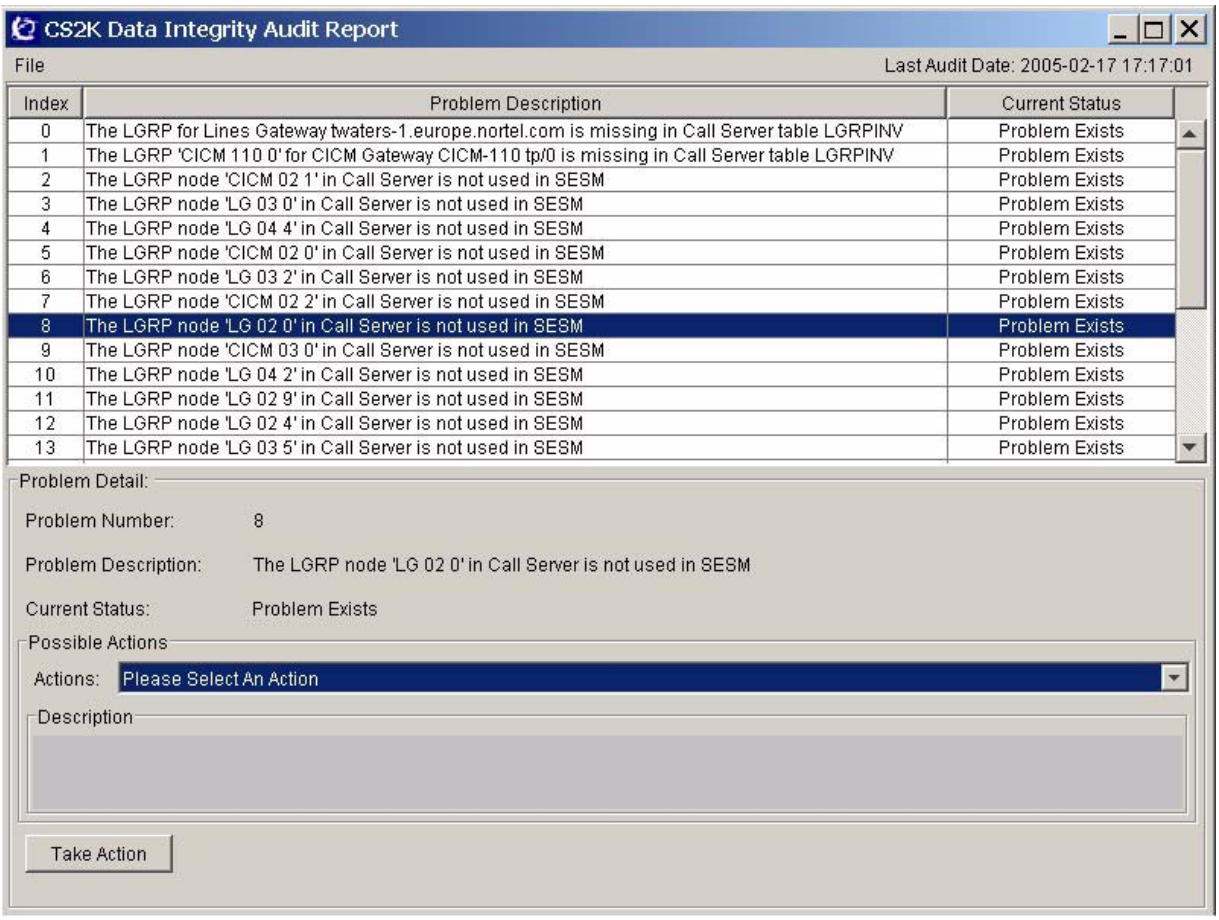
38.5.2.2.7 Context sensitive launching information

None.

38.5.2.2.8 Supplementary information

None.

38.5.2.3 GUI name: CS2K Data Integrity Audit Report



38.5.2.3.1 Functional description

This existing GUI displays problem reports for issues detected during the run of the audit. The functionality of the GUI is completely unchanged, however additional problem types will be detected by the “SIP Media Proxy Data Integrity Audit”. These new problem types will be displayed using the existing mechanism and appropriate Actions will be available via the Actions selector to correct the issues.

38.5.2.3.2 GUI usage and implications

Usage is unchanged.

38.5.2.3.3 GUI size

Table 5 New or modified GUIs

Abbreviated GUI name	Minimum instances	Maximum instances	Information on memory
CS2K Data Integrity Audit Report	0	1	No change

38.5.2.3.4 GUI fields

GUI fields are unchanged.

38.5.2.3.5 Usage example

Usage is unchanged.

38.5.2.3.6 GUI release history update

GUI unchanged but additional problem report types will be displayed.

38.5.2.3.7 Context sensitive launching information

None.

38.5.2.3.8 Supplementary information

None.

38.6 Configuration Walkthrough

Create a user or use an existing user for the Session Server(MCSEM) provisioning interface(OPI).

Use the CS2M configuration tool to configure the Session Server(MCSEM) connectivity information. See the MCSEM configuration that has been documented under activity A00008522.

If there are IP-VPN(NATs) provisioned already into the CS2M configuration manager, then perform an audit for the Session Server(MCSEM), to ensure the current data is synchronised.

Provision any new IP-VPN(NATs) or Distributed NATs into the CS2M Configuration Manager.

Make Configuration changes to existing gateways Or add new Gateways to the CS2K Configuration Manager to use the IP-VPN(NAT) information.

On the Session Server(MCSEM) provision the SIP Lines to use the routability groups that correspond to the Network Zones that were flowed through by the CS2M.

Calls between GWC controlled lines (IAD,H323,CICM) and MCS controlled SIP lines should now correctly insert Media Proxies when required.

39: Configuration (CN): A000010303

39.1 Feature Name

Map Level Service Control Application Programming Interface

39.2 Hardware and Software Requirements

39.2.1 Hardware requirements

In order to enable this capability for affected subscribers, the following must be present in the provider's network:

- Some Provider Network Server designed to support service queries/ updates via some Web or PC Client based interface.
- SESM/OSSGATE - An application that is used for the provisioning and maintenance of lines, trunks etc. The OSSGATE passes on the command information to the SDM.
- SDM - The SDM is an interface to the core. It takes in the commands given by the SESM and passes them onto the core and also takes the responses from the core and gives it to the SESM.

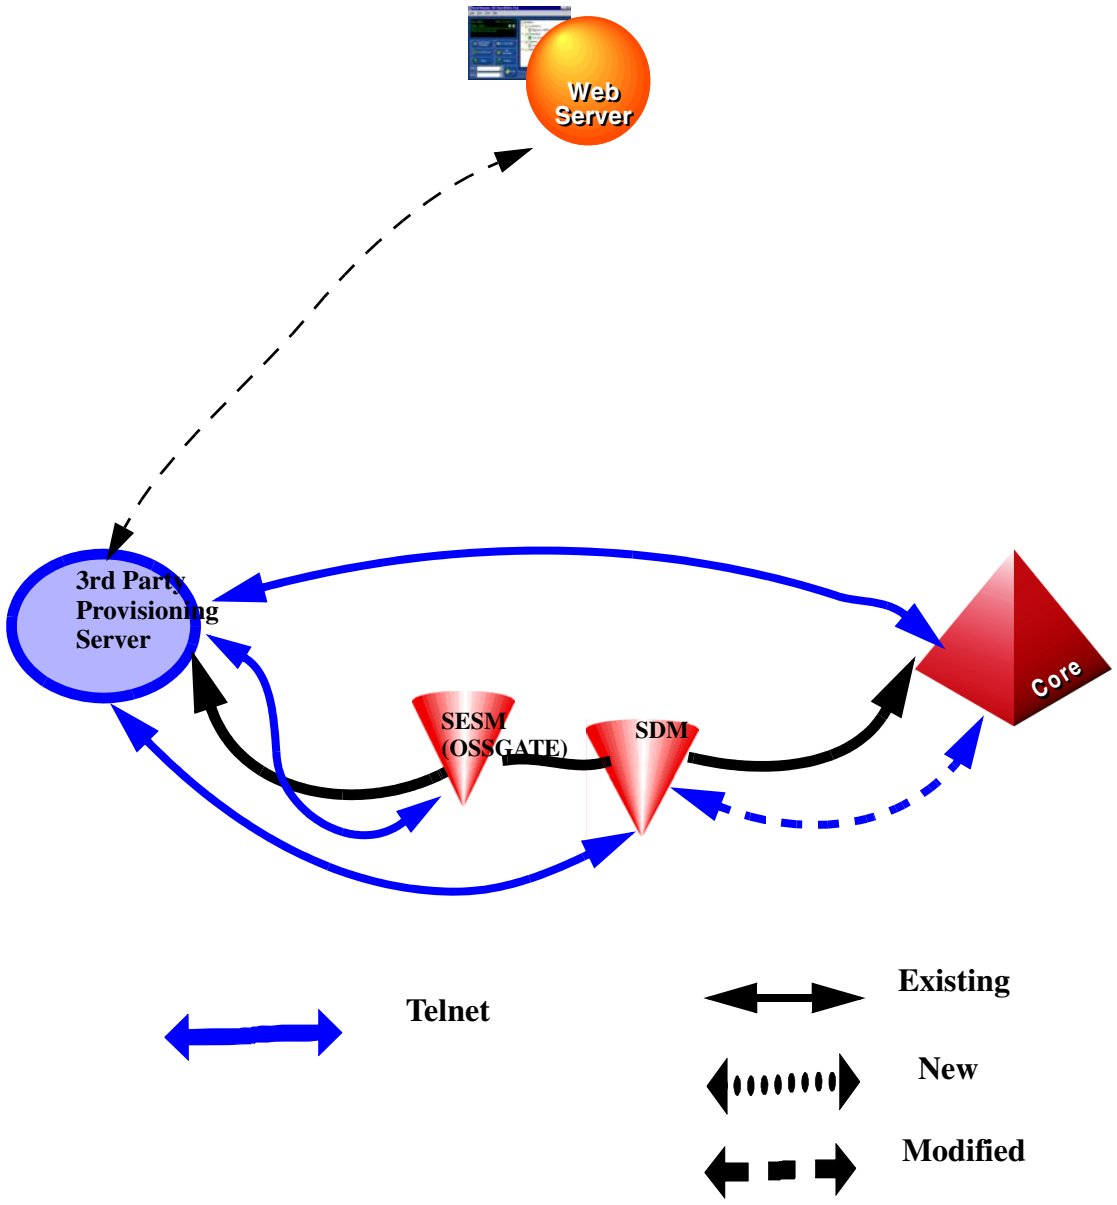
39.2.2 Software requirements

The new SOC SMGT0001 will control the CI interface to Service Management. This SOC will be independent of the AIN TCAP Service Management SOC control. The following table gives the possible supported state of both the SOCs:

Table 1 Supported SOC states

AIN SOC	Service Management SOC	Implication
ON	ON	Both interfaces will be active at the same time.
IDLE	IDLE	Both interfaces will be inactive at the same time.
ON	IDLE	AIN interface to be active and SVCNTRL to be inactive.
IDLE	ON	AIN interfaces to be inactive and SVCNTRL to be active.
ON for some	ON	Some combination of AIN interfaces active and SVCNTRL active.
ON for some	IDLE	Some combination of AIN interfaces active and SVCNTRL inactive.

39.3 Initial Configuration



In the case of CS2K, the commands issued by the end user will be sent via a 3rd party provisioning server to the OSSGATE via telnet. This is then sent to the SDM(Supernode Data Manager or CS2K Manager) which is the interface

to the core for processing. The output will then be sent back and displayed to the end user via the web server. In the case of TDM lines, there is a direct connection between the provisioning server and the core. This architecture can be used both for DMS and CS2K.

39.4 Software optionality control (SOC)

Table 2 SOC

SOC option name:	Service Mgmt-DMSCS2K
SOC option title:	Map Based Service Control
SOC option control type:	State
New SOC option?	Yes
SOC option order code	SMGT0001
Option defined in DRU:	CCM
Affected products:	SNNCSH09

39.5 Command interface changes

39.5.1 Directory: SVCNTRL

The command to enter into this CI tool is

> svcntrl <query/update> <DN> <feature/service> <attribute><attribute parameter>

39.5.1.1 Directory description

On entering command SVCNTRL, the user should enter one of the two options i.e. either query a service or update a service. For Query, the further options will be the DN, the feature/service and the attribute to be queried. For Update, the further options will be the DN, the feature/service and the attribute, and the attribute parameter to be updated.

39.5.1.2 Accessing directory: SVCNTRL

The directory will be a single level directory. The user will be able to enter the commands on a single line.

39.5.1.2.1 Access to directory or MAP level and return to CI

Access to the directory from CI prompt will be available on entering SVCNTRL at the CI level. Enter a Carriage Return to return to the CI prompt.

CI:

>svcntrl <query/update> <DN> <feature> <attribute><attribute parameter>

39.5.2 Command: SVCNTRL

39.5.2.1 Command type: NON- MENU

39.5.2.2 Command target: All

39.5.2.3 Command availability: RES

39.5.2.4 Command description

SVCNTRL is the command issued at CI prompt that is used to both query the status and/or programmed information as well as activate/deactivate and update their corresponding service.

39.5.2.4.1 The Query command

The Query command is used to query the following attributes depending on what the service is:

Table 3 List of supported Query attributes

Enumeration	Return Value	Description
status	active or inactive	Query the status of the corresponding service.
list	list of DNs 10 digits in length with /without priv. ind.	Query all entries in the corresponding service's screening list.
listSize	Positive integer less than 255	Query the number of entries in the corresponding service's screening list.
forwardDN	DN upto 30 digits in length	Query the forwarding DN of the corresponding call diversion service.
delayInterval	Positive integer between 1 and 10	Query the delay Interval(number of rings) of the corresponding service.
scList	List of DNs variable in length up to 30 digits	Query all entries in the corresponding Speed Call list.
all	Some aggregate o f the above	Query all attributes of the corresponding service.

The following table gives the structure of the SVCNTRL query command and how a valid command is to be issued. It also gives the valid option for each of the services. Only one attribute can be queried at a time.

Table 4 Query Command Syntax

Command	Action	DN	Feature	Attribute
SVCNTRL	Query	<10 digit DN>	MWI	Status All
			VMWI	
			AMWI	
			ACRJ	
			ACB	
			AR	
			CSMI	
			CWT	
			LDSA	
			MSB	
			SUPPRESS	
SVCNTRL	Query	<10 digit DN>	DRCW	Status List List Size All
			SCRJ	
			SIMRING	
SVCNTRL	Query	<10 digit DN>	CFU	Status Forward DN All
			CFDA	
			CFB	
SVCNTRL	Query	<10 digit DN>	SCA	Status List List Count All
			SCF	Status List List Count Forward DN All
SVCNTRL	Query	<10 digit DN>	CFDVT	Delay Interval All
SVCNTRL	Query	<10 digit DN>	SCS	Speed Call List All

Some examples of the Query command are:

Syntax to query the status of SCRJ for 6136631001

>svcntrl query 6136631001 scrj status

Status - Service_Active

Syntax to query the SCRJ list for 6136631001

>svcntrl query 6136631001 scrj list

List_Dn -

6136634567;6136678901;61366710021

6136631021; 6136789021;6136779001;

6136772021

Syntax to query SCRJ for 6136631001

>svcntrl query 6136631001 scrj all

Status - Service_Active

List_Size - 7

List_Dn -

6136634567; 6136678901; 61366710021

6136631021; 6136789021; 6136779001

6136772021;

If the DN is not provisioned with the service, then the following error message is displayed:

Syntax to query status of CSMI on 6136671021

>svcntrl query 6136671021 CSMI status

Failure - Unavailable_Resources

39.5.2.4.2 The Update Command

The Update command is used to update the following attributes depending on what the service is:

Table 5 List of supported Update Actions

Enumeration	Description
activate	Activate corresponding service.

Enumeration	Description
deactivate	Deactivate corresponding service.
delayInterval	Set delay interval for corresponding service.This is an integer value between 1 and 10 and represents the no. of rings.
adddn	Add specified DN to corresponding service's screening list.
deletedn	Delete specified DN from corresponding service's screening list.
deleteAlldn	Delete all DNs from corresponding service's screening list.
deleteAllPrivdn	Delete all private DNs from corresponding service's screening list.
setfwdDN	Set forwarding DN for corresponding call diversion service.
clearFwdDN	Clear forwarding DN for corresponding call diversion service.
toggle	Toggle status of the corresponding services.
invoke	Invoke the corresponding service.
changeList	Change a specified speed call cell entry.

The following table gives the structure of the SVCNTRL Update command and how a valid command is to be issued. It gives the valid option for each of the services. Only one attribute can be updated at a time.

Table 6 Update Command Syntax

Command	Action	DN	Feature	Attribute	Attribute parameters

SVCNTRL	Update	<10 digit DN>	MWI	Activate Deactivate	
			VMWI		
			AMWI		
			ACRJ		
			ACB		
			AR		
			CSMI		
			CWT		
			LDSA		
			MSB		
			SUPPRESS		
SVCNTRL	Update	<10 digit DN>	DRCW	Activate Deactivate Adddn Deletedn DeleteAlldn	
			SCRJ		DN <Dn> SpeedCallCode <SCC>
			SIMRING		
SVCNTRL	Update	<10 digit DN>	CFU	Activate Deactivate Setfwddn ClearFwddn	
			CFDA		dn <DN> SpeedCallCode <SCC>
			CFB		
SVCNTRL	Update	<10 digit DN>	SCA	Activate Deactivate Adddn Deletedn DeleteAlldn DeleteAllprivdn	dn <DN> SpeedCallCode <SCC> ICM
			SCF	Activate Deactivate Adddn Deletedn DeleteAlldn DeleteAllprivdn SetFwdDN ClearFwdDN	dn <DN> SpeedCallCode <SCC> ICM
SVCNTRL	Update	<10 digit DN>	CFDVT	Set Delay Interval < 1 to 10>(number of rings)	< 1 to 10> (number of rings)
SVCNTRL	Update	<10 digit DN>	CNDB	Toggle	
			CNAB		

SVCNTRL	Update	<10 digit DN>	COT	Invoke	
			CCW		
SVCNTRL	Update	<10 digit DN>	SCS	Change List	SpeedCallCode <SCC> dn <DN>
			SCL		
			SCU		

Note: For SIMRING, deleteallprivdn and ICM is invalid.

Some examples of the Update command are:

Syntax to activate Call Forward BusyLine on 4164731051

>svcntrl update 4164731051 cfb activate

Success - Service_Activated

Syntax to clear the forward DN on 4164731051

>svcntrl update 4164731051 cfb clearFwdDn

Success - ForwardingDn_Cleared

>svcntrl update 4164731051 cfb setFwdDn dn 4164631001

Success - ForwardingDn_Set

Error conditions:

If we try to activate an already activated service

>svcntrl update 4164731051 cfb activate

Failure - Service_Already_Active

If the user tries deleting a list which is empty, the response would be

>svcntrl update 4164731051 simring deleteallDN

Failure - List_Is_Empty

If the SOC for SPRING (call forward ringing) is not turned on, the response would be

>svcntrl update 4164731051 cfdvt delayInterval 4

Failure - Unavailable_Resources

39.5.2.5 Command syntax

Table 7 Command Syntax

Command	Parameters and variables
SVCNTRL	**input parameters** <query/update> <DN> <feature/service> <attribute> <attribute parameters> **output parameters** A readable sentence depending upon what the return code is

39.5.2.6 Qualifications and warnings

39.5.2.7 Responses

39.5.2.7.1 Error codes for the Query Command

Table 8 Error codes for the Query Command

Return Code	Description
Failure - Invalid_Dn	DN entered is not valid.
Failure - Unavailable_Resources	The service is not subscribed on the DN.
	The feature SOC is idle.
	SLE SOC is idle.
Failure - SOC_Idle	The SVCNTRL SOC is idle.

39.5.2.7.2 Responses for the update command

The following table gives the valid responses for the update command

Table 9 Responses for the Update Command

Response	Meaning
Success - Service_Activated	Successful activation/deactivation of the service.

Response	Meaning
Success - Service_Deactivated_or_Cancelled	Successful deactivation of the service.
Success - AnonymousEntry_Added	Successful addition of a private no to the list of a DN.
Success - PublicEntry_Added	Successful addition of a DN to the list of another DN.
Success - AnonymousEntry_Removed	Successful deletion of a private number from a DNs list.
Success - PublicEntry_Removed	Successful deletion of a DN from a DNs list.
Success - All_Anonymous_Entries_Removed	Successful deletion of all private DNs from the list.
Success - All_Entries_Removed	Successful deletion of all DNs from the list.
Success - ForwardingDn_Set	Successful setting of a FwdDN to another DN.
Success - ForwardingDn_Cleared	Successful clearing of a FwdDN from another DN.
Success - DelayInterval_Updated	Successful updation of delay interval of a DN.
Failure - Service_Already_Active	Not updated because the service is already active on the DN.
Failure - Service_Not_Activated	Gives this response because the service might be inactive and the user is trying to deactivate or in the case of ACB/AR if the feature queue is not present.
Failure -Invalid_Forwarding_Dn	FwdDN not set because the FwdDN did not pass validation.
Failure - List_Is_Empty	When trying to delete a DN from the list of another DN and if the list is empty.
Failure -List_Is_Full	When trying to add a DN to the list of another DN and if the list is full and cannot accommodate more DN's.
Failure - Public_Dn_Already_On_List	If the DN you are trying to add to the list of another DN is already present.
Failure - Anonymous_Dn_Already_On_List	If the private DN you are trying to add to the list of another DN is already present.
Failure - Dn_Not_On_List	If the DN you are trying to delete is not on the list.
Failure - No_Match	When trying to update the delay interval, if the ring control is not programmable ring type.

Response	Meaning
Failure - Unsuccessful_Update	When the update is not successful and for different features and actions, its meaning is different.
	For ACB/AR, activation of the feature is not supported.
	For CFB, if Fixed or Programmable version is not provisioned.
	For CFBL & CFDA, with control N type.
	FOR CFDA if IECFD is provisioned or if CFD Normal is provisioned.
	For Speed Call, if SCU is provisioned.
	For services that use SLE, if SLE datafills are missing in Table CUSTSTN.

39.5.2.7.3 Error codes for the update command

Table 10 Error codes for the Update Command

Return Code	Description
Failure - Invalid_Dn	DN entered is not valid.
Failure - MSRID_Does_Not_Match_User_Profile	For all types of MWT an Msr Id has to be input.This will be validated against Table MSRTAB.If there is a mismatch, then it returns this code.
Failure - Unavailable_Resources	The service is not subscribed on the DN.
	The feature SOC is idle.
	For ACB and AR, checks the validity of the feature and if the feature is not allowed gives this response.
	For ACRJ, COT if universal access is not permitted.
	For CFB, if IECFB is provisioned.
	For CFD, if IECFD is provisioned.
	For CFU, if CFU/CFI/CFF is not provisioned.
	For CNAB & CNDB, if the call is not up.
	FOR MWI, if EMW or CALLOG is assigned to the line.
	The SLE SOC is idle.
	Deactivate MWT when MWT is not active
Failure - SOC_Idle	The SVCNTRLCI SOC is idle.

Table 11 Map outputs with associated meanings and actions

Command
Ex1: If the user tries to update the delay interval of a DN with CFW ring control **>svcntrl** update 4164731051 cfdvt delayInterval 4 **RESPONSE**:>Failure - Unavailable_Resources **Meaning:** Each feature is controlled by a SOC and this SOC needs to be turned on. The above response means that the SOC for SPRING is not turned on. **System or user actions:** For the delay Interval attribute to be update the SOC for SPRING should be turned on. **Ex2:**If the user tries deleting the list of a DN with the SIMRING feature **>svcntrl update 4164731051 simring deleteallDN** **RESPONSE:> Failure - List_Is_Empty** **Meaning:This means that there is no DN present in the list of 4164731051** **System or user actions:** This is not an error scenario, so no action need be taken but the user can query the DN for the list before trying to delete the list.

39.5.2.7.4 Error responses when invalid entries are given

Table 12 Error responses for invalid entries

Return Value	Description
Failure - Invalid_Action	When any other value other than update or query is entered after SVCNTRL.
Failure - Invalid_DNformat	When the DN entered has alpha numeric values or if the DN is not of 10 digit form.
Failure - Unrecognized_Service	When the service entered is invalid.
Failure - Invalid_Attribute	When the attribute entered for that service is invalid.
Failure - Invalid_Attribute_Parameter	When the parameters for the attributes are specified incorrectly. For e.g., if the value of delay interval to be updated is greater than 10.
Failure - Missing_Parameter	When an incomplete command is issued, i.e. if the service, attribute, or any of the parameters are missing.

If the user enters an invalid option then the tool will throw an exception. Rather than prompting the user, the appropriate message will be given and the user

will have to re-enter the command with valid options. The following are the responses for invalid entries.

Ex 1: When the action given is not update/query

>svcntrl updation 6136631001 acrj activate

The response would be:

Failure - Invalid_Action

Ex2: If the DN is invalid

>svcntrl query abc6790123 drcw list

The response would be:

Failure - Invalid_DNformat

Ex3: If the DN entered is not 10 digit

>svcntrl query 6631001 cfb ForwardDN

The response would be:

Failure - Invalid_DNformat

Ex4: If the service is not valid

>svcntrl update 6136671021 cssi activate

The response would be:

Failure - Unrecognized_Service

Ex5: If the attribute is not valid for that service

>svcntrl update 4164671021 cndb FwdDn

The response would be:

Failure - Invalid_Attribute

EX7: If the attribute parameters are invalid

>svcntrl update 4164671001 cfdvt delayInterval 65

The response would be:

Failure - Invalid_Attribute_Parameter

Ex6: If the parameters entered are insufficient

>svcntrl update

The response would be:

Failure - Missing_Parameter

>svcntrl query scs

Failure - Missing_Parameter

39.5.2.8 Example

Table 13 Examples of SVCNTRLCI command

Description of task:	To query the delay Interval on DN 613 663 1001 with CFW ring control.
Command: MAP response:	>**svcntrl query 6136631001 CFDVT delayInterval** **Delay_Interval - 2**
Description of Task:	To set the forward DN for 6136631001 with cfb option
Command: MAP response:	>**svcntrl update 6136631001 cfb setFwdDN dn 6136671001** **Success - ForwardingDN_Set**
Description of Task:	To query the status of CSMI on 6136671021
Command: Map Response:	>**svcntrl query 6136671021 csmi status** **Failure - Unavailable_Resources** (This response is when the service CSMI is not subscribed on the DN)

39.6 OSSGate Interface Changes

39.6.1 XML Command Changes

N/A

39.6.1.1 Command XML

N/A

39.6.1.2 Response XML

N/A

39.6.2 Additional OSSGate Changes

Through this feature, the CI command, SVCNTRL is made accessible through OSSGate. For more information about SVCNTRL See “Command: SVCNTRL” on page 2664.

39.7 Security

39.8 Configuration Walkthrough

The following are the configuration steps for CS2K:

a. Enable SOC SMGT0001 on the core. The SOC needs to be turned on for the query and update commands to function.

b. Enable the SDM telnet session. This is necessary in order to make the interface to the core active.

c. For CS2K, enable the OSSGATE telnet session to enable provisioning.

d. For TDM, there should be a direct telnet connection from the 3rd party provisioning server to the core.

Ensure that telnet is enabled throughout the session.

40: Configuration (CN): A000010742

40.1 Feature Name

GWC EM Enhancements to Support SIREN

40.2 Hardware and Software Requirements

The components modified by this feature, GWC EM and SESM, will be delivered as part of the CS2M load (CS2K Management Tools). CS2M requires the SSPFS (Solaris Software Platform Foundation Software) load as its platform software. The software will interact with GWCs and other necessary components within the Succession and Siren environments.

40.3 Initial Configuration

The CS2M install scripts will be changed to prompt the user if running in Succession or Siren environment. If running in Siren environment, then the SAM21EM software will not be installed.

In order to accommodate various lab set up scenarios, a "lab only" mode will be supported by the SESM configure script. The user will need to enter "-labOnly" as a parameter when invoking the configure script. The SESM configure script will prompt for different information depending on whether running in Succession or Siren environment.

If running in Succession environment and in "lab only" mode, the configure script will prompt the user for the SAM21EM server's IP address and the SAM21EM database password. This is necessary for labs that have the SAM21EM software and the SESM software on different machines.

If running in Siren environment, the configure script will prompt the user for the Siren shelf's IP address and port. This information is required for lab and customer installations.

40.4 Office/Subnet parameters (OP/SP) (CM & SESM)

Not applicable

40.5 Upgrade Considerations

40.5.1 Dump and Restore (CM)

None

40.5.2 Element Management Upgrade

The SESM configuration information as to whether it is configured as Siren or Succession should be saved over an upgrade. Upgrade procedures will be the same as the Succession CS2M upgrade procedures.

It should be noted that this feature does not address Succession to Siren migration for SESM/GWC EM.

40.5.3 Downgrade impact

Downgrades are not applicable for the first release.

40.6 Data schema (DS) (CM, MIBS, RDB)

Not applicable

40.7 Service Orders (SO) (CM & SESM)

Not applicable

40.8 Software optionality control (SOC)

Not applicable

40.9 Element Management

The GWCEM/SESM component of the CS2K Management Tools is used to perform configuration and provisioning of GWCs.

40.9.1 New/modified GUIs

Table 1 New or modified GUIs

GUI name	NEW, CHANGED, or DELETED
GWC EM	Changed

40.9.2 GUI information

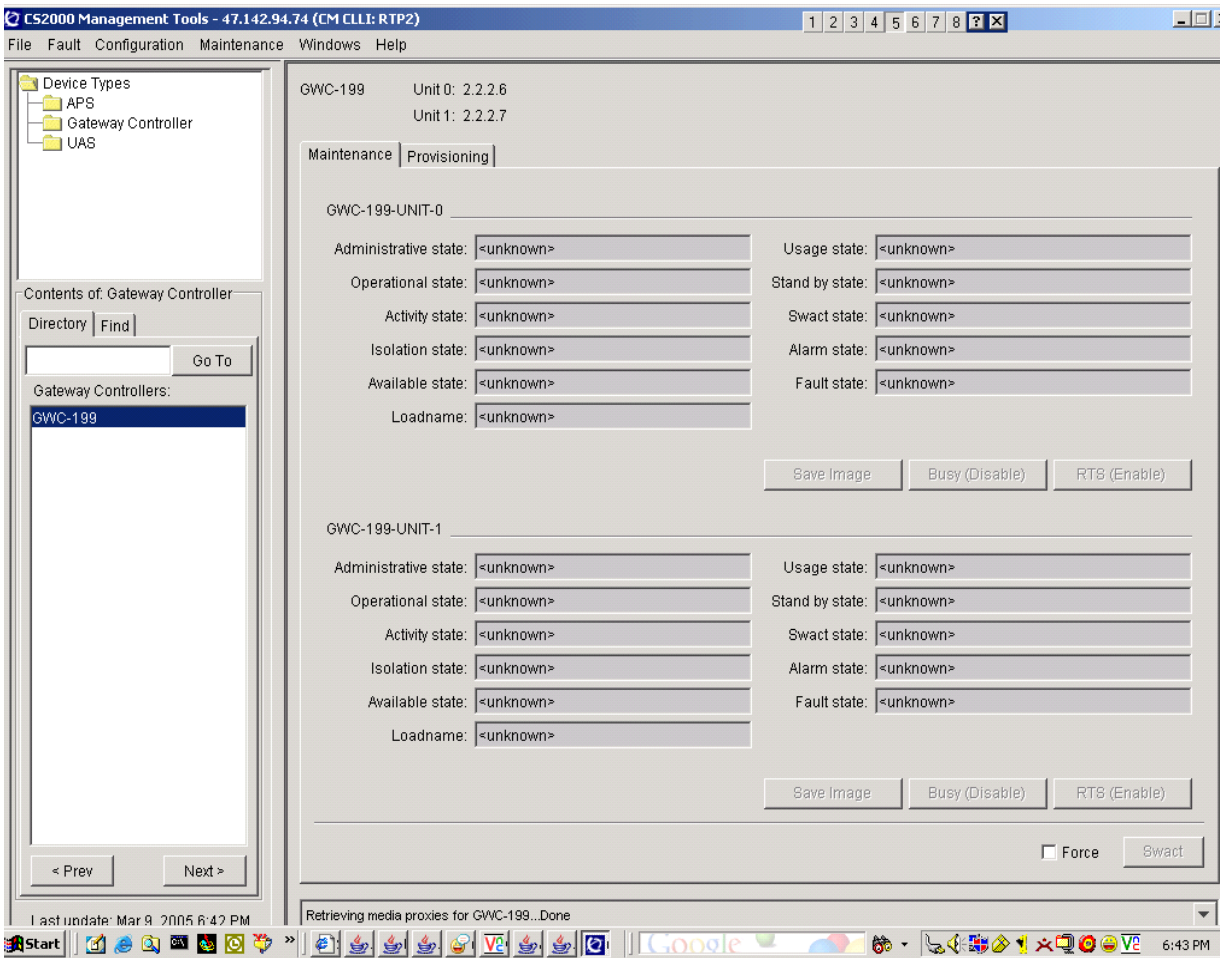
40.9.2.1 GUI name: GWC EM

Gateway Controller Element Manager

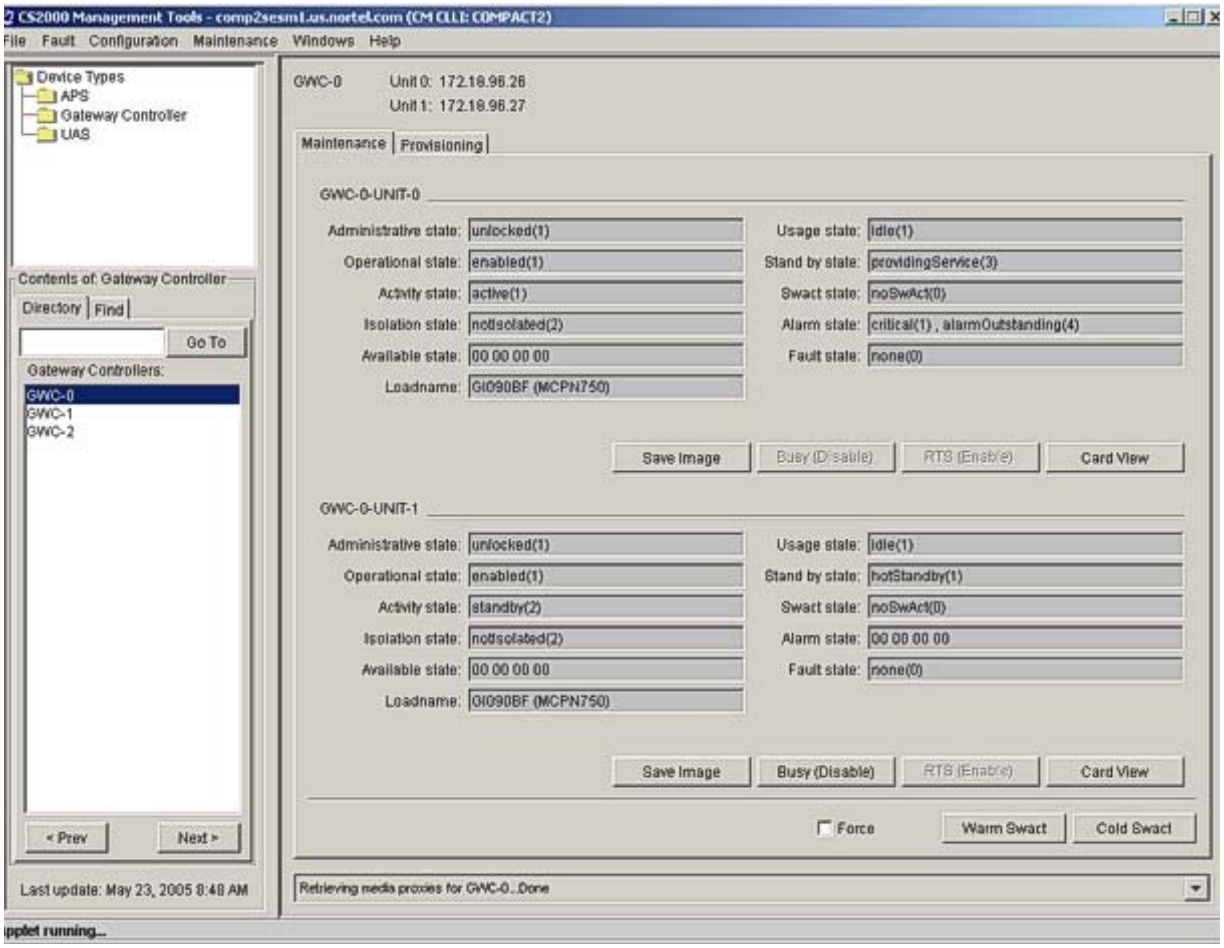
40.9.2.1.1 Functional description

There are two modifications necessary in the GWC EM GUI.

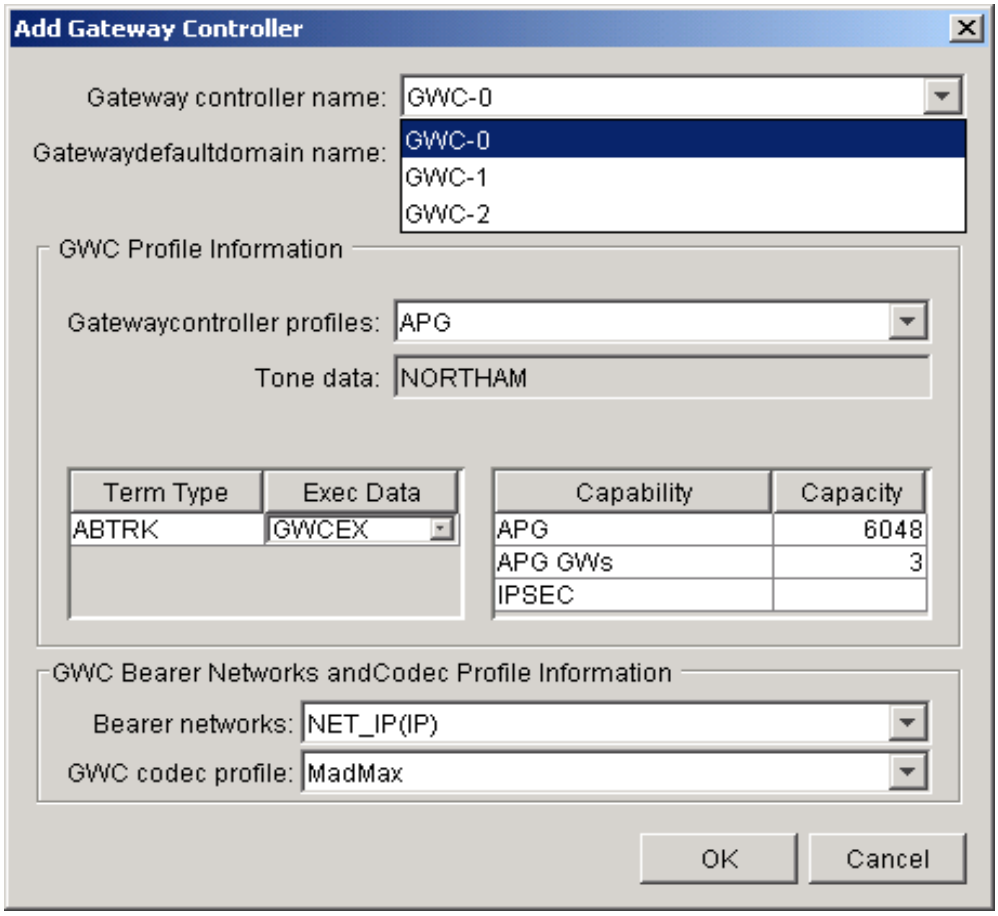
1. In Siren configuration, the ability to bring up the SAM21 card view of the GWC card is removed, and the warm and cold swact buttons are replaced with a single ‘swact’ button. The following picture shows the changes necessary for the Siren platform.



For clarity, it should be noted that for Carrier VoIP installations, the card view button will still be present, and the warm and cold swact buttons are not changed. This is shown below.



2. In both Siren and Succession configurations, the ‘Add GWC’ dialog box will now prompt only for GWC name and not the IP address. The IP addresses will be determined internally by the hardware management software. This picture shows the list of GWC’s displayed to the user. These GWC’s are the Gateway Controllers already provisioned in the Siren Shelf (in case of Siren) or SAM21 (in case of Succession).



40.9.2.1.2 GUI usage and implications

Current datafill order unchanged.

40.9.2.1.3 GUI size

No changes

40.9.2.1.4 GUI fields

Not applicable

40.9.2.1.5 Usage example

See screen examples in section “Functional description” on page 2678.

40.9.2.1.6 GUI release history update

The IP address field is removed from the ‘Add GWC’ dialog.

The ‘Card View’ button is removed in the Siren environment, and the ‘Warm Swact’ and ‘Cold Swact’ buttons are combined into a single ‘Swact’ button.

40.9.2.1.7 Context sensitive launching information

No changes

40.9.2.1.8 Supplementary information

Not applicable

40.10 User interface changes

Not applicable

40.11 OSSGate Interface Changes

40.11.1 XML Command Changes

The Add GWC (addGWCtoCS) operation is modified to make parameter gwcActvIp optional. The IP address will be looked up using the GWC name (gwcUIName). The tag is made optional because we do not want to change the current external OSS interface. If gwcActvIp is provided, it will not be used.

40.11.1.1 Command XML

Example:

```
<?xml version="1.0" encoding="UTF-8" ?>
<CommandList>
        <Command>
                <Interface>cs2kCfgMgrIf</Interface>
                <Methods>
                        <addGWCtoCS usn="1" version="1.0">
                                <Parameters>
                                        <csUIName>COMPACT6</csUIName>
                                        <gwcUIName>GWC-12</gwcUIName>
                                        <profileName>LARGE_LINENA</profileName>
                                        <gwcSnmpPort>161</gwcSnmpPort>
                                        <msgRouterIp>47.142.128.144</msgRouterIp>
                                        <msgRouterIpPort>4684</msgRouterIpPort>
                                        <bearerNetworkName>NET_IP</bearerNetworkName>
                                        <bearerFabricType>IP</bearerFabricType>
                                        <codecProfileName>Test</codecProfileName>
                                        <termType>POTS</termType>
                                        <termType>KEYSET</termType>
                                        <execLineup>POTSEX</execLineup>
                                        <execLineup>KSETEX</execLineup>
                                </Parameters>

New/modified tables, MIBs, or Database Schema

Table 1 New or modified tables

Table/MIB name	NEW/CHANGED/ or DELETED/	Table Control (NEW/ OLD/UNCHANGED)
LTCINV	CHANGED	UNCHANGED

41.6.1 Table/MIB/Remote Database Schema information

41.6.1.1 Name: LTCINV

41.6.1.1.1 Line Trunk Controller Inventory Table **Functional description**

Existing Table.

Usage sequence and implications (CM Only) Current datafill order remains unchanged.

SizeTable Size remains unchanged.

41.6.1.1.2 Fields/OIDs

Table LTCINV is changed such that an SMU XPM can now add the optional field, EXTDS512. This optional field was already valid for XPMs which were supported in an ABI configuration (e.g. LTC, LGC, PLGC, SMA2, etc.). This field is used to identify the host gateway, as defined in table GATWYINV.

This changes should have no impact on documentation, other than allowing an SMU entry to have field EXTDS512 as was previously allowed for LTC, LGC, PLGC, SMA2 and SMS).

Table 2 Table LTCINV, field OPTATTR description

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
OPTATTR	changed	n/a	EXTDS512	Now valid to enter EXTDS512 as an value in the OPTATTR field for SMU XPM.

41.6.1.1.3 Datafill example

The following example shows sample datafill for table LTCINV with SMU datafilled as an ABI XPM.

SMU 0 186 SME 1 18 2 E 26 6X02EE ESU13BB (POTS POTSEX) $ (4 30) (4 31)(4 32) (4 33) $ (UTR15) (MSG6X69) (CMR13 CMR10A) $ NORTHAM MX77AA MX77AA 0 UPFWNR04 (**EXTDS512** HOST ABI 10) $ 6X40AC N

41.6.1.1.4 Table release history update

n/a

Supplementary information The changes made to table LTCINV allowing SMU XPMs OPTATTR field to contain the EXTDS512 value are analogous to previous features allowing other XPMs to be supported in an ABI configuration.

42: Configuration (CN): A000011167

42.1 Feature Name

MG9KEM Central Userid and Password Support

42.2 Hardware and Software Requirements

This functionality is for an MG9K Element Manager (EM) that has SN09 or higher software version.

42.3 Initial Configuration

No changes.

42.4 Office/Subnet parameters (OP/SP) (CM & SESM)

The EM (subnet) level userid and password configuration information is in the Element Manager section of this document.

42.5 Upgrade Considerations

42.5.1 Dump and Restore (CM)

NA

42.5.2 Element Management Upgrade

For an upgrade to SN09, the central userid and password will be defaulted to "mg9kadm/mg9kadm". The already-defined NE-level userid and passwords will not be affected by the upgrade and will be used as the second level of authentication as described previously.

42.5.3 Downgrade impact

During a downgrade, the central userid and password will no longer be configured and the NE-level userid and passwords will be the same as they were in the previous release, unless they have been changed by the customer after the upgrade.

42.6 Data schema (DS) (CM, MIBS, RDB)

42.6.1 New/modified tables, MIBs, or Database Schema

The Office Wide Defaults table in the EM Oracle database will have two new rows used to store the EM-level userid and password: "centralid" and centralpw".

42.6.2 Table/MIB/Remote Database Schema information

NA

42.7 Service Orders (SO) (CM & SESM)

NA

42.8 Software optionality control (SOC)

NA

42.9 Element Management

The MG9K Element Manager will be used to define the EM-level userid and password.

42.9.1 New/modified GUIs

Table 1 New or modified GUIs

GUI name	NEW, CHANGED, or DELETED
Subnet View	Changed
Subnet Level User Id and Password	New

42.9.2 GUI information

42.9.2.1 GUI name: Subnet View

42.9.2.1.1 Functional description

This GUI is used to manage EM data that pertains the all the NEs defined for the EM.

42.9.2.1.2 GUI usage and implications

There is no requirement to datafill GUIs in a specific order.

42.9.2.1.3 GUI size

Table 2 New or modified GUIs

Abbreviated GUI name	Minimum instances	Maximum instances	Information on memory
Subnet View	1	1	NA

42.9.2.1.4 GUI fields

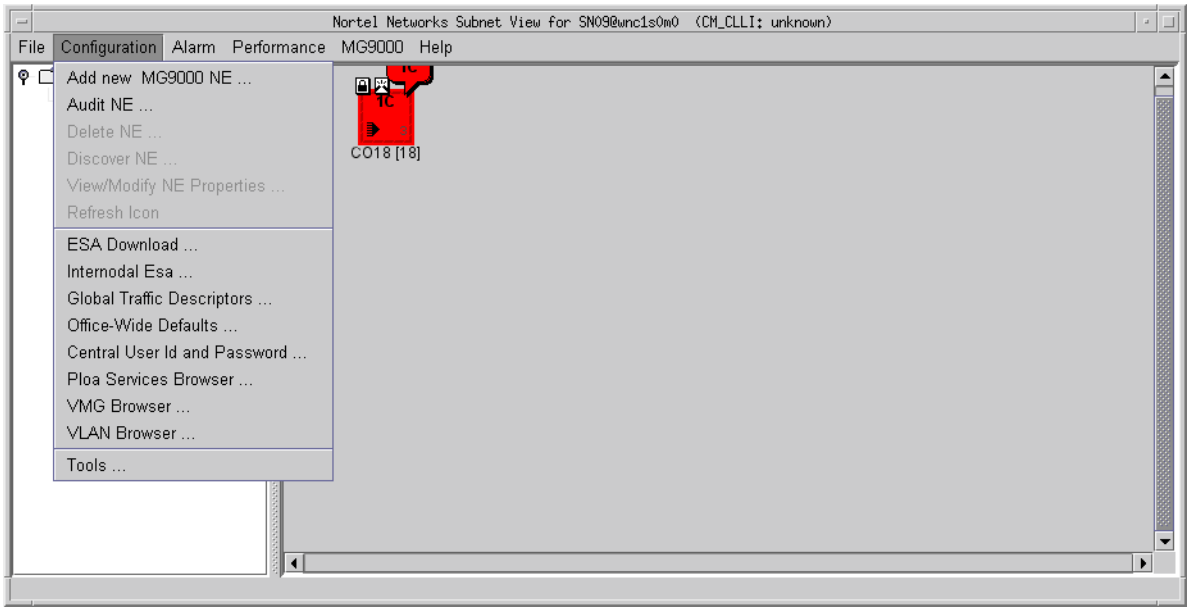
A new entry will be added to the Configuration pull-down menu on the Subnet View GUI. The following table lists fields for the pull-down menu in SubnetView.

Table 3 GUI field descriptions

Field	New or Changed	Subfield	Entry	Explanation and action	Associated MIB entry
Configuration	Changed	User Id and Password	NA - pull-down menu item	Selection of this item will open the User Id and Password GUI	NA

42.9.2.1.5 Usage example

The following figures show the Configuration level and User Id and Password GUIs.



42.9.2.1.6 GUI release history update

A new menu item, User Id and Password will be added to the pull-down Configuration menu.

Context sensitive launching information

The EM GUI is launched using JavaWebStart. There are no changes to the launching of the GUI.

42.9.2.1.7 Supplementary information

None.

42.9.2.2 GUI name: User Id and Password View

42.9.2.2.1 Functional description

This GUI is used define the subnet-level userid and password.

42.9.2.2.2 GUI usage and implications

There is no requirement to datafill GUIs in a specific order.

42.9.2.2.3 GUI size

Table 4 New or modified GUIs

Abbreviated GUI name	Minimum instances	Maximum instances	Information on memory
User Id and Password View	1	1	NA

42.9.2.2.4 GUI fields

The following table lists fields for the User Id and Password GUI. The ability to Apply data, Refresh data, and Close the GUI will also be provided via buttons at the bottom of the GUI.

Table 5 GUI field descriptions

Field	New or Changed	Subfield	Entry	Explanation and action	Associated MIB entry
User Id	New	None	NA - pull-down menu	1- 32 characters (must be alphabetic characters or numbers)	NA
Password	New	None	NA - pull-down menu	1- 128 characters The entered data will not be visible to the user.	NA

Table 5 GUI field descriptions

Field	New or Changed	Subfield	Entry	Explanation and action	Associated MIB entry
Password (Verify)	New	None	NA - pull-down menu	1- 128 characters The entered data will not be visible to the user. This field must match what is entered in the Password field and is used to verify entry of the same password in both fields.	NA

42.9.2.2.5 Usage example

The GUI will contain three new editable fields, User Id, Password, and Password (Verify). When the password is entered, it will not be visible to the user and must be entered twice to confirm that the customer has entered it correctly. The GUI will contain Apply, Refresh, and Close buttons.

42.9.2.2.6 GUI release history update

The new User Id and Password GUI is created.

Context sensitive launching information

The EM GUI is launched using JavaWebStart. There are no changes to the launching of the GUI.

42.9.2.2.7 Supplementary information

When the user configures or changes the userid and/or password, an Information message will be output to indicate that the entered userid and password will be used instead of the NE-level userid and password.

42.9.3 CLUI Interface

NA

42.10 User interface changes

NA

42.11 OSSGate Interface Changes

NA

42.12 Security

This activity provides IEMS/ Radius authentication of the MG9K userid and password. The userid and password will be configured on a per MG9K

Element Manager (EM) basis instead of only on an NE basis. If Radius is not available when the EM communicates with the MG9K, the NE-level userid and password will be used for authentication instead of the EM-level userid and password.

42.12.1 Network configuration

NA

42.12.2 Key management

NA

42.12.3 Protocol

NA

42.12.4 Authentication

The same EM-level userid and password must be entered at the IEMS/Radius server and at the EM GUI.

42.13 Configuration Walkthrough

To allow the IEMS/Radius server to provide central authentication of the MG9K userid and password, the same EM-level userid and password must be entered at the IEMS/Radius server and at the EM GUI. This authentication is required during ESA or OM data transfer to the MG9K.

The following provides additional information and the recommended configuration.

- The NE-level userid is not configurable (mg9kadm) and passwords can be configured on a per-MG9K basis.
    - When customers change the NE-level account password of a MG9K, the corresponding MG9K's password must be updated via the MG9K EM.
    - Based on customers' security policies, the NE-level account passwords can be all different or the same. MG9K EM/MG9K does not ensure that all NE-level account passwords are all different or the same. They are managedly independently of each other by the customers.
- An office-wide central account should be created and managed separately.
    - It is recommended that customers name the account using a different ID (i.e., not 'mg9kadm').
    - The userid and password for this central account should be changed via IEMS (Radius) first and then must be updated via the SN09 MG9K EM to keep it in sync.

- After the MG9K EM is upgraded to SN09, the MG9Ks should be upgraded.
- After all the MG9Ks have been upgraded to SN09, the userid and password defined in Radius for SN08 should be removed.
- Although MG9K does not support authorization in SN09, it is recommended that the SN09 central account be a member of the MGADM group.

43: Configuration (CN): A00011281

43.1 Feature Name

MS2000 IPSec Configuration via IEMS

43.2 Hardware and Software Requirements

SN09 IEMS

SN08 or later MS2000

43.3 Initial Configuration

Standard SN09 IEMS deployment

43.4 Office/Subnet parameters (OP/SP) (CM & SESM)

Not applicable.

43.5 Upgrade Considerations

Not applicable.

43.6 Data schema (DS) (CM, MIBS, RDB)

Not applicable.

43.9 Element Management

43.9.1 New/modified GUIs

Table 1 New or modified GUIs

GUI name	NEW, CHANGED, or DELETED
IEMS - MS2000 Node Configuration	Changed

43.9.2 GUI information

43.9.2.1 GUI name: IEMS-MS2000 Node Configuration

43.9.2.1.1 Functional description

This GUI is used to configure the MS2000 node from the IEMS. This feature extends the existing GUI to include configuration of the IPSec and IKE parameters needed to allow for secure messaging between the IEMS and the MS2000 as well as between the MS2000 and the GWC.

43.9.2.1.2 GUI usage and implications

To configure IPSec and IKE parameters and enable them on the device, the following steps must be taken:

- set the IPSec and IKE parameters on the MS2000, including the initial key, via the new IEMS GUI tool.
- set IPSec as enabled on the MS2000 and reset the box
- set the IPSec and IKE parameters, including the initial key, on the SSPFS HTML servlet that currently exists. For documentation on the SSPFS configuration tool, see: http://triweb/ja00/sloa/docs/howto_ipsec/howto_ipsec.html.
- return to the IEMS GUI and set the actual key.
- reset the MS2000
- return to the SSPFS HTML servlet and set the actual key.
- set the IPSec and IKE parameters for the GWC comms on the MS2000
- reset the MS2000

43.9.2.1.3 GUI size

Table 2 New or modified GUIs

Abbreviated GUI name	Minimum instances	Maximum instances	Information on memory
MS2000 Config	0	1	N/A

43.9.2.1.4 GUI fields

The following table lists fields for GUI MS2000 Config.

Table 3 IPSec GUI field descriptions

Field	New or Changed	Entry (examples)	Explanation and action	Associated MIB entry
IPSecPolicyRemoteIPAddress	New	47.142.42.135	Destination IP address or a DNS name, this parameter is mandatory.note: if a DNS is given make sure the DNS server is also configured (DNSPriServerIP)	<see field name>
IPSecPolicySrcPort	New	161	Source port. 0 means all ports match.	
IPSecPolicyDstPort	New	9961	Destination port. 0 means all ports match.	
IPSecPolicyProtocol	New	0	Protocol type. 0 - all protocols match; 17- UDP, 6-TCP.	
IPsecPolicyKeyExchangeMethodIndex	New	0-19 (see IKE table; matches with the IKE index)	The Index for the corresponding IKE entry, a few policies may be associated with a single IKE entry	
IPsecPolicyLifeInSec	New	600	Lifetime in seconds for security association derived from this policy.	

IPSecPolicyProposal Encryption_X	New	2	X – stands for the proposal number, up to 4 proposals are allowed [0-3].the valid encryption values are: 0 - NULL (no encryption) 1 - DES 2 - 3DES
IPSecPolicyProposal Authentication_X	New	4	X – stands for the proposal number, up to 4 proposals are allowed [0-3].the valid authentication values are: 2 - SHA1 (SHA1_96)4 - MD5 (MD5_96)
IKEPolicySharedKey	New	020a04090e	The pre-shared key. The key is in text string format. Both peers need to register the same pre-shared key for the authentication process to succeed. The MS2000 will accept any key, however it is recommended that a hex character sequence is used.
IKEPolicyProposalEncryption_X	New	2	X – stands for the proposal number, up to 4 proposals are allowed [0-3].the valid encryption values are: 1 - DES 2 - 3DES
IKEPolicyProposalAuthentication_X	New	4	X – stands for the proposal number, up to 4 proposals are allowed [0-3].the valid authentication values are: 2 - SHA1 (SHA1_96) 4 - MD5 (MD5_96)

IKEPolicyProposalDHGroup_X	New	1	X – stands for the proposal number, up to 4 proposals are allowed [0-3].the valid DH Group values are: 0 - 786 Bit 1 - 1024 Bit
IKEPolicyLifeInSec	New	1200	Lifetime in seconds for security association derived from this policy.

43.9.2.1.5 Usage example

See walkthrough section at the end of this section for examples of using this code.

43.9.2.1.6 GUI release history update

SN08 - MS2000 GUI introduced.

SN09 - Updated to include IPSec configuration mechanism.

43.9.2.1.7 Context sensitive launching information

Launched from the IEMS - right click on the MS2000 node and choose configure MS2000 node option.

43.9.2.1.8 Supplementary information

None

43.9.3 CLUI Interface

Not applicable.

43.10 User interface changes

Not applicable.

43.11 OSSGate Interface Changes

Not applicable.

43.12 Security

Not applicable.

43.13 Configuration Walkthrough

43.13.1 Adding IPSec to the MS2000 node

43.13.1.1 Add IKE and IPSec parameters to the MS2000 for IEMS/ MS2000 secure messaging

1. Launch the MS2000 Config and Maintenance Tool
2. Select the IPSec and IKE Config Tab
3. Select the IKE Configuration Tab
4. Select “Add Entry”
5. Enter the fields for the initial IKE configuration for the MS2000. These values will only be used to establish a temporary secure connection to allow the setting of the actual IKE fields. Essential: these fields should be selected based on the desired IPSec/IKE configuration for the lab. These fields will be needed for later configuration.
6. After all the fields are entered, the Add Entry button should be pressed.
7. Select the IPSec Configuration Tab.
8. Select “Add Entry”.
9. Enter the values for the IPSec temporary configuration. The index chosen for the IKE entry previously should be entered in the Exchange Method field here. Essential: these fields should be selected based on the desired IPSec/IKE configuration for the lab. These fields will be needed for later configuration.
10. Select “Add Entry”.
11. With both the IKE and IPSec tables configured, click the Enable IPSec check box.
12. In the new dialog box that appears, confirm the enabling of IPSec.
13. After receiving the message indicating successful enabling of IPSec, the MS2000 needs to be reset. This is done via the Reset button on the left-hand side of the MS2000 config tool. Reset the MS2000 to enable the new parameters.
14. Once the MS2000 is reset, the IEMS will not be able to talk to the MS2000 until the IEMS server is configured for IPSec with the MS2000 IP. This is done via the configuration GUI at http://(ip address of server)/ipsec/security.html.
15. Adding IPSec support on SSPFS is described in detail in this document: http://iwebrtp.us.nortel.com/spvn/sloa/docs/howto_ipsec/howto_ipsec.html

16 Add the IPSec and then the IKE parameters via the GUI provided. Ensure that the selections made match the selections made during the MS2000 configuration. Do not close this window as it will be used again later.

17 At this point, communications between IEMS and the MS2000 have been secured. Configuration of the actual IPSec/IKE parameters can now begin.

18 Return the IPSec/IKE Configuration tab of the MS2000 Config tool.

19 Select the IKE Configuration tab.

20 Select the row in the table and click “Edit Entry”.

21 In the edit dialog, modify the desired fields. If the parameters previous entered are what is desired for the actual IKE parameters, only the shared key field needs to be modified. Click “Save”.

22 Select the IPSec table if any of the IPSec parameters need to be modified. If so, click “Edit Entry”, modify the values, and click “Save”.

23 At this point, the MS2000 needs to be reset again in order to enable the new preshared key (and any other modified values).

24 The IEMS server IPSec configuration for communications with the MS2000 needs to be modified to support the new parameters and shared key. Return the SSPFS configuration tool and delete the existing entries added earlier. Add new entries to match the new configuration of the MS2000, including the new preshared key.

43.13.1.2 Add IPSec and IKE parameters for MS2000/GWC communications

1 If secure messaging between the MS2000 and IEMS are desired before sending the preshared key to the AMS, complete the steps in section 12.12.1.

2 On the IEMS GUI, launch the MS2000 Config and Maintenance Tool.

3 Select the IPSec and IKE Config Tab.

4 Select the IKE Configuration Tab.

5 Select “Add Entry”.

6 Enter the IKE values needed to communicate with the GWC. These values should match the values provisioned on the GWC when appropriate. Essential: note which index is chosen as this field will be needed for later configuration.

7 After all the fields are entered, the Add Entry button should be pressed.

8 Select the IPSec Configuration Tab.

9 Select “Add Entry”.

10 Enter the IPSec values needed to communicate with the GWC. The index chosen for the IKE entry previously should be entered in the Exchange Method field here.

11 Select “Add Entry”.

12 If IPSec is not currently enabled, enable it following the steps 11 and 12 in section "Adding IPSec to the MS2000 node" .

13 Reset the MS2000 box following step 13 in section "Adding IPSec to the MS2000 node" . The MS2000 will now communicate securely with the GWC.

43.13.2 Disable IPSec on the MS2000

1 On the IEMS GUI, launch the MS2000 Config and Maintenance Tool.

2 Select the IPSec and IKE Config Tab.

3 If the Enable IPSec check box is selected, deselect it to disable IPSec.

4 A dialog will appear to confirm the desire to disable IPSec. Click “Yes”.

5 If desired, the data in the IPSec and IKE configuration tables can be deleted from the MS2000. Select the appropriate tab, select the row and click “Delete Entry”.

6 Reset the MS2000 following step 13 in section "Adding IPSec to the MS2000 node" .

7 Once the MS2000 has reset, if IPSec was previously enabled between the IEMS and MS2000, the IEMS Server must disable IPSec to the MS2000 node in order to communicate.

8 Launch http://(ip address of server)/ipsec/security.html.

9 After logging in, select the entries corresponding to the MS2000 node and delete them. Once they are deleted, the IEMS will again be able to communicate with the MS2000.

43.13.3 Edit the preshared key on the MS2000

1 On the IEMS GUI, launch the MS2000 Config and Maintenance Tool.

2 Select the IPSec and IKE Config Tab.

3 Select the IKE Configuration Tab.

4 Select the row containing the key to update.

5 Click “Edit Entry”.

6 Update the preshared key.

7 Click “Save”.

8 Reset the MS2000 following step 13 in section 12.12.1.

9 Update the IEMS Server or GWC with the preshared key so that the MS2000 can communicate with that device.

44: Configuration (CN): A00011827

44.1 Feature Name

GWC Autonomous SWACT

44.2 Hardware and Software Requirements

The autonomous SWACT activity does not require special hardware.

The autonomous SWACT functionality is available for packetized voice solutions that utilize IP solutions (IP over GigE and AAL5) and ATM solutions (Voice over AAL2) with these products:

- MSC Server 1000
- MSC Server 2000
- CS 2000 (North American and International software loads)
- CS 2000 - Compact (North American and International software loads)

44.3 Initial Configuration

- The initial configuration for GWC autonomous SWACT is disabled for each GWC.

44.4 Upgrade Considerations

44.4.1 Element Management Upgrade

The following upgrades are supported:

- SN07 -> SN09.1
- SN08 -> SN09.1
- SN09 -> SN09.1

44.4.2 Downgrade impact

If a downgrade is needed, then the GWCs go back to the initial GWC autonomous SWACT state of disabled.

44.5 Data schema (DS) (CM, MIBS, RDB)

44.5.1 New/modified tables, MIBs, or Database Schema

Table 1 New or modified tables

Table/MIB name	NEW/CHANGED/ or DELETED/	Table Control (NEW/ OLD/UNCHANGED)
GWC Maintenance Controls MIB	NEW	N/A

Table 1 New or modified tables

Table/MIB name	NEW/CHANGED/ or DELETED/	Table Control (NEW/ OLD/UNCHANGED)
GWC.GWCMTCCONTROLS	NEW	N/A

44.5.2 Table/MIB/Remote Database Schema information

44.5.2.1 Name: GWC-Maintenance-Controls-MIB

44.5.2.1.1 Functional description

The GWC-Maintenance-Controls-MIB contains timers and other maintenance-related controls that are provisioned in CMT and are needed in the GWC.

44.5.2.1.2 Fields/OIDs

The following table lists fields/OIDs for GWC-Maintenance-Controls-MIB:

Table 2 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
gwcAutoSwactTimer	New		1	The timer represents the time to wait before doing a SWACT, given that the time starts after the following conditions have been met: -All gateways have been taken out-of-service by the GWC due to lost communication. The GWC determines communication has been lost with a gateway after approximately 40 seconds without receiving a message. -The messaging queues have been processed to notify the Core of the state transitions.
gwcAutoSwactAlarmFlag	New		2	This flag is sent down to the GWC to request the clearing of the alarm when the GWC does an autonomous SWACT.

44.5.2.1.3 Table release history update

SN09.1: Initial version of the GWC-Maintenance-Controls-MIB.

44.5.2.1.4 Translation verification and other tools

GWC-Maintenance-Controls-MIB does not use translation verification tools.

44.5.2.2 Name: GWC.GWCMTCCONTROLS

44.5.2.2.1 Functional description

The GWC.GWCMTCCONTROLS table contains timers and other maintenance-related controls that are provisioned in CMT.

44.5.2.2.2 Fields/OIDs

The following table lists fields/OIDs for GWC.GWCMTCCONTROLS

Table 3 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
GWCID	New		VARCHAR2 (32) NOT NULL	The ID of the GWC.
AUTOSWACTTIMER	New		NUMBER	The timer represents the time to wait before doing a SWACT, given that the time starts after the following conditions have been met: -All gateways have been taken out-of-service by the GWC due to lost communication. The GWC determines communication has been lost with a gateway after approximately 40 seconds without receiving a message. -The messaging queues have been processed to notify the Core of the state transitions.

44.5.2.2.3 Datafill example

The following example shows sample datafill for table GWCMTCCONTROLS:

```
GWCID                          AUTOSWACTTIMER

------------------------------- --------------

GWC-2                          40
```

44.5.2.2.4 Table release history update

SN09.1: Initial version of the GWCMTCCONTROLS table.

44.5.2.2.5 Translation verification and other tools

GWCMTCCONTROLS does not use translation verification tools.

44.6.2 GUI information

44.6.2.1 GUI name: ControllerPanel

The Controller Panel is within the Provisioning Panel.

44.6.2.1.1 Functional description

The Controller Panel contains IP address information, the GWC profile, Bearer Network and Codec Profile information, and other general information for the selected GWC. This GUI is modified to also contain GWC Autonomous SWACT information, as well as an additional Change button to change the state of the control and/or timer and to make a request to the GWC to do a clear of the Swact Alarm.

44.6.2.1.2 GUI usage and implications

The Controller Panel displays and modifies information concerning the GWC. The state of the GWC Autonomous SWACT control and timer (if control is enabled) is displayed on the Controller Panel. The GWC Autonomous SWACT state is initially disabled for all GWCs. If the Change button is selected, the state and/or timer can be changed for the specified GWC.

44.6.2.1.3 GUI size

Table 5 New or modified GUIs

Abbreviated GUI name	Minimum instances	Maximum instances	Information on memory
Controller Panel	No change.	No change.	N/A

44.6.2.1.4 GUI fields

The following table lists new fields for the Controller Panel GUI:

44.6.2.1.6 GUI release history update
SN09.1: Modification of Controller Panel for GWC Autonomous SWACT.

44.6.2.1.7 Context sensitive launching information
N/A

44.6.2.1.8 Supplementary information
N/A

44.6.2.2 GUI name: ChangeGWCAutoSwact

44.6.2.2.1 Functional description
The new dialog contains a check box for enabling the control and a timer where the user can enter an integer between 0 and 300 seconds. The timer cannot be filled in if GWC Autonomous SWACT is not enabled.

Three buttons exist on the dialog. The OK button is to process the changes. The Cancel button is to close the dialog without processing changes. After the autonomous SWACT occurs and the customer has identified and fixed the problem on the inactive unit, the Clr Alarm button can be used to make a request to the GWC to clear the alarm that gets generated when the GWC does an autonomous SWACT.

44.6.2.2.2 GUI usage and implications
This dialog appears whenever the GWC Autonomous SWACT button is selected on the Controller Panel. The current status of the control and timer for the selected GWC is displayed.

44.6.2.2.3 GUI size

Table 7 New or modified GUIs

Abbreviated GUI name	Minimum instances	Maximum instances	Information on memory
ChangeGWC AutoSwact	0	N/A	N/A

44.6.2.2.4 GUI fields
The following table lists fields for GUI:

Table 8 GUI field descriptions

Field	New or Changed	Subfield	Entry	Explanation and action	Associated MIB entry
Control	New		1	A check box, allowing the user to enable or disable GWC Autonomous SWACT.	GWC-Maintenance-Controls-MIB
Timer	New		2	A label and text box where the user can fill in the pre-Swact timer. The timer is only valid if the control is in the enabled state. The default value for the timer is 180 seconds.	GWC-Maintenance-Controls-MIB

44.6.2.2.5 Usage example

The following example shows a sample dialog for the ChangeGWCAutoSwact GUI:

44.7 Configuration Walkthrough

A change of the GWC Autonomous SWACT information can be made anytime after the GWC has been added.

45: Configuration (CN): A000012001

45.1 Feature Name

IEMS Call Server 2000 SIP Integration

45.2 Hardware and Software Requirements

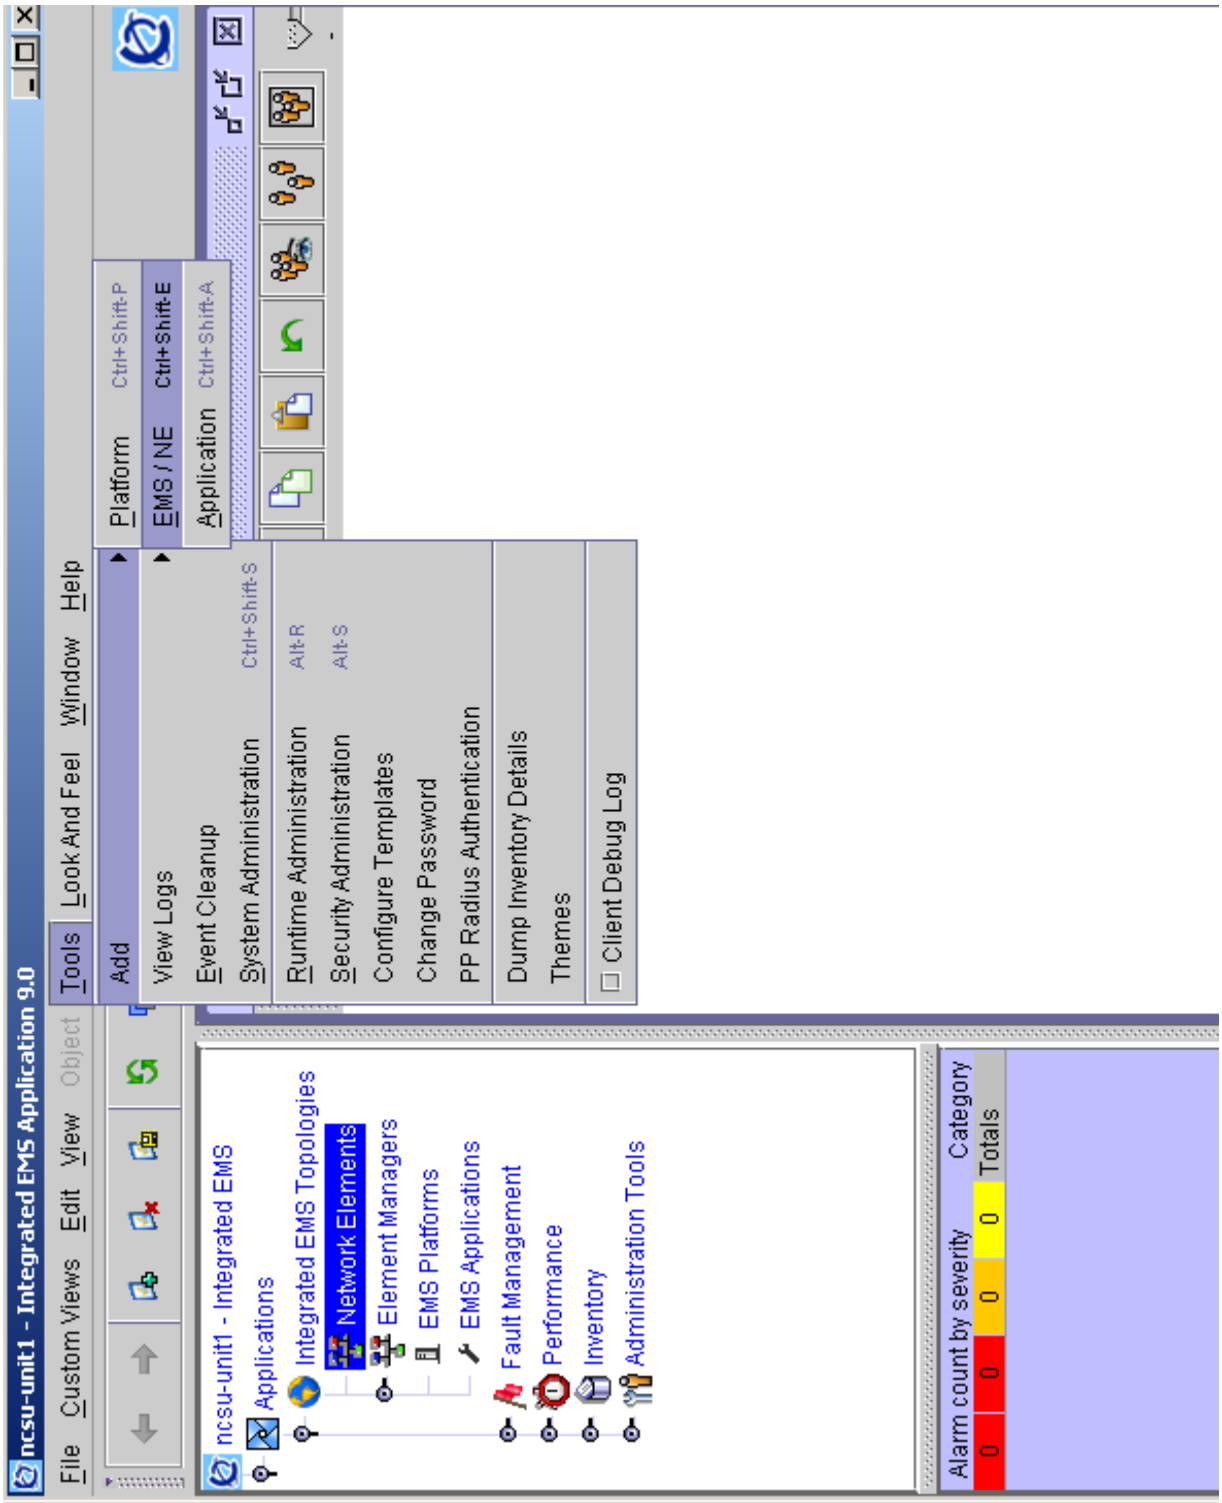
Note: All screen shots captured in this version are draft documents, and this document will be updated when the official versions are complete.

The feature requires IEMS to be installed on SN10 or later SSPFS loads.

45.3 Addition of an SSLines Mgr

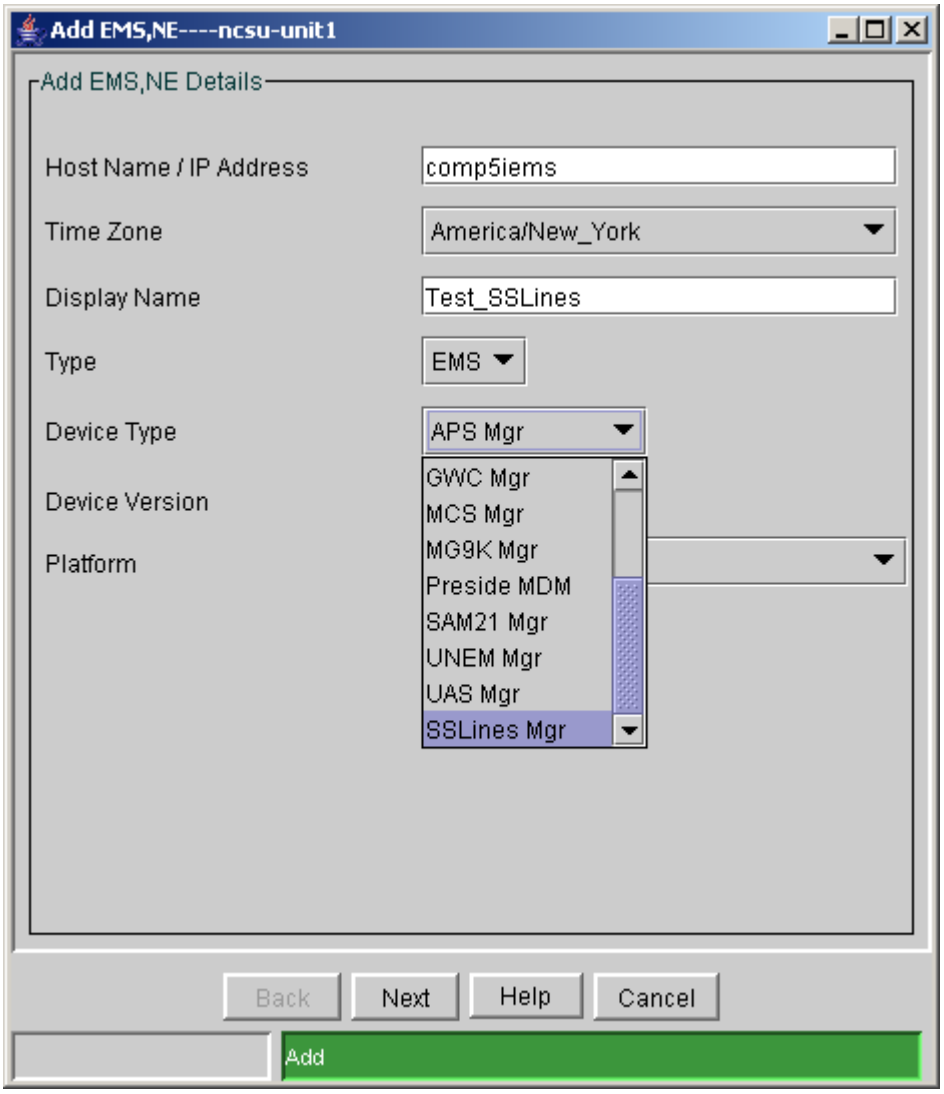
The SSLines configuration is similar to that of the MCS Mgr device in SN08, only shown here is the configuration of the first panel as all the other components are the same.

Figure 1 Getting add panel



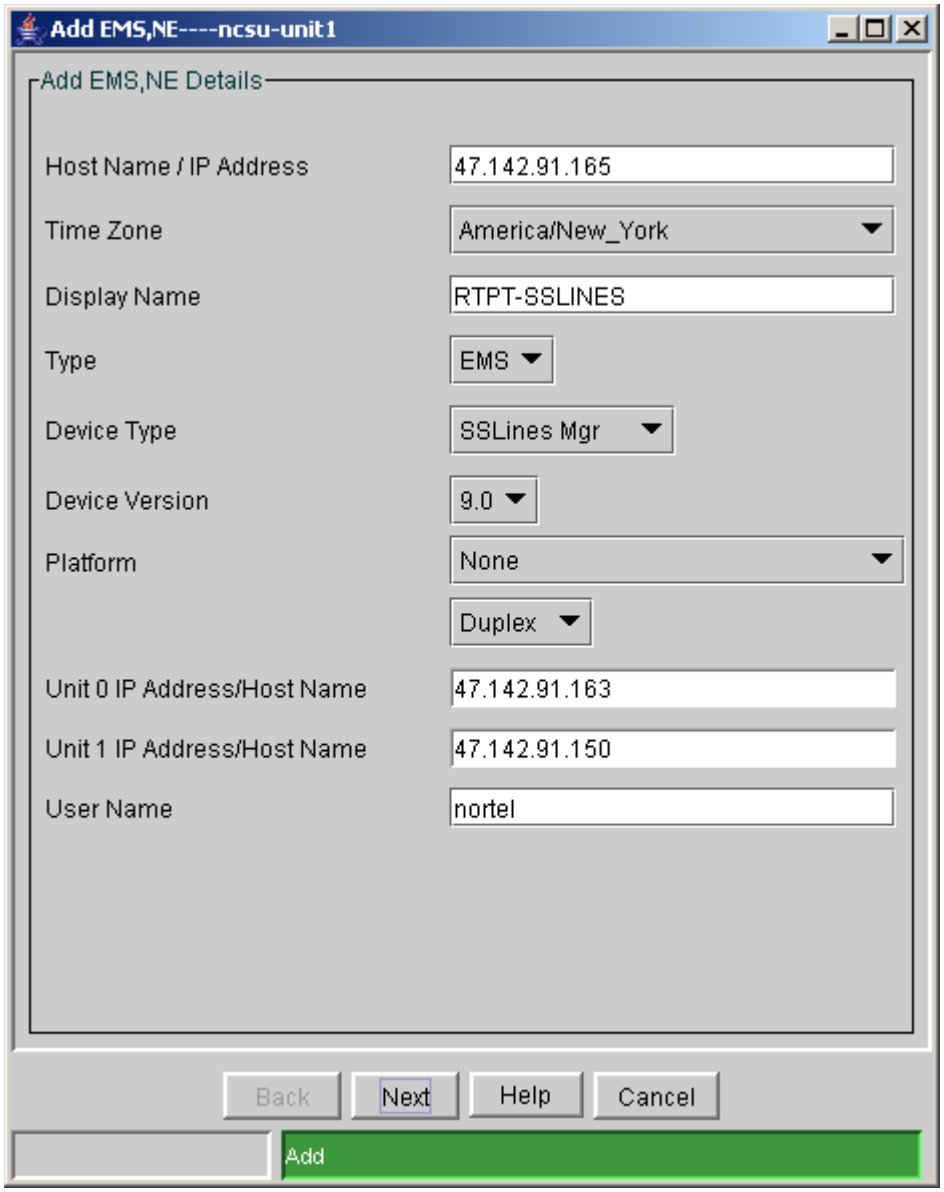
From this add panel, the SSLines option must be chosen.

Figure 2 Selecting SSLines Mgr



After this, the IP addresses for the System Manager platform and username are entered as follows. As shown below, the default is duplex for the SSLines or SIP lines on the Langley hardware.

Figure 3 Setting configuration data.



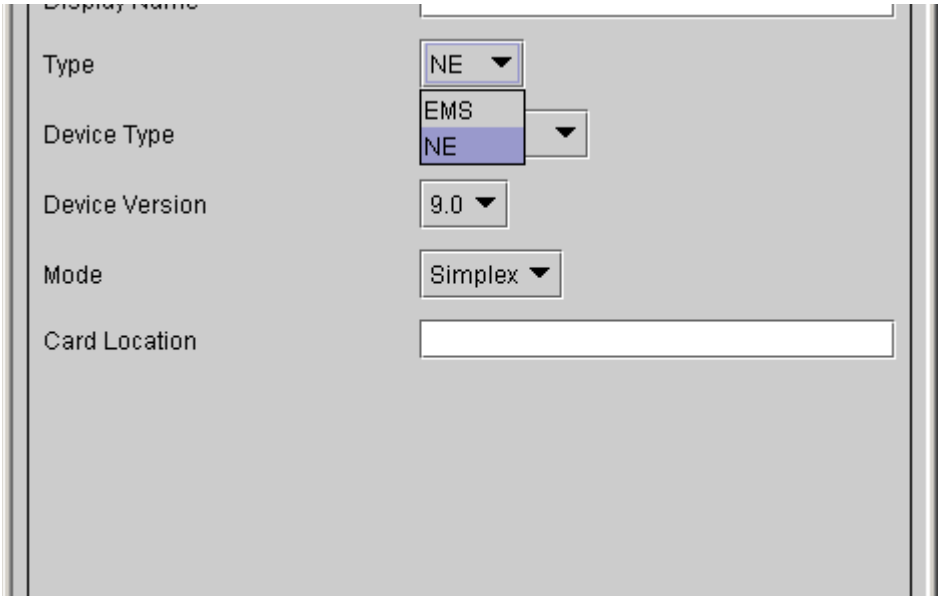
The other configuration screens are configured like the MCS Mgr configuration in SN08. Please see the SN08 documentation for those references.

45.4 Addition of an SSTrunks NE

The SSTrunks is the SN10 rebranded name of the Session Server. Following is a screen shot of the add panel. All SN08 configuration parameters are present in the SN10 version.

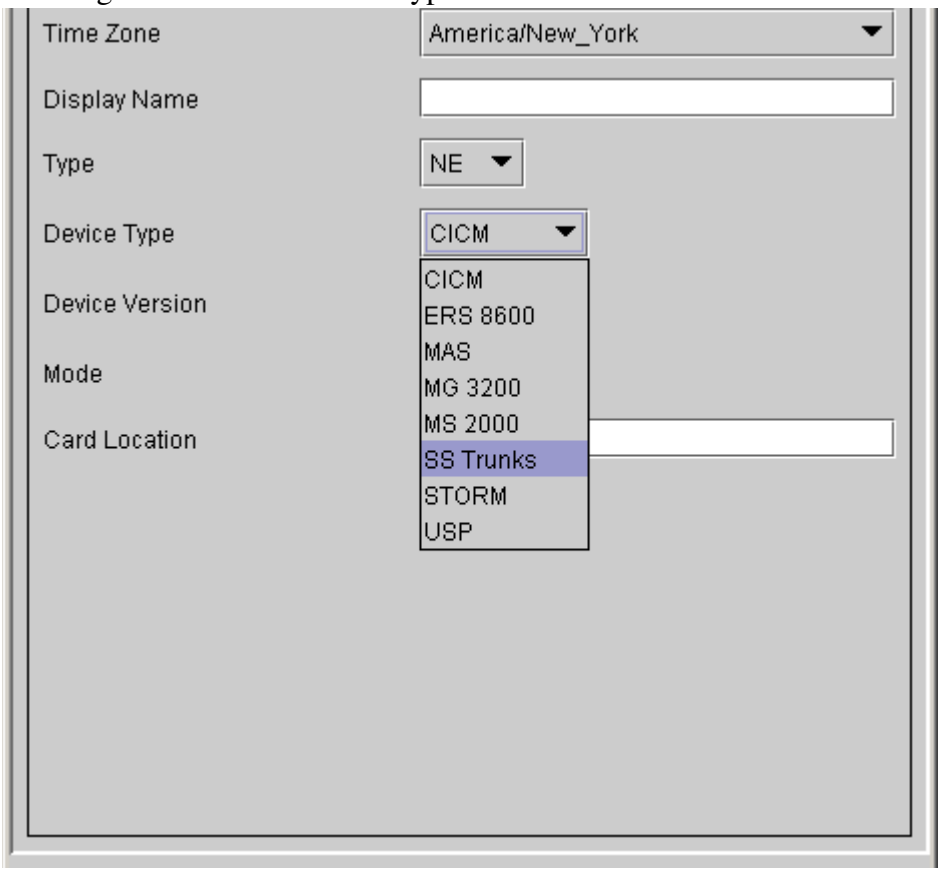
After the add node is selected, select Type as NE

Figure 4 Selecting Type as NE



Then the Device Type of SS Trunks is chosen:

Figure 5 Select Device Type of SS Trunks

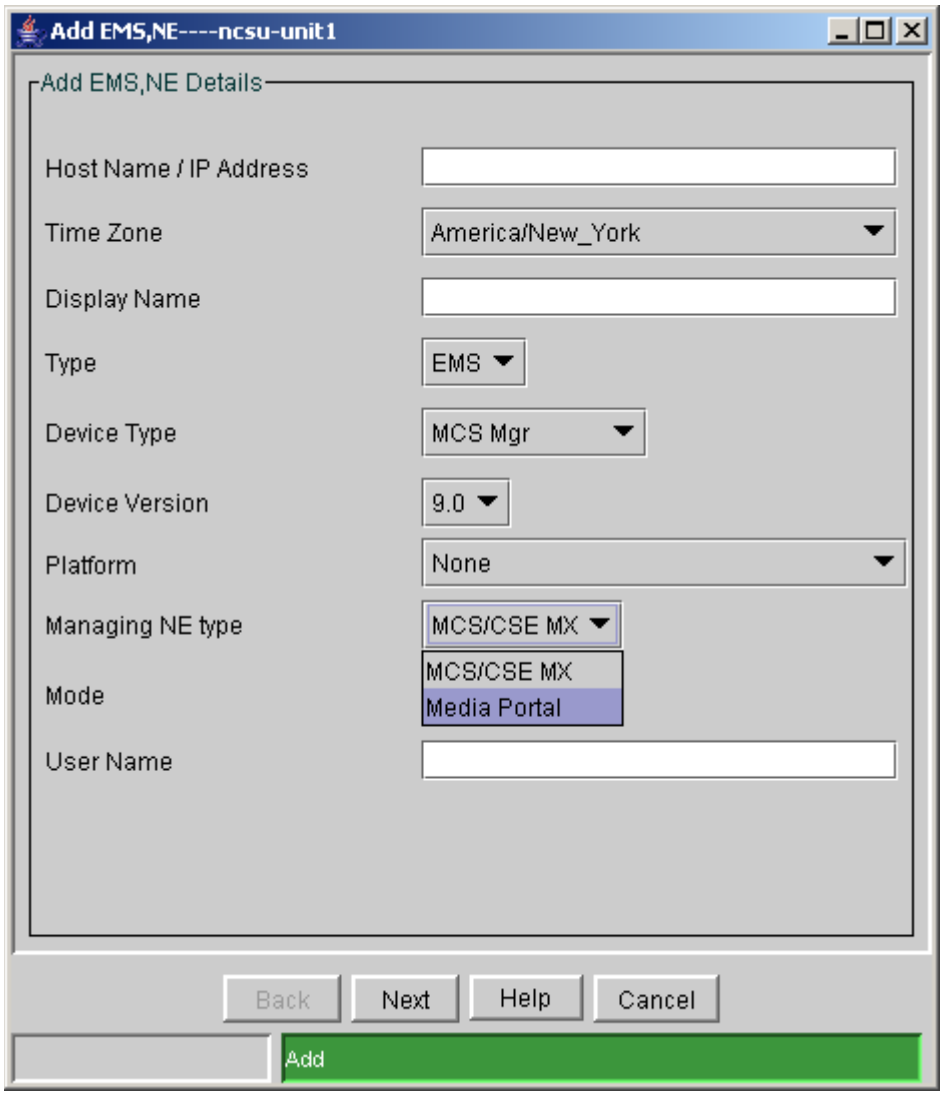


All configuration after the Device Type is chose is the same as SN08, please see the SN08 documentation for details.

45.5 Change of configuration for Media Proxy to Media Portal

The Media Proxy NE type has been changed to Media Portal as shown below.

Figure 6 Addition of MCS with Media Portal as NE



45.6 Configuring Session Managers for SSH launch

There is a requirement to be able to launch SSH directly to the Session Managers. To fulfill this requirement a new option needs to be added to allow the configuration of these Session Managers. This new option will be allowed from the EM in the MAP for SSLines.

Figure 7 Example launch of configure session manager

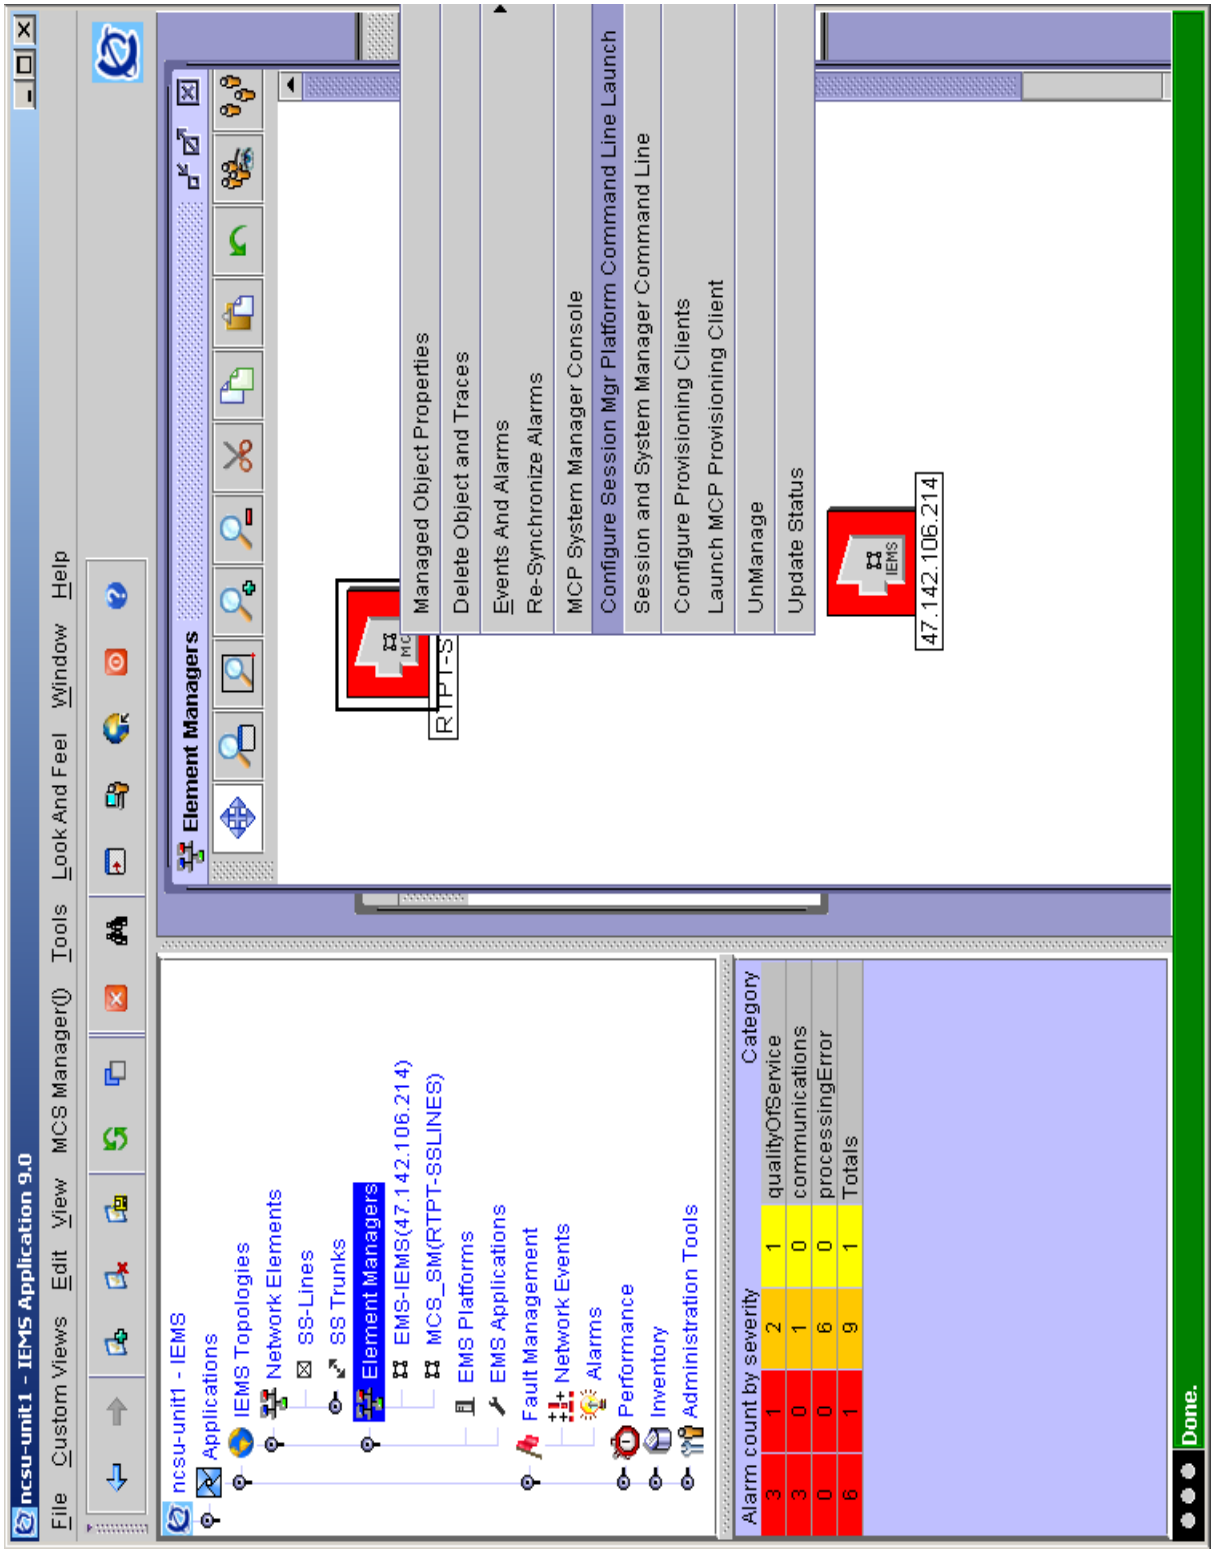


Figure 8 Or from MCS_SM map view

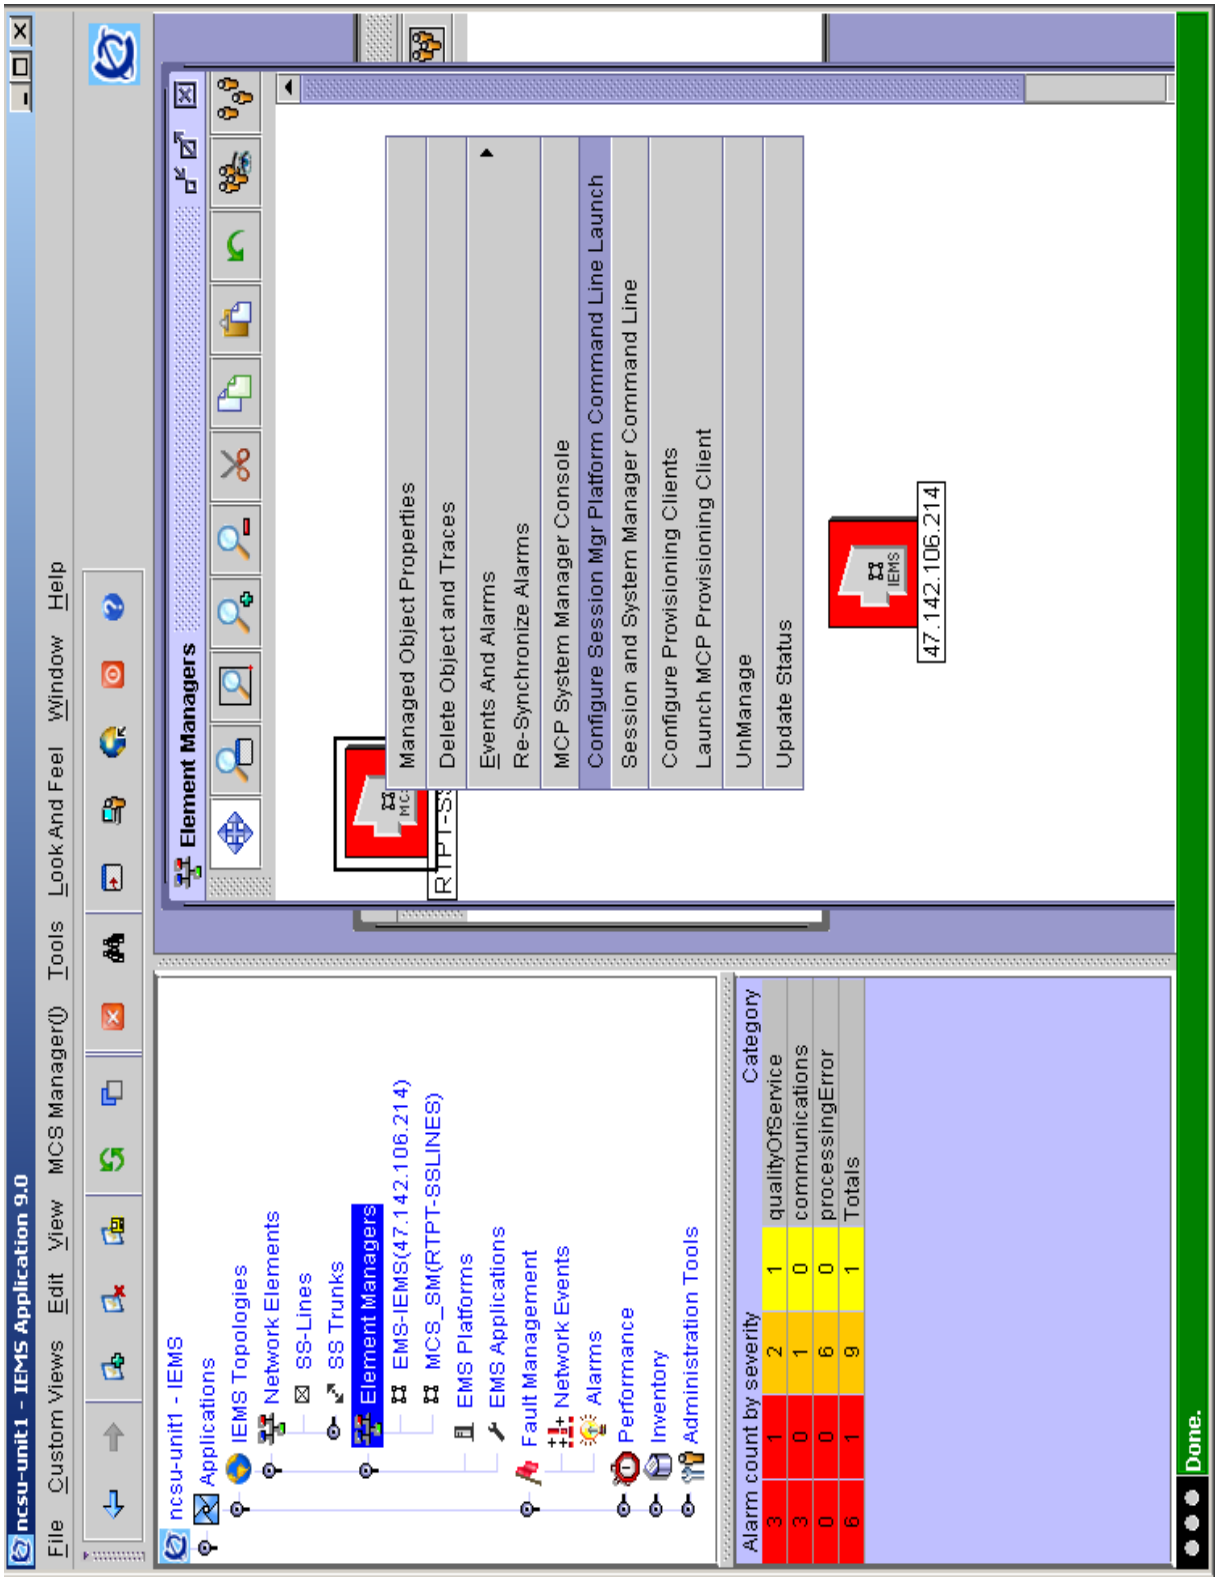

Figure 9 Configuring session managers that can have SSH launched to them

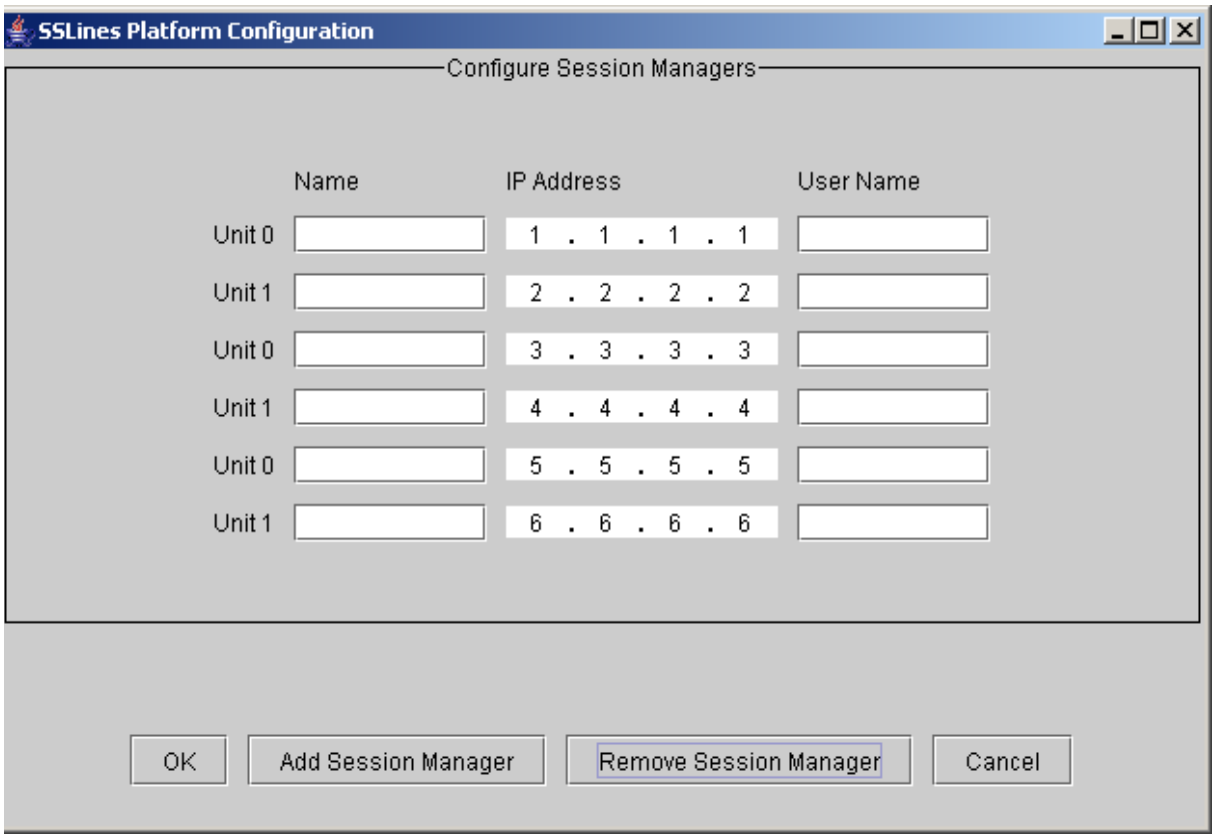


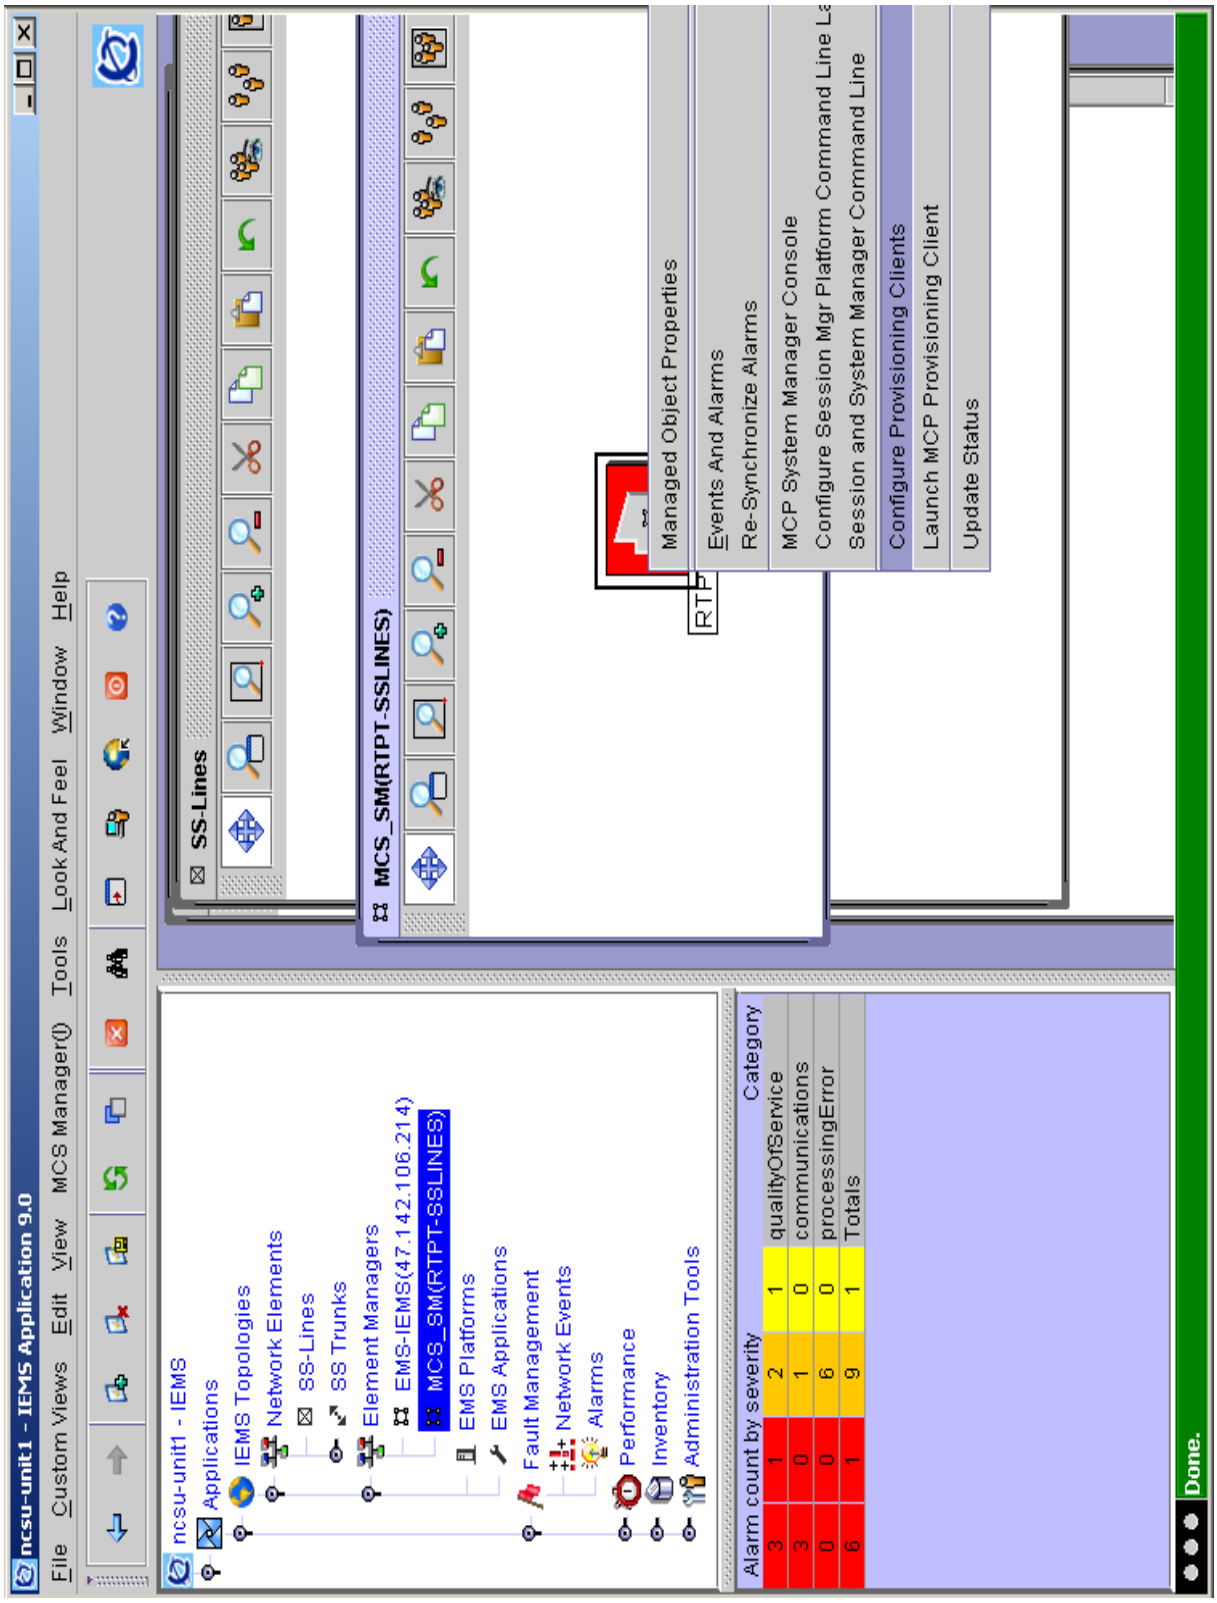
As noticed there can be 3 Session Manager pairs configured. This is a fully configured deployment.

The Add Session Manager and Remove Session Manager adds and removes a pair from the configuration screen. Only the Session Managers that are configured will be configured in the IEMS database.

45.7 Configuring Session Managers for SSH launch

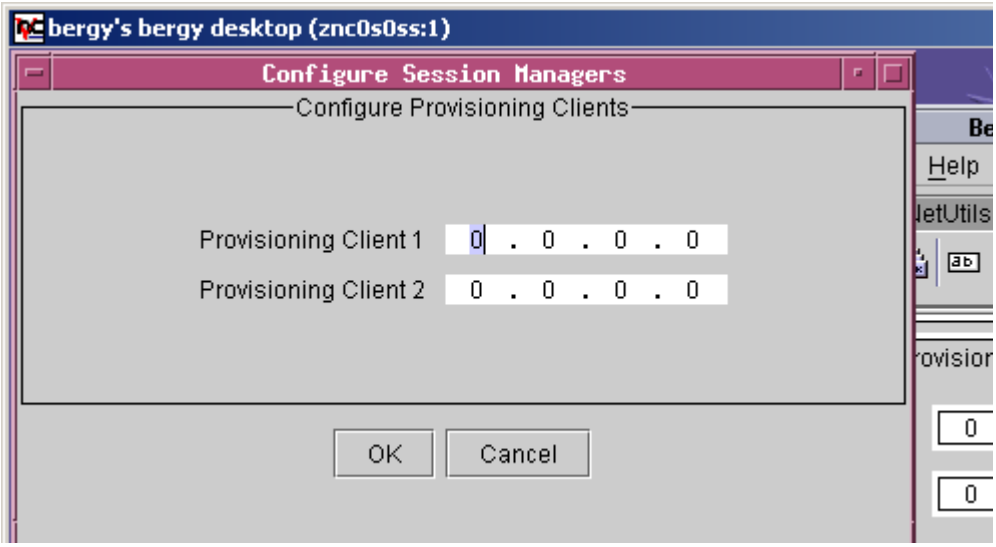
There is a requirement to be able to launch the Provisioning Client wherever they are running on the Sip lines deployment. To fulfill this requirement a new option needs to be added to allow the configuration of the IP addresses of where the provisioing servers are running. This new option will be allowed from the EM in the MAP for SSLines. These are not duplex or clustered.

Figure 10 Example launch of configuring Provisioning Client



The configuration of the provision clients can be done from either the MCS_SM map or from the Element Managers Map. Until the configuration is done, the provisioning clients cannot be launched.

Figure 11 Configuring Provisioning Clients for later launch



After the configuration the following dialog will be displayed.As the dialog indicates the WEBSERVER requires a restart prior to launching the provisioning client.The commands on the sspfs to restart the WEBSERVER is

servrestart WEBSERVER

Figure 12 Restart WEBSERVER dialog

45.8 Configuring the apache proxy using CLI

The apache webserver on the IEMS server machine must be configured to proxy https communication between the SSLines manager and its client and also between the povisioning webservers and the provisioning client. Both will be configured using the SSPFS cli tool.

The proxy configuration must be manually removed when the SSL lines platform is deprovisioned from IEMS.

Provisioning client proxy

An entry is required for each proisioning webserver IP. This the provsioning IP entered in the “SSL Lines Platform Configuration” frame in section 12.5.

Procedure (adding an entry):

1. Login into the IEMS server box as root and invoke the “cli” command:

#cli

Select option 2 (Configuration), then option 2 (Apache Proxy Configurration), then option 1 (add_proxy_conf).

2. Configure the proxy as shown below:

When prompted for the proxy IP address enter the address of the provisioning webserver.

When prompted for the “hostname/tag associated the IP” again enter the address of the provisioning web server.

When propmpted for the optional remote hostname/tag , leave blank and hit “Enter”

When prompted for the port number enter the value “8443”

Answer “Y” when prompted to restart the Apache server.

Repeat the steps above for the other provisioning client IP address.

The session below shows the proxy configuration for provisioning web server at IP address 47.142.23.24:

 # cli

Apache Web Service Stopping
WEBSERVER Stopped

Starting WEBSERVER through servstart
Updated alarm successfully.
Found valid security certificate, starting Web Services with SSL support...
Apache Web Service Starting
WEBSERVER Started

=== "add_proxy_conf" completed successfully

Apache Proxy Configuration
1 - add_proxy_conf (Add an IP to the Apache Proxy Module configuration)

2 - del_proxy_conf (Delete an IP from the Apache Proxy Module configuration)

3 - list_proxy_conf (List the Apache Proxy Module configuration)

X - exit

select - select - (X, 1-3) X

Procedure (removing an entry):

The procedure for removing a proxy entry is virtually identical to the procedure for adding an entry:

1. Login into the IEMS server box as root and invoke the “cli” command:

#cli

Select option 2 (Configuration), then option 2 (Apache Proxy Configurration), then option 1 (del_proxy_conf).

2. Delete the proxy entry by entering the provisioning IP address and port number when prompted.

The example session snippet below shows the IP address 47.142.24.23 being removed from the configuration:

Apache Proxy Configuration:

1 - add_proxy_conf (Add an IP to the Apache Proxy Module configuration)

2 - del_proxy_conf (Delete an IP from the Apache Proxy Module configuration)

3 - list_proxy_conf (List the Apache Proxy Module configuration)

X - exit

select - 2

=== Executing "del_proxy_conf"

Enter proxy IP address (X to exit): 47.142.23.24

Optional, enter remote hostname/tag associated with IP 47.142.23.24:

Enter port number [443]: 8443

Accept the following values:

IP Address = 47.142.23.24

Remote Tag =

Port Num = 8443

!!WARNING!! This will result in WEBSERVER going down (restarting) for a short time

Continue Removal? [Y/N]:

Enter proxy IP address (X to exit): 47.142.23.24

Optional, enter remote hostname/tag associated with IP 47.142.23.24:

Enter port number [443]: 8443

Accept the following values:

IP Address = 47.142.23.24

Remote Tag =

Port Num = 8443

!!WARNING!! This will result in WEBSERVER going down (restarting) for a short time

SSLines Management console proxy:

The configuration for the SSLines management console is identical to the provisioning client configuration above except for the port number and IP address used:

- When prompted for proxy IP address, use the address on which the management server resides.
- Use 12121 for the port number.

Below is an example session snippet for configuring proxy for server on IP address 47.142.200.69:

Apache Proxy Configuration

1 - add_proxy_conf (Add an IP to the Apache Proxy Module configuration)

2 - del_proxy_conf (Delete an IP from the Apache Proxy Module configuration)

3 - list_proxy_conf (List the Apache Proxy Module configuration)

X - exit

select - 1

=== Executing "add_proxy_conf"

Enter proxy IP address (X to exit): 47.142.200.69

Enter hostname/tag associated with IP 47.142.200.69: 47.142.200.69

Optional, enter remote hostname/tag associated with IP 47.142.200.69:

Enter port number [443]: 12121

Accept the following values:

IP Address = 47.142.200.69

Hostname = 47.142.200.69

Remote Tag =

Port Num = 12121

!!WARNING!! This will result in WEBSERVER going down (restarting) for a short time

Continue? [Y/N]:Y

46: Configuration (CN): A00012183

46.1 Feature Name

Public Key Manager

46.2 Hardware and Software Requirements

PKManager is bundled as part of the IEMS package. The manager application shares the IEMS platform dependencies.

46.3 Initial Configuration

Initial installation of the PKManager will be performed as part of the IEMS installation. The installation procedure will require changes to allow the PKManager servlet and web clients to be launched securely on initial startup. Currently, the certificate for Apache on SSPFS must be manually installed before secure communications over HTTPS can occur.

The IEMS installation script currently checks for an Apache certificate before allowing installation to proceed. With PKManager, the user now has the option to use their own certificate (from a third party - for example) or to allow the installation script to generate one automatically. The installation will prompt the user to select the certificate *mode* to use for the WebPKProxy (used by Tomcat) certificate: **“Create” or “Managed”**

- If **Managed Mode**, then the user will be prompted to enter the path for the certificate he wants to use. Once entered, new scripts will import the certificate into the PKManager database and install the certificate in the appropriate directory for Tomcats’ use.
- If **Create Mode** is chosen, then the user will be prompted to enter values for Distinguished Name components used in certificate generation. These include the following:

  Common Name, country, region, locality, email address, Organization name, organization unit name, and company.

The installation scripts will then generate a new certificate, add it to the PKManager database for tracking, and install it for Tomcat usage.

The user will have the ability to change these default settings for the distinguished name through the PKGUI. See Section 46.6.2.2 on page 2738 for screen details.

46.4 Upgrade Considerations

46.4.1 Dump and Restore (CM)

46.5 Data schema (DS) (CM, MIBS, RDB)

46.5.1 New/modified tables, MIBs, or Database Schema

New tables used by PKManager -- none

46.6 Element Management

IEMS

This feature integrates the Public Key Manager application with IEMS to provide the following capabilities from the IEMS GUI:

- Add the Public Key Manager as an application to IEMS topology
- View PKManager alarms on IEMS
- Launch the PKManager GUI client from IEMS using single sign-on.

Public Key Manager GUI (PKGUI)

The PKGUI is a web-based user interface that provides a set of user screens for certificate administration and management tasks. On successful login, the user is directed to a home page presenting links to various functions and displaying configuration and state information for the application and its registered clients.

User Authorization Note: This tool restricts access to users belonging to the authorization groups “secadm” and “secro”. All operations in the GUI will check for group membership before allowing access to a given operation. The group “secadm” is used to permit all operations in this tool; while “secro” is used to permit viewing and browsing only. See “PKGUI Auth Groups and Operations Mapping” on page 2764 for mapping details.

46.6.1 New/modified GUIs

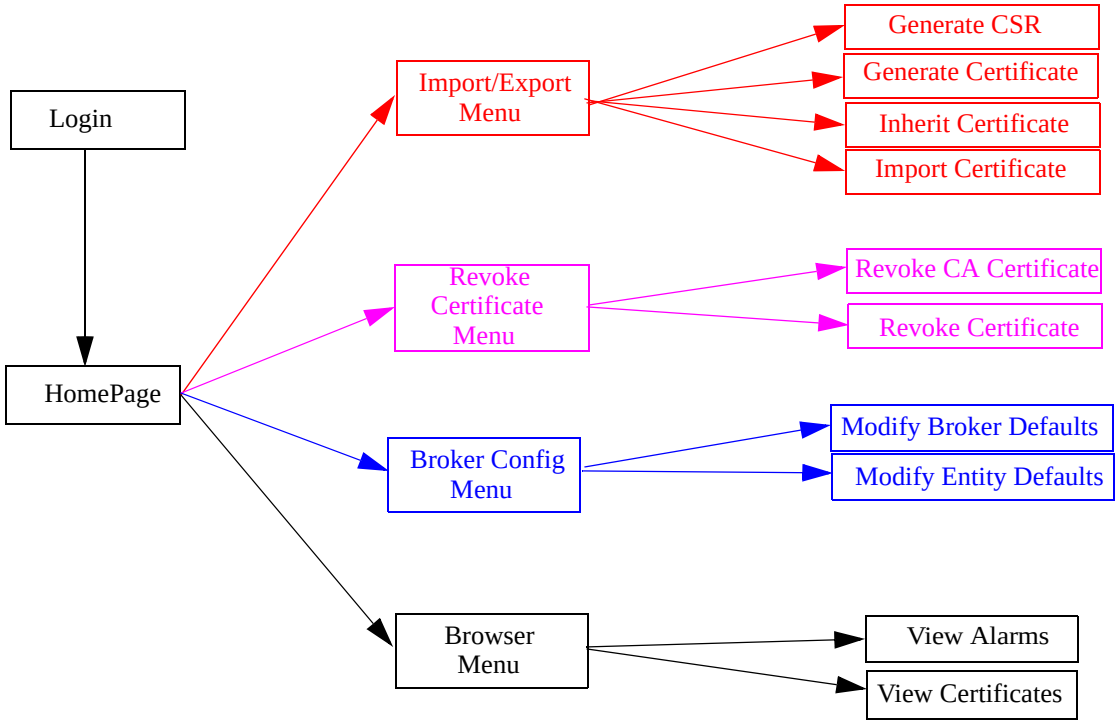
PKGUI Screen Flow



46.6.2 GUI information

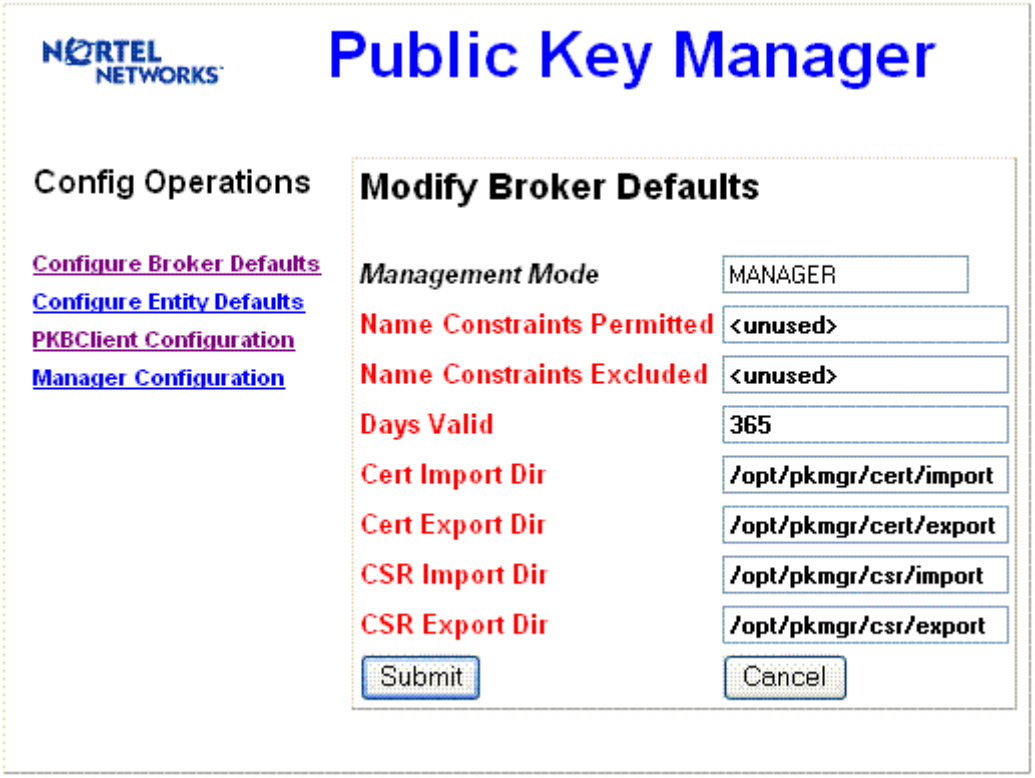
46.6.2.1 GUI name: Modify Broker Defaults

46.6.2.1.1 Functional description

The Modify Broker Defaults screen is accessed from the Broker Configuration link in the menu panel on the left side of the Home page. This menu will be displayed as the top-level or entry screen to the application.

This screen is intended for use during initial setup of the PKBroker application on SSPFS. It provides a simple form that allows the user to set default values for PKBroker parameters used throughout the PKGUI implementation. These defaults are saved in the PKBrokerProfile table on the PKManager server in SSPFS. The default profile name in the table is “NORTEL”.

Modify Broker Defaults Form



Screen Legend:
- User Input Fields
- Derived Values
- Defaults or fixed values

46.6.2.1.2 GUI usage and implications

This GUI is used to change default parameters used by the PKBroker during certificate generation and validation. Most of these parameters will be changed during initial setup and are not likely to be changed.

46.6.2.1.3 GUI fields

The following table lists fields for GUI or pull down menu “Modify Broker Defaults”.

Table 2 PKGUI - Modify Broker Defaults

Field	New or Changed	Subfield	Entry	Explanation and action	Associated MIB entry
Name Constraints Permitted	NEW			This field defines the constraints the user can specify during certificate generation and validation	
Name Constraints Excluded	NEW			This field defines the constraints the PKManager will **not** include in certificate generation and validation	
Days Valid	NEW			Defines the number of days a generated certificate will be valid in the system. The certificate will expire after this period.	
Certificate Import Directory	NEW			Input directory used by PKManager to retrieve certificates for import	
Certificate Export Directory	NEW			Output directory used by PKManager for generated certificates	
CSR Import Directory	NEW			Input directory used by PKManager to retrieve certificates for import	
CSR Export Directory	NEW			Output directory used by PKManager for generated certificates	

46.6.2.1.4 Usage example
See screen shot above.

46.6.2.1.5 GUI release history update

46.6.2.1.6 Context sensitive launching information
This GUI is launched by clicking the “Modify Entity Defaults” link from the “Broker Config Sub-menu”.

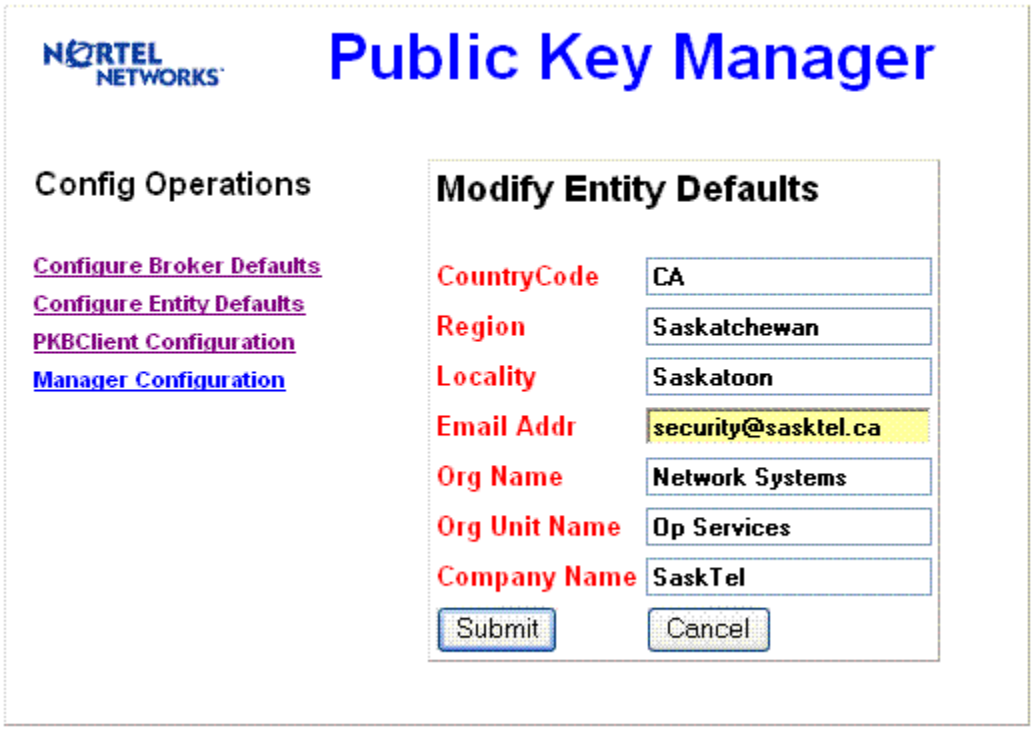
46.6.2.1.7 Supplementary information
NONE

46.6.2.2 GUI name: Modify Entity Defaults

46.6.2.2.1 Functional description
This screen allows the user to change the default Distinguished Name components used by the PKManager to generate certificates and requests.

This screen is intended for use during initial setup of the PKBroker application on SSPFS. It provides a simple form that allows the user to set default values for Distinguished Name parameters used for certificate management and generation. Configure Entity Defaults Form

Entity Defaults screen (prototype)



46.6.2.2.2 GUI usage and implications

This screen is intended for use during initial setup of PKManager - before it is used to generate a managed certificate or CSR. The customer has the option to set these values to their own customer values. These default values should not be changed once they are set.

46.6.2.2.3 GUI fields

The following table lists fields for GUI or pull down menu “Modify Entity Defaults”.

Table 3 GUI field descriptions

Field	New or Changed	Subfield	Entry	Explanation and action	Associated MIB entry
Country	NEW			2 character country code	
Region	NEW			State/Province/other	
Locality	NEW			City	
Email Address	NEW			email address	
Org Name	NEW			Organization Name	
Org Unit Name	NEW			Organization Unit Name	
Company	NEW			Company Name	

46.6.2.2.4 Usage example

The following example shows sample datafill or menu selection for GUI "Modify Entity Defaults" (also see screenshot above):

- Country: *US*
- Region: *North Carolina*
- Locality: *Raleigh*
- Email Address: *security@nortelnetworks.com*
- Organization Name: *Succession*
- Organization Unit Name: *OAM Security*
- Company Name: *Nortel*

46.6.2.2.5 GUI release history update

46.6.2.2.6 Context sensitive launching information

This GUI is launched by clicking the "Modify Entity Defaults" link from the "Broker Config Sub-menu".

46.6.2.2.7 Supplementary information

NONE

46.6.2.3 GUI name: Generate CSR for Export

46.6.2.3.1 Functional description

This screen will allow the user to generate a certificate request for submission to an external certificate authority. The user is required to manually enter the Entity ID and IP address of the certificate host. The EntityType will be selected from a drop-down menu containing the list of integrated devices to choose from.

Generate CSR for Export (proto)

Screen Legend:

User Input Fields

Derived Values

Defaults or fixed values

46.6.2.3.2 GUI usage and implications

46.6.2.3.3 GUI size

Table 4 New or modified GUIs

Abbreviated GUI name	Minimum instances	Maximum instances	Information on memory

46.6.2.3.4 GUI fields

The following table lists fields for GUI or pull down menu “Generate CSR for Export”.

Table 5 GUI field descriptions

Field	New or Changed	Subfield	Entry	Explanation and action	Associated MIB entry
EntityType	NEW		MG9KEM, MG9K, GWCEM, GWC, WebPKProxy	Selector (integrated devices only)	
EntityID	NEW			hostname of entity	
IP Address	NEW			IP address of entity	
Common Name	NEW			**Derived** value == <entityID> <IPAddress>	
Subject Alt Name	NEW			**Derived** value== <IP Address>	
Cert Request				Certificate request output file. Derived value == <entityID>CSR.pem	

Note: All Subject fields in the GUI are read-only and provided by the values set in the “Modify Entity Defaults” screen.

46.6.2.3.5 Usage example

The following example shows sample datafill or menu selection for GUI “Generate CSR for Export”:

The user is required to enter data for the following fields:

- ***Entity Type*** - list of **integrated** device types
- ***EntityID*** - this is a typically a hostname by convention

- ***IP address*** - (e.g.: 47.142.144.127)

The following fields comprise the Subject and are **NOT** configurable by the user from this screen. Values for these fields are loaded from the *EntityDefault* table.

Defaulted Fields (Subject)

Country Code
Region
Locality
Email Address
Organization Name
Organization Unit Name
Company Name

**Note: the above defaults are set during initial setup of the PKBroker and should NOT be changed. This is done through the "Configure Broker Defaults" screen.

Derived Fields:

The following fields are derived from the entered data. They include the following:

Common Name - derived by concatenating the entityID and IP address fields. The combined fields are delimited by the space character.

Example:
entityID = wnc0s0qh.us.nortel.com
IP=47.142.144.127
Common Name = "wnc0s0qh.us.nortel.com 47.142.144.127"

Subject Alternate Name - this field is assigned the IP address entered.

Certificate Request Output file - certificate request output files will always end with the suffix: **"**CSR.pem**".** The suffix is appended to the Entity ID to derive the final file name.

example: EntityID = wnc0s0qh
CSR file = wnc0s0qhCSR.pem

The files are generated to the default target directory: **/opt/pkmgr/csr/export.**

46.6.2.3.6 GUI release history update

46.6.2.3.7 Context sensitive launching information

This GUI is launched by clicking the "Generate CSR for Export" link from the "Import/Export Sub-menu".

46.6.2.3.8 Supplementary information

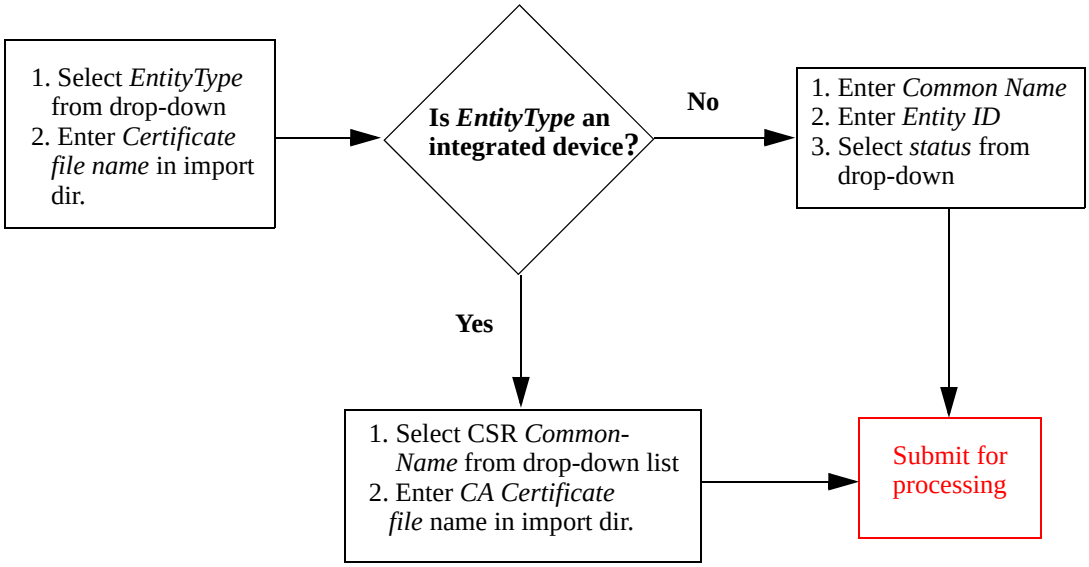
NONE

46.6.2.4 GUI name: Import Certificate

46.6.2.4.1 Functional description

This screen will allow the user to manually import certificates for expiration monitoring for a supported device. Most fields on this screen are common for both **integrated and non-integrated** devices. Certificates to be imported for integrated devices must be matched with a corresponding CSR from the database. In this scenario, a drop-down menu will be displayed to choose from available CSRs in the database. The operation integration "type" will be determined by the EntityType selected by the user and set appropriately in the PKBRequest object passed to the server.

Import Certificate - GUI Datafill Flow



46.6.2.4.2 GUI usage and implications

This screen is launched when selected from the Import/Export menu page.

Main Menu --> Import/Export Menu-->Import Certificate

46.6.2.4.3 GUI fields

The following table lists fields for GUI or pull down menu “Import Certificate”.

Table 6 GUI field descriptions

Field	New or Changed	Subfield	Entry	Explanation and action	Associated MIB entry
Entity Type			MG9KEM, MG9K, GWCEM, GWC, WebPKProxy,SSM	select from drop-down	
Device Certificate file				file name of Device certificate in default import directory	
CSR Common Name				Integrated devices - selected from drop-down NonIntegrated devices - entered manually by user to match import certificate	
CA Certificate file				Integrated EntityType only - file name of CA certificate in default import directory	
EntityID				NonIntegrated devices only - entered manually by user according to import certificate	
Status			Available, Unavailable	NonIntegrated devices only - select from drop-down	

46.6.2.4.4 Usage example

The following example shows sample datafill or menu selection for GUI “Import Certificate”:

User Input Fields

The user is initially presented with a single drop-down menu to select the entity type and a text box for specifying the certificate path on the server.

Common Fields:

- ***Entity Type*** - select from drop-down list
- ***Device Certificate path*** - this field is required for both import types.

When selected, the integration "type" will be determined and the screen will change as follows:

Integrated device fields:

- ***CSR Common Name*** - from drop-down list
- ***CA Certificate path*** - the file path to the CA certificate for the device cert to be imported.

If an integrated device is selected, (for example, GWCEM), then another drop-down menu will be displayed below the first containing the CommonNames of all outstanding CSRs in the database. The user can select from this list and the following fields will be auto-populated from it as read-only text:

- ***Entity ID***

Non-Integrated Device Fields:

If the entity type selected is not integrated, then additional text boxes will appear on the screen prompting the user for the following data fields:

- ***Common Name***
- ***Entity ID***
- ***Status*** - this will be entered as Active or Inactive from a drop-down menu.

Note: The default certificate import directory for all import types is:

/opt/pkmgr/cert/import.

**The user is required to place the certificate there for import.

46.6.2.4.5 GUI release history update

46.6.2.4.6 Context sensitive launching information

This GUI is launched by clicking the "Import CSR" link from the "Import/ Export Sub-menu".

No screenshot available

46.6.2.5 GUI name: Create Certificate for Export

Create Integrated/Non-Integrated Certificate for Export

46.6.2.5.1 Functional description

Integrated and Non-Integrated devices

This screen will allow the user to generate a private key and certificate for use with a supported device. This screen is common for both Integrated and non-integrated devices. The operation integration “type” will be determined by the EntityType selected by the user and set appropriately in the PKBRequest object passed to the server.

46.6.2.5.2 GUI usage and implications

46.6.2.5.3 GUI fields

The following table lists fields or pull down menu.

- ***Entity Type*** - select from drop-down list
- ***EntityID*** - this is a typically a hostname by convention
- ***IP address*** - (e.g.: 47.142.144.127)

Table 7 GUI field descriptions

Field	New or Changed	Subfield	Entry	Explanation and action	Associated MIB entry
EntityType	NEW		MG9KEM, MG9K, GWCEM, GWC, WebPKProxy	Selector (integrated devices only)	
EntityID	NEW			hostname of entity	
IP Address	NEW			IP address of entity	
Common Name	NEW			**Derived** value == <entityID> <IPAddress>	
Subject Alt Name	NEW			**Derived** value== <IP Address>	
Cert Output file	NEW			Certificate output file. **Derived** value == <entityID>Cert.pem	
Private Key file	NEW			Private Key output file. **Derived** value == <entityID>Key.pem	

User Input Fields

The user is required to enter data for the following fields:

- ***Entity Type*** - select from drop-down list
- ***EntityID*** - this is a typically a hostname by convention
- ***IP address*** - (e.g.: 47.142.144.127)

The following fields comprise the Subject ID and are **NOT** configurable by the user from this screen. Values for these fields are loaded from the *EntityDefault* table.

Defaulted Fields (Subject)

Country Code
Region
Locality
Email Address
Organization Name
Organization Unit Name
Company Name

**Note: the above read-only defaults are set during initial setup of the PKBroker and should NOT be changed. This is done through the "Configure Entity Defaults" screen.

Derived Fields:

The following fields are derived from the entered data. They include the following:

Common Name - derived by concatenating the entityID and IP address fields. The combined fields are delimited by the space character.

Example:
entityID = wnc0s0qh.us.nortel.com
IP=47.142.144.127
Common Name = "wnc0s0qh.us.nortel.com 47.142.144.127"

Subject Alternate Name - this field is assigned the IP address entered.

Certificate Output file - certificate output files will always end with the suffix: **"**Cert.pem**".** The suffix is appended to the Entity ID to derive the final file name.

Private Key Output File - certificate output files will always end with the suffix: **"**Key.pem**".** The suffix is appended to the Entity ID to derive the final file name.

example: EntityID = wnc0s0qh
cert file = wnc0s0qhCert.pem
key file = wnc0s0qhKey.pem

Note: Output files are saved in the export directory specified in the Broker Defaults screen. The default target directory is: **/opt/pkmgr/cert/export.**

46.6.2.6.8 Supplementary information

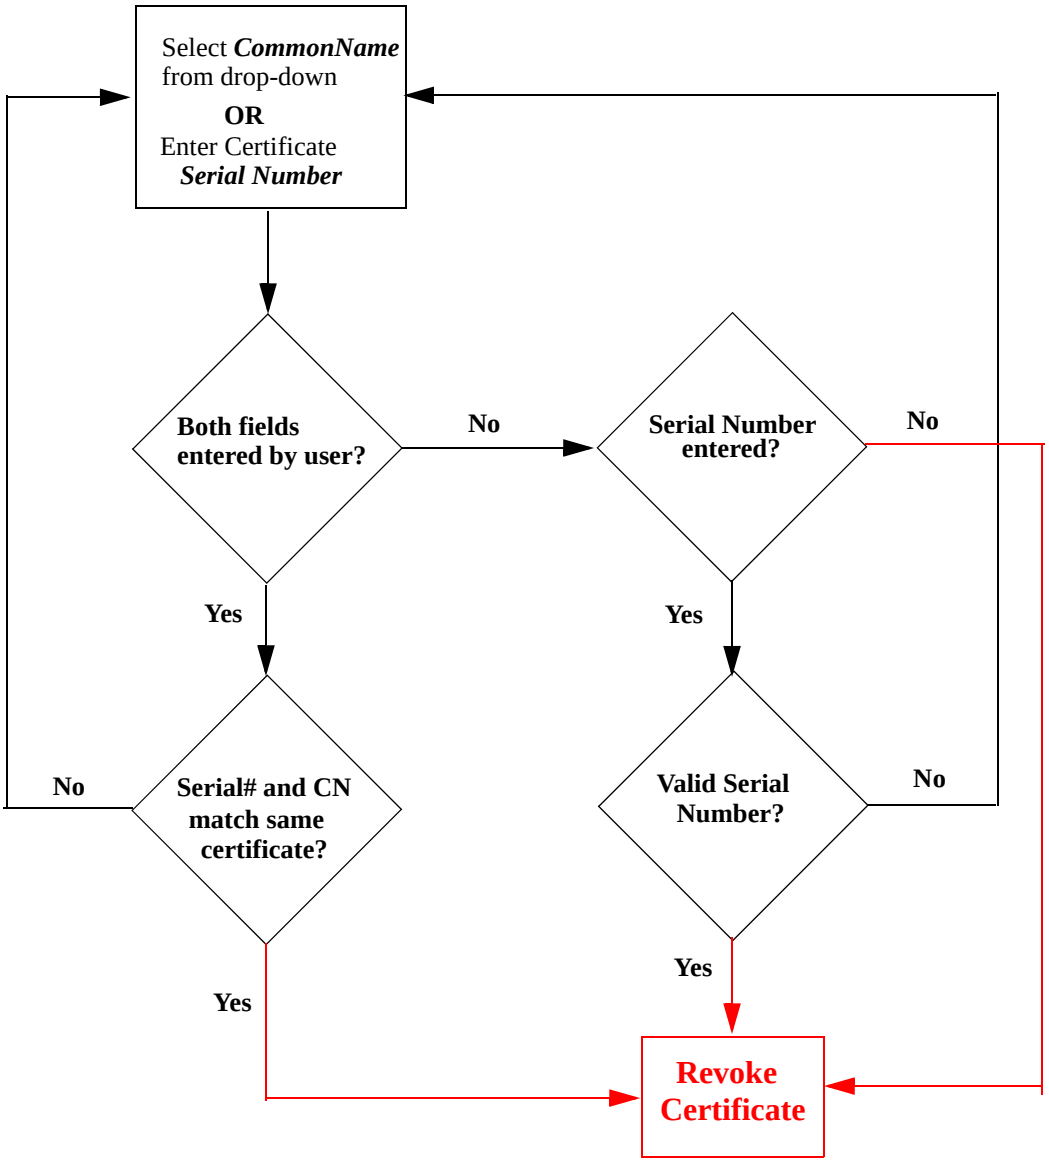
NONE

46.6.2.7 GUI name: Revoke Certificate

46.6.2.7.1 Functional description

This screen will allow the user to manually revoke any certificate that is monitored by the PKManager. ***Integrated device certificates*** that are revoked result in creation and delivery of replacement certificates to their original downstream clients.

Revoke Certificate - GUI Datafill Flow



46.6.2.7.2 GUI usage and implications

46.6.2.7.3 GUI fields

The following table lists fields for GUI or pull down menu “Revoke Certificate”.

Table 10 GUI field descriptions

Field	New or Changed	Subfield	Entry	Explanation and action	Associated MIB entry
Input Type	NEW		Radio Button	activates the input field to use: drop-down or text box	
Common Name	NEW		activated by radio button	Selector - drop-down list of certificate common names is presented for selection	
Serial Number	NEW		activated by radio button selection	User has option to directly enter the serial number of the certificate to revoke	

46.6.2.7.4 Usage example

The following example shows sample datafill or menu selection for GUI “Revoke Certificate”:

<screen-shot not available >

The user can specify a certificate to revoke in one of two ways:

- Select the certificate from a drop-down menu of certificate Common Names
- Enter the Serial Number of the certificate directly

If both fields are datafilled by the user, a check is performed to ensure the serial number entered matches the serial number of the certificate selected by Common Name. If only one field is used (as is the intended use - for convenience), then the certificate information is retrieved for the selected or entered certificate and used to populate the missing data in the other field.

46.6.2.7.5 GUI release history update

46.6.2.7.6 Context sensitive launching information

This GUI is launched by clicking the “Revoke Certificate” link from the “Revoke Certificate Menu”.

46.6.2.7.7 Supplementary information

46.6.3 GUI information

46.6.3.1 GUI name: Revoke CA Certificate

46.6.3.1.1 Functional description

Revoke CA Certificate is used to immediately revoke a CA certificate that is monitored by the PKManager. ***This operation should be used with extreme caution*** as it will cause the PKManager to initiate certificate replacements for **ALL** certificates generated and managed by the PKManager.

This screen will allow the user to select a root CA from a drop-down menu. This selection will be limited to one of the following

Common Names: (static drop-down)

- **PKBRoot**
- **PKBCA**

The initial screen will also display a warning to the user about the potential danger of this operation.

Once a selection has been made and the user submits the form data, an pop-up window will be presented asking the user to confirm the operation should proceed.

Since this operation could take a significant amount of time to run, all other GUI operations that modify data will be blocked. An error message will be displayed in the footer panel during this time for such operations. “View Certificates” and “View Alarms” screens will still be available for use.

*Note: Only users with “**secadm**” group membership will be permitted to run this command.*

User Input Fields

The user is initially presented with a single drop-down menu to select the root CA certificate by Common Name.

- **Common Name** (will be PKBRoot or PKBCA)

Following the application-wide convention, database or system error messages will be added to the request context and displayed in the footer window in red using the <html:errors> tag.

46.6.3.1.2 GUI usage and implications

46.6.3.1.3 GUI fields

The following table lists fields or pull down menu for “Revoke CA Certificate”.

Table 11 GUI field descriptions

Field	New or Changed	Subfield	Entry	Explanation and action	Associated MIB entry
Common Name	NEW		PKBRoot, PKBCA	Common Name Select from drop-down	

46.6.3.1.4 Usage example

The following example shows sample datafill or menu selection:

<no screen-shot available>

The user is initially presented with a single drop-down menu to select the root CA certificate by Common Name.

- **Common Name** (will be PKBRoot or PKBCA)

Following the application-wide convention, database or system error messages will be added to the request context and displayed in the footer window in red using the <html:errors> tag.

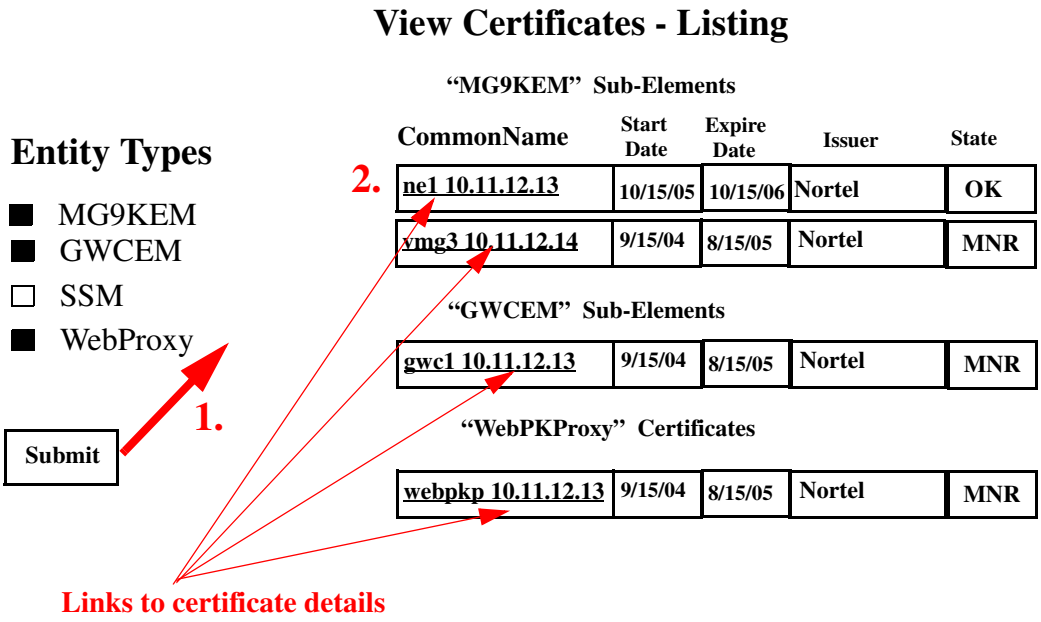
46.6.4 GUI information

46.6.4.1 GUI name: View Certificates

46.6.4.1.1 Functional description

This screen provides the user with the ability to browse certificates according to their entity type (device) hierarchy. The user has the ability to choose one or more entity types from which a database query will be launched to retrieve the associated data. A table of certificate summary information will be displayed. Next to each item listed will be a “View Details” button that will forward the

user to another screen displaying full contents of a specific certificate (see next GUI screen section). Entity types that logically contain sub-components (for example, MG9K contains VMGs), an additional *"List <childEntityType>s"* button will be provided next to the entry to list a summary of the sub-components. When selected, the sub-components summary are listed in the same format as the parent types. Each NE listed for the MG9K, for example, would have a button next to it called "List VMGs".



46.6.4.1.2 GUI usage and implications

Certificate Browser usage

1. User selects entity types to list in the certificate summary and clicks on submit to retrieve data. The representation above illustrates the fields retrieved for display and the strategy used to navigate.

2. The certificates are listed according to their manager types or category - if not managed.

46.6.4.1.3 GUI fields

The following table lists fields or pull down menu.

Table 12 GUI field descriptions

Field	New or Changed	Subfield	Entry	Explanation and action	Associated MIB entry
Common Name	NEW		Display field	Common Name of certificate	
Start Date	NEW		Display field	“Not Before” validity date of certificate	
End Date	NEW		Display field	“Not after” validity date of certificate	
Issuer	NEW		Display field	Name of certificate Issuer	
Status	NEW		Display field - must be one of: ok, maj, mnr	certificate expiration state

46.10 PKManager Configuration Walkthrough

1 User invokes IEMS installation script using existing procedure

2 Installation scripts detect if a managed certificate is already installed and prompts the user to enter one of the following selections:

- Use existing managed certificate (this is for IEMS upgrade only). Selecting this option will result in no further user input being needed for certificate management.
- Create a new CertificateL - this will prompt the user to enter values for Distinguished name components (see initial config section)
- Import a new, externally generated certificate - the user will be prompted to enter the path of the certificate to be imported and managed for use.

3 The appropriate conf script is invoked to ensure a certificate is in place before proceeding

4 IEMS installation proceeds as before.

46.11 MG9KEM Configuration

46.11.8.1 New/modified GUIs

Table 19 New or modified GUIs

GUI name	NEW, CHANGED, or DELETED
MG9000 Provisioning View	CHANGED
NE Properties View	CHANGED
GW Security Config panel	CHANGED

46.11.8.2 GUI name: MG9000 Provisioning View

46.11.8.2.1 Functional description

This is an existing view. This view is used for the initial commissioning of a NE.

46.11.8.2.2 GUI usage and implications

The MG9000 Provisioning View is updated to include a new “Use Certificate” option. With this new “Use Certificate” option, during the initial NE commissioning, the user can specify whether the NE intends to utilize PKI for securing the OAMP channel.

46.11.8.2.3 GUI fields

Table 20 GUI field descriptions

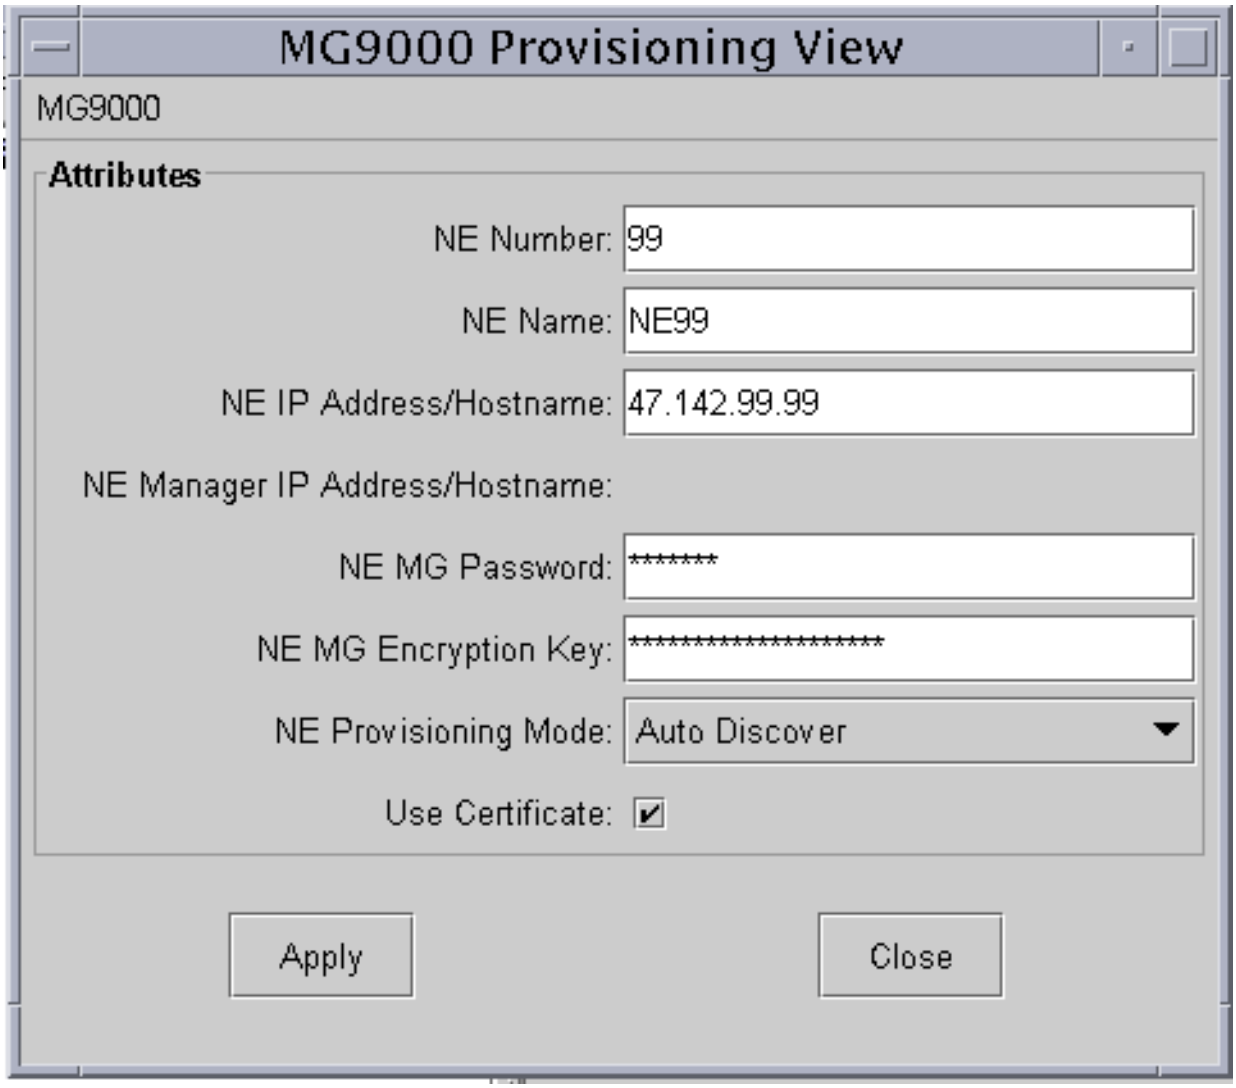
Field	New or Changed	Subfield	Entry	Explanation and action	Associated MIB entry
Use Certificate	new			whether the NE intents to use PKI for securing its OAMP channel	

46.11.8.2.4 Usage example

To launch the GUI, from the Mg9kEM Subnet GUI, click on the “Configuration” pulldown menu, then select the “Add new MG9000 NE...” from the list. Once the view is displayed, the user may fill in all the parameters for the NE and if PKI is required for securing the OAMP channel between the EM and the NE, the “Use Certificate” check box should be selected.

Note: Before provisioning a NE to use PKI, provisioning steps at the LCI and SSM are required. For details on how to fully provision the NE to use PKI, please refer to the initial commissioning procedures in the Configuration Walkthrough section.

Here is an example of the view:



46.11.8.2.5 GUI release history update

46.11.8.2.6 Context sensitive launching information

This view is accessible from the Mg9kEM Subnet View

46.11.8.2.7 Supplementary information

46.11.8.3 GUI name: Properties View

46.11.8.3.1 Functional description

This is an existing view. This view is used to display or modify NE specific attributes.

46.11.8.3.2 GUI usage and implications

The Properties View is updated to include a new “Use Certificate” option. The user can use this view to view or modify the PKI setting that controls the security for the OAMP channel.

Two additional display fields are added to Properties View:

- Last Pushed Certificate

  This field displays the serial number of the last device certificate that was successfully downloaded to Mg9k.

- Latest Certificate

  This field displays the serial number of the latest device certificate received from the PKBroker.

Normally, if PKI is in use for this NE, these two fields should contain the same serial number. However, if for some reason, the Mg9k does not have the latest certificates available, the two fields would not match. A manual certificate download can be initiated to push the latest certificates to the gateway.

46.11.8.3.3 GUI fields

.

Table 21 GUI field descriptions

Field	New or Changed	Subfield	Entry	Explanation and action	Associated MIB entry
Use Certificate	new			whether the NE intents to use PKI for securing its OAMP channel	
Last Pushed Certificate	new			the serial number of the last device certificate that was successfully downloaded to Mg9k	
Latest Certificate	new			the serial number of the latest device certificate received from the PKBroker	

46.11.8.3.4 Usage example

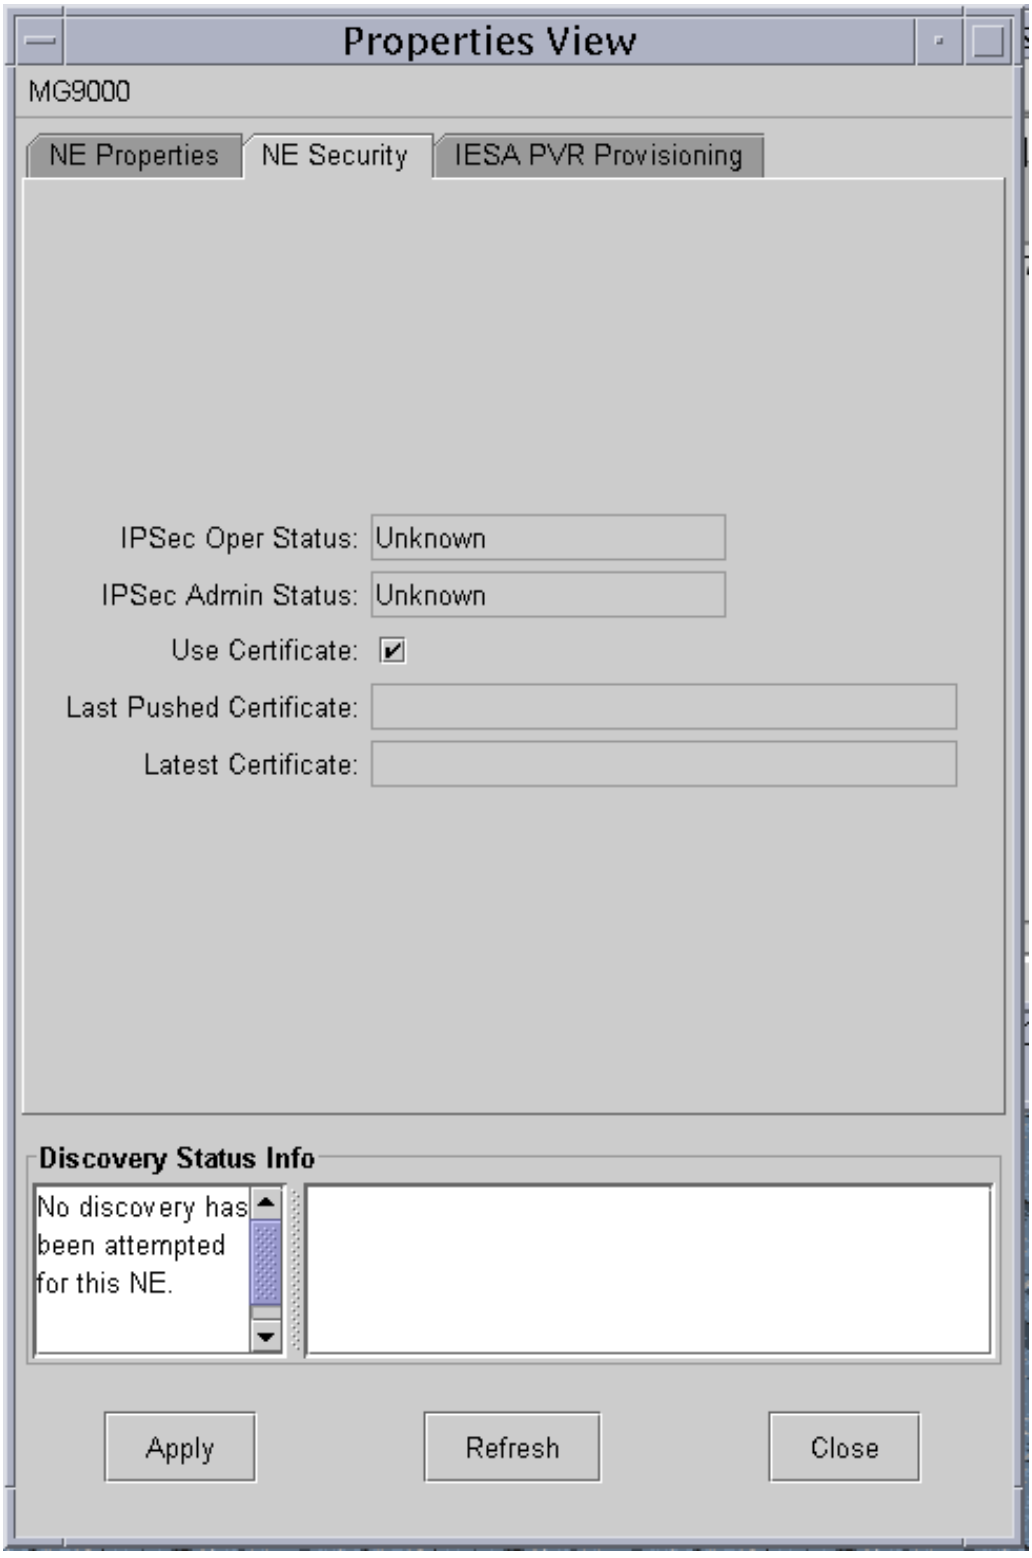
To launch the GUI, select a NE from the Mg9kEM Subnet GUI then click on the “Configuration” pulldown menu, then select the “View/Modify NE

Properties...” from the list. Once the view is displayed, the user may view or change the PKI setting for the NE by selecting the “NE Security” tab and manipulating the “Use Certificate” setting from the GUI.

> **Note:** To avoid unexpected communication loss between the EM and the NE, proper procedures should be followed when modifying the PKI option for the NE. Please refer to the procedures in the Configuration Walkthrough section for more details.

Assuming the “Use Certificate” indicator is already set for the NE, if for some reason, a manual certificate download is required to re-send the certificates to the gateway, the “Apply” button can be use to initiate the certificate download request.

Here is an example of the view:



46.11.8.3.5 GUI release history update

46.11.8.3.6 Context sensitive launching information

This view is accessible from the Mg9kEM Subnet View

46.11.8.3.7 Supplementary information

46.11.8.4 GUI name: GW Security Config panel

46.11.8.4.1 Functional description

This is an existing view. This view is used to configure security information for the call control channel between the Mg9k and the GWC.

46.11.8.4.2 GUI usage and implications

The GW Security Config panel is updated to include a new selector where the user can specify whether the VMG intends to use certificate, preshared key for securing it callp link. When the “Use Certificate” option is specified, the EM will, start the process to retrieve and download the certificates to the gateway. The user can continue with the remaining VMG provisioning steps without waiting for the certificate download to complete. However, the gateway will not enable call processing for this VMG until it has successfully received and processed the VMG certificates from the E

The GW Security panel will also contain a new option to allow the user to explicitly trigger a certificate download request.

Prior to this feature, the GW Security Config panel is an optional panel during VMG provisioning. With this feature, this panel will become a required step during VMG provisioning. When provisioning a new VMG, the GW Security Config panel will be presented as part of the VMG provisioning progression. The user will have to select the type of security the VMG will use.

46.11.8.4.3 GUI fields

Table 22 GUI field descriptions

Field	New or Changed	Subfield	Entry	Explanation and action	Associated MIB entry
Security Infrastructure	new	Certificates or Preshared Key		whether the VMG intends to use PKI or PSK for securing its callp channel	
Last Pushed Certificate	new			the serial number of the last device certificate that was successfully downloaded to Mg9k	

Table 22 GUI field descriptions

Field	New or Changed	Subfield	Entry	Explanation and action	Associated MIB entry
Latest Certificate	new			the serial number of the latest device certificate received from the PKBroker

This view is accessible from the Mg9kEM Switched Line Services View.

46.11.8.4.7 Supplementary information

46.11.9 User interface changes

N/A

46.11.10 OSSGate Interface Changes

N/A

46.11.11 Security

46.11.11.1 MG9kEM

Only users in the “emsrw” or “emsadm” group are authorized to setup or modify the PKI related options for the NE (i.e. OAMP link). This is consistent with other NE specific provisioning actions.

Only users in the “emssprov”, “emsrw” or “emsadm” group are authorized to setup or modify the PKI related options for the VMGs (i.e. Callp links). This is consistent with other VMG specific provisioning actions.

46.11.12 Configuration Walkthrough

46.11.12.1 Mg9kEM - OAMP link with PKI

The following procedures should be followed when provisioning and modifying the security setting for the OAMP channel between the Mg9kEM and the Mg9k.

Overall Assumptions:

1. The certificate for the EM box itself is already installed and working. Setting up PKI for the EM box itself is not covered here.
2. With the exception of the “Initial Commissioning” procedure, all other procedures assume:
   a. Mg9k is fully discovered
   b. Mg9k is at 9.x+ load
   c. OAMP link between the EM and the Mg9k is up and running.
3. Enabling security for the Mg9k is done from the LCI; not from the EM.
4. The following transition scenarios are covered by this document:
   — no security to PKI
   — PSK to PKI
   — PKI to PSK

— PKI to no security

5. The following transition scenarios are part of the existing IPsec functionality and are not covered by this document:

— no security to PSK

— PSK to no security

46.10.12.1.1 Initial commissioning

Assumptions: none

Procedure:

1. At the LCI, commission the Mg9k:
   a. Unlock all cards. Provision Carriers and unlock them
   b. At the DCC IPsec Config screens:
      i. select “Use Certificates” checkbox
      ii. configure remaining IPsec fields
      iii. enable security
   c. Continue the normal commissioning steps:
      i. provision OAMP parameters to give the Mg9k a presence in the network
      ii. user make notes of the fingerprint info for the Mg9k
      iii. at the completion of the provisioning steps, the Mg9k will not initiate a cold start trap to the EM; it will wait for its set of certificate files to be delivered by the EM.
2. At the SSM, add an IPsec policy and IKE entry for the OAMP link to use certificates
3. At the EM, add a new NE for the newly commissioned Mg9k:
   a. User selects the “user certificate option when provisioning the NE, and the EM performs the following checks:
      i. the IKE entry with PKI exists for this NE
      ii. Mg9k is running the 9.x+ load
      iii. Mg9k is present in the network (i.e. fingerprint available)
   b. If all the previous conditions are met, the user is presented with the Mg9k’s fingerprint for verification. Once the fingerprint is verified, the EM:
      i. gets the Mg9k’s certificates from PKManager
      ii. bundles the certificates into a tar file

iii. SFTP the certificate tar file to the Mg9k's active DCC

c. If the conditions are not met or Mg9k fingerprint verification fails, the user will have the option to create the NE without the "Use Certificate" indicator; the EM will not attempt the certificate transfer process in this case. Once the NE is created, the user can modify the NE setting to "Use Certificate" which will in turn perform all the same checks again before initiating the certificate download process.

4. Once the Mg9k receives the certificate bundle, the Mg9k:

a. validates and installs the certificates for use by Windriver IPsec stack

b. once the file is installed, it's sync'd to the mate DCC card

c. after the certificate files are functional, the Mg9k will use them to establish an SA with the EM

d. when this SA is established, a cold start trap is sent

Limitations and restrictions:

1. The IPsec and IKE provisioning is controlled at the SSM. Adding/deleting policies may result in communication loss between the EM and Mg9k.

2. The EM will only display the Mg9k fingerprint at the GUI from user initiated request.

46.10.12.1.2Transitioning from no security to PKI

Assumptions:

1. In SSM, IPsec policy does not exist for this NE

Procedure:

1. At the EM, modify the NE's setting to "Use Certificate". The EM:

a. gets the Mg9k's certificates from PKManager

b. bundles the certificates into a tar file

c. SFTP the certificate tar file to the Mg9k's active DCC

d. informs the user to complete the SSM and LCI steps

2. Once the certificate delivery to the Mg9k is successful, at the SSM, the user will add an IPsec policy and IKE entry for the OAMP link to use certificates

3. At the LCI's DCC IPsec config screens, update the IPsec configuration:

a. select "Use Certificates" checkbox

b. configure remaining IPsec fields

c. enable security

d. the Mg9k will:

i. establish the SA with the EM

ii. send nnIpsecCertifDownload trap to EM

Limitations and restrictions:

1. the communication link between the Mg9k and the EM will be down during the time when the IPsec policy is in affect but the security for the Mg9k is not yet enabled n from the LCI. (i.e. between steps 2 and 3)

46.10.12.1.3 Transitioning from PSK to PKI

Assumptions:

1. The SSM component supports flex policy

2. In SSM, IKE entry with ***PSK*** exists for this NE

Procedure:

1. At the SSM, add an IKE entry for the OAMP link to use certificates. Since the SSM supports flex policy, the OAMP link is not affected.

Note: if IKE entry with PSK did not exist when the IKE/PKI entry is added, the communication between the NE and the EM will go down. This is really a transition from no security to PKI; steps in this section are not applicable in this case.

2. At the EM, modify the NE's setting to "Use Certificate". If the IKE entry with PKI exists for this NE and the communication channel between EM and NE is up, the EM:

a. gets the Mg9k's certificates from PKManager

b. bundles the certificates into a tar file

c. SFTP the certificate tar file to the Mg9k's active DCC

d. sets the DCC's nnIpsecConfigEtnry::nnIpsecConfigAuthenMethod field to "certificate"

e. once the Mg9k receives the certificates, the Mg9k will:

i. reestablish SA using PKI

ii. send nnIpsecCertifDownload trap to EM

3. EM will reply on the nnIpsecCertifDownload trap to indicate the NE is now using PKI. EM will continue to encrypt with PSK until it receives the nnIpsecCertifDownload trap?

4. If IKE entry with PKI does not exist for this NE or the communication channel is down between the EM and the NE, the transition attempt is blocked.

Limitations and restrictions:

46.10.12.1.4Transitioning from PKI to PSK

Assumptions:

1. The SSM component supports flex policy
2. In SSM, IKE entry with ***PKI*** exists for this NE
3. The NE on the EM is set to "Use Certificate"
4. Preshared key on the EM and the NE are both previously provisioned and they match each other

Procedure:

1. At the SSM, add an IKE entry for the OAMP link to use PSK. Since the SSM supports flex policy, the OAMP link is not affected.

   Note: if IKE entry with PKI did not exist when the IKE/PSK entry is added, the communication between the NE and the EM will go down. This is really a transition from no security to PSK; steps in this section are not applicable in this case.
2. At the EM, modify the NE's setting by ***deselecting*** the "Use Certificate" indicator. If the IKE entry with PSK exists for this NE and the communication channel between EM and NE is up, the EM:
   a. sets the DCC's nnIpsecConfigEtnry::nnIpsecConfigAuthenMethod field to "psk". Mg9k should fail the set request if it does not have the preshared key or could not transition to PSK mode
   b. the Mg9k will:
      i. reestablish SA using PSK
      ii. send nnIpsecCertifDownload trap to EM?
3. EM will reply on the nnIpsecCertifDownload trap to indicate the NE is now using PSK. EM will continue to encrypt with PKI until it receives the nnIpsecCertifDownload trap?
4. If IKE entry with PSK does not exist for this NE or the communication channel is down between the EM and the NE, the transition attempt is blocked.

Limitations and restrictions:

1. if there is a preshared key mismatch between the EM and the NE, the keys will need to be manually reconciled from the EM and/or LCI.

46.10.12.1.5 Transitioning from PKI to no security

Assumptions:

1. In SSM, only IKE entry with PKI exists for this NE
2. The NE on the EM is set to “Use Certificate”

Procedure:

1. At the SSM, the user deletes the IPsec policy and IKE/PKI entry for the OAMP link
2. At the LCI’s DCC IPsec config screen, disable security
3. At the EM, modify the NE’s setting by deselecting the “Use Certificate” indicator.
   a. If IKE entry with PKI does not exist for this NE, remove the certificate related data from the EM for this NE
   b. If only the IKE entry with PKI exists for this NE, inform the user complete the SSM and LCI steps first

Limitations and restrictions:

1. the communication link between the Mg9k and the EM will be down during the time when the IPsec policy removed but the security for the Mg9k is not yet disabled from the LCI. (i.e. between steps 1 and 2)

46.10.12.1.6 Disabling IPsec

Assumptions:

Procedure:

1. Remove all IPsec and IKE entries for the NE
2. At the LCI’s DCC IPsec config screen, disable security
3. Although not required, it’s recommended that if the NE at the EM is provisioned to “Use Certificate”, this indicator is removed from the EM.

Limitations and restrictions:

46.10.12.1.6 Certificate Recovery from Comm. Link Down

Assumptions:

1. Communication is down between the EM and the NE and certificate corruption at the Mg9k is suspected
2. The NE on the EM is set to “Use Certificate”

Procedure:

1. User confirms IP connectivity between the EM and the NE (e.g ping)
2. At the EM, user initiates a certificate download from the GUI
3. At the LCI, reconfigure other security related data as needed

Limitations and restrictions:

46.1 MG9K Configuration

46.1.1 Hardware and Software Requirements

46.1.1.1 MG9K

Standard Media Gateway 9000 configuration.

46.1.2 Initial Configuration

46.1.2.1 MG9K

Standard Media Gateway 9000 Element Manager (MG9000 EM) configuration.

46.1.3 Office/Subnet parameters (OP/SP) (CM & SESM)

N/A

46.1.4 Upgrade Considerations

46.1.4.1 Dump and Restore (CM)

46.1.4.2 MG9K Upgrade

46.1.4.3 Downgrade impact

46.1.4.4 MG9K

PKI support is available in SN09.x loads.

46.1.5 Data schema (DS) (CM, MIBS, RDB)

N/A

46.1.6 Service Orders (SO) (CM & SESM)

N/A

46.1.7 Software optionality control (SOC)

N/A

46.1.8 MG9K

46.1.8.1 New/modified GUIs

Table 23 New or modified GUIs

GUI name	NEW, CHANGED, or DELETED
IPSec Control	CHANGED

46.1.8.2 GUI name: LCI IPsec Control

The LCI is used to configure and control IP Security on the MG9K's Data Controller Card (DCC).

46.1.8.2.1 Functional description

This is an existing view which allows a user the select the 'Authentication Type' used by IPsec to secure the node's external IP interface.

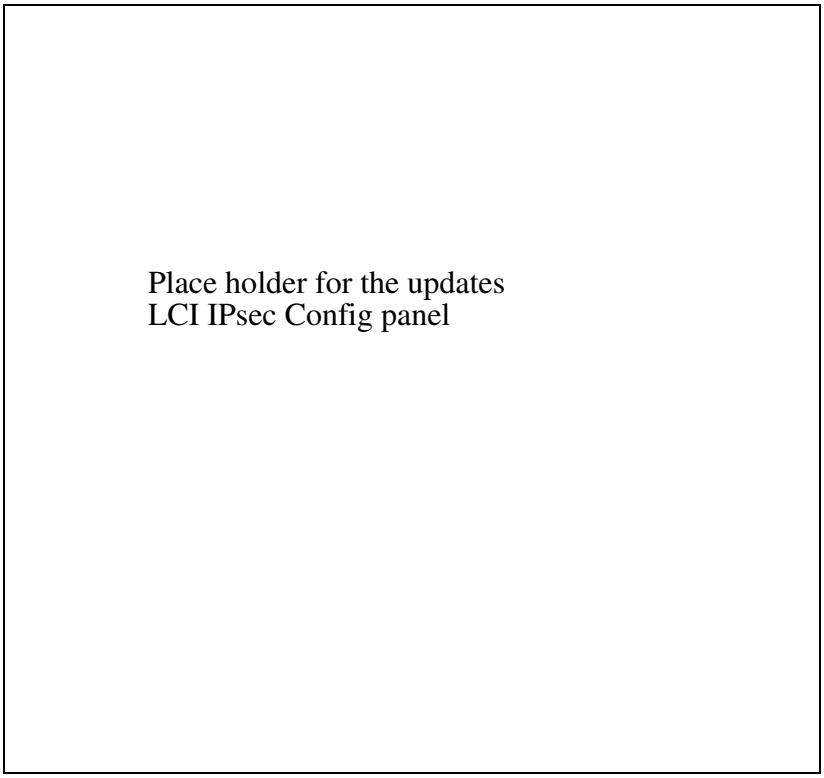
46.1.8.2.2 GUI usage and implications

The IPsec Configuration View is updated to allow the user to select authentication type of pre-shared key or Digital Certificate.

46.1.8.2.3 Usage example

The LCI is used to manage the IPsec options on the DCC card of the MG9K. Optionally, it can be used to also configure and control IP security for VMGs. For the DCC, the LCI is essential to bring a node in service with IP security enabled.

Here is an example of the view:



46.1.8.3 GUI name: LCI OAMP Control Panel

This screen is mainly used to configure the OAMP link's network parameters. It also the user to configure a preshared encryption key. This key is used to encrypt/decrypt sensitive data transferred between the MG9K and its element manager. When digital certificates are used to authenticate the IPsec channels between the MG9K and it manager, a pre-shared key is no longer required as sensitive data can be encrypted with the device certificate.

46.1.8.3.1 Functional description

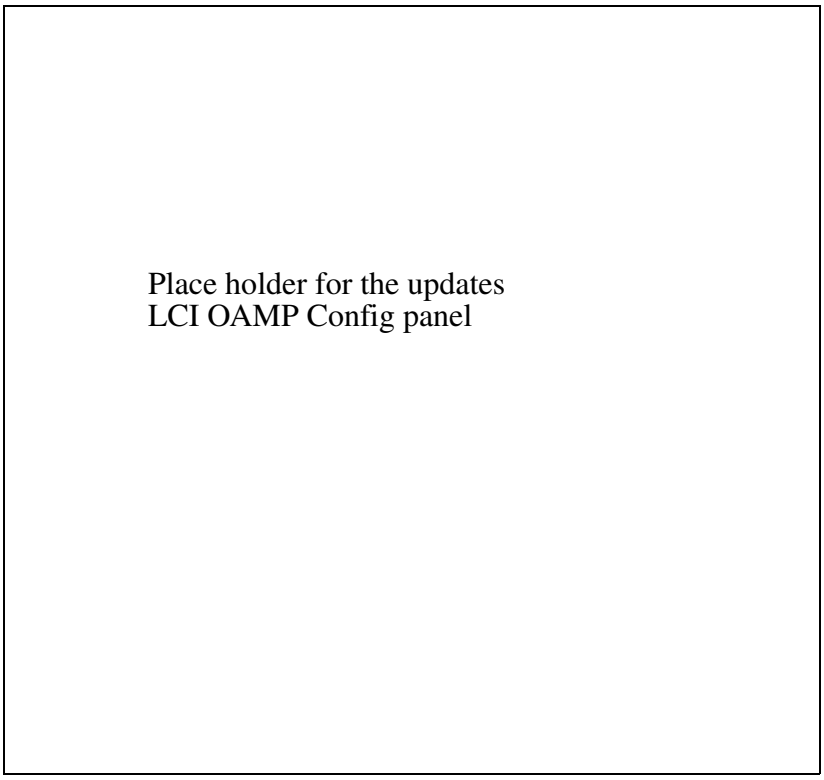
Given that it is a customer preference to authenticate IPsec with digital certificates, the OAMP config screen will no longer enforce the a key to be entered unless there is no authentication type selected.

46.1.8.3.2 GUI usage and implications

If the user chooses to configure the OAMP screen before configuring the IPSec scree, they will be asked to either enter a PSK or go back to the IPsec control screen and configure IPsec.

46.1.8.3.3 Usage example

Here is an example of the view:



46.1.9 OSSGate Interface Changes

N/A

46.1.10 Security

46.1.10.1 MG9K LCI

LCI users are ‘administrative’ users and currently have permissions for node wide changes.

46.1.11 Configuration Walkthrough

See walkthroughs in previous section.

46.2 GWC-EM Configuration

46.2.1 Hardware and Software Requirements

46.2.2 Initial Configuration

46.2.3 Office/Subnet parameters (OP/SP) (CM & SESM)

N/A

46.2.4 Upgrade Considerations

46.2.4.1 Dump and Restore (CM)

46.2.4.2 Element Management Upgrade

46.2.4.3 Downgrade impact

When SN09.1 SESM has detected an earlier GWC load, it should only allow provisioning of a single preshared key in the new IKE Authentication dialog. Any SNMP SETs to the older GWC load must use the existing MIB tables, not the new definitions.

46.2.5 Data schema (DS) (CM, MIBS, RDB)

46.2.5.1 New/modified tables, MIBs, or Database Schema

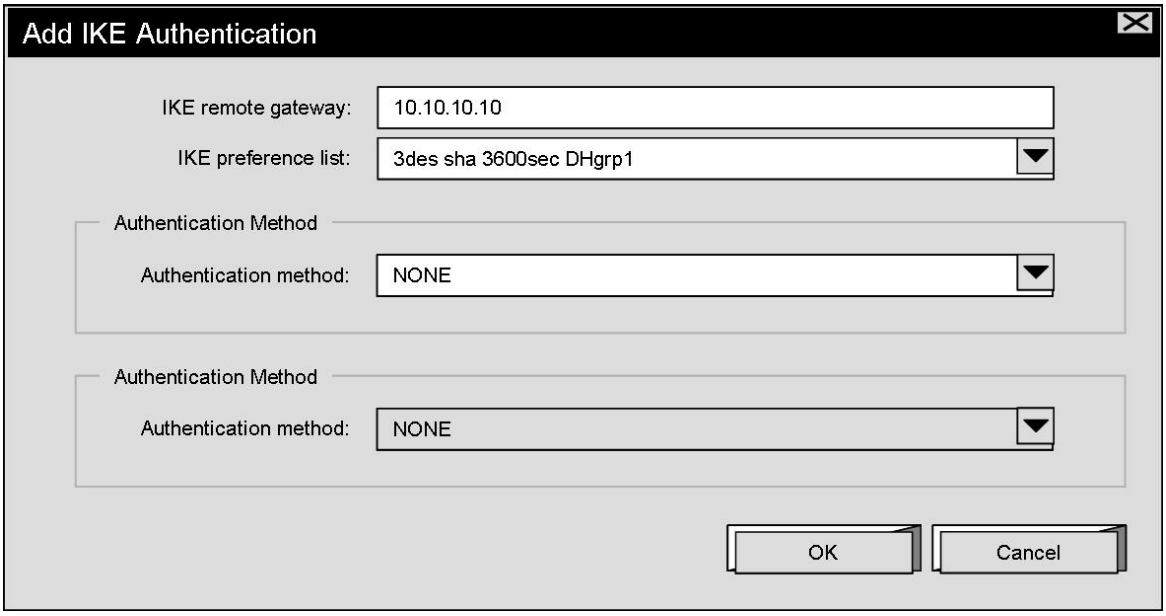
46.2.10.5.8 Supplementary information
N/A

46.2.10.6 GUI name: Add/Change IKE Authentication dialog



46.2.10.6.1 Functional description

This dialog show the IKE authentication configuration parameter list and is used to configure these parameters.

46.2.10.6.2 GUI usage and implications

Provisioning a GWC with IPsen supported, then configure IKE authentication.

46.2.10.6.3 GUI size

N/A

46.2.10.6.4 GUI fields

This dialog will include 4 field:

- IKE remove gateway.
- IKE preference list cl.
- PKI.
- Preshared-Key.

46.2.10.6.5 Usage example

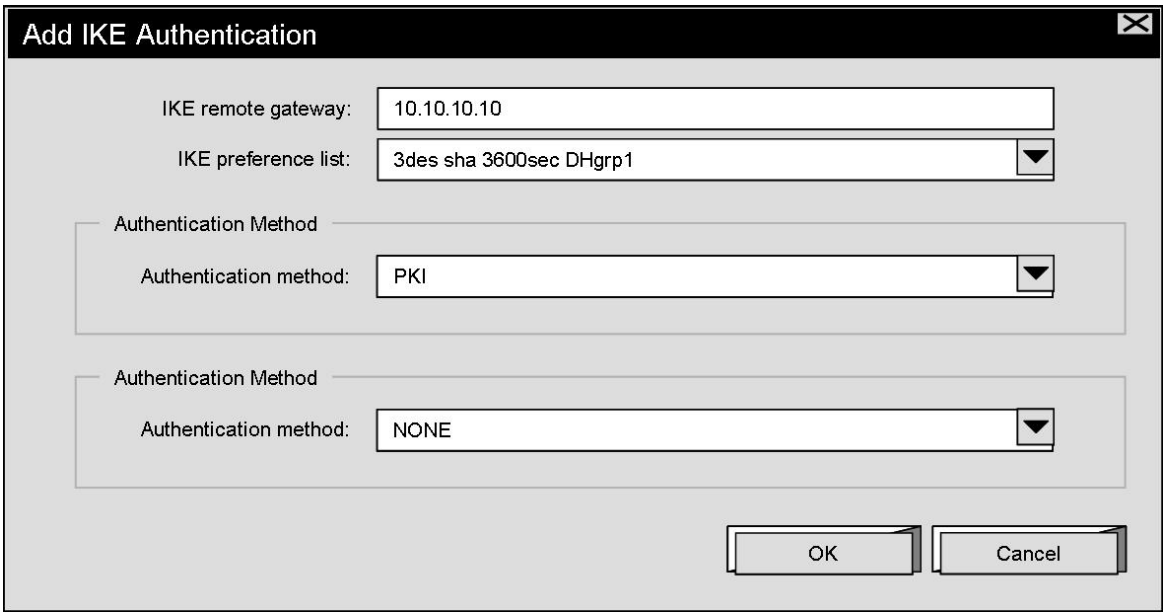
In IKE authentication panel, when the “Add” button is clicked, the “Add IKE Authentication” dialog box will appears, which includes following fields:

- IKE remove gateway column contains an IPV4 address.
- IKE preference list column contains an index into the “IKE Preference List” panel.

- Authentication Method field is a drop down selector, available values consisting of “None”, “PRESHARED” and “PKI”.
- Please note that the second Authentication Method only becomes editable after the first Authentication Method is datafilled. They have the same available values.
- In SN10, at most one PKI and at most one PRESHARED can be selected in the same IKE Authentication item. E.g. you can select only “PKI”, or only “PRESHARED” as authentication method. Also you can select both “PKI” and “PRESHARED” as authentication methods. But you cannot select two “PKI” or two “PRESHARED”.

If you select PKI as authentication method, just simply save it by clicking “OK” button.

Figure 1 Add IKE Authentication - PKI method



If you select “PRESHARED” as authentication method, three more fields will appear on the dialog box:

- Preshared key format field is a drop down selected, only be shown when “PRESHARED” is selected as authentication method. Available values consisting of “ASCII” and “HEX”.
- Preshared key data is a text field, only be shown when “PRESHARED” is selected as authentication method.
- Last modified data is a non editable text field, only be shown when “PRESHARED” is selected as authentication method. SESM will display current time in this field.

Add IKE Authentication - Preshared method

46.2.14 Configuration Walkthrough

The following transition scenarios are covered by this document:

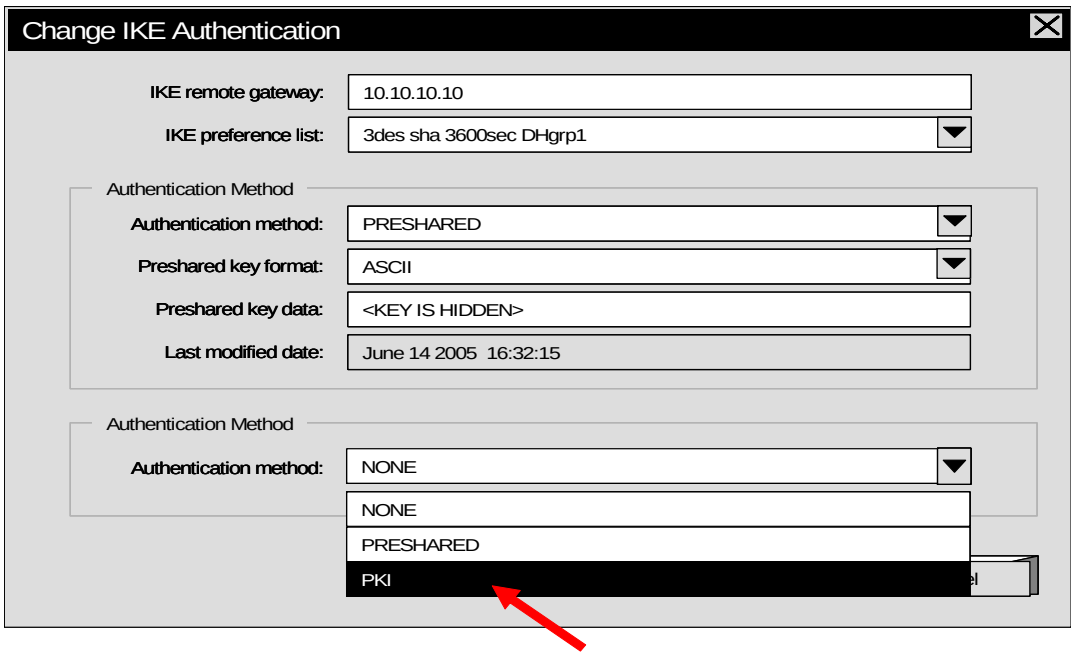
1. PSK to PKI

2. PKI to PSK

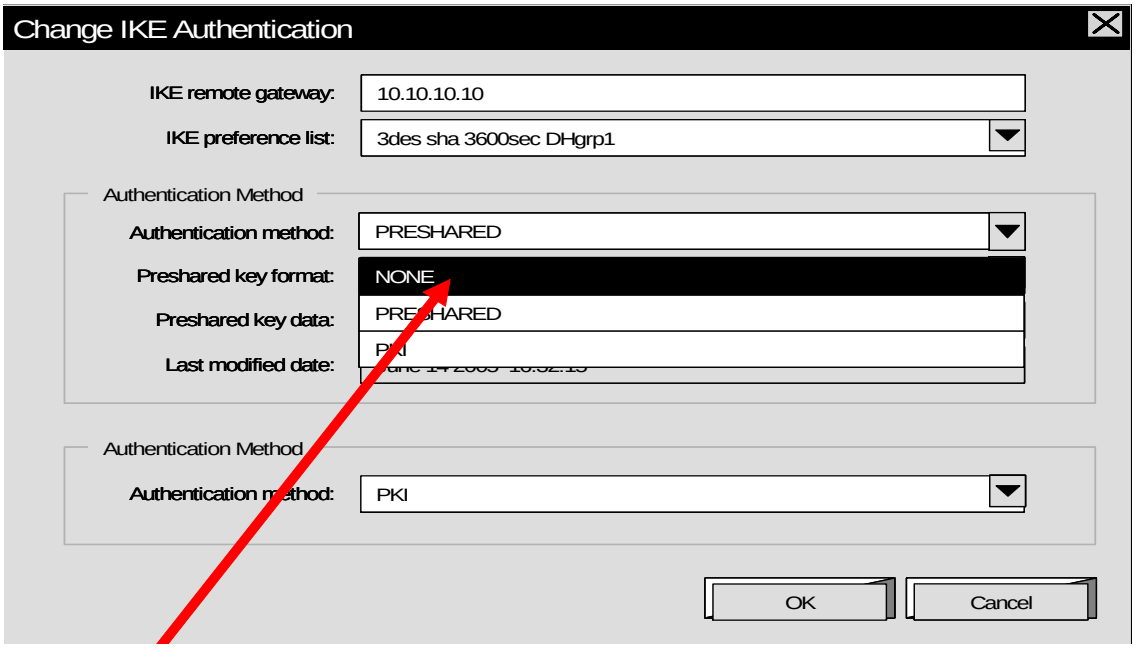
46.2.14.1 Transition from PSK to PKI

1. In IKE authentication panel, select “Change” button.

In the IKE authentication change dialog, set the second Authentication Method to PKI: (PSK -to- PSK + PKI)



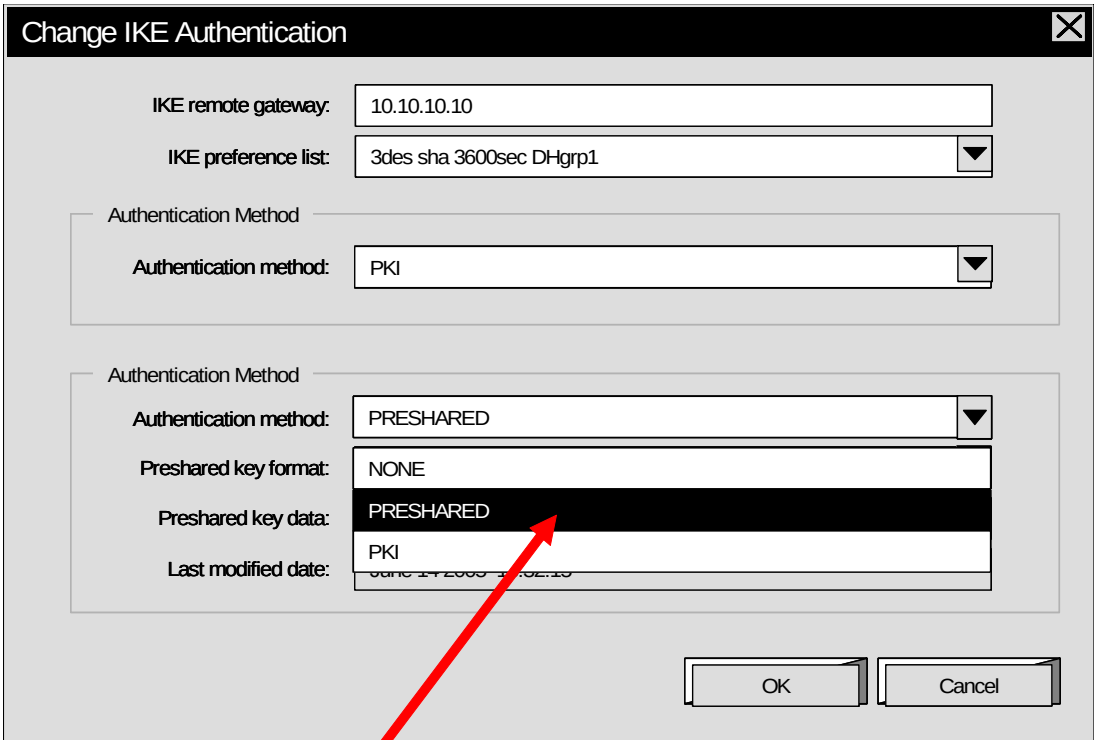
2. After the GWC use the PKI as its new profile, the customer will delete the PSK from the IKE authentication setting: (PSK+PKI - to - PKI)



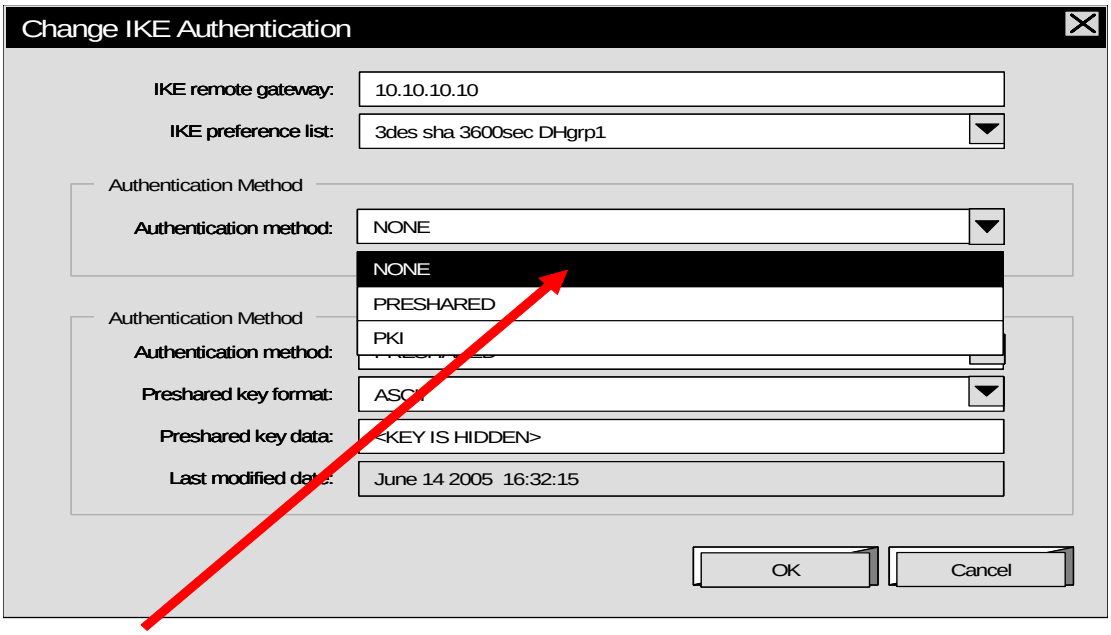
46.2.14.2 Transition from PKI to PSK

1. In IKE authentication panel, select “Change” button.

In the IKE authentication change dialog, set the second Authentication Method to PSK: (PKI -to- PKI + PSK)



2. After the GWC use the PSK as its new profile, the customer will delete the PKI from the IKE authentication setting: (PKI+PSK - to - PSK)



46.3 Configuration - SSM Certificate Handling

46.3.1 Hardware and Software Requirements

SN09.1 or later software load for SSPFS and the MG9K Element manager.

46.3.2 Initial Configuration

46.3.2.1 SSPFS Certificate

From a high-level, here are the steps to install the certificate “chain” on the SSPFS Machine from PKBroker.

1. Load IEMS with the required SN09.1 or later software.
2. Load both SSPFS and MG9000 Element Manager with required SN09.1 or later software.
3. For installing the certificate(s) on the SSPFS machine, thru PKBroker, the craftsperson will perform a certificate signing request from X. This is done by X. Behind scenes, PKBroker sends request to SSM on the SSPFS Machine. SSM generates a certificate signing request and forwards the CSR to PKBroker and the certificate is returned along with all supporting certificates. These certificates are installed in Solaris.
4. To verify the installation of certificates, the craftsperson will press the display all certificates button from the Certificate page.

46.3.2.2 IKE Entry with certificates

IPSec and IKE configuration parameters that are provisioned, via the Server Security Manager (SSM), must match the corresponding IPSec and IKE parameters on the MG9000, provisioned via the LCI and MG9000 Element Manager.

From a high-level here are the steps to enable security on the OAM&P links.

1. Load both MG9000 and MG9000 Element Manager with required software.
2. When commissioning the MG9000,the craftsperson will enable security using certificates for that network element using the Node Provisioning view of the Element Manager.
3. The craftsperson will then use a web browser and connect to the MG9000 Element Manager server machine. (SSM) After logging in, the craftsperson will enable security by creating IPSec and IKE entries using the MG9000 IP address. When provisioning the IKE entry the craftperson will elect to use certificates instead of pre-shared key.
4. Cold start from MG9000 or manual discovery from Element Manager.
5. This will complete securing the OAM&P link.

46.3.3 Office/Subnet parameters (OP/SP) (CM & SESM)

Not applicable

46.3.4 Upgrade Impact

46.3.4.1 Server Security Manager

For SN07 or earlier to SN09.1 upgrades, there are no impacts as IPSec was not available.

For SN08 or SN09 to SN09.1 upgrades, an SSPFS backup and restore will be necessary to move IPSec configuration forward to SN09.1. No data conversion will be necessary.

46.3.5 Data schema (DS) (CM, MIBS, RDB)

New Mib for the OAM&P provisioning of IPSec: TBD

New Mib for the VMG provisioning of IPSec: TBD

46.3.6 OSS Changes

None

46.3.7 External Interface Changes

None.

46.3.8 Server Security Manager

46.3.8.1 GUI name: Server Security Manager

Server Security Manager

46.3.8.1.1 Functional description

This HTML webpage is used to define security parameters to secure communications into and out from the SSPFS Machine. This includes MG9000 Element Manager to MG9000 OAM&P communications.

The craftsperson will be presented with two tables representing currently provisioned security parameters. One for IPSec parameters and one for IKE parameters. Options to add and delete entries are available. Adding entries will be performed using HTML forms.

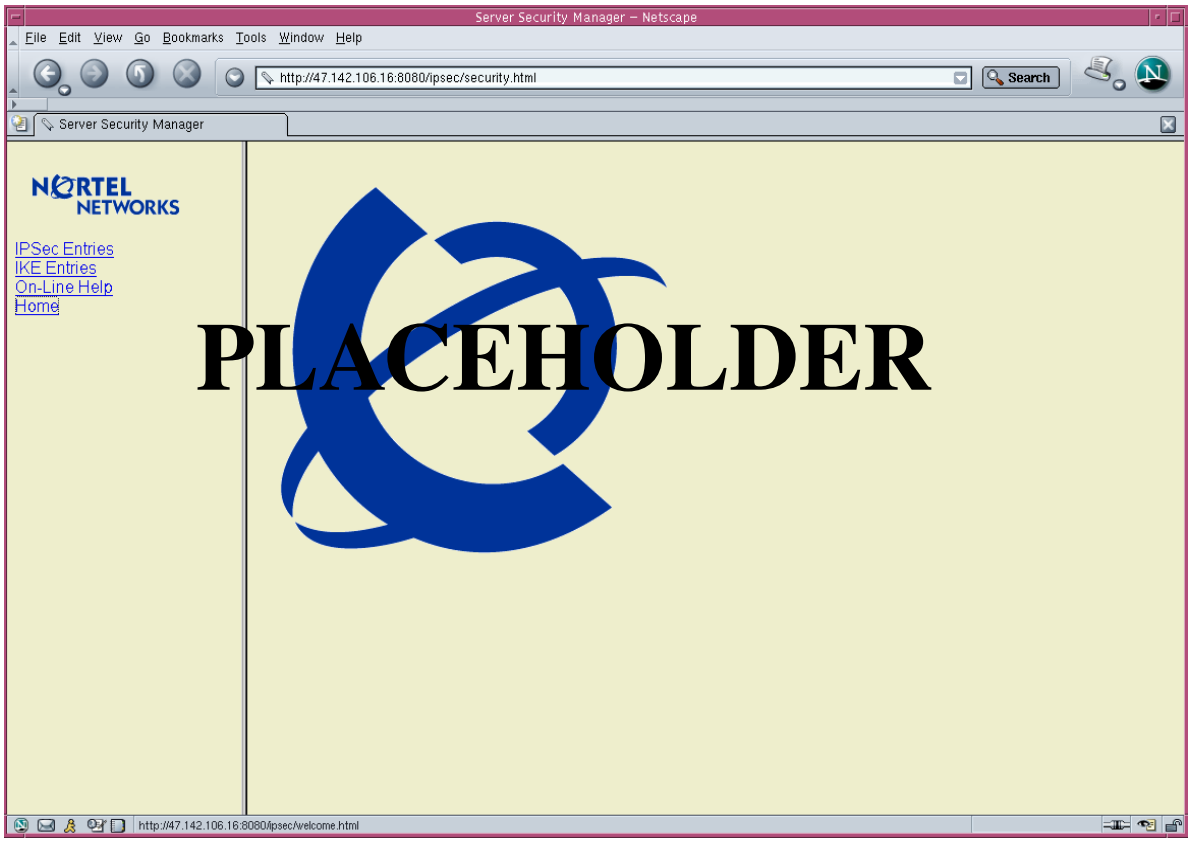
The IPSec Entries page allows retrieval and manipulation of IPSec policies for a host server. Once the policies are configured, all outbound and inbound datagrams are subject to policy checks as they exit and enter the host server. If no entry is found, no policy checks will be completed, and all the traffic will pass through. Depending upon the match of the policy entry, a specific action will be taken.

The IKE Entries page allows retrieval and manipulation of Internet Key Exchange policies for a host server. Once a policy is configured, the IKE daemon running on the host server discovers a remote host's public encryption key. The local system can then encrypt messages destined for the remote host whose public key it has discovered.

A new "Transforms" button will be available from the IKE Entries page to allow the craftperson to enter and view multiple transforms per IKE entry. For example, one transform could support a preshared key and another could support certificates.

A new "Certificates" link will be available on the navigation bar on the left. This will access the SSPFS Machine's certificates. Options to perform certificate signing requests to the CA authority and to delete certificates will be found.

The following is the first page presented to the craftsperson upon opening the Security Interface:



Navigation is perform using the links on the left frame. User input is performed or operation output is displayed in the right frame.

46.3.8.1.2 GUI usage and implications

First, IPSec entries are created using the desired parameters. If the craftsperson has chosen to use the “IPSec” action, the second step is to create a corresponding IKE entry using the desired parameters.

This interface provides for securing all network communications and not just Element Manager communications. Care must be taken when provisioning or deleting the security parameters, so as not to effect other essential communications, such as telnet, ftp, etc.

46.3.8.1.3 IPSec Entry

No changes are planned.

46.3.8.1.4 IKE Entry

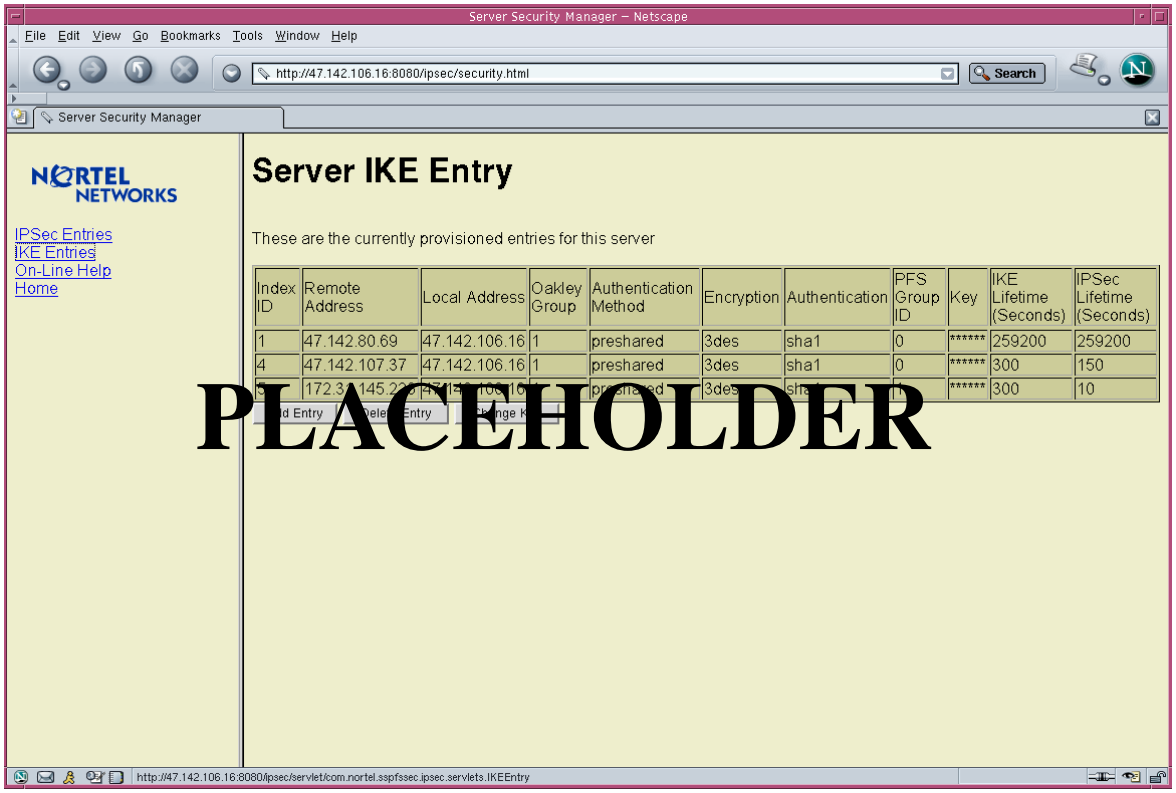
The following table lists the security fields for IKE parameters.

Table 26 IPSec field descriptions

Field	New or Changed	Subfield	Entry	Explanation and action
Index ID	No	No	Integer	Internal index used by the server to track and reference IKE entries.
Remote Address	No	No	A numeric internet IP address of the form: www.xxx.yyy.zzz	IP address of the remote system communicating with this server.
Local Address	No	No	A numeric internet IP address of the form: www.xxx.yyy.zzz	IP address of this server.
Type	New	No	Preshared Key or Certificate	Selects the type of security negotiation and authentication to use.
Oakley Group	No	No	1 (768-bit), 2 (1024-bit), or 5 (1536-bit).	The Oakley Diffie-Hellman group used for IKE Security Association key derivation.
Authentication Method	No	No	Preshared is the only supported option.	The authentication method used for IKE phase 1.
Encryption	No	No	des, 3des, and blowfish.	Specifies the encryption algorithm for a Security Association.
Authentication	No	No	sha1 and md5.	Specifies the authentication algorithm for a Security Association.
PFS Group ID	No	No	0 (do not use Perfect Forward Secrecy for IPsec SAs), 1 (768-bit), 2 (1024-bit), and 5 (1536-bit).	The Oakley Diffie-Hellman group used for IPsec Security Association key derivation.
Key	No	No	16 - 120 character ASCII string	Specifies the preshared key for this Security Association.
IKE Lifetime	No	No	Maximum allowed value is 2,419,200 seconds, 40,320 minutes, 672 hours or 28 days.	Specifies the lifetime for a IKE phase 1 Security Association.
IPSec Lifetime	No	No	Maximum allowed value is 2,419,200 seconds, 40,320 minutes, 672 hours or 28 days.	Specifies the lifetime for an IPSec Security Association.

46.3.8.1.5 IKE provisioned entries example

The following example shows a number of IKE entries for an SSPFS server:



PLACEHOLDER

46.3.8.1.6 IKE entry form example

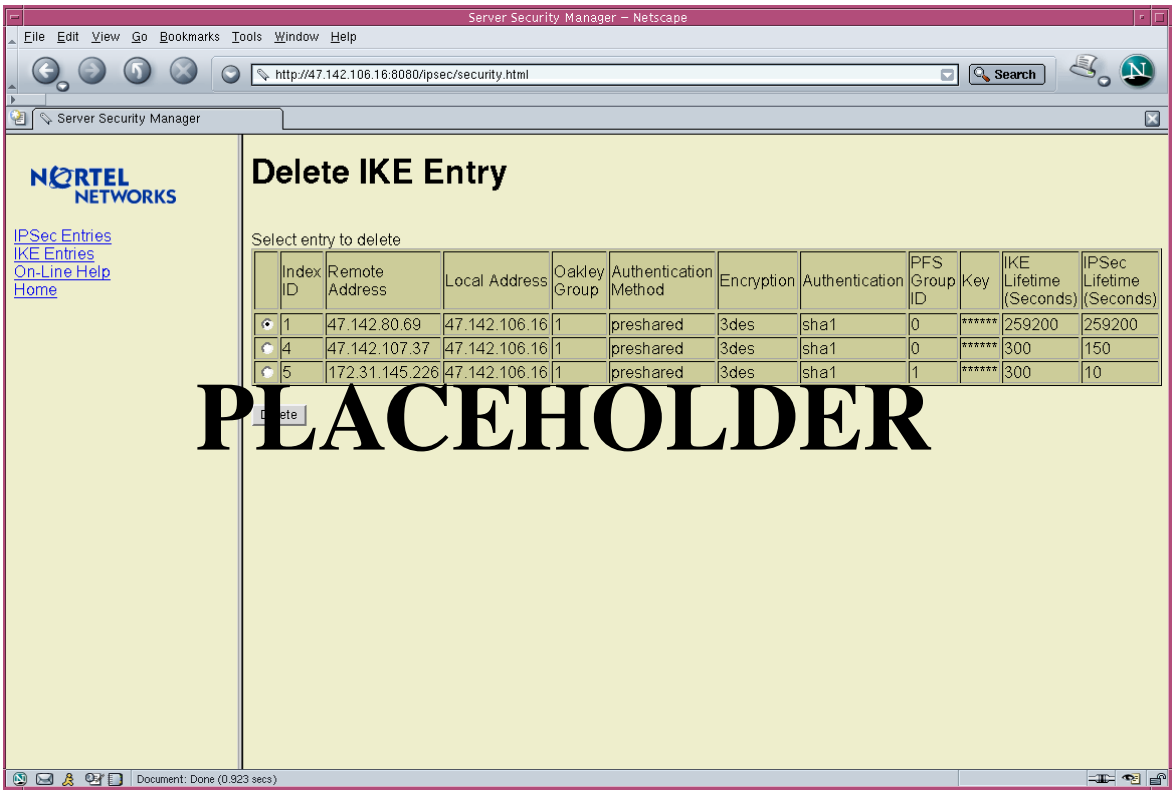
The following example shows a form for deleting a transform from IKE entry for an SSPFS server:



PLACEHOLDER

46.3.8.1.11 MG9000 Parameter settings

For each MG9000 provisioned and requires IP security, two IPSec entries must be created, one bypass for “ping” and another for “ipsec”. For each “ipsec” entry there must be a corresponding IKE entry.

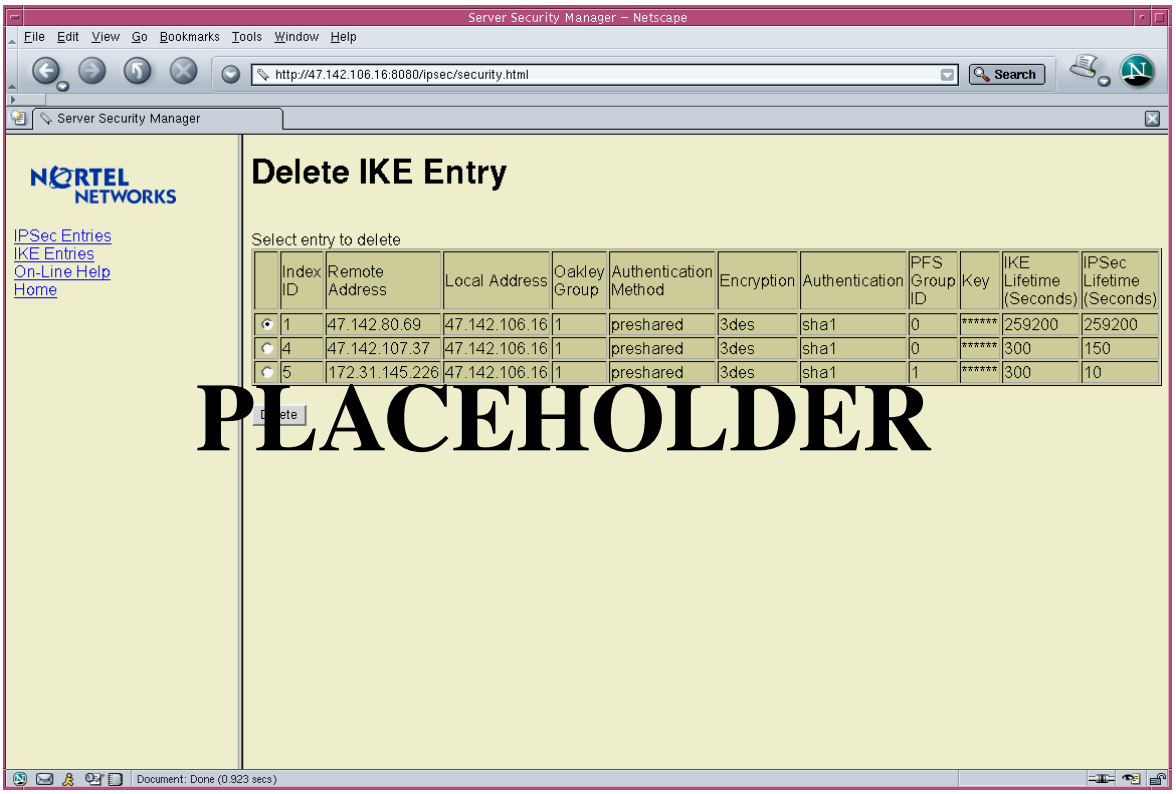
The IKE entry must be provisioned as follows:

1. Remote Address is the address of the MG9000 as seen by the Element Manager.
2. Local Address is the address of the Element Manager as seen by the MG9000.
3. Type is “Certificate”
4. Oakley Group is “1”.
5. Encryption Algorithm is “3des”.
6. Authentication Algorithm is “sha1”.
7. PFS Group ID is “1”.

8. IKE Lifetime is “8”.
9. IKE Lifetime Unit is “hours”.
10. IPSec Lifetime is “8”.
11. IPSec LIfetime Unit is “hours”.

46.3.8.1.12 Certificate Commands example

The following example shows the certificate commands available for an SSPFS server:



PLACEHOLDER

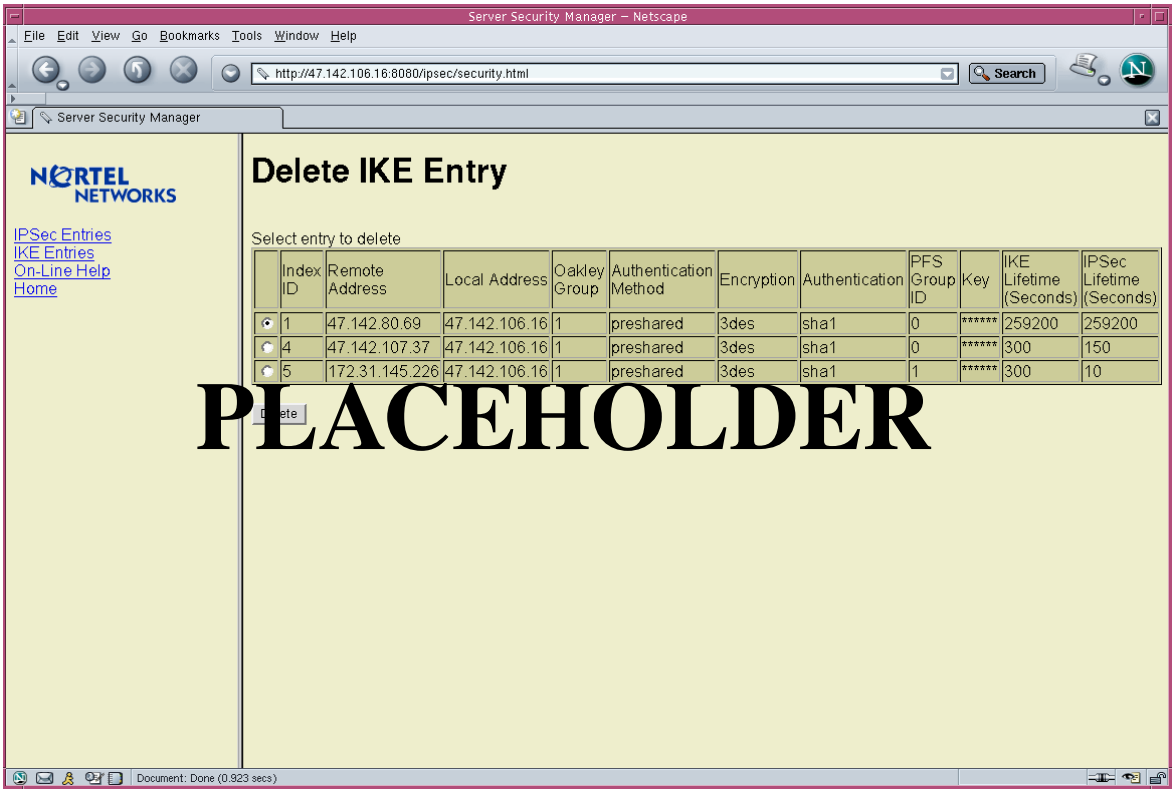
46.3.8.1.13 Certificate command page

The commands are as follows:

1. Certificate Signing Request - generate a certificate signing request.
2. Clear All - remove all certificates from the machine.
3. Display All - display all certificates currently provisioned.

46.3.8.1.14 Display All certificate example

The following example shows the Display All certificate page:



PLACEHOLDER

46.3.8.1.15 Display All certificate page

This page will display all the certificates currently provisioned on the SSPFS machine.

46.3.8.1.16 GUI release history update

The following information was added:

1. Type field to select Preshared Key or Certificate to IKE entry form and IKE table.
2. New pages for IKE transforms. Add, delete and view transforms.
3. New pages for certificates. Certificate Signing Request, Clear All and Display All.

46.3.8.1.17 Supplementary information

None

46.3.8.1.18 CLUI Interface

Not applicable

46.3.9 Command interface changes

Add, Delete and show IKE Entry transforms.

Certificate signing request command line option.

46.3.10 Security

46.3.10.1 Network configuration

No changes to the network are necessary to support the IPSec implementation.

46.3.10.2 Key management

46.3.10.2.1 SSPFS IKE Preshared key

The SSPFS IKE preshared key input by the user in the SSPFS Security Servlet. This key is secured by the use of secure http, if configured, from the browser to the server. Solaris stores all keys in a hidden system file not accessible by common users but is available to the ROOT user.

46.3.10.2.2 SSPFS Certificate Public/Private key

For the SSPFS Certificate Public/Private keys, Solaris stores all keys in a hidden system file not accessible by common users but is available to the ROOT user.

46.3.10.3 Protocol

IPSec is being used on the Solaris machine.

46.3.10.4 Authentication

Succession login will still be used for SSPFS Security Servlet.

46.3.11 Configuration Walkthrough

46.3.11.1 SSM Certificate Installation (Initial Commissioning)

From a high-level, here are the steps to install the certificate “chain” on the SSPFS Machine from SSM running on the SSPFS Machine.

1. Load IEMS with the required SN09.1 or later software.
2. Load both SSPFS and MG9000 Element Manager with required SN09.1 or later software.
3. For installing the certificate(s) on the SSPFS machine, thru the SSM Servlet, the craftsperson will perform a certificate signing request from the Certificate page. This is done by pressing the Cert Signing Request button. Behind scenes, the certificate is forwarded for signing and returned along with all supporting certificates. These certificates are installed in Solaris.
4. To verify the installation of certificates, the craftsperson will press the display all certificates button from the Certificate page.

46.3.11.2 SSM Certificate Installation (PKBroker)

From a high-level, here are the steps to install the certificate "chain" on the SSPFS Machine from PKBroker.

1. Load IEMS with the required SN09.1 or later software.
2. Load both SSPFS and MG9000 Element Manager with required SN09.1 or later software.
3. For installing the certificate(s) on the SSPFS machine, thru PKBroker, the craftsperson will perform a certificate signing request from X. This is done by X. Behind scenes, PKBroker sends request to SSM on the SSPFS machine. SSM generates a certificate signing request and forwards the CSR to PKBroker and the certificate is returned along with all supporting certificates. These certificates are installed in Solaris.
4. To verify the installation of certificates, the craftsperson will press the display all certificates button from the Certificate page.

46.3.11.3 SSM Certificate Removal

From a high-level, here are the steps to remove the certificate "chain" on the SSPFS Machine.

1. Load both SSPFS and MG9000 Element Manager with required software.
2. For removing the certificate(s) from the SSPFS machine, thru the SSM Servlet, the craftsperson will perform a delete all certificates from the Certificate page. This is done by pressing the Clear Certificates button. Behind scenes, the certificates are removed.
3. To verify the deletion of certificates, the craftsperson will press the display all certificates button from the Certificate page.

47: Configuration (CN): A00012198

47.1 Feature Name

GLC12 Coin Card Support from EM

47.2 Hardware and Software Requirements

The MG9000 and MG9000 software load which supports GLC12 card should be available.

47.3 Initial Configuration

The GLC12 card should be present on the MG9000.

47.4 Office/Subnet parameters (OP/SP) (CM & SESM)

NA

47.5 Upgrade Considerations

Since this card is supported in SN09.1 release, upgrade and downgrade scenarios have to be taken care.

No special care to be taken for EM upgrade/downgrade.The normal upgrade procedure will be followed for upgrading the EM to SN09.1. If SN09.1 EM is managing a node which has a GLC12 card, it would be displayed as GLC12 as against SAA12 in previous releases.

When a SN09.1 EM managing a SN09.1 MG9000 (with a GLC12 card) has to be downgraded to SN09, the MG9000 has to be downgraded (with proper patches for GLC12) prior to downgrading the EM. In SN09 EM the GLC12 card would be displayed as SAA12 card. The functionality is same when SN09.1 EM is downloaded SN08. In SN07EM, the GLC12 card will not be discovered.

47.6 Data schema (DS) (CM, MIBS, RDB)

NA

47.7 Service Orders (SO) (CM & SESM)

NA

47.8 Software optionality control (SOC)

NA

47.9 Element Management

There are no new views added for this feature. The card view will display the GLC12 card details and when the user double clicks on the port, the Line circuit view will open as shown in the following figures,

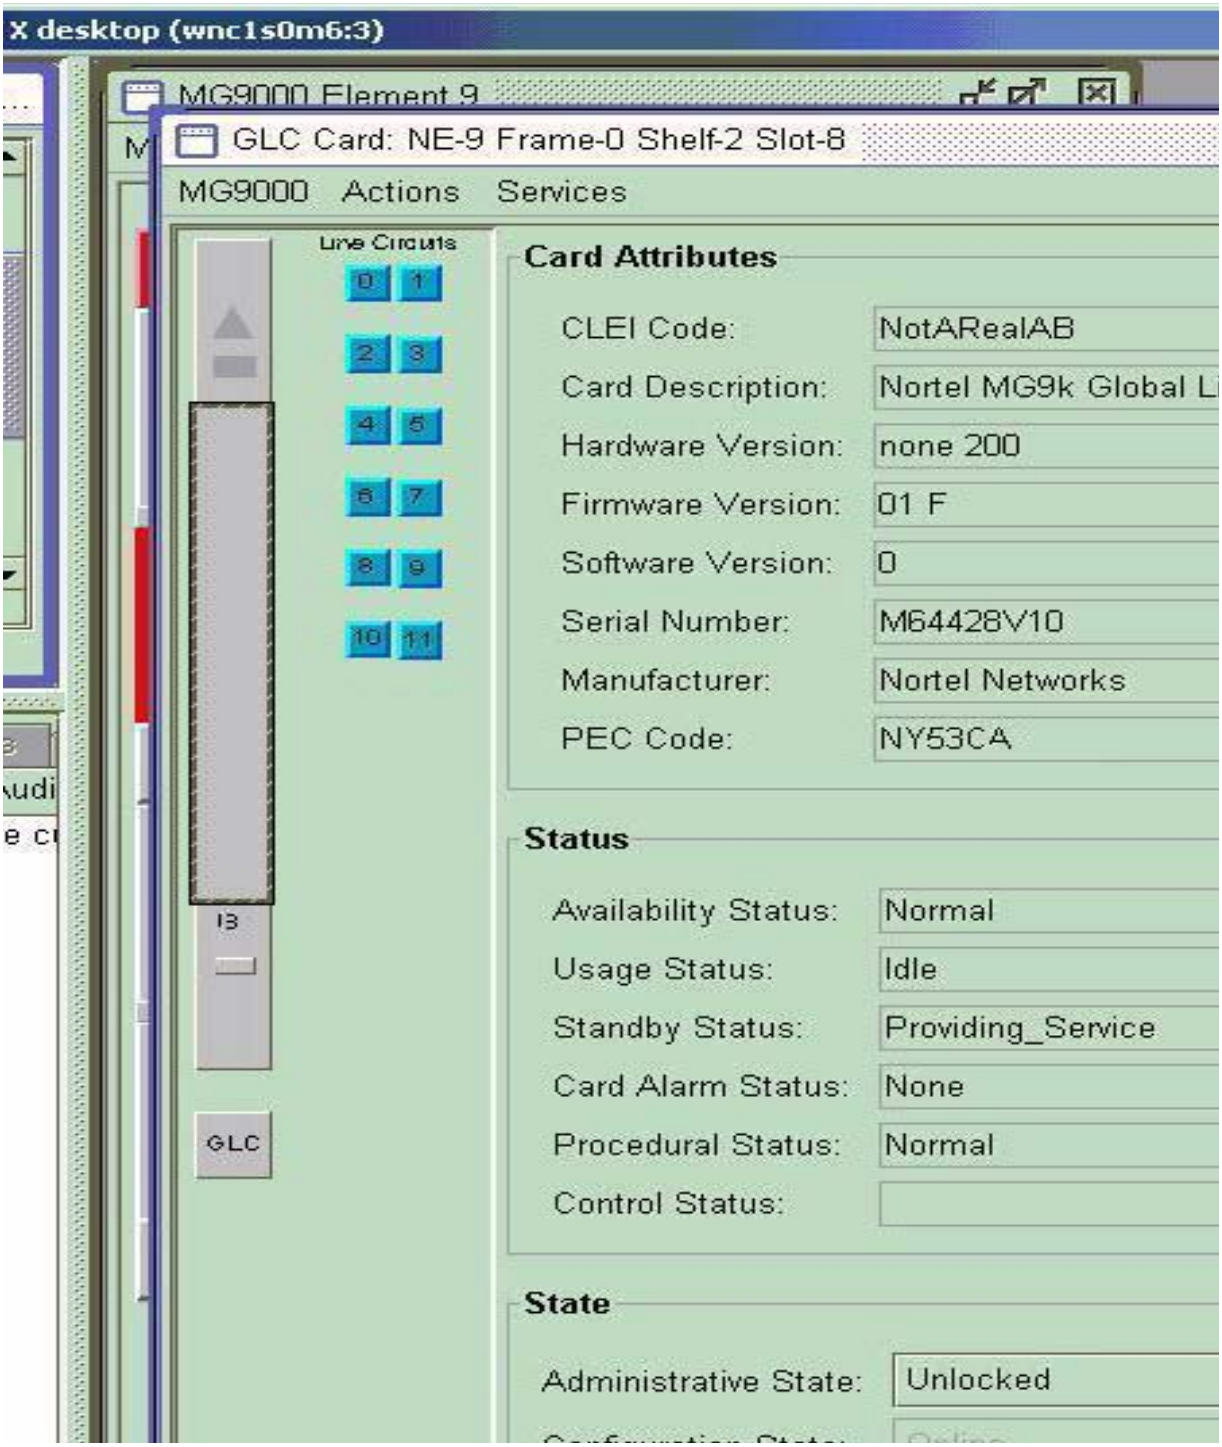


Figure 1: GLC12 Card View

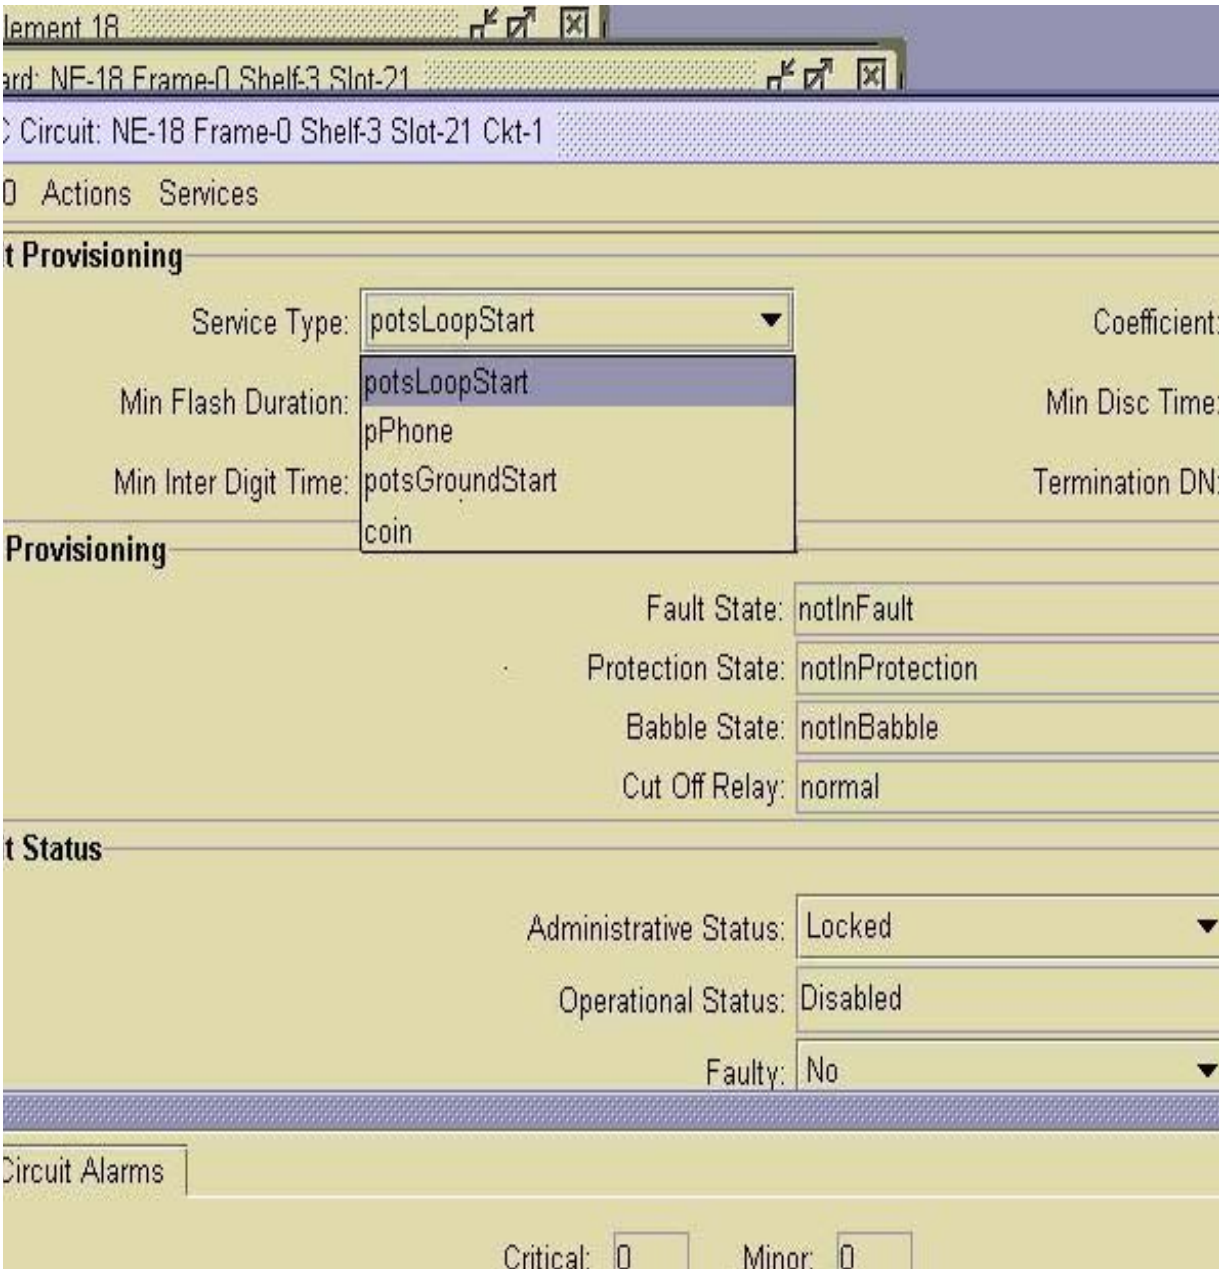

Figure 2: GLC12 Circuit View

The GLC12 line circuit will support pPhone, potsGroundStart, potsLoopStart and coin service types. The SAA12 can be replaced with a GLC12(and vice versa) without deprovisioning the card. When the card is replaced, if the circuit

view and circuit listing views will be closed if they are open. When the user opens the views again, the GLC information will be displayed in these views. When a SAA12 card is replaced with a GLC12 card, in the card view the actions submenu will be added. This actions submenu will have ‘Coefficient Table Manager’ entry. Clicking on which ‘Line Coefficient Table ‘will be opened.The circuit listing view which can be opened from Services submenu will display coefficient with other details.

When a GLC12 card will be replaced with a SAA12 card, the actions submenu will be removed and the circuit listing view will not display coefficient details with other existing details.

The audit will correct if there is a mismatch in the PEC code types, the proper card types would be decided depending on the PEC code and the same would be updated in the EM

Line Coefficient Download:

With this design, the EM is limiting the market the user can select for VMGs which in turn will limit the line coefficients on the GW.

A combobox ‘NE Market’ has been added to Add New MG9000 view. The user has to select the market from the market list while adding the NE. By default the market in the officewide defaults will be selected. The user can modify the market and apply the market to NE. The same market has to be selected for the VMGs which will be created.

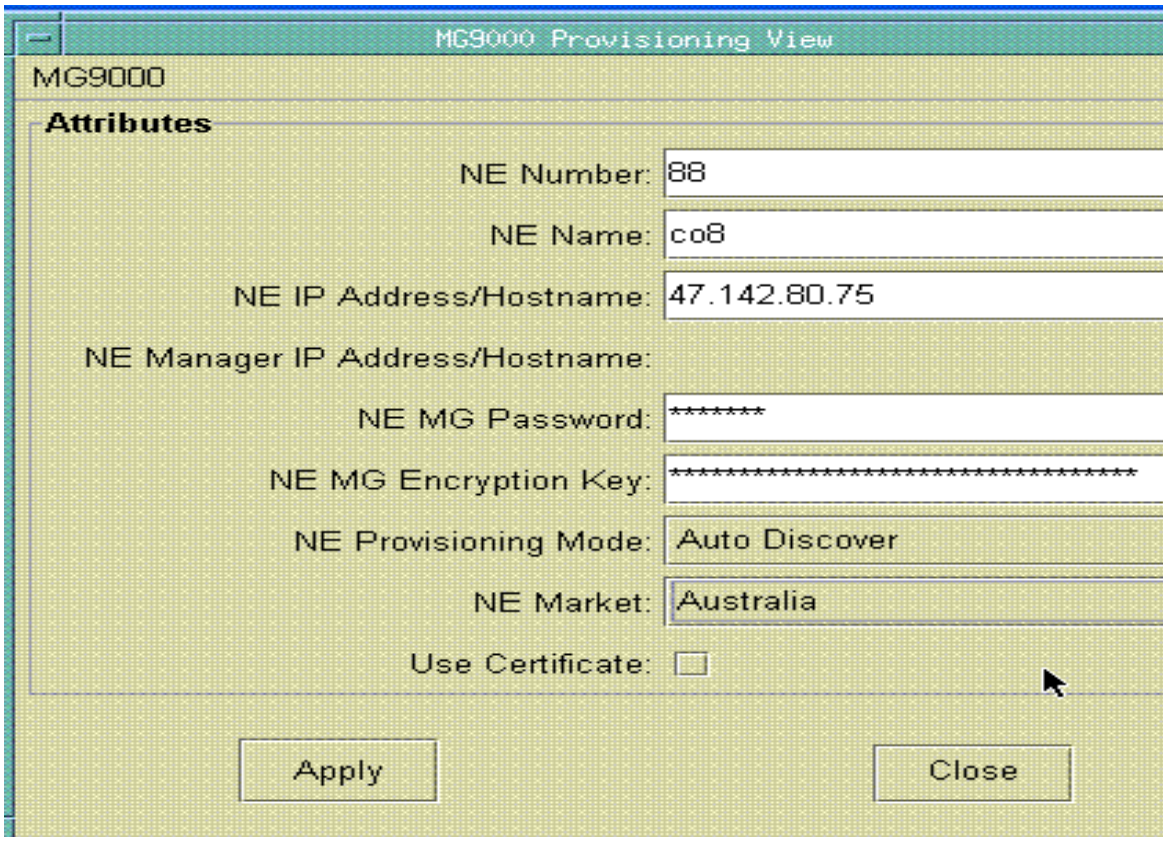

Figure 3: Add New MG9000 View

The market set for the NE can be viewed from 'Add/Modify NE Properties View'. This market's coefficients will be downloaded onto the GW during LineCoefficient audit.

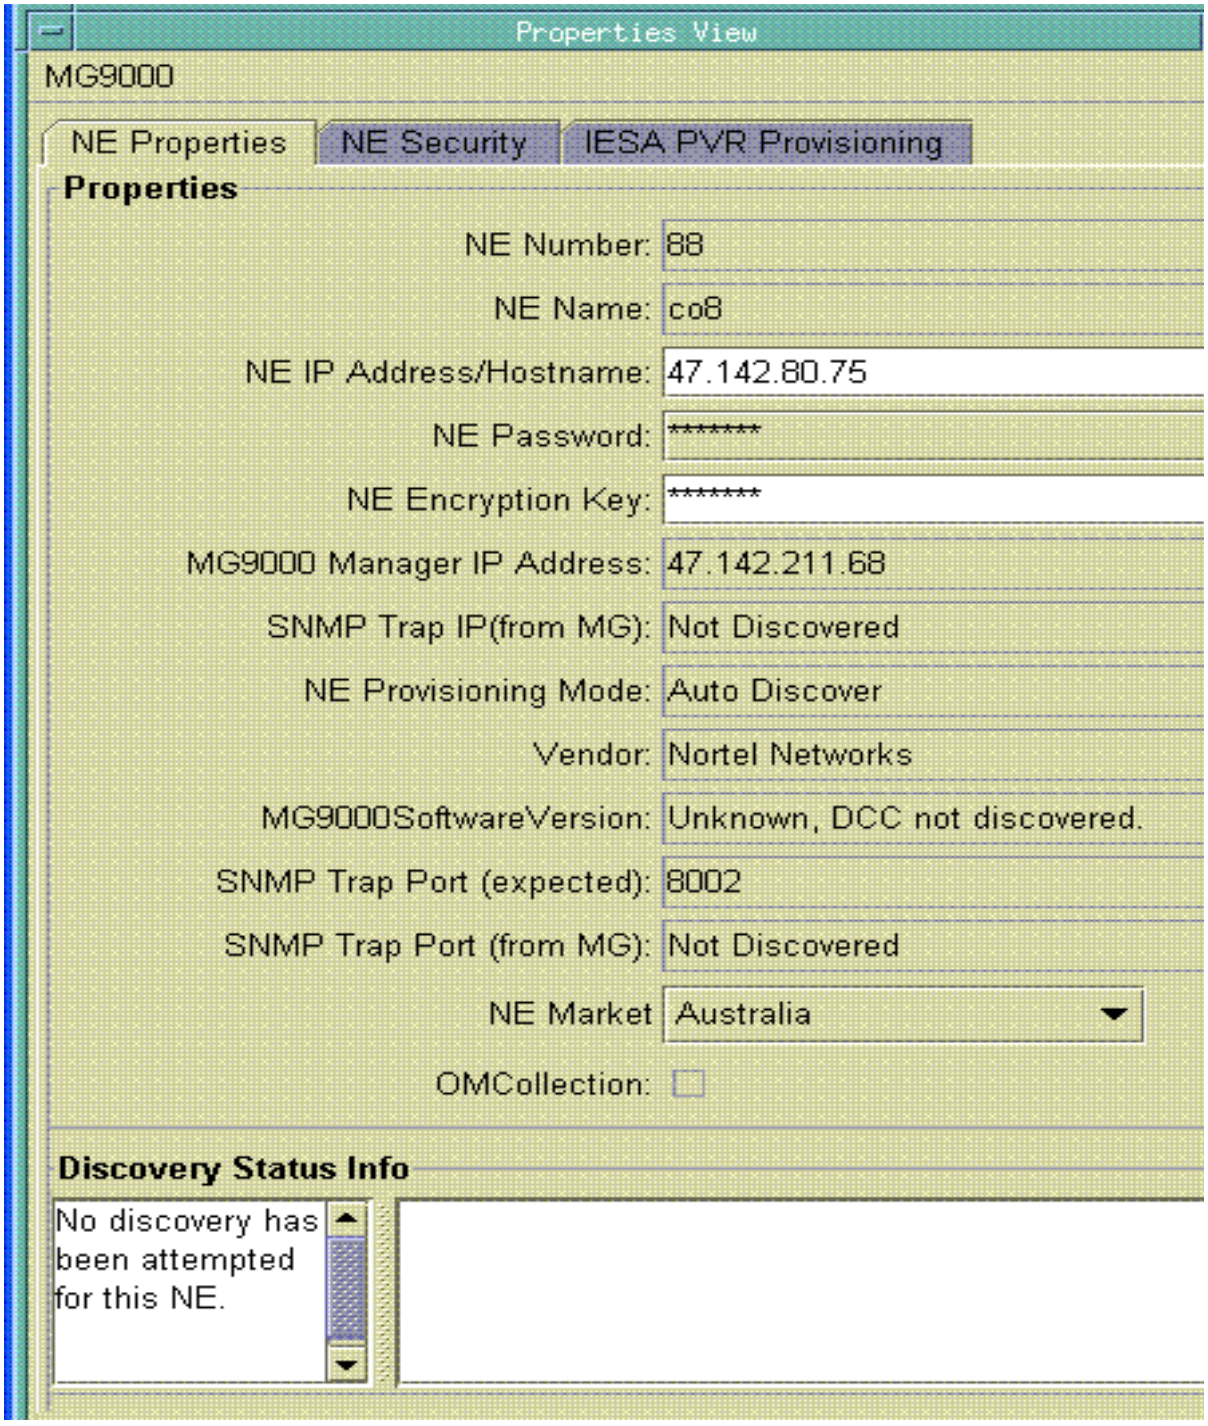

Figure 4: Add/Modify NE Properties View

Once the VMGs are created, the market can be modified only if the new market selected belongs to the same country code as that of the set market. If the user tries to select a market which does not belong to the same country code, an error message will be displayed to the user. If there are no VMGs the market can be modified to any other market (different country code) and the line coefficient audit will run which will push those coefficients onto the GW.

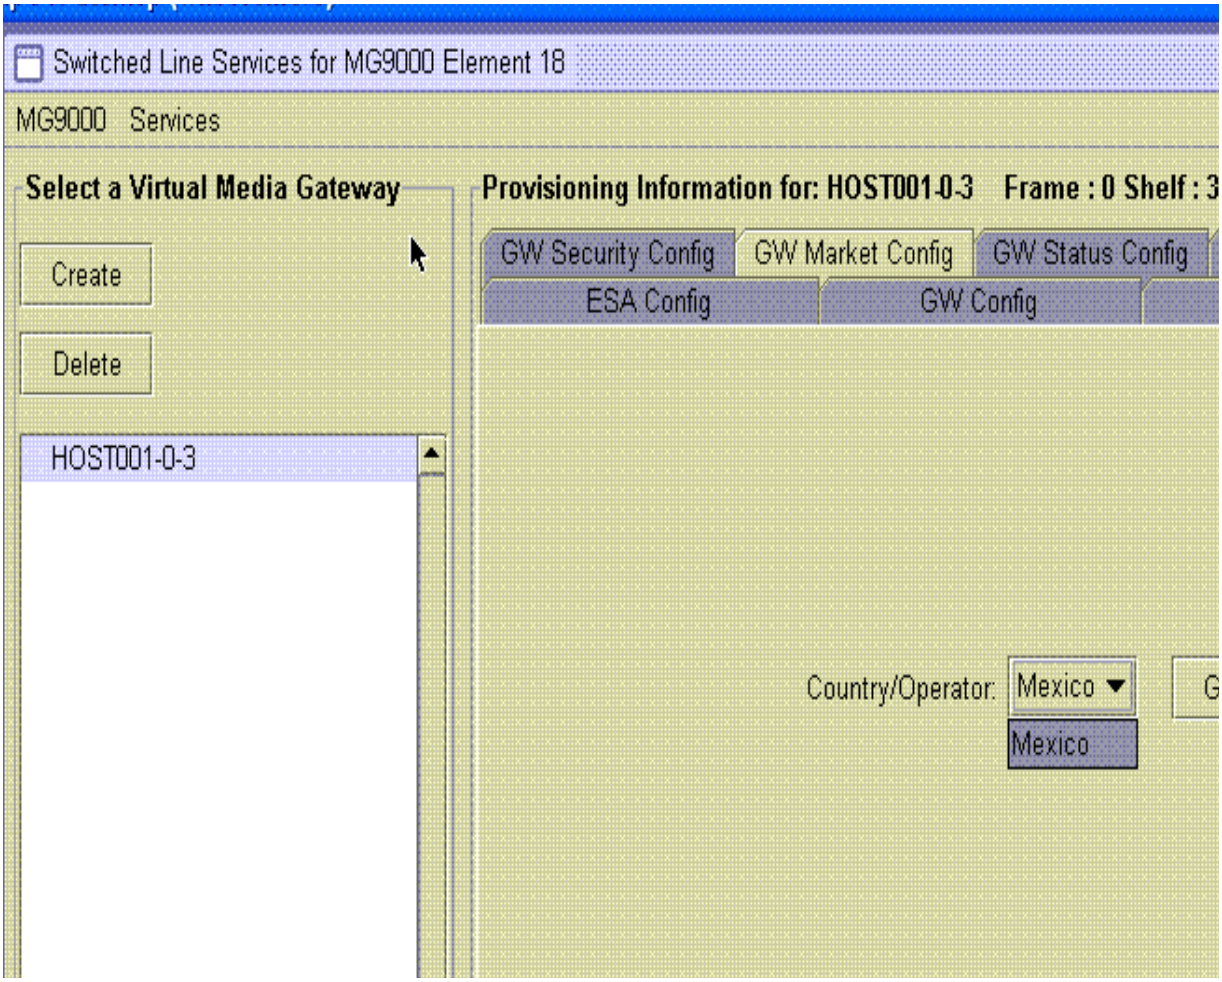

Figure 5: Get market for VMG.

Once the market is set for the NE, the VMGs created will have to use the same NE market. In SwitchLineServices View in the getMarket() tab in the VMG displays only the market set for that NE. But if a VMG already exists (before setting the NE's market, this can happen during upgrade scenarios) which has a different market, then both VMG market and the NE market will be displayed. The user will be able to change the market to NE market.

None

49.5.2 Element Management Upgrade

Once the GLC, WLCor SAA hardware is replaced with a GLC NTNY53BA or NTNY53CA PEC code, any changes to the FPGA configuration load can be made via software downloading a new FPGA configuration load onto the GLC card. Normally, the FPGA configuration load for a GLC card is not changed. Only under rare circumstances would the FPGA configuration load be changed. Therefore, normal release to release upgrades do not include downloading GLCs.

The process for upgrade would be to upgrade the entire office utilizing the mg9kuptool upgrade CLUI tool. Once the entire office is upgraded, the customer should examine the FPGA configuration load on the GLC cards and make sure there is not a new release of the GLC configuration load. If there is a new release of the configuration load, the upgrade GUI from the frame view can be utilized to download multiple GLCs per PEC code. If only one GLC needs the new FPGA configuration load, for example to soak the new configuration load prior to releasing to all GLC cards, the software download manager should be selected from the card view for the chosen GLC card.

No alarms are output in the event two GLC cards with the same PEC code have different FPGA configuration loads.

49.5.3 Downgrade impact

If the ITP card is downgraded to a release that does not support downloading of GLC cards, any NTNY53BA and any NTNY53CA GLC cards can be attempted to download the FPGA however, since the ITP card does not support the software download of the FPGA, an error from the ITP is output. The customer is not prevented from attempting to download the FPGA as long as the correct GLC hardware is still in place.

49.6 Data schema (DS) (CM, MIBS, RDB)

norLineVineticReload 1.3.6.1.4.1.562.38.6.8.18

The norLineMib is changed to add in a new nnUemgLineTestTypes. This new test type tests to see if the circuit controller associated with this circuit needs to be reloaded. If no reload is necessary the test is completed. If the circuit controller needs to be reloaded, the controller for the 4 associated circuits is reloaded.

49.7 Service Orders (SO) (CM & SESM)

49.9 Element Management

49.9.1 New/modified GUIs

GUI name	NEW, CHANGED, or DELETED
GLC card View	Changed
GLC diagnostic View	Changed
Upgrade View from Frame View	Changed

49.9.1.1 GUI name: GLCC

GLC Card View

49.9.1.1.1 Functional description

The GLC Card View is modified to allow a new action of software downloading to occur. The software download manager menu item allows the configuration load of the FPGA on the GLC card to be software downloaded from the SDM/CBM. This prevents a hardware retrofit of the GLC card in the unlikely event the FPGA configuration load needs to change once the card is in the field. Also the GLC Card View is modified to show the FPGA

configuration load on the GLC card. Showing the FPGA configuration load allows the customer to visibly see what configuration load is currently on the hardware and allows the customer to determine if a new load needs to be downloaded to the FPGA.

49.9.1.1.2 GUI usage and implications

The floating IP must be assigned prior to using the GLC software downloading action. Also, the GLC card must be locked before the software downloading can take place. The software download manager invokes the existing software download GUI used to software download MTA and XDSL cards. The customer would have to input the file name including the directory path, IP address of the SDM/CBM, the user name on the SDM/CBM used to upgrade/ software download loads, and the server password to the SDM/CBM just as they do today for MTA and XDSL cards.

49.9.1.1.3 GUI size

49.9.1.1.4 GUI fields

Table 1 New or modified GUIs

Abbreviated GUI name	Minimum instances	Maximum instances	Information on memory
GLCC	0 if no GLCs assigned in the office	one per GLC card in the office(14 per shelf for master shelf and 18 per shelf for each subtending shelf)	no increase in memory

The following table lists fields for GUI GLCC.

Table 2 GUI field descriptions

Field	New or Changed	Subfield	Entry	Explanation and action	Associated MIB entry
Actions Menu	Changed	Software Download Manager	none	Added new Software Download Manager menu selection for GLC cards. This brings up the existing software download GUI view.	None for new menu option, existing NorNodeSWLoadEntry for software download GUI view.
FGPA Configura-tion Load	New	None	none	Displays the current FPGA load on the GLC card	norNodeSWLoadCurrentLoadName

49.9.1.1.5 Usage example

49.9.1.1.6 GUI release history update

Add Software Download Manager menu under the action menu for GLC card views. Add new area, configuration Load, to display the FPGA configuration load to the user.

49.9.1.1.7 Context sensitive launching information

In order to allow the user to select the software download, the user must have read write privileges. The software download manager and configuration Load are only visible to GLCs which have a PEC code of NTNY53BA or above. The software download manager and configuration load do not appear on NTNY53AA or NTNY53AB GLC cards.

49.9.1.1.8 Supplementary information

None

49.9.1.2 GUI name: GLCD

GLC Circuit Diagnostic View

49.9.1.2.1 Functional description

In order to perform the new diagnostic test, Circuit Controller Diagnostic, the GLC Line Circuit View for a particular circuit is opened from the GLC Card View. The Circuit Controller diagnostic is designed to determine if the circuit controller needs to be reloaded, and reload if necessary as determined by the gateway. The Actions menu from the GLC circuit View is selected. Maintenance menu is selected. Diagnostic menu is selected and inside the Diagnostic View, a new Diagnostic type is added for checking to see if a circuit controller requires reloading. The new diagnostic type is Circuit Controller Diagnostic.

49.9.1.2.2 GUI usage and implications

This new circuit controller diagnostic could be used if all four circuits of a circuit controller were in the operational disabled state and there were no other readily apparent reason for the 4 circuits to have an issue. The GLC card GUI indicates which 4 circuits are in a circuit controller group by alternating between dark blue and light blue. The first 4 GLC circuits are in one circuit controller group. Circuits 4 - 7 are in the next circuit controller group, and so on. So if a group of 4 circuits have no dialtone and there is no other apparent cause, run the circuit controller diagnostic or perform a lock-forced unlock if it appears to be an entire card.

49.9.1.2.3 GUI size

The GLC Circuit View and Diagnostic View are existing GUIs. Adding in a new selectable diagnostic type does not add any memory to the GUI.

49.9.1.2.4 GUI fields

The following table lists fields for GLCD

Table 3 GUI field descriptions

Field	New or Changed	Subfield	Entry	Explanation and action	Associated MIB entry
Diagnostic Type	Changed	Controller Diagnostic	None	Selecting the new Controller diagnostics determines if the controller for this line circuit and the other 3 line circuits on this controller needs to be reloaded and reloads if appropriate	norLineVineticReload

49.9.1.2.5 Usage example

The following example shows menu selection for GLCD GUI to invoke the controller diagnostic:

49.9.1.2.6 GUI release history update

Add a new diagnostic type for circuit controller diagnostic for GLC Circuits. All GLCs, NTNY53AA/AB/BA/CA, are able to perform the circuit controller diagnostic. This diagnostic tests the circuit controller to determine if this single circuit controller needs to be reloaded.

49.9.1.2.7 Context sensitive launching information

In order to allow the new diagnostic, circuit controller diagnostic, to be selected the user must have maintenance privileges. The circuit controller diagnostic is available to any GLC PEC code including NTNY53AA and NTNY53AB.

49.9.1.2.8 Supplementary information

None

49.9.1.3 GUI name: UPGF

Upgrade View from the Frame View

49.9.1.3.1 Functional description

In order to provide the customer with the ability to software download all GLCs of a certain PEC code, the Upgrade Wizard invoked from the upgrade view for multiple cards is changed to add in the GLC-32 BA and GLC-12 CA check boxes to indicate software download of the FPGA is required for these GLC PEC codes.

49.9.1.3.2 GUI usage and implications

The customer selects the frame view. From the frame view, the customer selects the Actions pull down menu and selects Software Upgrade, the user then selects the Configure button from the upgrade view. The upgrade wizard opens and the user selects complete upgrade (GLC FPGAs can not be prep downloaded) and clicks on the Next button. The Card Type Selection portion of the upgrade wizard is shown and the user selects GLC-12 CA Cards and may optionally chose to select GLC-32 BA Cards. The software upgrade order would be GLC-32 BA cards, GLC-12 CA cards, XDSL cards, MTA cards, DS1 cards, ABI cards, ITP cards, ITX cards, and then Supercore cards. Downgrading order would be the opposite starting with Supercore cards and ending with GLC-32 BA cards.

49.9.1.3.3 GUI size

Table 4 New or modified GUIs

Abbreviated GUI name	Minimum instances	Maximum instances	Information on memory
UGPF	0	1 per NE	no increase

49.9.1.3.4 GUI fields

The following table lists new or modified fields for the Upgrade Wizard invoked from the UpgradeView >

Table 5 GUI field descriptions

Field	New or Changed	Subfield	Entry	Explanation and action	Associated MIB entry
GLC-32 BA Cards	New	None	N/A	Check this box to software download all GLC-32 BA cards in the office	N/A
GLC-12 CA Cards	New	None	N/A	Check this box to software download all GLC-12 CA cards in the office	N/A

49.9.1.3.5 Usage example

The following example shows the addition of the GLC-32 BA and GLC-12 CA cards to the upgrade wizard.:

49.9.1.3.6 GUI release history update

Add GLC cards to the upgrade wizard only when opened from the frame view. Since there are separate FPGA loads for each GLC PEC code, the different PEC codes for the GLCs may be selected.

49.9.1.3.7 Context sensitive launching information

In order to view the upgrade wizard and see the GLC cards, the user must have administration privileges. Also, the GLC selection boxes only appear if the customer has those GLC PEC codes in the office. For example, if the customer only has NTNY53AB cards in the system, no GLC cards are shown in the upgrade wizard. If the customer has only NTNY53BA GLC cards in the office then only the GLC-32 BA Cards selection box would appear. Only GLCs with PEC codes above NTNY53BAare shown in the upgrade wizard.

No changes

49.13 Configuration Walkthrough

Replace GLC or WLC card with the NTNY53BA version of the GLC hardware. The ITP must be running with a software load capable of allowing the software download to the FPGA on the GLC card.

Once the NTNY53BA or NTNY53CA version of the GLC is resident in the system, the FPGA for those GLCs can be attempted to be software downloaded. First, select a GLC card and open the GLC card view. Examine the FGPA configuration load to determine if the FPGA has the correct load. If the FPGA does not have the correct load, verify the GLC Administrative State is locked. Lock the card if the administrative state is unlocked. Select the action menu, select the software download manager item. A new software download view is opened. Enter the File Path (the directory path and FPGA load name on the SDM/CBM), Server IP (IP address of the SDM/CBM where the loads reside), Server userName (user name on the SDM/CBM used to software download or upgrade loads), Server password (password on the SDM/CBM used to software download). Select Download button. Once the download has completed, unlock the GLC card.

50: Configuration (CN): A00012223, A00012217, A00012225

50.1 Feature Name

SESM Support for SIP Lines, Part 2

50.2 Hardware and Software Requirements

This feature requires the 905-240 GWC card, pec code NTRX51DL. It also requires that the CM, GWC SESM and MCS gateways are on a SN09 drop 2 load for all documented functionality to be available (otherwise the SN09 functionality is the default).

50.3 Initial Configuration

50.3.1 SESM-CS2K Prov Mgr EM Server Configuration

```
SESM-CS2KSS configuration

OPI - Provisioning Manager Interface configuration

Enter OPI transport protocol to EM server ( http/https - default: https)
 [1] - http
 [2] - https
 [x] - exit

select - 2

 Enter the IP address / Name of the primary CS2KSS prov server (default:
47.142.91.164) : 47.142.91.164
 Enter the primary CS2KSS prov server https port (default is 8443): 8443

 Enter the IP address / Name of the secondary  CS2KSS prov server (default:
47.142.91.164) : 47.142.91.164
 Enter the secondary CS2KSS EM server https port (default is 8443): 8443

 Enter the OPI administrator user name (default: admin): admin

 Enter the OPI administrator password:
 Re-enter the OPI administrator password:

OMI - Provisioning Manager Interface configuration

Enter OMI transport protocol to EM server ( http/https - default: https)
 [1] - http
 [2] - https
 [x] - exit

select - 2

 Enter the IP address / Name of the primary CS2KSS mtc server (default:
47.142.91.164) : 47.142.91.164
 Enter the primary CS2KSS mtc server https port (default is 12121): 12121
```

```
 Enter the IP address / Name of the secondary  CS2KSS mtc server (default:
47.142.91.164) : 47.142.91.164
 Enter the secondary CS2KSS mtc server https port (default is 12121): 12121

 Enter the OMI administrator user name (default: admin): admin

 Enter the OMI administrator password:
 Re-enter the OMI administrator password:

OPI - Provisioning Manager configuration

Transport protocol to EM server                   :   https://
Primary CS2KSS Provisioning Manager IP / Name     :   47.142.91.164
Primary CS2KSS Provisioning Manager port          :   8443
Secondary CS2KSS Provisioning Manager IP / Name   :   47.142.91.164
Secondary CS2KSS Provisioning Manager port        :   8443
The administrator user name                       :   admin

OMI - Maintenance Manager configuration

Transport protocol to Maintenance Manager         :   https://
Primary CS2KSS Maintenance Manager IP / Name      :   47.142.91.164
Primary CS2KSS Maintenance Manager port           :   12121
Secondary CS2KSS Maintenance Manager IP / Name    :   47.142.91.164
Secondary CS2KSS Maintenance Manager port         :   12121
The administrator user name                       :   admin

Is the information correct? (y or n) :y
```

The configuration tool will prompt the user to enter the following for the OMI link information:

- Transport protocol to SS-EM server (https).
- IP address / host name of primary SS-EM server
- IP address / host name of secondary SS-EM server. Some configurations may not include a secondary SS EM server. If so, configure the same information provided for the primary server (by default this should be the case).
- HTTPS communication port to SS EM server (12121).
- SS-EM Provisioning Manager administrator user name
- SS-EM Provisioning Manager administrator password

The OPI version information is not required anymore since it is dynamically determined when the OPI and OMI links come into service.

The IP address and port will be used to generate the SS-EM Provisioning Manager URL which in turn will be added to sesm.properties file.

As part of the configuration, the IP address will be validated for format, range and reachability. Other user entered data will be validated for format, range, values etc.

The user name will be added to sesm.properties as clear text.

The password will be stored separately and accessible only to the root user.

All configuration information (url, username, etc.) except password can be displayed by using the SESM "/opt/nortel/NTsesm/admin/bin/configure" tool.

50.4 Office/Subnet parameters (OP/SP) (CM & SESM)

Not Applicable.

50.5 Upgrade Considerations

Initial support for Session Server SIP lines gateways was delivered in SN09. This feature will extend that support in various areas (provisioning, audits, and maintenance) and will therefore be required to implement a backwards compatibility mechanism in order to allow interactions with older Session Server element manager loads which do not support the new functionality.

50.5.1 Dump and Restore (CM)

Not Applicable.

50.5.2 Element Management Upgrade

Upgrading the SESM from SN09 to SN09 drop 2 loads while the Session Server remains on SN09 level software can be done without the need for manual interactions. The backwards compatibility logic within SESM should be able to query any existing Session Server element managers for its load version and implement the backwards compatible interface accordingly.

Some new configuration will be required for the SESM application following either the upgrade of the Session Server or the upgrade of the SESM in order to allow SESM connections to the maintenance system on the Session Server element manager. These new connections are necessary to enable SN09 drop 2 maintenance, audit and provisioning capabilities following system upgrade.

50.5.3 Downgrade impact

No impact - works as per current process.

50.6 Data schema (DS) (CM, MIBS, RDB)

N/A

50.7 Service Orders (SO) (CM & SESM)

No new service orders are created under this activity, however a new suboption for the SIP_DATA option is defined which can be used in NEW/CHF/EST/ ADD commands applicable to SIP lines hosted off of Session ServerVMGs.

All listed may also be used via the Bulk Provisioning Tool.

50.7.1 Service order change details

LCC and options
A new SIP_DATA suboption is introduced by this feature. The SIP_DATA suboption SIP_SUBDOMAIN, like the existing suboptions, is not presented to XACore SERVORD (it is removed from the command prior to XACore SERVORD command processing).

50.7.1.1 Option Format:

SIP_DATA sub-options-and-values $

where

sub-options = SIP_CLIENT_TYPE, SIP_URI, SIP_PASSWD, SIP_PACKAGE, SIP_LOCATION, ***SIP_SUBDOMAIN***

The SIP_DATA option and sub-option tags and values may be entered in either lower or upper case transparently.

> ***Note:*** sub-option values have external case restrictions. See "50.7.1.4 Usage/Format Validation and Rules" on page 2846.

50.7.1.2 Sub-option value formats:

SIP_SUBDOMAIN option value format = {token_string_value}

50.7.1.3 SIP_DATA Sub-option and Value Examples:

"SIP_DATA SIP_PACKAGE test package SIP_URI someone@nortel.com **SIP_SUBDOMAIN rtp.nortel.com** SIP_CLIENT_TYPE SIP Line SIP_LOCATION Nortel Networks.RTP.NC0 SIP_PASSWD test1password $"

50.7.1.4 Usage/Format Validation and Rules

OSSGate/SERVORD+ SIP_DATA SIP_SUBDOMAIN validation will be limited. The Session Server element manager will be responsible for validating the actual value contents.

When the SIP_SUBDOMAIN suboption is specified in provisioning commands (e.g. NEW, EST, etc.), subsequent queries (e.g. QLEN/QDN/etc.) will include a SIP_SUBDOMAIN data in output.

Queries showing SIP_URI information will always include the domain (not sub-domain) information formatted as <user>@<domain>. If a subdomain

value is used in the SIP_URI suboption (<user>@<subdomain>) in provisioning commands, subsequent queries will show the SIP_URI with the domain, <user>@<domain>.

Prior to delivery of this feature content, if the customer has more than 35000 lines (> 1 Session Server for lines) the SIP_URI suboption in the command must include the subdomain. Subsequent queries will not display information about subdomains.

The use of Directory Number in the SIP_URI value (e.g. 2145209999@nortel.com) is discouraged. CDN commands which modify the DN assigned to the user will ***not*** automatically update the SIP_URI.

50.7.1.4.1 Rules Enforced for SIP_DATA by OSSGate/SERVORD+

Breaking these rules causes immediate command failure/rejection by OSSGate/SERVORD+:

- One or more sub-options are REQUIRED when the SIP_DATA option is specified.
- Sub-option tags are reserved words and may not be used as values for other sub-options or for any non-related types (e.g. CM customer group, gateway names, etc.). For example, “SIP_PASSWORD sip_password” is an invalid option and value pair. “sip_password” may not be used as the value specified for the SIP_PASSWORD sub-option. “sip_password” may not be used as a part or whole value for any other sub-option (e.g. “SIP_LOCATION sip_passwd” will be rejected).
- The SIP_DATA terminator, “$”, is a reserved token and may not be used as a value of any SIP_DATA sub-option. If a sub-option is present in the SIP_DATA options list, then it must have a valid value other than “$”.
- The tag-value pair relationship for the options/sub-options will be enforced from a simple format perspective. All sub-options must have associated values. The overall SIP_DATA option must be terminated by a “$”.
- Multiple/extraneous SIP_DATA options or sub-options found in a single NEW/CHF/EST/ADD command, will result in rejection of the command by OSSGate/SERVORD+. This limits the number of SIP LENs/endpoint which can be included in EST/ADD group commands to **ONE**.
- SIP_URI must be of the format user@domain. The domain information is parsed from the URI value. A missing domain (e.g. missing @ delimiter or domain information) will cause immediate command failure. An invalid domain name specified will be rejected by the Session Server Provisioning Manager.
- SIP_LOCATION must be included in the SIP_DATA option when the command issued results in the creation of a new user on the Session Server.

- SIP_SUBDOMAIN is an optional suboption and if not present, the domain parsed from the URI is used when creating the user on the Session Server element manager

50.7.1.4.2 Rules NOT Explicitly Enforced for SIP Data by OSSGate/SERVORD+

These rules are not explicitly enforced by OSSGate/SERVORD+. Breaking these rules may cause command failures or other unintended consequences:

- SIP_DATA and the associated sub-option tags are reserved words and may not be used as values for any non-related types (e.g. CM customer group, gateway names, etc.). Use of the reserved keywords in this manner may cause unexpected problems when attempting to use OSSGate/SERVORD+ for provisioning ANY type of line.
- CHF commands affecting SIP_DATA on SIP lines requires that gateway/termination names (or associated LEN) be used in the command instead of DN. Use of DN will result in the command being processed only by the CM, which is undesirable when SIP_DATA is present in the command.
- ADO and DEO commands for SIP lines affecting MDN data requires that gateway/termination names (or associated LEN) be used in the command instead of DN (e.g. “ADO $ <DN or LEN> <OPTIONS>”). Use of DN will result in the command being processed only by the Core/CM, which will result in group data misalignment between the Core/CM and the SS-EM.
- Use of the SIP_DATA option is not supported in commands which do not affect SIP lines or in commands which are not supported for flowthrough **for** SIP lines. Use of the SIP_DATA option in these commands may cause unintended command failures.
- The SIP_DATA option may fall anywhere in the command string except as the first token (which is reserved for the command name), however it is ***highly recommended*** that the SIP_DATA option be placed in the normal option field range of the command.
- The values assigned to sub-options SIP_CLIENT_TYPE, SIP_PACKAGE, and SIP_LOCATION are ***case sensitive***. **When commissioning these associated values on the Session Server Provisioning Manager, you MUST use the case which will be sent from the OSS (some OSS support only upper case, some lower case, and yet others mixed case).** Failure to commission these values in the Session Server Provisioning Manager using the case text supported by the OSS will result in command failures at OSSGate/SERVORD+.
- SIP_URI is normalized to lower case by the Session Server Provisioning Manager when received from OSSGate/SERVORD+. Caseless comparisons are performed by the Session Server Provisioning Manager when determining if a URI entered at OSSGate is already in use (e.g. “Slynch@Nortel.com” is considered identical to “slynch@nortel.com” from the Session Server Provisioning Manager’s perspective). Only the

normalized/lower-case URI is stored by the Session Server Provisioning Manager (e.g. “USERname1@Domain1.net” received from OSSGate/ SERVORD+ would be stored as “username1@domain1.net” in the Session Server Provisioning Manager).

50.7.1.5 Data Mapping Example

In the following command,

LEN: MSM1 00 0 00 00

is mapped to

VMG: TestMSMVMG.1

termination/endpoint: MSM1/000/0/0000

OSSGate command:

```
NEW $ 9195200500 IBN PRADEFAULT 0 0 LATA1 0 MSM1 00 0 00 00 DPL
Y 10 SIP_DATA SIP_PACKAGE test package SIP_PASSWD test1Password
SIP_URI someone@somecompany.com SIP_CLIENT_TYPE SIP Line
SIP_LOCATION Nortel Networks.RTP SIP_SUBDOMAIN
local.somecompany.com $ MDN SCA Y Y TONE N $
```

XACore SERVORD command derived from OSSGate command:

```
NEW $ 9195200500 IBN PRADEFAULT 0 0 LATA1 0 MSM1 00
0 00 00 DPL Y 10 MDN SCA Y Y TONE N $
```

Data sent to SS-EM:

VMG: TestMSMVMG.1

termination: MSM1/000/0/0000

Domain: somecompany.com

Subdomain: local.somecompany.com

User: someone

Password: test1Password

firstName: SIPLineUser (default value)

lastName: SIPLineUser (default value)

Package: test package

locale: English (default value)

timezone: Eastern Standard Time (default value)

clientType: sip line

DN: 9195200500

location: nortel networks.rtp

status: ACTIVE (default value)

group type: MDN

group name: 9195200500

50.7.2 New commands

Not Applicable.

50.7.3 Line equipment format changes

50.7.3.1 LEN

No LEN format changes are introduced by this feature. Typical LEN format for SS LENs:

SITE FFF G TT tt

SITE = SITE name

FFF = frame number, 0-511

G = group number, 0-9

TT tt = terminal, 00 00 - 10 23

50.7.3.2 Media gateway endpoint format

No gateway/endpoint format changes are introduced by this feature. Typical SS VMG and endpoint formats:

VMG = 64 character free-form string (e.g. TestSSVMG.1)

endpoint/termination = SITE/FFF/G/TTtt

where SITE, FFF, G, and TTtt value are as specified in the SS LEN format with the following conversion padding rules:

- The LEN's individual TT tt values will always be zero-padded to 2 digits when converted to an endpoint/termination name (e.g. TT tt value "2 7" would be converted to an endpoint/termination TTtt value of "0207").
- The LEN's FFF value will always be zero-padded to 3 digits (e.g. FFF value "6" would be converted to endpoint/termination FFF value "006").

50.8 Software optionality control (SOC)

50.9 Element Management

SESM

50.9.1 New/modified GUIs

Table 1 New or modified GUIs

GUI name	NEW, CHANGED, or DELETED
Line Data Audit	**CHANGED**

50.9.2 GUI information

50.9.2.1 GUI Name: Line Data Audit

In this feature, the line audit will also audit the data in Session Server EM. The audit GUI look and feel does not change, except that few checks are added to warn the user of system load. Also the audit output file (both valid and problem files) will have extra information pertaining to the Session Server audit.

50.9.2.1.1 Functional description

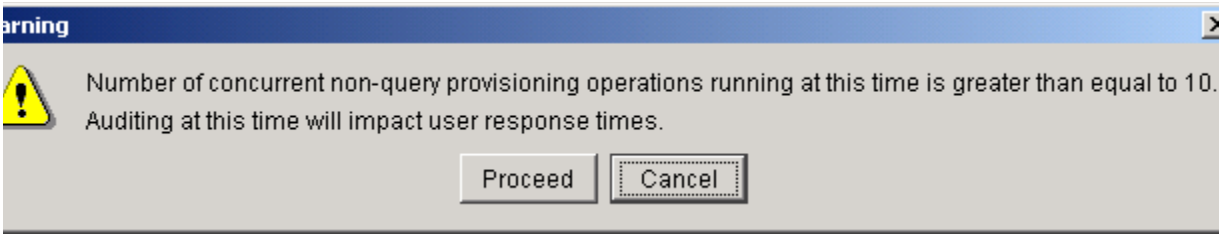
Warning Dialogues in Audit GUI:

One of the requirement in this feature is to avoid running (at least warn) line audit when the system is loaded, as the audit might impact more important provisioning activities. In this feature, the manual line audit will check for the system load and warn the user if its not an appropriate time to run audit.

If any of the three checks is true, then the server will return 'not ready' with details to the GUI, which in turn will pop a dialogue box to warn user of system load and gives him a chance to decide if he wants to run the audit at a later time, since running audit has the potential to slow down the system impacting higher priority provisioning activities.

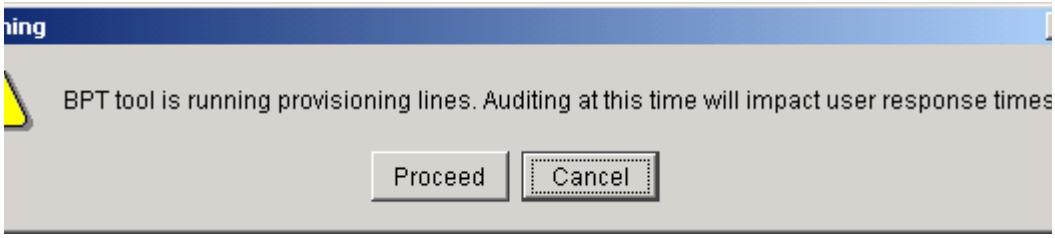
First check done by the server is to see if there are 10 or more concurrent non-read-only operations in progress. If yes, the audit server returns 'not ready' with details to the GUI. Shown below is example dialogue box.

Figure 1 Warning if 10 or more non-query type line provisioning in progress



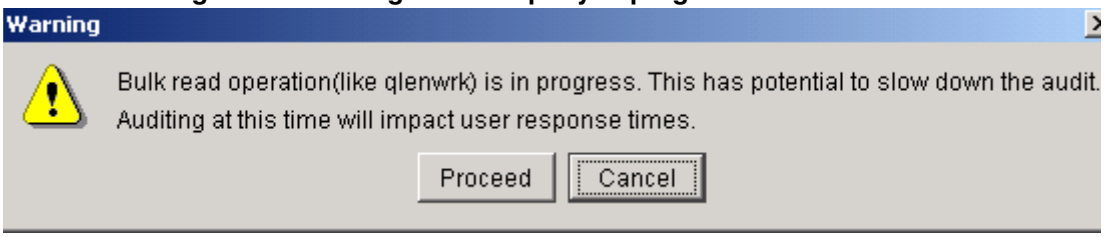
The second check is to see whether BPT tool is running a lines batch operation. If yes, the server returns ‘not ready’ with details to GUI. Shown below is example dialogue box in this condition.

Figure 2 Warning if BPT tool is running, provisioning lines



The third check is to see whether any bulk query operation (like qlenwrk,qdnwrk etc) is already in progress. If yes, the server will return ‘not ready’ to the GUI. Shown below is example dialogue box in this scenario.

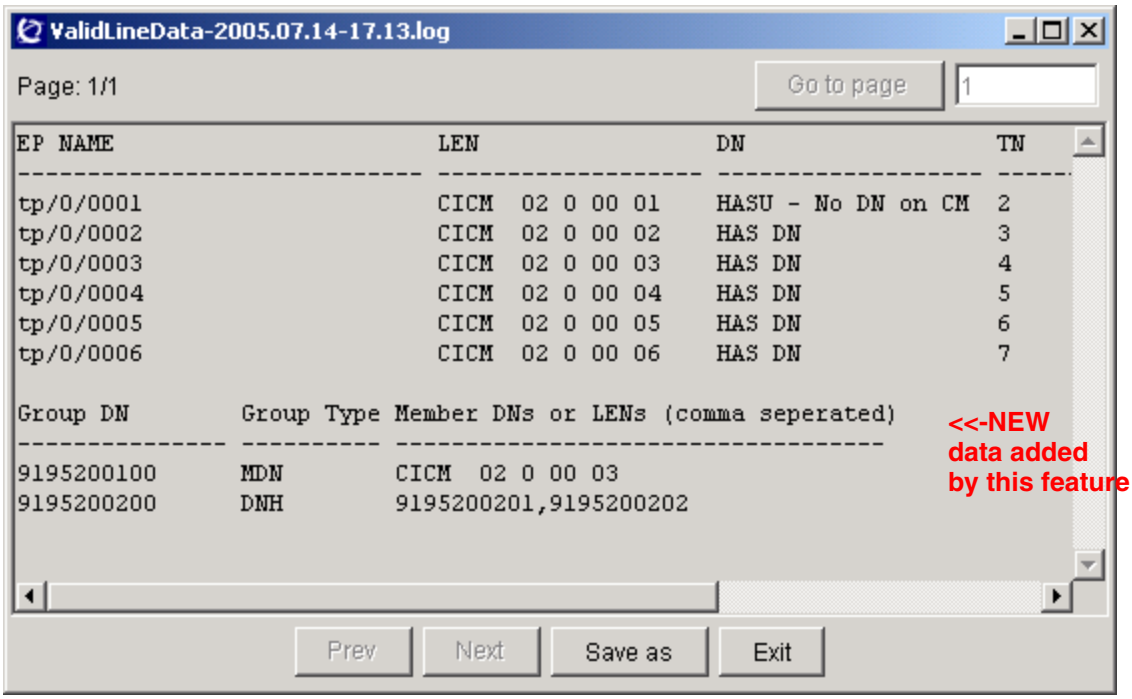
Figure 3 Warning if a bulk query in progress before line audit starts



Line Data Audit Valid Data output:
After the line data audit finishes, the ValidLineData.log file will have additional information obtained by auditing the Session Server EM.

The endpoints in GWCEM will be compared with SS EM, the group DN and its member DN information will be compared with the core and the DN to len mapping will also be compared with the core.

In the first screen shot is shown, valid data w.r.t the Session server will be at bottom. In the following screen shot, the group DN and its type and the member DNs are printed on screen, which is new audit data added by this feature if SIP MGs are provisioned.



50.9.2.2 Line Data Audit Problem Data output:

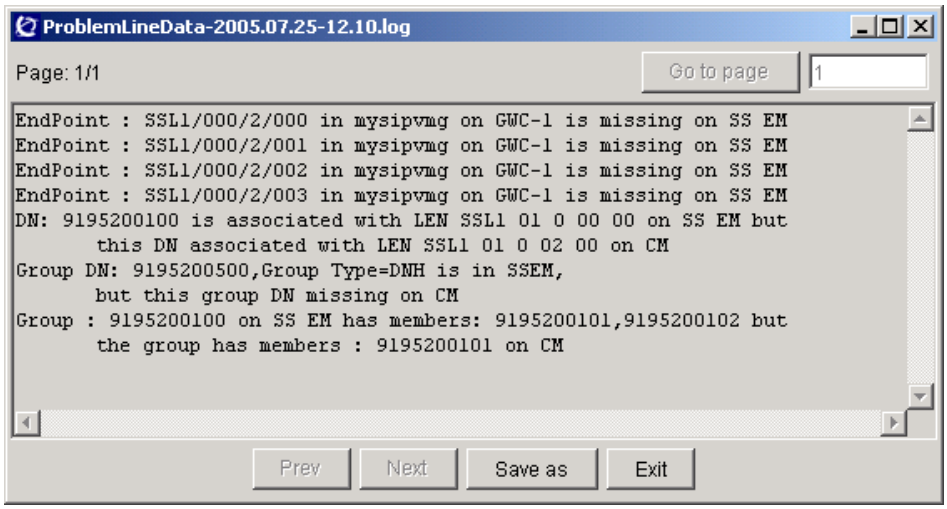
Shown below is screen shot of problem line data results. The problems could be in following areas

1. Endpoint exists in GWCEM, but not in Session server EM

2. DN associated with endpointId (len) in SS EM, while that same DN maps to different LEN on core

3. group DN in SS EM but that group information is missing in core

4. member DN/LENs in SS EM belonging to a group do not match the member list in that group on core.



50.9.2.3 GUI usage and implications

50.9.2.3.1 GUI size

Not applicable.

50.9.2.3.2 GUI fields

Table 2 GUI field descriptions

Field	New or Changed	Subfield	Entry	Explanation and action	Associated MIB entry

50.9.2.3.3 Usage example

50.9.2.3.4 GUI release history update

50.9.2.3.5 Context sensitive launching information

Not impacted, no changes

50.9.2.3.6 Supplementary information

None

50.9.2.4 CLUI Interface

Warning in BPT on Audit Running:

A check is introduced in BPT tool where it determines if Line Audit is currently running. If yes, BPT tool will warn the user that line audit is in

progress and gives the user a chance to run the lines batch later, as the throughput of the Lines batch could be slower due to line audit running.

Screen shot from BPT tool when lines batch is started if line audit is in progress.

***** W A R N I N G *****

Line Audit is currently in progress.

This lines batch may run slower and may also invalidate audit results

Do you still want to proceed with lines batch? <y/n>:

The above warning tells the user that line audit is in progress and perhaps the lines batch should be run after the audit is finished.

50.9.3 LMM CLUI

To access the LMM CLUI telnet to OSSGate, enter ^B, “mode MTC”. Once in the MTC level, “LMM” is entered for access to the LMM CLUI.

```
>
? mode MTC

Mode is MTC.
```

The CMCLLI command is used to return the SDM IP and CMCLLI name:

```
>CMCLLI
      SDM IP = 47.142.134.124
      CM CLLI = RTP2

>LMM
      report <-v>
      report <-l> <report name>
      report <-gen> <GWC Options>

      post <-d, -l, -gw, -u, -r, -set, -display, -count>

      bsy <-d, -l, -gw, -set> [inb]
      rts <-d, -l, -gw, -set>
      tst <-d, -l, -gw, -u, -set>
      FRLS <-d, -l>

      qdn <dn>
      qlen <len>
      qsip <dn, len>

      help

      quit
```

The commands (i.e. report, bsy) can be entered in either upper or lower case. The options (i.e. -d, -l) must be entered in lower case. The parms can be entered in either case but in the case of the GW name, should be in the proper case.

50.9.3.1 REPORT Commands

The REPORT commands are used with the GW in Trouble reports. Using the commands, the user has the ability to list, view and delete any of the reports. The GENERATE or GEN is used to run the process to create a report.

Command format:

```
report <-l>
report <-v> <REPORT NAME>
report <-gen> <GWC List | all>
```

Command usage:

To obtain a list of reports currently available

```
>report -l
The following reports are available:
Report-2005-08-10-22-06-14
```

To view a specific report

```
>report -v Report-2005-08-10-22-06-14
GW Name   Results for GWC-0
t1124ent.us.nortel.com   GW DISABLED

GW Name   Results for GWC-10
test4   GW DISABLED
```

To request a new GW in Trouble report for GWC 1

```
report -gen 1
```

To request a new GW in Trouble report for GWC 1, 2 and 3

```
report -gen 1, 2, 3
```

or

```
report -gen 1-3
```

or

```
report -gen 1, 2-3
```

To request a new GW in Trouble report for all valid (small and large line) GWCs

```
report -gen all
```

50.9.3.2 MTC Commands

This set of commands is used to perform operations on either one or a set of lines.

Command format:

```
post -d <DN> [verbose]
post -l <LEN> [verbose]
```

```
post -gw <GW/VMG> [verbose]
post -u <URI> [verbose]
post -r <Domain name> [verbose]
post -display [verbose]
post -count

bsy -d <DN> [inb]
bsy -l <LEN> [inb]
bsy -gw <GW or VMG> [inb]
bsy -set [inb]

rts -d <DN>
rts -l <LEN>
rts -gw <GW/VMG>
rts -set

tst -d <DN>
tst -l <LEN>
tst -gw <GW/VMG Name>
tst -u <URI>
tst -set

frls -d <DN>
frls -l <LEN>
```

50.9.3.2.1 REPORT Commands

The REPORT commands are used with the GW in Trouble reports. Using the commands, the user has the ability to list and view any of the reports. The -gen is used to run the process to create a report.

Command format:

```
report <-l>
report <-v> <REPORT NAME>
report <-gen> <GWC List | all>
```

Command usage:

To obtain a list of reports currently available

```
>report -l
The following reports are available:
Report-2005-11-14-12-12-01
```

To view a specific report

```
>report -v Report-2005-11-14-12-12-01
GWC-14  Number of GWs out of service = 1

R7A20204.rtp7.net status = GW DISABLED

GWC-13  Number of GWs out of service = 11

To request a new GW in Trouble report for GWC 1
report -gen 1
```

To request a new GW in Trouble report for GWC 1, 2, 3 and 4

```
report -gen 1, 2, 3, 4
```

or

```
report -gen 1-4
```

or

```
report -gen 1, 2-4
```

To request a new GW in Trouble report for all valid (small and large line) GWCs

```
report -gen all
```

50.9.3.2.2 POST

The POST command can be used to generate a set of lines and be used for maintenance (BSY, etc.) actions.

The POST command will list the contents of the post set to the screen using a “brief” format. The information listed will be dn, len, uri, clientIp, gwc, lcc, cm line state, scc line state and MCS line state (if a SIP Line).

The VERBOSE option includes included the above and adds the following, GW/VMG name, GW ipaddress, GW type, endpointName, domain/ subdomain.

To post by DN (SIP Line)

```
>post -d 7550505
DN         = 6137550505
LEN        = SS 00 0 00 05
LCC        = IBN
GWC NAME   = GWC-5
GW NAME    = rtp7ssa
EPT NAME   = SS/000/0/0005
GW EPT ST  = ON-HOOK
CM EPT ST  = IDL
SIP URI    = user5@rtp7ssa.com
CLIENT IP  =
SS EPT ST  =

Number of endpoints returned = 1
```

To post by DN, non SIP Line

> post -d 6210010

```
DN         = 6136210010
LEN        = UAIP 00 1 00 00
LCC        = IBN
GWC NAME   = GWC-14
GW NAME    = rtp7-1104b.us.nortel.com
EPT NAME   = aaln/1
GW EPT ST  = ON-HOOK
CM EPT ST  = IDL

Number of endpoints returned = 1
```

To post by LEN:

```
      > post -l ss 0 0 0 5
DN         = 6137550505
LEN        = SS 00 0 00 05
LCC        = IBN
GWC NAME   = GWC-5
GW NAME    = rtp7ssa
EPT NAME   = SS/000/0/0005
GW EPT ST  = ON-HOOK
CM EPT ST  = INB
SIP URI    = user5@rtp7ssa.com
CLIENT IP  =
SS EPT ST  =
```

To post by GW:

Note: Since the minimum VMG size for SIP is 1023 endpoints, posting by vmg may take a long time (approx 5 mins per LGRP) and will produce a huge output.

```
      > post -gw rtp7-1104b.us.nortel.com
DN         = 6136210010
LEN        = UAIP 00 1 00 00
LCC        = IBN
GWC NAME   = GWC-14
GW NAME    = rtp7-1104b.us.nortel.com
EPT NAME   = aaln/1
GW EPT ST  = ON-HOOK
CM EPT ST  =

DN         = 6136210011
LEN        = UAIP 00 1 00 01
LCC        = IBN
GWC NAME   = GWC-14
GW NAME    = rtp7-1104b.us.nortel.com
EPT NAME   = aaln/2
GW EPT ST  = ON-HOOK
CM EPT ST  =

DN         = 6136210012
LEN        = UAIP 00 1 00 02
LCC        = RES
GWC NAME   = GWC-14
GW NAME    = rtp7-1104b.us.nortel.com
EPT NAME   = aaln/3
GW EPT ST  = ON-HOOK
CM EPT ST  =

DN         = 6136210013
LEN        = UAIP 00 1 00 03
LCC        = RES
GWC NAME   = GWC-14
GW NAME    = rtp7-1104b.us.nortel.com
EPT NAME   = aaln/4
GW EPT ST  = ON-HOOK
CM EPT ST  =
```

To post by URI:

```
      > post -u user5@rtp7ssa.com
DN         = 6137550505
LEN        = SS 00 0 00 05
LCC        = IBN
GWC NAME   = GWC-5
GW NAME    = rtp7ssa
EPT NAME   = SS/000/0/0005
GW EPT ST  = ON-HOOK
CM EPT ST  =
SIP URI    = user5@rtp7ssa.com
CLIENT IP  =
SS EPT ST  =
```

To post Registered users by domain. This command will return the users that have registered their clients with their provisioned domains.

Note: This command may take a long time and will produce a huge output.

```
      > post -r rtp7ssa.com
DN         = 6137550505
LEN        = SS 00 0 00 05
LCC        = IBN
GWC NAME   = GWC-5
GW NAME    = rtp7ssa
EPT NAME   = SS/000/0/0005
GW EPT ST  =
CM EPT ST  =
SIP URI    = user5@rtp7ssa.com
CLIENT IP  =
SS EPT ST  =

DN         = 6137550510
LEN        = SS 00 0 00 10
LCC        = IBN
GWC NAME   = GWC-5
GW NAME    = rtp7ssa
EPT NAME   = SS/000/0/0010
GW EPT ST  =
CM EPT ST  =
SIP URI    = user10@rtp7ssa.com
CLIENT IP  =
SS EPT ST  =

Number of endpoints returned = 2
```

To display the contents of the post se using the verbose option:

```
      >  post -display verbose
DN         = 6137550505
LEN        = SS 00 0 00 05
LCC        = IBN
GWC NAME   = GWC-5
GW NAME    = rtp7ssa
EPT NAME   = SS/000/0/0005
GW EPT ST  = ON-HOOK
CM EPT ST  = IDL
SIP URI    = user5@rtp7ssa.com
CLIENT IP  =
SS EPT ST  =
```

```
Node Num  = 213
Term Num  = 6
GWC IP    = 47.142.92.172
GW IP     = 47.142.91.154
GW TYPE   =
```

To display the number of entries in the post set:

```
>post -count
Post set size = 104
```

50.9.3.2.3 BSY

The BSY commands informs the CM to perform the requested action. A response message indicates the success or failure of the command. These messages are generated by the CM.

To Maintenance/Manual Busy a line by DN:

```
> bsy -d 7550505
DN = 7550505
CM RETURN CODE = CM_OK
```

To Maintenance/Manual Busy a line by LEN:

```
>  bsy -l ss 0 0 0 5
LEN = ss 0 0 0 5
CM RETURN CODE = CM_OK
```

To Maintenance/Manual Busy all lines on a GW:

```
> bsy -gw rtp7-1104b.us.nortel.com
DN = 6136210010
CM RETURN CODE = CM_OK
DN = 6136210011
CM RETURN CODE = CM_OK
DN = 6136210012
CM RETURN CODE = CM_OK
DN = 6136210013
CM RETURN CODE = CM_OK
```

To Busy by the posted set:

```
> bsy -set
DN = 6136210010
CM RETURN CODE = CM_OK
DN = 6136210011
CM RETURN CODE = CM_OK
DN = 6136210012
CM RETURN CODE = CM_OK
DN = 6136210013
CM RETURN CODE = CM_OK
```

The BSY INB operation performs two operations; first is a BSY then upon success, performs the INB operation. If the line is already in the BSY state then only the INB operation is performed.

If the line is IDL

```
      >  bsy -d 7550505 inb
DN = 7550505
CM RETURN CODE = CM_OK
DN = 7550505
CM RETURN CODE = CM_OK
```

If the line is BSY

```
> bsy -d 7550505 inb
DN = 7550505
CM RETURN CODE = CM_ALRDY_IN_REQ_STATE
DN = 7550505
CM RETURN CODE = CM_OK
```

50.9.3.2.4 RTS

To return-to-service a line by DN:

```
      > rts -d 7550505
DN =  7550505
CM RETURN CODE = CM_OK
```

To return-to-service a line by LEN:

```
      >  rts -l ss 0 0 0 5
LEN = ss 0 0 0 5
CM RETURN CODE = CM_OK
```

To return-to-service all lines on a GW:

```
      > rts -gw rtp7-1104b.us.nortel.com
DN = 6136210010
CM RETURN CODE = CM_OK
DN = 6136210011
CM RETURN CODE = CM_OK
DN = 6136210012
CM RETURN CODE = CM_OK
DN = 6136210013
CM RETURN CODE = CM_OK
```

To Busy by the posted set:

```
      > rts -set
DN = 6136210010
CM RETURN CODE = CM_OK
DN = 6136210011
CM RETURN CODE = CM_OK
DN = 6136210012
CM RETURN CODE = CM_OK
DN = 6136210013
CM RETURN CODE = CM_OK
```

50.9.3.2.5 TST

The TST performs a diag (where possible) depending upon the GW's ability to perform diagnostics on endpoints. Only GCP and MGCP GWs support the TST command.

To test by DN (SIP):

```
> tst -d 7550505

DN = 6137550505
LINE_STATE = PASSED
ENDPOINT_STATE = UNKNOWN
CLIENT = user5@47.142.166.65
TEST RESULT = PASSED
```

To test by DN (MGCP line):

```
> tst -d 6210010

DN = 6136210010
LINE_STATE = ON-HOOK
ENDPOINT_STATE = OK
```

To test using the LEN (SIP)

```
      > tst -l ss 0 0 0 5

DN = 6137550505
LINE_STATE = PASSED
ENDPOINT_STATE = UNKNOWN
CLIENT = user5@47.142.166.65
TEST RESULT = PASSED
```

To test using the URI

```
      > tst -u user5@rtp7ssa.com

URI = user5@rtp7ssa.com
LINE_STATE = PASSED
ENDPOINT_STATE = UNKNOWN
CLIENT = user5@47.142.166.65
TEST RESULT = PASSED
```

To test by GW (or VMG).

Note: Testing by VMG may take a long time and produce a large amount of information.

MGCP based GW:

```
> tst -gw rtp7-1104b.us.nortel.com

DN = 6136210010
LINE_STATE = ON-HOOK
ENDPOINT_STATE = OK
DN = 6136210011
LINE_STATE = ON-HOOK
ENDPOINT_STATE = OK
DN = 6136210012
LINE_STATE = ON-HOOK
ENDPOINT_STATE = OK
DN = 6136210013
LINE_STATE = ON-HOOK
```

```
ENDPOINT_STATE = OK
```

SIP GW

```
> tst -gw rtp7ssa

DN = 6137550500
LINE_STATE = FAILED
ENDPOINT_STATE = UNKNOWN
ERROR = Test Executed

DN = 6137550501
LINE_STATE = FAILED
ENDPOINT_STATE = UNKNOWN
ERROR = Test Executed
```

50.9.3.3 QUERY Commands

The query commands are used to perform various existing queries. These queries are the same as those from Servord.

Command format:

```
qdn <DN>
qlen <LEN>
qsip <DN, LEN>
```

Command usage:

To Query a DN

```
QDN 7201000
------------------------------------------------------------------------------
DN:     7201000
TYPE: SINGLE PARTY LINE
SNPA: 619   SIG: DT    LNATTIDX: N/A

50.9.3.4 MISC Commands

To quit from the LMM level - the user will remain in the MTC mode.

```
QUIT
```

50.9.3.5 Command Parsing

Multiple commands can be input on the same line - they must be separated by a ";". Up to 4 lens, dns or uris can be specified with the POST, BSY, TST and RTS commands. Due to the potential volume of output, only one GW or VMG can be specified.

The commands are not case sensitive, but the parameters may be, i.e. GW name will be case sensitive.

51: Configuration (CN): A00012526

51.1 Feature Name

TDM Call Recording Feature

51.2 Hardware and Software Requirements

There is no specific hardware requirement for this feature. The basic ICM software package as well as the software for the SN10 feature A00012527 are needed to use this feature.

51.3 Initial Configuration

The subscription to this feature has to be done according to the DS section below.

51.4 Office/Subnet parameters (OP/SP) (CM & SESM)

N/A

51.5 Upgrade Considerations

51.5.1 Dump and Restore (CM)

No new tables are being added for this feature.

51.5.2 Element Management Upgrade

N/A

51.5.3 Downgrade impact

None.

51.6 Data schema (DS) (CM, MIBS, RDB)

51.6.1 New/modified tables, MIBs, or Database Schema

The following table describes changed table information.

Table 1 New or modified tables

Table/MIB name	NEW/CHANGED/ or DELETED/	Table Control (NEW/ OLD/UNCHANGED)
SCAISSRV	Changed	Unchanged

51.6.2 Table/MIB/Remote Database Schema information

51.6.2.1 Name: SCAISSRV

Switch Computer Application Interface Subservices table.

51.6.2.1.1 Functional description

Table SCAISSRV is used to enter default tuples for each SCAI message category as well as to add customizable category. This allows the customer to subscribe to these categories using Table SCAIPROF.

51.6.2.1.2 Usage sequence and implications (CM Only)

Current datafill order unchanged.

51.6.2.1.3 Size

Table 2 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
SCAISSRV	0	511	Protected

51.6.2.1.4 Fields/OIDs

The following table lists fields for table SCAISSRV.

Table 3 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
TRNKINFO	New	Subfield	Y/N	trunk information

A new default tuple CTXEVENT19$ under category CTXEVENT will be created with the optional parameter TRNKINFO of the function CALLOFFR set to Y.
A new default tuple RESEVENT19$ under category RESEVENT will be created with the optional parameter TRNKINFO of the function CALLOFFR set to Y.

A new default tuple ACDEVENT19$ under category ACDEVENT will be created with the optional parameter TRNKINFO of the function CALLQUED and CALLOFFR set to Y.

```
TABLE SCAISSRV
 SUBSERV SPROFILE
 ------------------------------------------------
CTXEVENT19$ CTXEVENT (SETOFFHK Y Y Y)
(CALLOFFR Y Y Y Y Y Y Y Y Y Y Y Y Y Y Y Y)
(CALLANSWR Y Y Y Y Y Y Y Y Y Y Y Y Y Y Y) (CALLREL Y Y Y Y)
(CALLNAME Y Y Y Y Y) $
```

RESEVENT19$ RESEVENT (SETOFFHK Y Y)

```

51.6.2.1.6 Table release history update

A new field TRNKINFO is added under function CALLOFFR for categories RESEVENT, CTXEVENT and ACDEVENT, under function CALLQUED for category ACDEVENT.

This feature will be released in SN10. An activatable patch will also be available in SN09.

51.6.2.1.7 Supplementary information

N/A

51.6.2.1.8 Translation verification and other tools.

SCAISSRV does not use translation verification tools.

51.7 Service Orders (SO) (CM & SESM)

N/A

51.8 Software optionality control (SOC)

This feature will have a state controlled SOC. With the SOC turned on, the new parameter added to indicate the trunk information will be sent in the two existing messages, dv_call_queued_U and dv_call_offered_U messages,

provided the new parameter is subscribed for these messages and the call is coming in from a trunk. For nodal calls, no trunk information will be provided, the new parameter will not show in the message.

With the SOC turned off, even if the new parameter for the two messages have been subscribed to, the new parameter will not be sent along with the messages.

Table 4 SOC

SOC option name:	ICM Call Recording
SOC option title:	Yes
SOC option control type:	State
New SOC option?	Yes
SOC option order code	ICM00085
Option defined in DRU:	CCM
Affected products:	LEC00023, LET 00023, LLT00023 SN10, ISN10, SE09, SE10

52: Configuration (CN): A00012527

52.1 Feature Name

Provisioning of CS2K trunks on GW and Carrier basis

52.2 Hardware and Software Requirements

Software Requirements:

- SN09 drop 2 Succession Core load or later

52.3 Initial Configuration

52.4 Office/Subnet parameters (OP/SP) (CM & SESM)

N/A

52.5 Upgrade Considerations

52.5.1 Dump and Restore (CM)

Table GATWYINV and GWEPCARR will use the existing data transfer "TabXfr" mechanism available to all Table Control tables to preserve their data during an upgrade.

52.5.2 Element Management Upgrade

N/A

52.6 Data schema (DS) (CM, MIBS, RDB)

52.6.1 New/modified tables, MIBs, or Database Schema

Table 1 New or modified tables

Table/MIB name	NEW/CHANGED/ or DELETED/	Table Control (NEW/ OLD/UNCHANGED)
GATWYINV	CHANGED	UNCHANGED
GWEPCARR	NEW	NEW

52.6.2 Table GATWYINV Database Schema information

52.6.2.1 Name: GATWYINV

Long Table Name: GATeWaY INVentory

52.6.2.1.1 Functional description

Table GATWYINV holds the gateway related information. It currently allows only ABI GWs which are provisioned in parallel in the CM and SESM. The modification shall allow support for PVG and GW gateways.

As the gateway physical location and element manager information is not significant for GW and PVG gateway types, the tuple options ELMGR and GTWYLOC are not allowed for these gateway types.

GATWYINV Table needs to be datafilled prior to datafilling table GWEPCARR.

52.6.2.1.2 Usage sequence and implications (CM Only)

No change to datafill order. The sequence is as follows:

1. Table SERVRINV - GWC datafill

2. Table GATWYINV - GW datafill

52.6.2.1.3 Size

Table 2 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
GATWYINV	0	32767	Memory is automatically allocated in increments with block size of 2K.

52.6.2.1.4 Fields/OIDs

Table 3 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
GTWYPRFL	Changed	Refined to support for 2 new profiles	PVGPRF	PVG gateway profile
			GWPRF	Generic Gateway (GW) profile

52.6.2.1.5 Datafill example

```

52.6.3 Table GWEPCARR Database Schema information

52.6.3.1 Name: GWEPCARR

Long Table Name: GateWay End Point CARRier

52.6.3.1.1 Functional description

New table GWEPCARR shall hold the mapping from GW and carrier number to the TID range used by trunks on the carrier. The key to table GWEPCARR is the GW type and number and the carrier number. The number of channels on a carrier is restricted to 24 for North America and 31 for International. The table will also hold the carrier name information.

Only Add and Delete operations will be supported on table GWEPCARR.

Datafilling table GWEPCARR with a gateway, that does not exist in table GATWYINV, is not allowed.

52.6.3.1.2 Usage sequence and implications (CM Only)

Tables must be datafilled in the following sequence:

1. Table GATWYINV - Gateway datafill.

2. Table GWEPCARR - New Table, Gateway and carrier datafill.

52.6.3.1.3 Fields/OIDs

Table 4 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Valid entries	Explanation and action
GWCARR	New	GW_TYPE	{NLGW,ABI,CICM,GW,MG9K,PVG,MS,SESS}	{GW, PVG}	This is the type of the gateway as defined on the Core. The valid values are PVG and GW.
		GW_NUM	{0 - 1023}	{0-1023}	This is the unique external number of the gateway.
		CARRIER_NUM	{0 - 168}	{1-168}	This is the carrier over which the trunk is configured. Valid Values are in the range {1 - 168}
HOST	New	HOST_TYPE	{GWC}	{GWC}	This is a valid pm type of the cside host xpm.
		HOST_NO	{0 - 255}	{0 - 255}	The unique external number of the cside host Gateway Controller.
START	New	GW_CARR_TERM_NUM_TC	{1 - 4094}	{1 - 4094}	This gives the starting terminal number on a particular carrier.
CARRSIZE	New	GTWY_CARRIER_SIZE_TC	{0 - 31}	{24, 31}	This is 24 for North America and 31 for International loads.
CARRNAME	New	CARR_NAME_VECTOR	Up to 32 Char's	Up to 32 Char's	Carrier Name as given in the SESM

52.12 Configuration Walkthrough

The craftsperson has to manually look into the SESM datafill and then provision tables GATWYINV and GWEPCARR in core.

Given below are the SESM data and the corresponding core datafills that needs to be done.

Figure 9 Gateway information in SESM

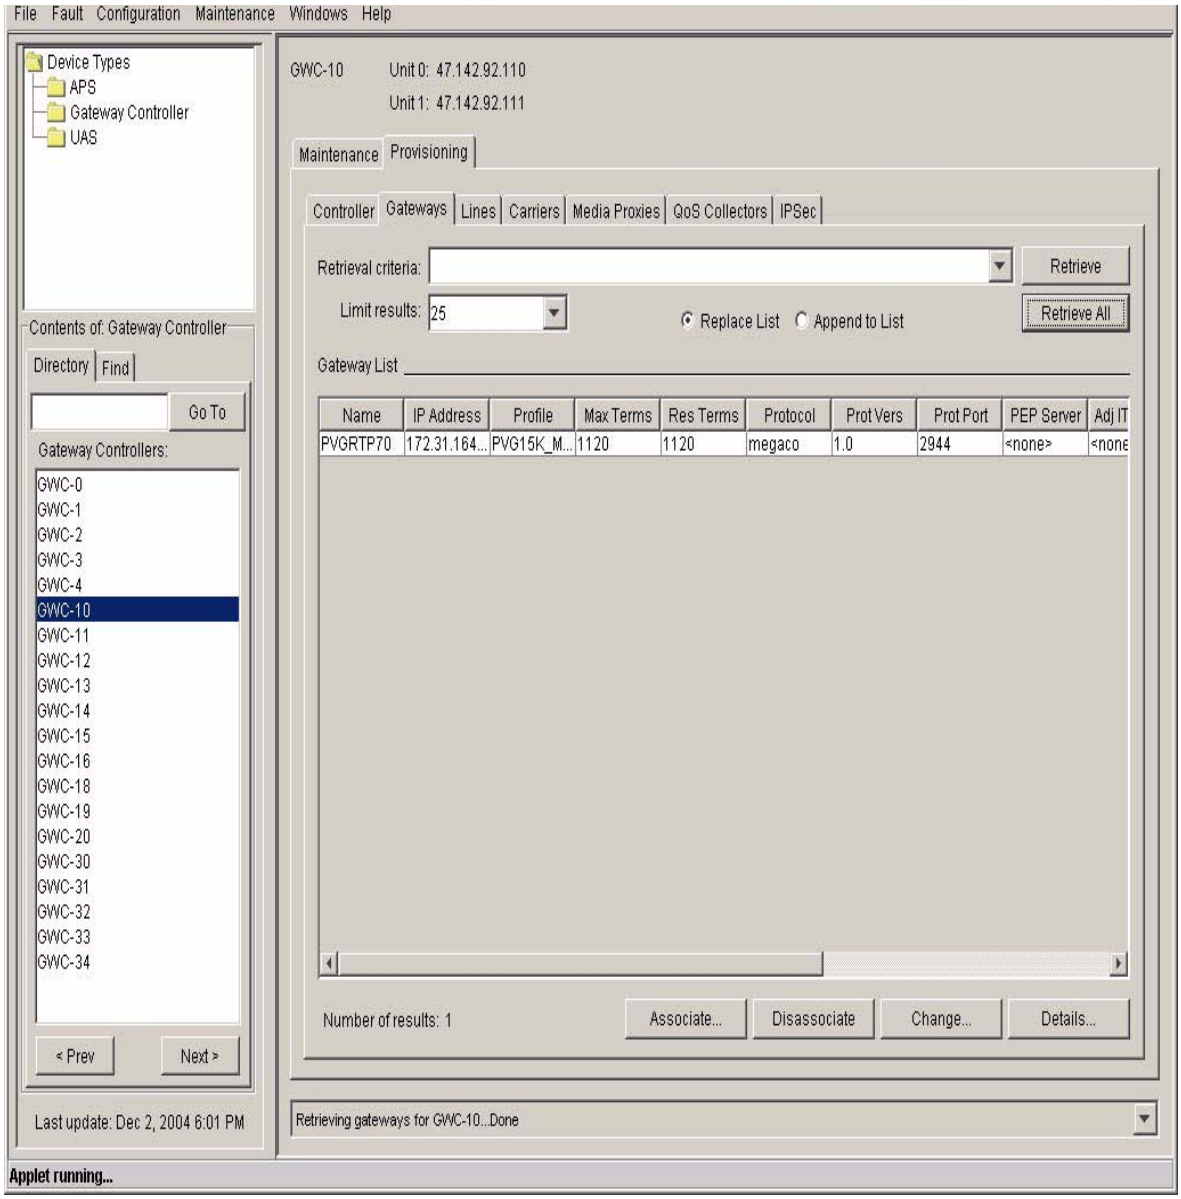

Figure 10 Table GATWYINV - Sample tuple

```
GTWY   PMNO  GTWYPRFL  GTWYNAME  GTWYADDR  GTWYCSPM  GTWYOPTS
-------- ---------- ---------- ---------- ---------- ---------- ----------
  PVG     5         PVGPRF      PVGRTP70    (172 31 164 1) $       HOST GWC 10     $
```

Figure 11 Carrier information in SESM

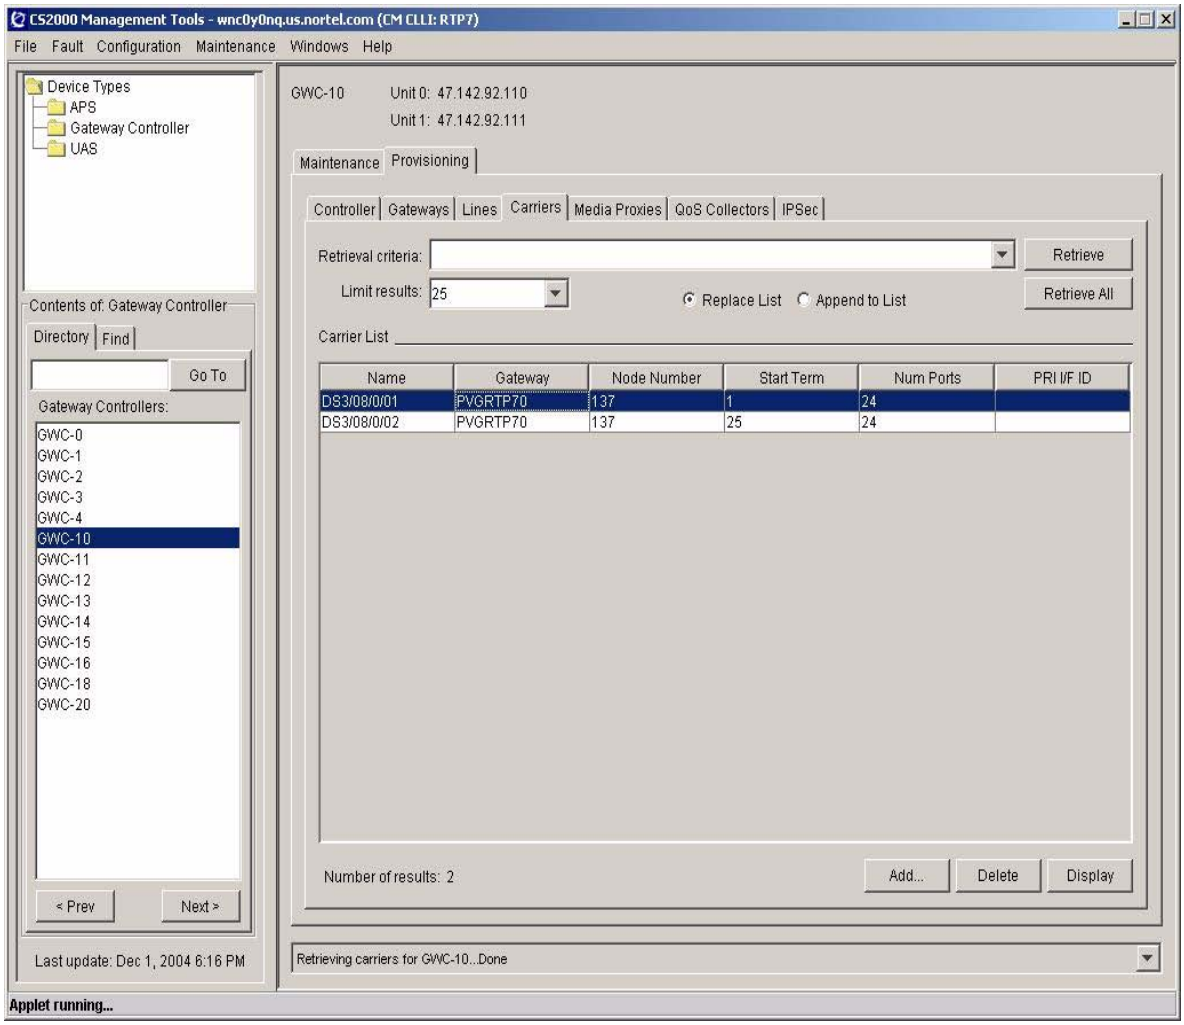

Figure 12 Table GWEPCARR - sample tuples

```
TABLE GWEPCARR:
GWCARR          HOST          START       CARRSIZE    CARRNAME
---------------------------------------------------------------------------------------
PVG 1 1         GWC 10        1             24          DS3/08/0/02
```

53: Configuration (CN): A00012570

53.1 Feature Name

Disabling Non-secure Network Services in SSPFS

53.2 Hardware and Software Requirements

Any SSPFS supported platform running SN09.1+ release.

53.3 Initial Configuration

The initial configuration is done via SSPFS CDs. Upon completion of the SSPFS fresh install, this feature will disable: ftp, tftp, telnet, snmp and nfs.

53.4 Office / Subnet parameters (OP/SP) (CM & SESM)

No new office parameters introduced by this feature.

53.4.1 New/modified office/subnet parameters

Not applicable.

53.4.2 Parameter information

Not applicable.

53.5 Upgrade Impact

Upon system upgrade from one release to the other, the state of non-secure services is preserved. The disabling of such services has to be performed via cli after the upgrade.

53.5.1 Dump and Restore (CM)

Not applicable.

53.5.2 Element Management Upgrade

Not applicable.

53.5.3 Downgrade impact

Since the non-secure service state are not altered on upgrade, there is no impact on downgrade.

53.6 Data schema (DS) (CM, MIBS, RDB)

53.6.1 New/modified tables MIBs or Database Schema

Not applicable.

53.6.2 Table/MIB/Remote Database Schema information

Not applicable.

53.7 Service Orders (SO) (CM & SESM)

Not applicable.

53.8 Software optionality control (SOC)

Not applicable.

53.9 Element Management

Not applicable.

53.9.1 New/modified GUIs

Not applicable.

53.9.2 GUI information

Not applicable.

53.9.3 CLUI Interface

As identified before, new sub-menu items will be introduced into the "**Security Services Configuration**" layer within the configuration panel for SSPFS cli configuration tool.

53.10 User interface changes

53.10.1 Directory: <directory name/MAP level>

For pictorial representation of the menu level, please refer to the diagram in figure 2.

The top level CLUI is invoked via the command cli. The result is listed below:

```
# cli
Command Line Interface
 1 - View
 2 - Configuration
 3 - Other

 X - exit

select –
```

To get to the configuration level, the operator is requested to enter 2. The resulting menu is prompted to the operator:

```
Configuration
1 - NTP Configuration
 2 - Apache Proxy Configuration
 3 - DCE Configuration
 4 - OAMP Application Configuration
 5 - CORBA Configuration
 6 - IP Configuration
 7 - DNS Configuration
 8 - Syslog Configuration
 9 - Remote Backup Configuration
```

```
10 - Database Configuration
11 - NFS Configuration
12 - Bootp Configuration
13 - Restricted Shell Configuration
14 - Security Services Configuration
15 - Login Session
16 - Location Configuration
17 - Cluster Configuration
18 - Succession Element Configuration
19 - snmp_poller (SNMP Poller Configuration)
20 - backup_config (Backup Configuration)
 X - exit

select –
```

Option 14 above will be extended. Here is the new menu generated when the operator selects option 14:

```
Security Services Configuration
1 - Socks Configuration
 2 - IEMS Server Location Configuration
 3 - PAM Configuration
 4 - Common Inet Services (ftp, tftp, telnet, snmp and nfs)
 5 - Tools Inet Services (time, daytime)
 6 - Other Inet Services
 7 - proftpd User Configuration
 8 - query_registry (Query Network Services Package Registration)
 X - exit

select -
```

Upon selection of any of the new sub-menus 4-6, the operator will get the following commands menu:

```
Common Services Configuration (ftp, tftp, telnet, snmp and nfs)
 1 - query_common_inetd (Services State Query )
 2 – enable_common_inetd (Enable a service registered in inetd.conf)
 3 - disable_common_inetd (Disable a service registered in inetd.conf)

 X - exit

select -
```

Here is an example of the result of a query state for the Common Network Services:

```
Common Services State
0. telnet       Enabled
1.    ftp       Disabled
2.   tftp       Enabled
3.   snmp       Disabled
4.    nfs       Disabled
```

Here is an example of the disable Service command:

```
Enable Common Service
1. tftp /usr/sbin/in.tftpd
2. telnet       /usr/sbin/in.telnetd
```

```
Select service number to disable: 1
The selected services was tftp  /usr/sbin/in.tftpd
Configuration file updated.
Operating system deamon refreshed.
Oparation completed.
```

Upon the selection of proftpd User Configuration, the operator will receive the following options:

```
1 - query_proftpd_users (Query users defined in proftpd)
 2 - add_proftpd_user  (Add a user to proftpd)
 3 - add_dflt_GWC_anonymous_user (Restore the GWC anonymous user )
 4 - del_proftpd_user (Delete a given user from proftpd)
 5 – query_user_registry (Query the packages registered for ftp users)
```

53.10.2.1 Qualifications and warnings

Not applicable.

53.10.2.2 Responses

Not applicable.

53.10.2.3 Example

Not applicable.

53.11 Security

The security implications of this feature are that on a fresh install of the SSPFS software, the default state of the non-secure services such as ftp, tftp, snmp, telnet and nfs will be preserved. A configuration tool is provide to root user group to be able to manually disable these services to increase the security profile of the target platform.

53.11.1 Network Configuration

Not applicable.

53.11.2 Key Management

Not applicable.

53.11.3 Protocol

Not applicable.

53.11.4 Authentication

Not applicable.

53.12 Configuration Walkthrough

The section walks through minor changes in the platform initial installation, upgrade, patching and power cycle/failover.

On system installation, a minor change is performed to the sspfs post-install script resulting into the disabling non-necessary services such as RPC not used in any sspfs product offering.

On system upgrade, the setting of non-secure services is maintained throughout the upgrade. Once the system is re-clone/back in sync, then the non-secure services can be disabled manually via cli.

For system patching via NPM, the preferred option is to use sftp. Therefore the deactivation of non-secure services should have no impact to the patchability of the platform.

For power-cycle or failover of a node in the cluster, there is a small window of time when the control files are being synchronized and the inetd services is being re-initialized. Since this script functionality is typically done once after upgrade, it is acceptable to re-run the configuration if a power-cycle or failover occurred during the configuration changes.

54: Configuration (CN): A00012889

54.1 Feature Name

Passphrase Protected Keys for SSH

54.2 Hardware and Software Requirements

- OpenSSH installed on SDM/CBM.
- SBA and OMDD applications are installed and InSv.

54.3 Initial Configuration

- Configure and activate a SBA stream.
- No initial configuration of OMDD is required.

54.4 Office/Subnet parameters (OP/SP) (CM & SESM)

N/A

54.5 Upgrade Impact

N/A

54.6 Data schema (DS) (CM, MIBS, RDB)

N/A

54.7 Service Orders (SO) (CM & SESM)

N/A

54.8 Element Management

N/A

54.9 Command interface changes

N/A

54.10 Security

54.10.1 Secure Data Transfer to OSS with Public Key Authentication

This feature enhances the existing secure outbound file transfer functionality by introducing the key-based (public key) authentication.

The key-based authentication mechanism is provided as an additional option for the user. Hence, the user can select to use either the password-based or the key-based authentication while adding and changing the secure file transfer schedules in the SBA (billmtc) or OMDD (omui) user interface programs.

54.10.2 Passphrase protection.

The passphrase is stored in the Private Data Manager in an encrypted format.

54.11 Configuration Walkthrough

54.11.1 Host key acceptance for downstream OSS

The initial host key acceptance of the downstream processor should be done manually before it can use the SSH protocol to transfer file from SDM/CBM. Figure 1 shows an example how to accept a host key manually.

Figure 1 Host key acceptance

54.11.2 SBA specific configuration

SBA secure outbound file transfer can be configured by adding or changing an existing schedule tuple after the user has done a host key acceptance.The “sendfile” command can be used to validate if OSS is ready for key-based authentication. Text in bold indicates changes in SBA UI.

Figure 2 shows an example on how a user can configure secure outbound file transfer using password-based authentication.

Figure 3 shows an example on how a user can configure secure outbound file transfer using key-based authentication.

Figure 4 shows an example of how to append the public key to .ssh/ authorized_keys file of the user on the remote system running with OpenSSH server.

Figure 5 and Figure 6 shows an example of how a user can modify the existing schedule tuple configuration.

Figure 7 and Figure 8 shows an example of how a user can delete the schedule tuple.

Figure 2 Prompts for schedule add (*Password based authentication*).

54.11.3 OMDD specific configuration

This activity modifies the Add, List and Modify File Transfer Destination menus of OMUI. The “Add File Transfer Destination” menu in OMUI enables the user to configure a destination where OMDD can transfer OM reports. The “Modify File Transfer Destination” menu enables the user to modify an already configured file transfer destination.

When the file transfer destination is added or modified, user will be asked to select the type of user authentication, in addition to the already existing parameters. The choices for the type of user authentication will be “Password” and “Key”.

If the user chooses “Key”, a message will be displayed informing the user to dump the contents of the public key file into the authorization file of the destination machine.

Figure 9 shows an example configuration of file transfer destination using Password-based authentication.

Figure 10 shows an example configuration of file transfer destination using Key-based authentication.

The same changes are made in the “Modify File Transfer Destination” menu also.

Figure 11 shows the list of names of the file transfer destinations that are currently configured.

The text in bold indicate the changes to the OMDD UI.

Figure 9 OMUI File Transfer Destination menu (password-based)

```

Performance Management List (PFs)

Introduction

This chapter describes impacts to performance management, such as operational measurements and performance measurements, for the features planned for this release. Only those features with performance-management impacts are listed.

Featid	Title
A00007544.AB06	NCAS Link and SIP NMS Support based on RFC 3842
A00007547.AB12	SIP Lines Core Call Processing Support
A00009515.AA14	Out-of-Band Interop with MCS
A00009777	IEMS Mediant 2000 Integration
A00009893.AA12	Session Server Call Processing Overload
A00012109.AA17	Session Server Shared Library Replacement (SLR) Patching

1: Performance (PF): A00007544

1.1 Feature Name

NCAS Link and SIP NMS Support based on RFC 3842

1.2 Performance management strategy

The Operational Measurements will be pegged to generate the performance history. The details of performance management will be than developed as per engineering rules.

1.3 Performance management tools and utilities

The OMSHOW command and EADAS will be used for the OM display and OM transfer to remote system.

1.4 Performance Measurements (PM), Operational Measurements (OM), and stats

This feature does not have any specific PM. However, this feature introduces new OM groups in the DMS/CS2K Core and in the Session Server (NGSS).

1.4.1 PM, OM, and stats format

The OM in the NGSS and CORE follow the previously defined OM strategy and framework. The new group and appropriate fields are added. An existing OM group INSCTP is also pegged whenever necessary. The following are the details of the new OM groups and fields in the NGSS and DMS/CS2K Core.

1.4.1.1 OM Group NMSNCAS (NGSS)

The New OM group called NCAS_LINK is introduced to keep a record of the state changes of the NCAS Link and the number of messages sent and received over the NCAS link

This OM group accurately tracks the messages send and received on the NCAS link between CS2K Core and Session Server. The OM pegging will provide

information on the message traffic between CS2K Core and Session Server.It will also have a count of the number of times the NCAS Link has gone down and come up

1.4.1.2 Release history update

Added new in this release.

1.4.1.3 Registers

The following table gives an overview of the registers associated with the NCAS_LINK OM group.

Table 1 OM Registers in the NMSNCAS OM Group

OM field	Description
NUM_LINK_UP	Number of times the NCAS Link is brought up
NUM_LINK_DOWN	Number of times the link goes down
NUM_MSG_SENT	Number of messages sent over the NCAS Link
NUM_MSG_RCVD	Number of times a response is received over the NCAS Link
NUM_MSG_SEND_FAIL	Number of times the message send fails
NUM_MSG_RCV_FAIL	Number of times the message receive fails.

The following figure will be updated during coding.

OM group registers displayed are as follows:

Figure 1 OM Group Display

<regName> <regName> <regName> <regName>

1.4.1.4 Group Structure

OM group provides one tuple for each NCAS selector datafilled in Table MSGRTE.
Key field: <KField><description> TBA

Info field: <IField><description> TBA

1.4.1.5 Associated OM groups

None

1.4.1.6 Associated functional groups

The following functional groups are associated with OM group: None

1.4.1.7 Associated functionality codes

Not Applicable

1.4.1.8 OM group registers logic flow chart

TBA

1.4.2 Register NUM_LINK_UP

1.4.2.1 Register description

This register represents how many times the NCAS Link has been brought up.

1.4.2.2 Register release history update

New in this release

1.4.2.3 Associated registers

1.4.2.4 Associated logs

TBA

1.4.3 Register NUM_LINK_DOWN

1.4.3.1 Register description

This register represents how many times the NCAS Link has gone down.

1.4.3.2 Register release history update

New in this release

1.4.3.3 Associated registers

1.4.3.4 Associated Logs

1.4.4 Register NUM_MSG_SENT

1.4.4.1 Register description

This register represents how many times the a message is successfully sent over the NCAS Link.

1.4.4.2 Register release history update
New in this release

1.4.4.3 Associated registers
None

1.4.4.4 Associated logs
None

1.4.5 Register NUM_MSG_RCVD

1.4.5.1 Register description
This register represents how many times responses are successfully received over the NCAS Link .

1.4.5.2 Register release history update
New in this release

1.4.5.3 Associated registers
None.

1.4.5.4 Associated logs
None.

1.4.6 Register NUM_MSG_SEND_FAIL

1.4.6.1 Register description
This register represents how many times the message sent over the NCAS Link has failed

1.4.6.2 Register release history update
New in this release

1.4.6.3 Associated registers
None.

1.4.6.4 Associated logs
None

1.4.7 Register NUM_MSG_RCV_FAIL

1.4.7.1 Register description
This register represents how many times the a message receive over an NCAS Link has failed.

1.4.7.2 Register release history update
New in this release

1.4.7.3 Associated registers

None.

1.4.7.4 Associated logs

None

1.4.8 Performance File (CSV, SSV, XML) Format

The NGSS performance file format is used.

1.4.9 OM Group NMSNCAS (For CS2K Core only)

1.4.9.1 OM description

The New OM group called NMSNCAS is introduced to keep a record of the NMS messages sent and received by the CS2K Core over NCAS link.This OM group accurately tracks the messages sent and received on the NCAS link between CS2K Core and Session Server. The OM pegging will provide information on the message traffic between CS2K Core and Session Server.

1.4.9.2 Release history update

Added new in this release.

1.4.9.3 Registers

The following table gives an overview of the registers associated with the NMSNCAS OM group.

Table 2 OM Registers in the NMSNCAS OM Group

OM field	Description
SCTPNMSS	NMS TCAP messages sent successfully over SCTP
SCTPNMSR	NMS TCAP messages received successfully over SCTP
SCTPREJS	NMS REJ messages sent successfully over SCTP
SCTPREJR	NMS REJ messages receievd successfully over SCTP

The following figure will be updated during coding.

OM group registers display on the MAP terminal as follows:

Figure 2 OM Group Display

1.4.9.4 Group structure

OM group provides one tuple for each NCAS selector datafilled in Table MSGRTE.

Key field: <KField><description> TBA

Info field: <IField><description> TBA

1.4.9.5 Associated OM groups

None.

1.4.9.6 Associated functional groups

None

1.4.9.7 Associated functionality codes

Not Applicable

1.4.9.8 OM group registers logic flow chart

1.4.10 Register SCTPNMSS (applies only to DMS)

1.4.10.1 Register description

This register represents how many NMS TCAP messages are sent to SCTP in half hour time period. This will provide information of performance needs for the NCAS link.

1.4.10.2 Register release history update

New in this release

1.4.10.3 Associated registers

None.

1.4.10.4 Associated logs

NMSS115.

1.4.11 Register SCTPNMSR (applies only to DMS)

1.4.11.1 Register description

This register represents how many NMS TCAP messages are received from SCTP in half hour time period.This will provide information of performance needs for the NCAS link.

1.4.11.2 Register release history update

New in this release

1.4.11.3 Associated registers

None.

1.4.11.4 Associated logs

NMSS116

1.4.12 Register SCTPREJS (applies only to DMS)

1.4.12.1 Register description

This register represents how many NMS REJECT messages are sent to SCTP in half hour time period.

1.4.12.2 Register release history update

New in this release.

1.4.12.3 Associated registers

None

1.4.12.4 Associated logs

NMSS117

1.4.13 Register SCTPREJR (applies only to DMS)

1.4.13.1 Register description

This register represents how many NMS REJECT messages are received from SCTP in half hour time period.

1.4.13.2 Register release history update

New in this release.

1.4.13.3 Associated registers

None

1.4.13.4 Associated logs

NMS118

1.4.14 OM Group INSCTP (For CS2K Core only)

This is an existing OM Group defined for AIN Transports. The OMs pegged for this OM Group are as follows:

- **MSGOUT:** Pegs Outgoing IN messages using SCTP
- **MSGIN:** Pegs Incoming IN messages using SCTP
- **SDFAIL:** Pegs IN messages using SCTP for which send failed
- **DATAERR:** Pegs IN messaageswhich encounted errors at application data
- **MSG2BIG:** Pegs IN messages which failed due to message length
- **BMSOPFAIL:** Peg instances when buffer errors are encountered while sending IN messages over SCTP
- **DATARCVD:** Pegs for incoming IN message decoding
- **NOTREADY:** Pegs when SCTP layer indicates that it is not ready to process the message.

Please refer to A00004500 for further information.

2: Performance (PF): A00007547

2.1 Feature Name

SIP Lines Core Call Processing Support

2.2 Performance management strategy

2.3 Performance management tools and utilities

2.4 Performance Measurements (PM), Operational Measurements (OM), and stats

New OM group DPLOM.

Registers:

- DPLFNVA
- DPLFBAL
- DPLFREB
- DPLRLOS
- DPLRCAL
- DPLUSE
- DPLFRE
- DPLNOA
- DPLNOD

2.4.1 PM, OM, and stats format

2.4.2 Performance File (CSV, SSV, XML) Format

2.4.3 OM Group template (applies only to DMS)

2.4.3.1 OM description

OM Group DPLOM - Dynamic Packet Line OM

2.4.3.2 Release history update

Creation of new group DPLOM

2.4.3.3 Registers

OM group registers display on the MAP terminal as follows:

Figure 1 OM Group Display

DPLFNVA	DPLFBAL	DPLFREB	DPLRLOS
DPLCAL	DPLUSE	DPLUSE2	DPLFRE
DPLFRE2	DPLNOA	DPLNOA2	DPLNOD
DPLNOD2			

2.4.3.4 Group structure

OM group provides 1 tuple for the CS2K.

Key field: None

Info field: None

2.4.3.5 Associated OM groups

<None>

2.4.3.6 Associated functional groups

The following functional groups are associated with OM group: <None>

2.4.3.7 Associated functionality codes

Not applicable

2.4.3.8 OM group registers logic flow chart

2.4.4 Register DPLFNVA

2.4.4.1 Register description

Register DPLFNVA

Dynamic Packet Line Failed Allocation due to No VIDs Available.

DPLFNVA is a peg register. It records the number of times that a call failed to allocate a VID from the DPL VID resource because the free list was empty

2.4.4.2 Register release history update

Initial creation

2.4.4.3 Associated registers

<None>

2.4.4.4 Associated logs

<None>

2.4.5 Register DPLFBAL

2.4.5.1 Register description

Register DPLFBAL

Dynamic Packet Line Failed Allocation due to Queue Balancing

DPLFBAL is a peg register. It records the number of times that a call failed to allocate a VID from the DPL VID resource because the free list was being balanced

2.4.5.2 Register release history update

Initial creation

2.4.5.3 Associated registers

<None>

2.4.5.4 Associated logs

<None>

2.4.6 Register DPLFREB

2.4.6.1 Register description

Register DPLFREB

Dynamic Packet Line Failed Dealocation due to Queue Rebuilding.

DPLFREB is a peg register. It records the number of times that a call failed to return a VID to the DPL VID resource because the free list was being rebuilt.

2.4.6.2 Register release history update

Initial creation

2.4.6.3 Associated registers

<None>

2.4.6.4 Associated logs

<None>

2.4.7 Register DPLRLOS

2.4.7.1 Register description

Register DPLRLOS

Dynamic Packet Line Recover Lost

DPLRLOS is a peg register. It records the number of VIDs that were recovered and put back on the resource pool free list when a call failed to return a VID to the DPL VID resource pool free list because the free list was being rebuilt.

2.4.7.2 Register release history update
Initial creation

2.4.7.3 Associated registers
<None>

2.4.7.4 Associated logs
<None>

2.4.8 Register DPLRCAL

2.4.8.1 Register description
Register DPLRCAL

Dynamic Packet Line Recover Call VID.

DPLRCAL is a peg register. It records the number of VIDs that were recovered and put back on the resource pool free list when a call failed to return a VID to the DPL VID resource pool free list because the call terminated abnormally.

2.4.8.2 Register release history update
Initial creation

2.4.8.3 Associated registers
<None>

2.4.8.4 Associated logs
<None>

2.4.9 Register DPLUSE

2.4.9.1 Register description
Register DPLUSE

Dynamic Packet Line Usage.

DPLUSE is a usage register. The scan rate is slow: 100s. It records the number of VIDs allocated from the DPL VID resource pool.

2.4.9.2 Register release history update
Initial creation

2.4.9.3 Associated registers
<None>

2.4.9.4 Associated logs
<None>

2.4.10 Register DPLFRE

2.4.10.1 Register description
Register DPLFRE

Dynamic Packet Line Free.

DPLFRE is a usage register.The scan rate is slow: 100s. It records the size of the DPL VID resource pool free list.

2.4.10.2 Register release history update
Initial creation

2.4.10.3 Associated registers
<None>

2.4.10.4 Associated logs
<None>

2.4.11 Register DPLNOA

2.4.11.1 Register description
Register DPLNOA

Dynamic Packet Line Number Of Allocations.

DPLNOA is a peg register. It records the number of times that a call successful allocations from the DPL VID resource pool

2.4.11.2 Register release history update
Initial creation

2.4.11.3 Associated registers
<None>

2.4.11.4 Associated logs
<None>

2.4.12 Register DPLNOD

2.4.12.1 Register description

Register DPLNOD

Dynamic Packet Line Number Of Deallocations.

DPLNOD is a peg register. It records the number of times that a call successfully returned a VID to the DPL VID resource pool

2.4.12.2 Register release history update

Initial creation

2.4.12.3 Associated registers

<None>

2.4.12.4 Associated logs

<None>

3: Performance (PF): A00009515

3.1 Feature Name

Out-of-Band Interop with MCS

3.2 Performance management strategy

The Operational Measurements will be pegged to generate the performance history. The details of performance management will be then developed as per engineering rules.

3.3 Performance management tools and utilities

The OMSHOW command and EADAS will be used for the OM display and OM transfer to remote system.

3.4 Performance Measurements (PM), Operational Measurements (OM), and stats

This feature does not have any specific PM. However, this feature introduces new OM groups in the Session Server (NGSS).

Following two new groups are added under this activity:

- SIPGW_OOB OM Group
- SIPGW_NCAS OM Group

3.4.1 PM, OM, and stats format

The OM in the Session Server follows the previously defined OM strategy and framework. Two new groups and appropriate fields are added. See section 14.3.3. for details on the OM groups and their registers.

3.4.2 Performance File (CSV, SSV, XML) Format

The Session Server performance file format is used.

3.5 SIPGW_OOB OM Group

3.5.1 SIPGW_OOB OM description

The New OM group called SIPGW_OOB is introduced to keep a record of the Out-of-Band related SIP messages sent and received between the Session Server and the MCS.

3.5.2 Release history update

Added new in this Release

3.5.3 Registers

The following table gives an overview of the registers associated with the SIPGW_OOB OM group.

Table 1 OM Registers in the SIPGW_OOB OM Group

OM field	Description
REFER_RECEIVED	OBB REFER REceived
REFER_ACCEPTED	OOB REFER Accepted - 202 Accepted sent
REFER_REJECTED	OOB REFER Rejected
NOTIFY_200OK	NOTIFY Sent following receipt of CLOSE msg
NOTIFY_PROCEEDING	Proceeding NOTIFY sent
NOTIFY_TERMINATE	Final NOTIFY sent
NOTIFY_REPORT_FAIL	NOTIFY sent indicating failure.

OM group registers display on the MAP terminal as follows:

Figure 1 OM Group Display

<regName> <regName> <regName> <regName>

3.5.4 Group structure

3.5.5 Associated OM groups

SIPGW_NCAS OM Group - See section 14.5 for detailed description

3.5.6 Associated functional groups

None

3.5.7 Associated functionality codes

None

3.5.8 OM group registers logic flow chart

Figure 2 Successful OOB REFER Scenario

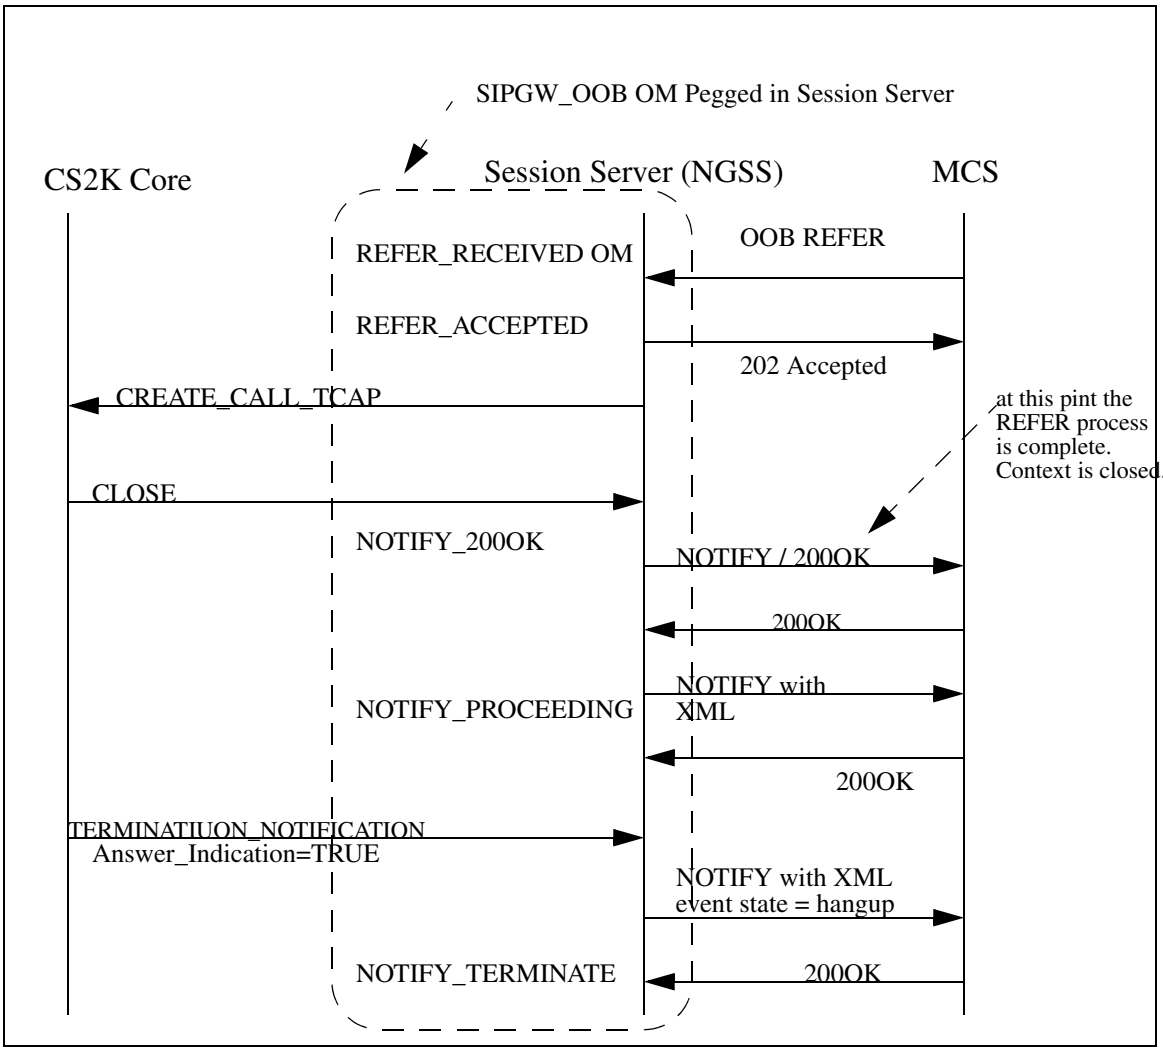

Figure 3 Failure OOB REFER Scenario

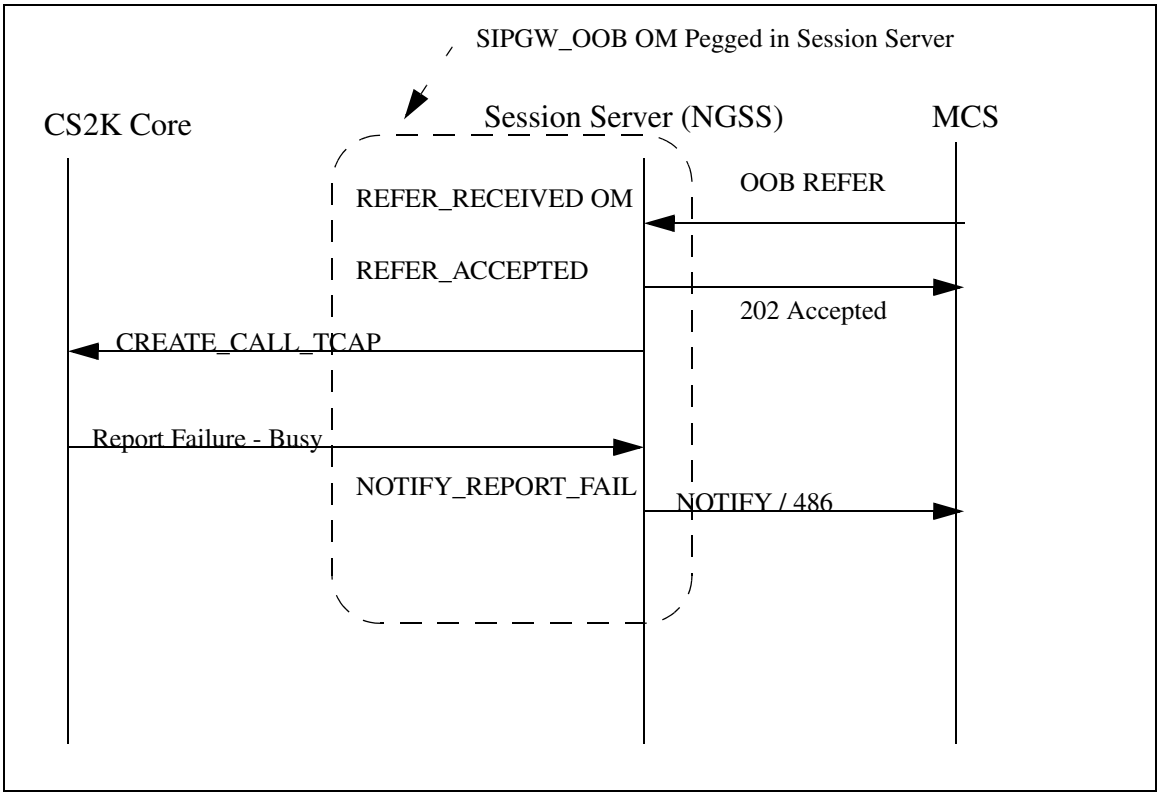

Figure 4 Failure OOB REFER Scenario

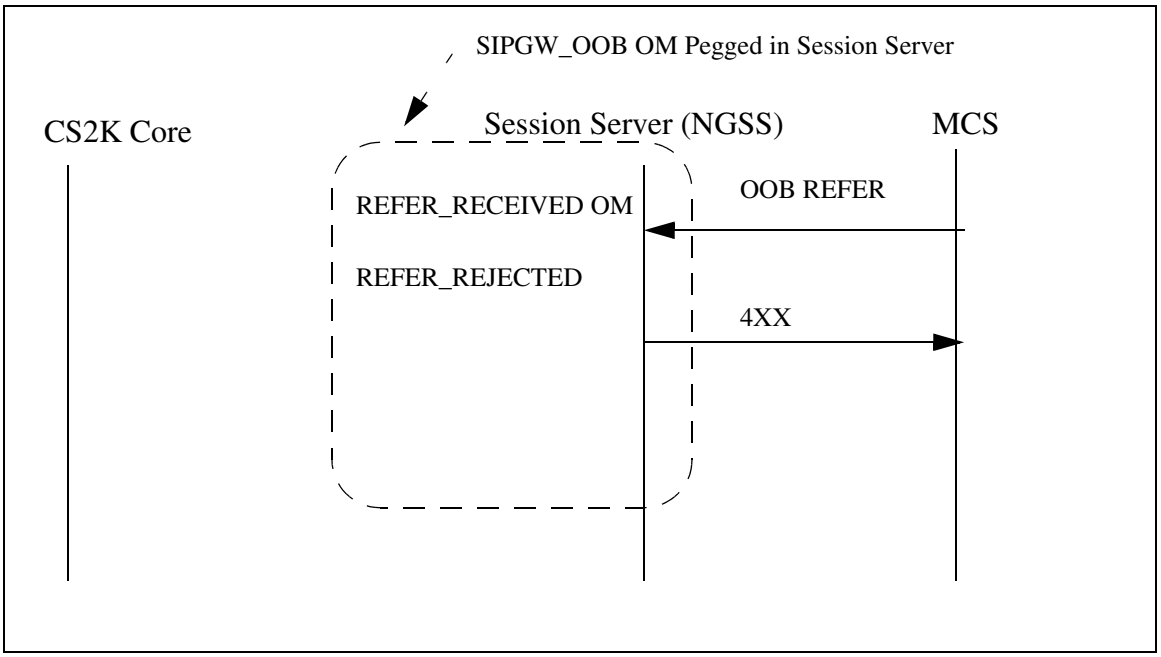

3.5.9 Register REFER_RECEIVED

3.5.9.1 Register description

This register is pegged every time the Session Server receives an Out-of-Band REFER request from the MCS.

3.5.9.2 Register release history update

New in this release

3.5.9.3 Associated registers

REFER_ACCEPTED, REFER_REJECTED

3.5.9.4 Associated logs

None

3.5.10 Register REFER_ACCEPTED

3.5.10.1 Register description

This register is pegged every time the Session Server validates an Out-of-Band REFER request and requests a Create_Call TCAP to be sent to the core.

3.5.10.2 Register release history update

New in this release

3.5.10.3 Associated registers

REFER_RECEIVED, CREATE_CALL_SENT (SIPGW_NCAS group),

3.5.10.4 Associated logs

None

3.5.11 Register REFER_REJECTED

3.5.11.1 Register description

This register is pegged every time the Session Server is unable to validate the OOB REFER request.

3.5.11.2 Register release history update

New in this release

3.5.11.3 Associated registers

REFER_RECEIVED

3.5.11.4 Associated logs

None

3.5.12 Register NOTIFY_200OK

3.5.12.1 Register description

This register is pegged every time the Session Server receives a CLOSE TCAP message from the core and a NOTIFY/200OK request is sent to the MCS

3.5.12.2 Register release history update

New in this release

3.5.12.3 Associated registers

CLOSE_RECEIVED (SIPGW_NCAS group)

3.5.12.4 Associated logs

None

3.5.13 Register NOTIFY_PROCEEDING

3.5.13.1 Register description

This register is pegged every time the Session Server sends a NOTIFY/ Proceeding msg to the MCS.

3.5.13.2 Register release history update

New in this release

3.5.13.3 Associated registers

CLOSE_RECEIVED (SIPGW_NCAS group)

3.5.13.4 Associated logs

None

3.5.14 Register NOTIFY_TERMINATE

3.5.14.1 Register description

This register is pegged every time the Session Server sends a NOTIFY msg indicating that the Call has ended.

3.5.14.2 Register release history update

New in this release

3.5.14.3 Associated registers

TERM_NOTIFY_RECEIVED (SIPGW_NCAS group)

3.5.14.4 Associated logs

None

3.5.15 Register NOTIFY_REPORT_FAIL

3.5.15.1 Register description

This register is pegged every time the Session Server sends a NOTIFY msg indicating a failure in Create_Call Completion

3.5.15.2 Register release history update

New in this release

3.5.15.3 Associated registers

FAILURE_RECEIVED (SIPGW_NCAS group)

3.5.15.4 Associated logs

None

3.6 SIPGW_NCAS OM Group

3.6.1 SIPGW_NCAS OM description

The New OM group called SIPGW_NCAS is introduced to keep a record of the Out-of-Band related TCAP messages sent and received between the Session Server and the CS2K. TCAP messages are sent over and SCPLite NCAS link

3.6.2 Release history update

Added new in this Release

3.6.3 Registers

The following table gives an overview of the registers associated with the SIPGW_NCAS OM group.

Table 2 OM Registers in the SIPGW_OOB OM Group

OM field	Description
CREATE_CALL_SENT	CREATE_CALL Request Sent
CREATE_CALL_FAIL	CREATE_CALL Request failed
CLOSE_RECEIVED	CLOSE Msg Received
TERM_NOTIFY_RECEIVED	CLOSE Msg Received

OM group registers display on the MAP terminal as follows:

Figure 5 OM Group Display

3.6.4.3 Associated functionality codes

None

3.6.4.4 OM group registers logic flow chart

Figure 6 Successful OOB REFER Scenario

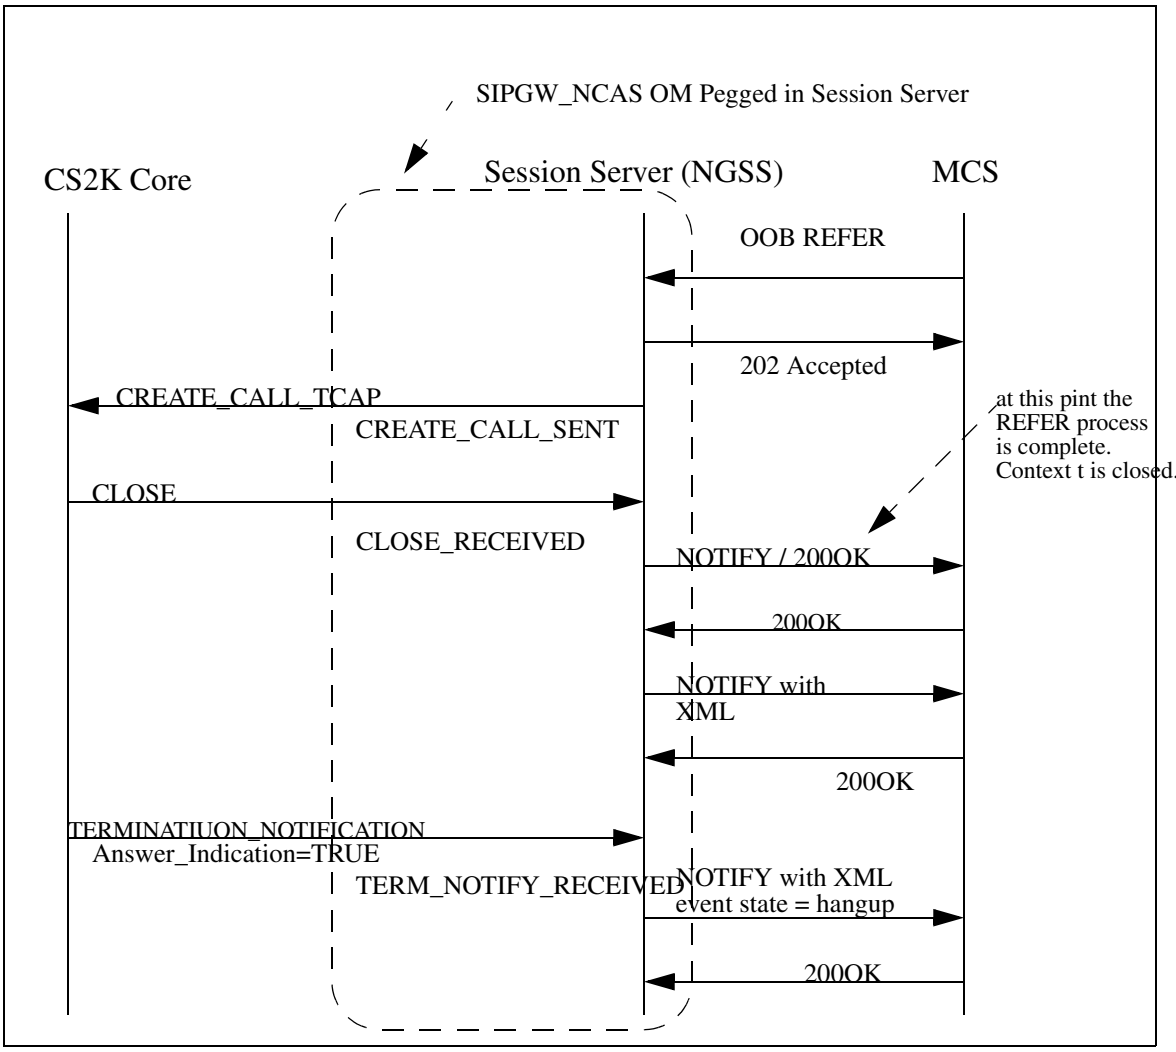

Figure 7 Failure OOB REFER Scenario

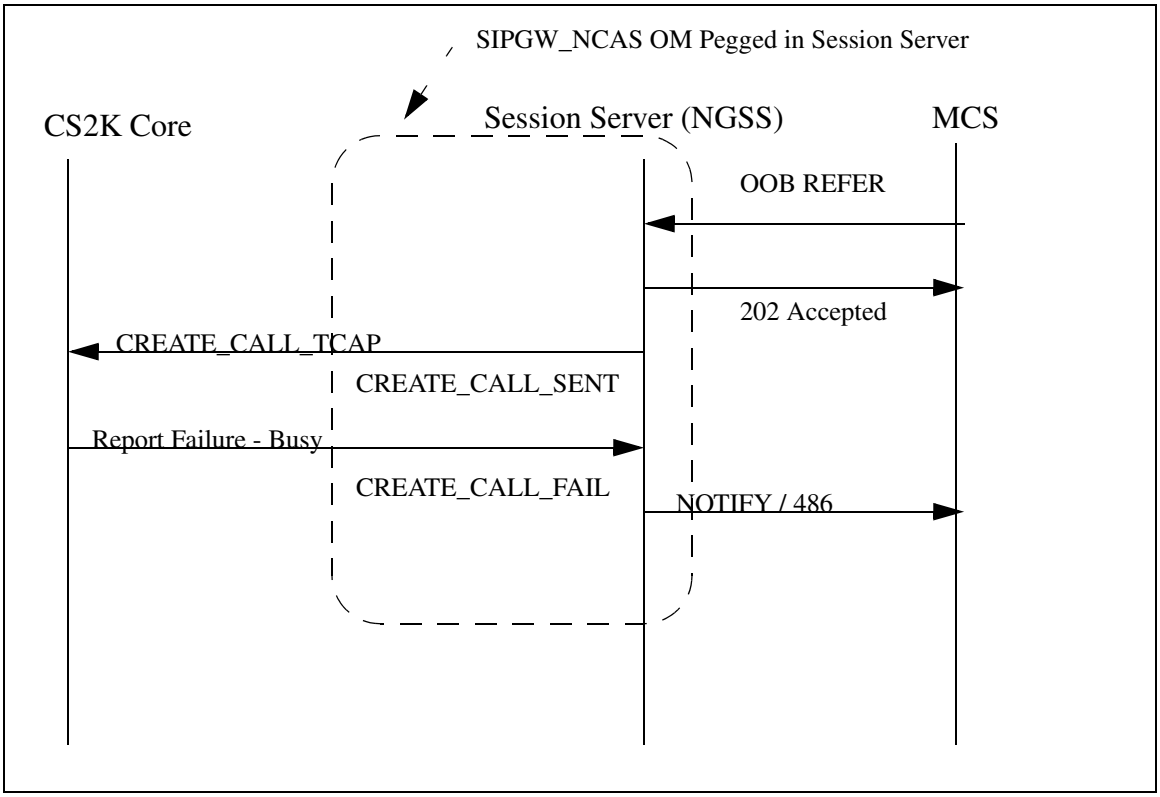

3.6.5 Register CREATE_CALL_SENT

3.6.5.1 Register description

This register is pegged every time a Create_Call is sent to the core over the NCAS link.

3.6.5.2 Register release history update

New in this release

3.6.5.3 Associated registers

REFER_RECEIVED, REFER_ACCEPETD (SIPGW_OOB Group)

3.6.5.4 Associated logs

None

3.6.6 Register CREATE_CALL_FAIL

3.6.6.1 Register description

This register is pegged every time a Create_Call request fails to complete

3.6.6.2 Register release history update

New in this release

3.6.6.3 Associated registers

NOTIFY_REPORT_FAIL (SIPGW_OOB Group)

3.6.6.4 Associated logs

None

3.6.7 Register CLOSE_RECEIVED

3.6.7.1 Register description

This register is pegged every time the Session Server receives a CLOSE msg in response to the Create_Call request

3.6.7.2 Register release history update

New in this release

3.6.7.3 Associated registers

NOTIFY_200OK, NOTIFY_PROCEEDING (SIPGW_OOB Group)

3.6.7.4 Associated logs

None

3.6.8 Register TERM_NOTIFY_RECEIVED

3.6.8.1 Register description

This register is pegged every time the Session Server receives a Terminate_Notification msg from the core

3.6.8.2 Register release history update

New in this release

3.6.8.3 Associated registers

NOTIFY_TERMINATE (SIPGW_OOB Group)

3.6.8.4 Associated logs

None

4: Performance (PF): A00009777

4.1 Feature Name

IEMS Mediant 2000 Integration

4.2 Performance management strategy

IEMS will collect the Performance metrics from the MG 3200 as it is being done for the MS2000 via SNMP. The below mentioned PMs from the acPerfMediaGateway MIB will be included for data collection for MG 3200 device.

The OIDs for which data collection would be done are :

PM Name	OID
Call Processing Performance Management	
acPerfCpNumDupsForCompletedTransactions	1.3.6.1.4.1.5003.10.1.1.1
acPerfCpNumDupsForOutstandingTransactions	1.3.6.1.4.1.5003.10.1.1.2
acPerfCpMessageSendSuccesses	1.3.6.1.4.1.5003.10.1.1.3
acPerfCpMessageSendErrors	1.3.6.1.4.1.5003.10.1.1.4
acPerfCpMessageReceiveSuccesses	1.3.6.1.4.1.5003.10.1.1.5
acPerfCpMessageReceiveErrors	1.3.6.1.4.1.5003.10.1.1.6
acPerfCpProtocolSyntaxErrors	1.3.6.1.4.1.5003.10.1.1.7
acPerfCpMessageRetransmissions	1.3.6.1.4.1.5003.10.1.1.8
acPerfCpMessageMaxRetransmissionsExceeded	1.3.6.1.4.1.5003.10.1.1.9
acPerfCpMessagesFromUntrustedSources	1.3.6.1.4.1.5003.10.1.1.10
RTP Performance Measurements	
acPerfRtpSenderPackets	1.3.6.1.4.1.5003.10.1.2.1
acPerfRtpSenderOctets	1.3.6.1.4.1.5003.10.1.2.2
acPerfRtpReceiverPackets	1.3.6.1.4.1.5003.10.1.2.3
acPerfRtpReceiverOctets	1.3.6.1.4.1.5003.10.1.2.4
acPerfRtpRcvrLostPackets	1.3.6.1.4.1.5003.10.1.2.5
acPerfRtpFailedDueToLackOfResources	1.3.6.1.4.1.5003.10.1.2.6
acPerfRtpSimplexInSessionsTotal	1.3.6.1.4.1.5003.10.1.2.7
acPerfRtpSimplexInSessionsCurrent	1.3.6.1.4.1.5003.10.1.2.8
acPerfRtpSimplexOutSessionsTotal	1.3.6.1.4.1.5003.10.1.2.9

acPerfRtpSimplexOutSessionsCurrent	1.3.6.1.4.1.5003.10.1.2.10
acPerfRtpDuplexSessionsTotal	1.3.6.1.4.1.5003.10.1.2.11
acPerfRtpDuplexSessionsCurrent	1.3.6.1.4.1.5003.10.1.2.12
System Performance Measurements	
acPerfSystemPacketEndpoints	1.3.6.1.4.1.5003.10.1.3.1
acPerfSystemPacketEndpointsInUse	1.3.6.1.4.1.5003.10.1.3.2

A new XML file template containing the above OIDs will be created for the performance collection of MG 3200 and all the necessary changes to include this in collection and report jobs will be done in the IEMS.

MG 3200 Integration A00009777 - DID Document

5: Performance (PF): A00009893

5.1 Feature Name

Session Server Call Processing Overload

5.2 Performance management strategy

OM group SIPGW_OVERLOAD is added to the Session Server to provide statistics related to the resourses that are monitored to determine whether the SIP Gateway application is in overload.

5.3 Performance Measurements (PM), Operational Measurements (OM), and stats

5.3.1 PM, OM, and stats format

Component: SIPGW_OVERLOAD

Performance measurement name: CPU_OCCUPANCY

Performance measurement description: The value calculated for the amount of time the CPU spent performing work as a percentage to its total running time over the last sampling period.

History: created in SN09

Performance Value Range: 0 - 100

Collection Interval: /opt/apps/etc/sipAppEnvVars (numSamples x interval)

OSS delivery (and interface) or Local only: Local

OSS Collection Interval: N/A

Element Manager Screen Name: N/A

File Name: /opt/apps/ngsspm/stdhist/ NGSS.STD_OMs.QoS.<year>.<month>.<day>_<time>_EDT.csv

Memory Usage: 4 Bytes

Component: SIPGW_OVERLOAD

Performance measurement name: CPU_OCCUPANCY_HWM

Performance measurement description: The maximum value calculated for the amount of time the CPU spent performing work as a percentage to its total running time over a 30 minute period. Reset to 0 every 30 minutes.

History: created in SN09

Performance Value Range: 0 - 100

Collection Interval: /opt/apps/etc/sipAppEnvVars (numSamples x interval)

OSS delivery (and interface) or Local only: Local

OSS Collection Interval: N/A

Element Manager Screen Name: N/A

File Name: /opt/apps/ngsspm/stdhist/ NGSS.STD_OMs.QoS.<year>.<month>.<day>_<time>_EDT.csv

Memory Usage: 4 bytes

Component: SIPGW_OVERLOAD

Performance measurement name: GCP_QUEUE_SIZE

Performance measurement description: The size of the GCP queue at the time the last sample was collected.

History: created in SN09

Performance Value Range: 0 - 4,294,967,296

Collection Interval: /opt/apps/etc/sipAppEnvVars (numSamples x interval)

OSS delivery (and interface) or Local only: Local

OSS Collection Interval: N/A

6: Performance (PF): A00012109

6.1 Feature Name

Session Server Shared Library Replacement (SLR) Patching

6.2 Performance management strategy

Unchanged

6.3 Performance management tools and utilities

Unchanged

6.4 Performance Measurements (PM), Operational Measurements (OM), and stats

This activity adds five spare registers to each of the NGSS SIPGW OM groups listed below:

- SIPGW_CALLP
- SIPGW_SERVICES
- SIPGW_MISC
- SIPGW_TLS
- SIPGW_OVERLOAD
- SIPGW_OOB
- SIPGW_NCAS

In addition, the following three spare OM groups are added by this feature:

- SIPGW_SPARE1
- SIPGW_SPARE2
- SIPGW_SPARE3

The spare OM registers and spare OM groups introduced by this activity are reserved for future use.

6.4.1 PM, OM, and stats format

6.4.1.1 SIPGW_CALLP spare OMs

The following table lists the spare registers added to the SIPGW_CALLP OM group.

Table 1 OM Group: SIPGW_CALLP

Register Name	Description
SIPGW_CALLP_SPARE_1	reserved for future use
SIPGW_CALLP_SPARE_2	reserved for future use
SIPGW_CALLP_SPARE_3	reserved for future use
SIPGW_CALLP_SPARE_4	reserved for future use
SIPGW_CALLP_SPARE_5	reserved for future use

6.4.1.2 SIPGW_SERVICES spare OMs

The following table lists the spare registers added to the SIPGW_SERVICES OM group.

Table 2 OM Group: SIPGW_SERVICES

Register Name	Description
SIPGW_SERVICES_SPARE_1	reserved for future use
SIPGW_SERVICES_SPARE_2	reserved for future use
SIPGW_SERVICES_SPARE_3	reserved for future use
SIPGW_SERVICES_SPARE_4	reserved for future use
SIPGW_SERVICES_SPARE_5	reserved for future use

6.4.1.3 SIPGW_MISC spare OMs

The following table lists the spare registers added to the SIPGW_MISC OM group.

Table 3 OM Group: SIPGW_MISC

Register Name	Description
SIPGW_MISC_SPARE_1	reserved for future use
SIPGW_MISC_SPARE_2	reserved for future use
SIPGW_MISC_SPARE_3	reserved for future use
SIPGW_MISC_SPARE_4	reserved for future use
SIPGW_MISC_SPARE_5	reserved for future use

6.4.1.4 SIPGW_TLS spare OMs

The following table lists the spare registers added to the SIPGW_TLS OM group.

Table 4 OM Group: SIPGW_TLS

Register Name	Description
SIPGW_TLS_SPARE_1	reserved for future use

Register Name	Description
SIPGW_TLS_SPARE_2	reserved for future use
SIPGW_TLS_SPARE_3	reserved for future use
SIPGW_TLS_SPARE_4	reserved for future use
SIPGW_TLS_SPARE_5	reserved for future use

6.4.1.5 SIPGW_OVERLOAD spare OMs

The following table lists the spare registers added to the SIPGW_OVERLOAD OM group.

Table 5 OM Group: SIPGW_OVERLOAD

Register Name	Description
SIPGW_OVERLOAD_SPARE_1	reserved for future use
SIPGW_OVERLOAD_SPARE_2	reserved for future use
SIPGW_OVERLOAD_SPARE_3	reserved for future use
SIPGW_OVERLOAD_SPARE_4	reserved for future use
SIPGW_OVERLOAD_SPARE_5	reserved for future use

6.4.1.6 SIPGW_OOB spare OMs

The following table lists the spare registers added to the SIPGW_OOB OM group.

Table 6 OM Group: SIPGW_OOB

Register Name	Description
SIPGW_OOB_SPARE_1	reserved for future use
SIPGW_OOB_SPARE_2	reserved for future use
SIPGW_OOB_SPARE_3	reserved for future use
SIPGW_OOB_SPARE_4	reserved for future use
SIPGW_OOB_SPARE_5	reserved for future use

6.4.1.7 SIPGW_NCAS spare OMs

The following table lists the spare registers added to the SIPGW_NCAS OM group.

Table 7 OM Group: SIPGW_NCAS

Register Name	Description
SIPGW_NCAS_SPARE_1	reserved for future use
SIPGW_NCAS_SPARE_2	reserved for future use
SIPGW_NCAS_SPARE_3	reserved for future use

Register Name	Description
SIPGW_NCAS_SPARE_4	reserved for future use
SIPGW_NCAS_SPARE_5	reserved for future use

6.4.1.8 SIPGW_SPARE1 spare OMs

The following table lists the registers added to the new SIPGW_SPARE1 OM group.

Table 8 OM Group: SIPGW_SPARE1

Register Name	Description
SIPGW_SPARE1_REG_1	reserved for future use
SIPGW_SPARE1_REG_2	reserved for future use
SIPGW_SPARE1_REG_3	reserved for future use
SIPGW_SPARE1_REG_4	reserved for future use
SIPGW_SPARE1_REG_5	reserved for future use
SIPGW_SPARE1_REG_6	reserved for future use
SIPGW_SPARE1_REG_7	reserved for future use
SIPGW_SPARE1_REG_8	reserved for future use
SIPGW_SPARE1_REG_9	reserved for future use
SIPGW_SPARE1_REG_10	reserved for future use

6.4.1.9 SIPGW_SPARE2 spare OMs

The following table lists the registers added to the new SIPGW_SPARE2 OM group.

Table 9 OM Group: SIPGW_SPARE2

Register Name	Description
SIPGW_SPARE2_REG_1	reserved for future use
SIPGW_SPARE2_REG_2	reserved for future use
SIPGW_SPARE2_REG_3	reserved for future use
SIPGW_SPARE2_REG_4	reserved for future use
SIPGW_SPARE2_REG_5	reserved for future use
SIPGW_SPARE2_REG_6	reserved for future use
SIPGW_SPARE2_REG_7	reserved for future use
SIPGW_SPARE2_REG_8	reserved for future use
SIPGW_SPARE2_REG_9	reserved for future use
SIPGW_SPARE2_REG_10	reserved for future use

6.4.1.10 SIPGW_SPARE3 spare OMs

The following table lists the registers added to the new SIPGW_SPARE3 OM group.

Table 10 OM Group: SIPGW_SPARE3

Register Name	Description
SIPGW_SPARE3_REG_1	reserved for future use
SIPGW_SPARE3_REG_2	reserved for future use
SIPGW_SPARE3_REG_3	reserved for future use
SIPGW_SPARE3_REG_4	reserved for future use
SIPGW_SPARE3_REG_5	reserved for future use
SIPGW_SPARE3_REG_6	reserved for future use
SIPGW_SPARE3_REG_7	reserved for future use
SIPGW_SPARE3_REG_8	reserved for future use
SIPGW_SPARE3_REG_9	reserved for future use
SIPGW_SPARE3_REG_10	reserved for future use

6.4.2 Performance File (CSV, SSV, XML) Format

Unchanged

6.4.3 OM Group template (applies only to DMS)

RelDoc Introduction, International

TDM and Carrier VoIP SOFTWARE

PRODUCT COMPUTING MODULE LOAD RELEASE DOCUMENT

(PCL) Release Document

ATTENTION International Customers: Use both parts

The features in this section of the document are specific and exclusive to the International market. Any features that apply to both the North American and International markets are located in the North American section of this document.

This release document is supplied for each Software Stream for the International load. This release document provides software feature information pertinent to the new software load.

A status of DRAFT or PRELIMINARY means the final feature content of the software release has not been finalized and features may be added or deleted without notice. A status of STANDARD indicates that the feature content of the software release is firm.

The release document consists of the following sections:

FEATURE CONTENT
This section provides information concerning TDM and Carrier VoIP system features associated with software releases. Due to process conflicts, information on PVG and MDM features is limited. Each office configuration is customized to meet Telco/Carrier requirements. The following subsections include information necessary to determine that system software changes have occurred since the last software release.

> ***Note:*** Only features NEW or CHANGED in the release(s) covered by the document are included.

CROSS REFERENCE TABLES

This section contains tables to make it more efficient to find information. A description of the tables precedes them.

The following sections provide information necessary to support changes applicable to the new software release. Only features that impact a section category are included; therefore, some sections may be left out of this NTP because none of the features for this release had an impact to that section.

- Functional Descriptions (FN) -summarizes the functions of the feature
- Fault Management (FM)) --indicates major additions/changes to the LOGs and Alarms.
- Configuration (CN) may include information on the following:
  - — Data Schema (DS) -indicates major additions/changes to the Data Schema table
  - — Service Orders (SO) -indicates major additions/changes to the Service Orders
  - — User Interface (UI) - indicates major additions/changes to the User Interface
- Accounting (ACC)
  - — Automatic Message Accounting (AM) -indicates major additions/ changes to the AMA
- Performance (PF) -- indicates major additions/changes to Operational Measurements (OMs) and/or Performance Measurements.

How To Use the Feature Content Section

The feature content software section contains the documentation for the features new or changed in the release. There are tables included to help in the reading of the feature content section.

The items in the tables are feature numbers and feature functional groups. Features are designed by NT against an NT featid.

A functional group is made up of several features.

- Table 1: Feature to Functional Group Cross Reference

  These tables list all International features new to the release that may be included in the release document. The functional group is indicated along with the Nortel featid and its title against which the documentation has been written.

- Table 2: Functional Group to Feature Impacts Cross Reference

  These tables list all documentation listed in the feature content section. As stated above, the documentation is sorted first by feature functional group,

and then by featid within the functional group. This table indicates which sections are included (for example, FM, CN, PF, or ACC) in the release document.

Publication history-International

October 2006

(I)SN09U is an extension of the (I)SN09 software release and supersedes both (I)SN09 and (I)SN09FF for CVoIP applications. (I)SN09 continues to be supported for TDM-only applications. The (I)SN09U software release incorporates all capabilities of (I)SN09, (I)SN09FF, and additional corrective content delivered as part of Nortel's (I)SN09 software robustness program. (I)SN09, (I)SN09FF, and (I)SN09U are valid terms for use within the (I)SN09U software release.

Version 01.04 re-release of Standard for (I)SN09U, combining content from SN09 and SN09FF.

May 2006

Version 01.03 re-release of Standard for (I)SN09FF due to CR changes in the North American section of the document.

April 2006

Version 01.02 Standard release for (I)SN09FF. The following features have been added for the Standard version:

- A00009297, QoSR: Support of AAL2
- A00012291, MG15K Call-waiting Tone Support & Additional International Tones
- A00012847, CS2K DPNSS Message Waiting Indicator for UMS
- A00013286, Core Flex Large Line GWC Prof (Phase 1)

December 2005

Version 01.01 Preliminary release for (I)SN09FF.

(I)SN09U Feature Subset Cross Reference Tables: International Features

Feature to Functional Group Cross Reference

Table 1 shows International feature IDs, feature titles, and the corresponding functional group (under Stream and release).

> ***Note:*** Features available in Nortel's FMDOC library show a version/issue number (i.e., AA05, etc.), while the features obtained from other sources do not have a version/issue number.

For details on specific features, refer to the FN sections.

Featid	Title	Stream and release
Note: Core is comprised of Base/TL, CCM, CNA, CSP, MSH, SHR, and UCS streams.		
A00009024.AA22	ETSI BRI (Basic Rate Interface) on Succession - PhaseI	WT22, GC09
A00009037.AA06	CORE - Enhanced ESA for International MG9000	WT22
A00009039.AA09	International MG9000 Line Test Support	WT22
A00009097	IUP ACI Handling Enhancement	WT22
A00009120.AA17	Multi-Time Zone Enhancments	WT22
A00009143.AA11	FTUP & SPIROU NAOC to VN4/VN6/ETSI PRI & H323 AOC Interworking	GC09
A00009145.AA10	Record Feature Usage	WT22
A00009158.AA04	M3UA over SCTP from Core to USP	Core22
A00009165.AA03	USP - Offline Routesets without Alarms	Core22, USP11
A00009216.AA10	JI-ISUP to Base ETSI ISUP V2 Mapping Enhancement	WT22
A00009228.AA07	International Trunk Interception in CS2K	WT22
A00009245.AA12	Succession Test Trunks: T904 Support	WT22
A00009282	MG9KEM - International ESA and MLPP Support	MG9KEM09
A00009297	QoSR: Support of AAL2	GC09
A00009321.AA15	NMC Code Blocking	WT22
A00009322.AA16	Call Lock and Do Not Disturb Enhancements	WT22
A00009373	Vodafone Portugal 3G Video Features (Interworking)	MCS09
A00009446.AA01	M2UA/SCTP Protocol for PVG SS7 backhaul support	USP11
A00009489.AA11	CHT: Call Waiting Enhancement	WT22
A00010168.AA06	H.323 support for COnnected Line Presentation/ COn-nected Line Restriction (COLP/COLR)	GC09

Table 1 Feature to Functional Group Cross Reference

Featid	Title	Stream and release
Note: Core is comprised of Base/TL, CCM, CNA, CSP, MSH, SHR, and UCS streams.		
A00011363.AA03	International H.323 2CLI (Calling Line Identity) Support	WT22, GC09
A00012291	MG15K Call-waiting Tone Support & Additional International Tones	PVG09.1
A00012349.AA10	U3WC Support For SIP Lines	WT23
A00012477.AA09	Session Initiation Protocol (SIP) Services - Call Completion to Busy Subscriber (CCBS)	WT23
A00012509.AA11	SIP Services Wake up Call Reminder	WT23
A00012510.AA15	SIP Services: Malicious Call Trace	WT23
A00012511.AA10	SIP Services: Payment Ceiling Advice (PCA)	WT23
A00012847.AA06	CS2K DPNSS Message Waiting Indicator for UMS	WT23
A00013275	C&W: CS2M support for variable sized LGRP	CS2M09.1
A00013286.AA12	Core Flex Large Line GWC Prof (Ph1)	Core23

Functional Group to Feature Impacts Cross Reference

Table 2 is organized alphabetically by functional group. Within each group, the features are listed numerically. If a Feature belongs to more than one group, it appears in each group to which it belongs. The table also indicates which sections are included for a given feature (for example, FN, FM, CN, PF, or ACC) in the release document.

Table 2 Functional Group to Feature Impacts Cross Reference

Functional Descriptions (FN)

Introduction

This chapter describes new and changed International features that are planned for this release.

Featid	Title
A00006663.AB02	DDRM Alarms and Audits
A00006664.AB05	DDRM Line Testing
A00006665.AB06	DDRM ESA Support
A00007289.AA06	RT Selector Enhancement for Metering
A00008429.AA09	Ring Back When Free (RBWF) Enhancements
A00008477.AA10	Increase size of table MSGRTE
A00008479.AA05	IP Correlation ID Enhancement
A00008484.AA07	IN Terminating Trigger Feature Interactions
A00008556.AA35	SIP Lines Core OAMP support
A00008721.AA09	DUAL RCO2 Development
A00009024.AA22	ETSI BRI (Basic Rate Interface) on Succession - PhaseI
A00009037.AA06	CORE - Enhanced ESA for International MG9000
A00009039.AA09	International MG9000 Line Test Support
A00009097	IUP ACI Handling Enhancement
A00009120.AA17	Multi-Time Zone Enhancments

A00009143.AA11	FTUP & SPIROU NAOC to VN4/VN6/ETSI PRI & H323 AOC Interworking
A00009145.AA10	Record Feature Usage
A00009158.AA04	M3UA over SCTP from Core to USP
A00009165.AA03	USP - Offline Routesets without Alarms
A00009216.AA10	JI-ISUP to Base ETSI ISUP V2 Mapping Enhancement
A00009228.AA07	International Trunk Interception in CS2K
A00009245.AA12	Succession Test Trunks: T904 Support
A00009282	MG9KEM - International ESA and MLPP Support
A00009297	QoSR: Support of AAL2
A00009321.AA15	NMC Code Blocking
A00009322.AA16	Call Lock and Do Not Disturb Enhancements
A00009373	Vodafone Portugal 3G Video Features (Interworking)
A00009446.AA01	M2UA/SCTP Protocol for PVG SS7 backhaul support
A00009489.AA11	CHT: Call Waiting Enhancement
A00010168.AA06	H.323 support for COnnected Line Presentation/COnnected Line Restriction (COLP/COLR)
A00011363.AA03	International H.323 2CLI (Calling Line Identity) Support
A00012291	MG15K Call-waiting Tone Support & Additional International Tones
A00012349.AA10	U3WC Support For SIP Lines
A00012477.AA09	Session Initiation Protocol (SIP) Services - Call Completion to Busy Subscriber (CCBS)
A00012509.AA11	SIP Services Wake up Call Reminder
A00012510.AA14	SIP Services: Malicious Call Trace
A00012511.AA09	SIP Services: Payment Ceiling Advice (PCA)

A00012847.AA06	CS2K DPNSS Message Waiting Indicator for UMS
A00013275	C&W: CS2M support for variable sized LGRP
A00013286.AA12	Core Flex Large Line GWC Prof (Phase 1)
A00013457	Message Waiting Indication using SIP VM/UM based on RFC 3842 (*FN located in the North American chapter*)

1: Functional Description (FN): A00009037

1.1 Feature name and Feature ID

A00006663 - DDRM ALARMS AND AUDITS

1.1.1 INTRODUCTION

DDRM (DMS Dicle Remote Module) project provides remote LCM node facility to DRX-4 rural exchanges in Turk Telecom network.

This activity handles two components : Alarms and OM & LOGS

- **Component 1. Alarm**

DDRM is capable of detecting and reporting faults for almost all hardware cards. This feature enables to follow up those alarms via OM, LOGs & MAPCI and allows the craftperson to specify the faulty cards remotely. Alarm severity are positioned properly on MAPCI and activate proper processes in DDRM Maintenance SW. Node Status is set to SBSY or ISTB and/or related line states are set to lockout state till the recovery messages are received by DDRM in brief.

Solicited Queries of configurationare made by basic DMS MTC process.

*** RTS:** In test phase all DDRM Alarms are cleared except LC Alarm to refresh permanent alarm conditions in case of any missing recovery messages: **this cleanup is done if only both units are out of service**

Then status of cards datafilled at LCMINV is requested by DMS during test phase. DDRM bundles those status in one ack. response message (implemented ISN08 Activity A00006661). DDRM rescan the alarm conditions and reports all card faulty once it gains the activity.

*** TEST PM:** This clears all DDRM Alarms except LC Alarms on DMS if both unit states are out of service. DDRM reports the mismatch on the configured / datafilled cards at LCMINV in reply. DDRM is expected to produce the current alarm messages if alarm condition remains after INSV state by means of unsolicited messages.

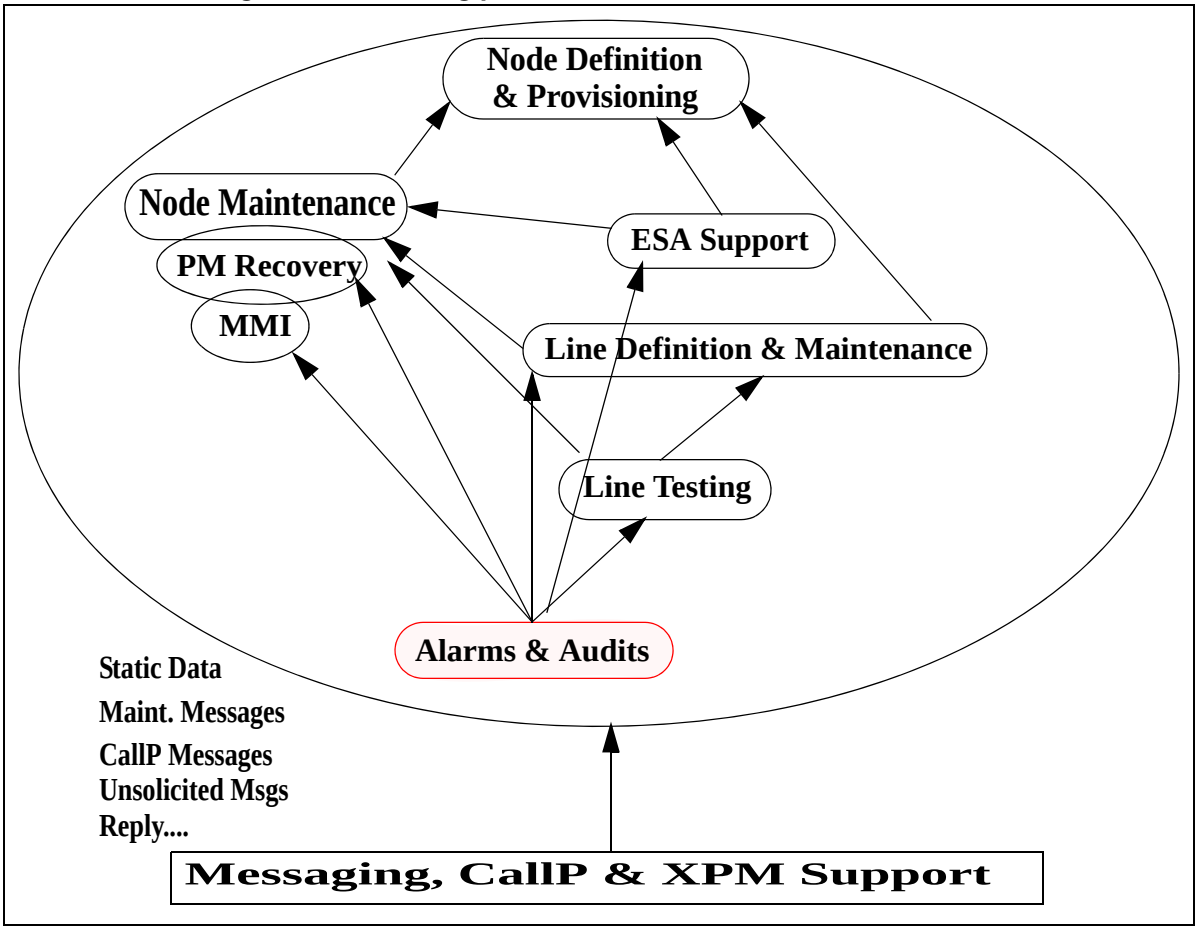
*** AUDIT**: Existing RLCM Node and Line Audits continue to work for DDRM. For babbling faults, DMS Babbling Audit and recovery may commence diagnostic tests for recovery of the alarms if Babbling is reported: DDRM is not capable of reporting babblings on the line at ISN09 but DMS is ready to accept. As such babbling is not testable.

DMS doesn't limit to send existing audits, queries and maintenance messages for DDRM: DDRM is expected to ignore those messages as they are not useless for DDRM.

- **Component 2. OM**

This component aims changes to resuse the existing OM of RLCMs for new RLCM variant - DDRM. Figure 1 on page 20 shows the big picture view and how this part of the project fits in the overall project:

Figure 1 DDRM big picture view



1.1.2 ALARM - GENERIC BEHAVIOUR

The following alarms are reported by DDRM node to DMS:

- Module Alarm
- Card Configuration Alarm
- POC Alarm
- Ring Alarm
- -48v Alarm
- ETM /TBK Alarm

DDRM reports the mismatches during RTS if the configuration data sent by DMS according to the datafill at LCMINV doesn't match the real configuration on DDRM shelfs. Mismatches are registered as an alarm and be monitored by executing Query Fault for posted at MAPCI:MTC:PM Level.

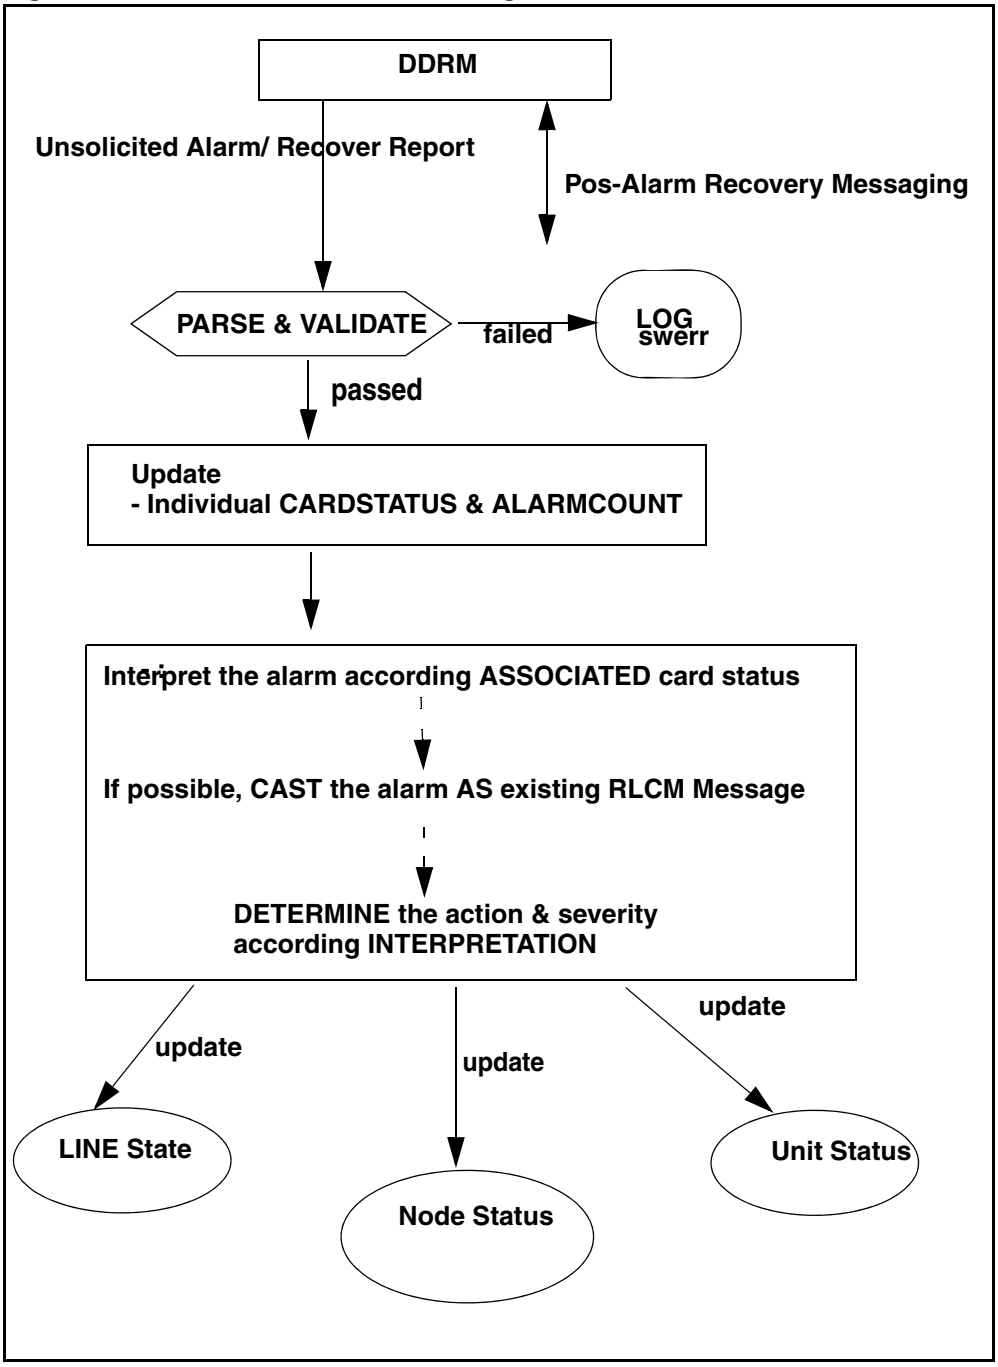
When the reasons occurred on DDRM for those alarms the modified DMS-X / LCM messages are sent to DMS. After the reception of this indication, DMS takes the related actions like changing the state of DDRM and / or changing the state of lines and managing the call processing related facilities etc.

When the reasons which cause the alarms are recovered DDRM sends the modified DMS-X / LCM messages to DMS. After that DMS takes the related actions and the service facilities of DDRM node and it's subscribers continue as expected.

DMS-X/LCM messages conveys the faulty card address as the subject of recovery or alarmed condition.

DMS accept those messages if node state is INSV or ISTB status: **any reports are ignored by DMS for status except of INSV or ISTB status.**

Figure 2 Alarm - Generic Behavior Diagram



1.1.3 Additional Queries By DMS

RTS and TEST PM queries GNS, MXC, UTR, LTT-TMS, D's if those are datafilled at LCMINVproperly (ISN08 MTC Activity).

ISN09 DDRM enables to reports all of alarms once it gains the activity.

RTS failes if bundle ack message includes the alarms which causes a SBSY condition on Node Status. status for these cards: This messaging is done by Test Sub-routine of RTS process, which is also called during TEST PM command.

All alarms are cleared during Test Phase of TST./RTS/or SBSY->RTS transition if node status is not ISTB/INSV.

Other queries are relevant with Node Audit and Line Diagnostics: those audits may enable DDRM to rescan the alarms and report unsolicited (not expected as reply against audit/recover messages) if the need is raised.

1.1.4 Alarm Conditions and Severity Map

Table on page 24 gives the problem reasons which cause alarms, their severity class, the state of DDRM after reception of the alarm and the existence of a recovery message for them, as described at DMS_DDRM Spec. Document at FMDOC.

Any individual module alarm does not reveal a problem associated with single or both units of DDRM. For example an MXC controls the LCs on its shelf and each shelf contains odd and even subdrawers (equivalent 4xLC = 1 Subdrawer of an standard LCM), where RLCM even drawers are controlled by unit0 whilst odds are under control of unit1. So an individual MXC cannot indicate a single unit problem.

When a alarm occurs for DDRM node it is shown on DMS MAP level. For the display of alarms on DMS MAP level see section.

Table 1: Alarm - Severity

Card problems & subscriber alarms on DDRM	Alarm severity Class			Modified DMS-X/ LCM report message (From DDRM)	DDRM state	Modified DMS-X/ LCM Recovery message (From DDRM)	Remarks
Card problems on DDRM	**Critical**	**Major**	**Minor**				
Last GNS Card (single and double plane)	+			+	SYSB	+	
One GNS Card (double plane)		+		+	ISTB	+	Both units of DDRM is INSV.
One DTC card (for 2 DTC configuration)		+		+ [1]	ISTB	-	The DDRM unit which is connected to the DTC card with problem is in SYSB state and DDRM is in take-over mode. The other unit is in INSV and DDRM state is ISTB. Any clean-up is not expected on SYSB unit because DDRM is ISTB state. The existing calls which are connected through this DTC should be released by DDRM / DMS. If there is no problem with E1 links then they are taken from the service.

Table 1: Alarm - Severity

Card problems & subscriber alarms on DDRM	Alarm severity Class			Modified DMS-X/ LCM report message (From DDRM)	DDRM state	Modified DMS-X/ LCM Recovery message (From DDRM)	Remarks
Card problems on DDRM	Critical	Major	Minor				
Last DTC card	+			+ [2]	CBSY/ SYSB	NA	The alarm report message is expected if there is at least one E1 available.
One MXC card		+		+	ISTB	+	The subscribers on the same shelf with this MXC card are not given any service facilities and their state are set to LO. DDRM state is ISTB. LTT / TMS, UTR, POC & RG cards on the same shelf are assumed as out of service even if there are no alarm messages specific for these cards. If LTT / TMS cards are on the same shelf then MTA tests are affected for all subscribers
Last MXC card	+			+	SYSB	+	

Table 1: Alarm - Severity

Card problems & subscriber alarms on DDRM	Alarm severity Class			Modified DMS-X/ LCM report message (From DDRM)	DDRM state	Modified DMS-X/ LCM Recovery message (From DDRM)	Remarks
Card problems on DDRM	Critical	Major	Minor				
One UTR card			+	+	ISTB	+	
Last UTR card		+		+	ISTB	+	
LTT - TMS card		+		+	ISTB	+	The messages are received separately for each card.

Table 1: Alarm - Severity

Card problems & subscriber alarms on DDRM	Alarm severity Class			Modified DMS-X/ LCM report message (From DDRM)	DDRM state	Modified DMS-X/ LCM Recovery message (From DDRM)	Remarks
Card problems on DDRM	Critical	Major	Minor				
One POC card			+[3]	+	ISTB	+	The POC card alarm can not be provided from DDRM for standby POC card. **So when a problem occurs on the standby POC card** the alarm severity class is based on MXC and GNS cards. But for any reason a POC alarm about the standby card is received but any other alarm message e.g. like MXC on this shelf is not received standby POC alarm is seen on DMS MAP but subscribers are expected to continue their service facilities as before this alarm. If there is not any Critical alarm reason then DDRM state is ISTB.

Table 1: Alarm - Severity

Card problems & subscriber alarms on DDRM	Alarm severity Class			Modified DMS-X/ LCM report message (From DDRM)	DDRM state	Modified DMS-X/ LCM Recovery message (From DDRM)	Remarks
Card problems on DDRM	Critical	Major	Minor				
Last POC card	+			NA	SYSB	NA	When a problem on last POC card occurs E1 links are went down and the problem can not be reported.*DDRM node is restarted*. If this alarm is received because of any reason but not any other alarm condition (e.g about DTC,MXC & GNS) occurs then POC alarm is received by DMS but subscribers are expected to continue their service facilities as before this alarm.
One -48V input			+	+	ISTB	+	

Table 1: Alarm - Severity

Card problems & subscriber alarms on DDRM	Alarm severity Class			Modified DMS-X/ LCM report message (From DDRM)	DDRM state	Modified DMS-X/ LCM Recovery message (From DDRM)	Remarks
Card problems on DDRM	**Critical**	**Major**	**Minor**				
2nd -48v	+			NA	SYSB	NA	When the 2nd -48v problem occurs E1 links are went down and the 2nd 48v problem can not be reported. If this alarm is received because of any reason but not any other alarm condition (e.g about DTC,MXC & GNS) occurs then -48v alarm is received by DMS but subscribers are expected to continue their service facilities as before this alarm.
Ringing generator on one POC card			+	+	ISTB	+	
Ringing generator on standbyPOC card		+		+	ISTB	+	
Last ringing generator on POC card	+			+	ISTB	+	
Subscriber alarms on DDRM [4]							

Table 1: Alarm - Severity

Card problems & subscriber alarms on DDRM	Alarm severity Class			Modified DMS-X/ LCM report message (From DDRM)	DDRM state	Modified DMS-X/ LCM Recovery message (From DDRM)	Remarks
Card problems on DDRM	Critical	Major	Minor				
Line is defined but there is no H/W				+	Not affected	+	
Line is defined but there is wrong card				+	Not affected	+	
Hazard / Babbling				+	Not affected	+	

Table 1: Alarm - Severity

Card problems & subscriber alarms on DDRM	Alarm severity Class			Modified DMS-X/ LCM report message (From DDRM)	DDRM state	Modified DMS-X/ LCM Recovery message (From DDRM)	Remarks
Card problems on DDRM	Critical	Major	Minor				
ETM card		+		+	ISTB	+	If there is no ETM option datafill on DMS then DDRM does not send this alarm even if ETM module exists and / or it has a problem. If there is ETM option datafill on DMS but there is no ETM module on DDRM or there is a problem with it then ETM alarm is sent by DDRM. In this case test facilities are not supported for DDRM. The test attempts are failed and a proper prompt is given on DMS.
TBK card			+	+	ISTB	+	The message is received separately for each TBK card including the status of all TBK cards.

Note 1: If the DTC alarm message is received and there is no E1 link problem between this DTC card and DMS the alarm report message is expected from both units. The existing calls which are connected by this DTC card are released **by DDRM / DMS.** The related E1 links are taken from the service for not to assign a speech channel through them.

Note 2: The alarm report message is expected for the last available DTC card if there is at least one available E1 link.

Note 3: It is a Critical alarm for a single plane configuration.

Note 4: Subscriber alarm is expected for the cases; a- during the initializing phase b-RTS DRWR command c-TST DRWR command d-card out. The alarm severity class of the defined conditions for DDRM subscribers are based on the existing threshold value criteria on DMS as office based.

1.1.5 Module Alarm: GNS

If the CPUs can not be communicated on DDRM node, DMS is informed via the modified DMS-X / LCM message which is sent from DDRM. The CPUs can be on MXC, DTC and GNS cards of a DDRM node. The effect of the alarm changes based on the card type of CPU.
These type of problems are recovered on DDRM node itself.

DDRM is expected to drop the calls which are controlled with GNS in alarmed condition.

If the problem is with one of GNS card then DDRM node is out of order unless there is no standby of GNS card. If there is a standby GNS (double plane configuration) then the service facilities are given to the related modules over the standby GNS. The priority of the alarm is identified based on the message is for the last available GNS or not.

For "double plane" configuration;

- If modified DMS-X / LCM message is received for one of GNS card it means **a Major PM** alarm for DMS. A major alarm indication is seen on DMS and the state of DDRM node is changed to **ISTB** while both units are in INSV. The service facilities of DDRM subscribers are not effected. When the problem with GNS card is recovered then DDRM sends a new defined DMS-X / LCM message to DMS. If there is not another alarm or problem, "Major PM" alarm indication is cleared on DMS MAP and the state of DDRM node is changed to INSV again.
- If the 2nd of modified DMS-X / LCM message is received for the remaining GNS card it means a **Critical PM** alarm for DMS. A critical alarm indication is seen on DMS and the state of DDRM node is changed as **SYSB** on DMS. DDRM node stays in SYSB state until a message about the recovery of at least one GNS card is received. The existing procedures

on DMS for a critical PM alarm on a remote node is valid (call processing stops, state changes of DDRM node and its' subscribers etc). If at least one of GNS card problem is recovered DDRM sends a new defined DMS-X / LCM message to DMS. After that if there is not another alarm or problem, the state of DDRM is returned to ISTB from SYSB. If the problem with the 2nd GNS card is also recovered then the state of DDRM is changed to INSV from ISTB . Call processing and other service facilities continue as expected.

For "single plane" configuration if the modified DMS-X / LCM message is received for the problem on GNS card it means a **Critical PM** alarm for DMS. A critical alarm indication is seen on DMS and the state of DDRM node is changed as **SYSB** on DMS. DDRM node stays in SYSB state until a message about the recovery of the GNS card is received. The existing procedures on DMS for a critical PM alarm on a remote node is valid (call processing stops, state changes of DDRM node and its' subscribers etc)

When the problem is recovered then DDRM sends a new defined DMS-X / LCM message to DMS. If there is not another alarm or problem, **Critical PM** alarm indication is cleared on DMS MAP and the state of DDRM node is changed to INSV again.

The details of this alarm is queried via "QueryPM FLT" command on PM level.

1.1.6 Module Alarm : MXC

If there is a problem with MXC card then the subscribers which are on the same shelf with this MXC are not given any service. It means a **Major PM** alarm for DMS. DMS changes the state of DDRM node to **ISTB**.

*A*ll lines (LMB) , UTR , LTT, TMS , POC and RG cards on the shelf are out of service along the period of alarmed condition. The service facilities for the subscribers which are controlled by MXC cards on other shelves continue without any interruption.

MXC Alarms raise LC alarms on the shelf of the alarmed MXC and all datafilled lines on the shelf goes to LO until recovery of MXC alarms.

For all card alarms are displayed as MXC Alarmed once Query LC command is executed. All application that utilize utr ,ltt-tms functions are expected to check MXC alarms first : if MXC is alarmed, the application assume that other cards relevant with the shelf of MXC alarmed are out of service.

If MXC alarm is recovered , all LC alarms of the cards that equipped on the shelf of MXC are cleared at DMS, all equipped/datafilled lines goes to IDLE. Other card status are returned to the status that is set prior to MXC Alarm. And DDRM is expected to reports the alarms after rescan is done once MXC recovers on DDRM. (LTT/TMS, UTR, POC and RG) .

The modified DMS-X / LCM message is seperately received for each MXC card problem and DDRM state is ISTB. If all MXC cards on a DDRM node have problem then all subscribers are effected and it means a **Critical PM** alarm for DMS. The state of DDRM node is changed as SYSB on DMS. The existing behaviors of DMS will be kept for line states.

When the problem with the MXC card is recovered DDRM sends the modified DMS-X / LCM message to DMS. This message is seperately sent for each MXC card. After that if there is not another alarm or problem the line states of subscribers are changed automatically and the service facilities of subscribers which are controlled by this MXC are started. The state of DDRM node stays in ISTB until the problems for all MXC cards are recovered in case that no another ISTB reasons exist.

The details of this alarm is queried via "QueryPM FLT" command on PM level. All cards are displayed as MXC Alarm or the current alarms are masked with MXC Alarm when DDRM reports MXC Alarm exception message. Upon receiving Recover Message, masks on the current alarms disappeared and previous alarm are displayed if no recover message is received regarding to the previous alarm.

1.1.7 DTC Problems

1.1.7.1 DTC Hardware and Setup Configuration on DDRM

The sharing of E1 link indexes according to 2 DTC card and 4 E1 link configuration on DDRM :

- **The E1 links with 0th and 2nd indexes** are connected to DTC 0 and they are assumed as Unit 0. The 1st channel of E1 primary link (with 0th index) is the messaging channel.
- **The E1 links with 1st and 3th indexes** are connected to DTC 1 and they are assumed as Unit 1. The 1st channel of E1 primary link (with 1th index) is the messaging channel.

The number of message channels for DDRM are based on DTC card configuration as defined below;

- **2 DTC card with 2 / 1 E1 links -** Each DTC has one message channel and each DTC card means a unit of DDRM node
- **1 DTC with 2 E1 links -** This DTC card has two message channels and each E1 means a unit of DDRM node
- **1 DTC with 1 E1 link -** This DTC card has one message channel and only one unit of DDRM is in-service. This means that DDRM node is in takeover mode.

At least one DTC is expected on DDRM side. If one of two messaging channels are full then takeover occurs and the subscribers on this unit are given their service facilities over the other units' message channel. If the speech channels of a unit is full other unit's speech channels are used. But its' message channel is in-service and DMS sends the messages over the available 2 message channels.

See Table 2 on page 36 for the number of E1 link and message channels based on the relation between DMS datafill and DDRM configuration.

Table 2: DDRM units based on the DTC & E1 datafill on DMS and DDRM configuration Table 1

DMS datafill	DDRM config	DDRM Unit 0	DDRM Unit 1	Remarks
DTC 0 : 2 E1 DTC 1 : 2 E1	DTC 0 : 2 E1 DTC 1 : 2 E1	INSV (One message channel & 2 E1 link)	INSV (One message channel & 2 E1 link)	
DTC 0 : 1 E1 DTC 1 : 2 E1	DTC 0 : 1 E1 DTC 1 : 2 E1	INSV (One message channel & 1 E1 link)	INSV (one message channel & 2 E1 link)	
DTC 0 : 1E1 DTC 1 : 1 E1	DTC 0 : 1E1 DTC 1 : 1 E1	INSV (one message channel & 1 E1 link)	INSV(one message channel & 1 E1 link)	
DTC 0 : 2 E1 DTC 1 : 1 E1	DTC 0 : 2 E1 DTC 1 : 1 E1	INSV (one message channel & 2 E1 link)	INSV (one message channel & 1 E1 link)

DTC 0 : 2 E1 DTC 1 : 2 E1	DTC 0 : 1 E1 DTC 1 : 1 E1	ISTB (One message channel & 1 E1 link	ISTB (One message channel & 1 E1 link)	DDRM does not send an E1 alarm for DTC 0 & DTC 1.
DTC 0 : 2 E1 DTC 1 : 2 E1	DTC 0 : 1 E1 DTC 1 : 2 E1	ISTB (One message channel & 1 E1 link)	INSV (One message channel & 2 E1 link)	DDRM does not send an E1 alarm for DTC 0.

Table 1

DMS datafill	DDRM config	DDRM Unit 0	DDRM Unit 1	Remarks
DTC 0 : 2 E1 DTC 1 : 2 E1	DTC 0 : 2E1 DTC 1 : 1E1	INSV (one message channel & 2 E1 link)	ISTB (One message channel & 1 E1)	DDRM does not send an E1 alarm for DTC 1.
DTC 0 : 2 E1 DTC 1 : -	DTC 0 : 2 E1 DTC 1 : 2 E1 / 1 E1/ -	INSV (one message channel & 1 E1 link)	INSV (one message channel & 1 E1 link	Both E1 links should be connected to DTC 0. DTC 1 is not configured on DDRM.
DTC 0 : 2 E1 DTC 1 : -	DTC 0 : 1 E1 DTC 1 : 2 E1 / 1 E1/ -	ISTB (one E1 is available & 1 E1 link)	MANB / CBSY	E1 link should be connected to DTC 0. DDRM does not send an E1 alarm for DTC 0. DTC 1 is not configured on DDRM.
DTC 0 : 1 E1 DTC 1 : -	DTC 0 : 2 E1 DTC 1 : 2 E1 / 1 E1 / -	ISTB (one mesage channel & 1 E1 link)	MANB / CBSY	DTC 1 is not configured on DDRM.
DTC 0 : - DTC 1 : 2 E1	DTC 0 : 2 E1 / 1 E1 / - DTC 1 : 2 E1	INSV(One message channel & 1 E1 link)	INSV (one message channel & 1 E1 link	Both E1 links should be connected to DTC 1. DTC 0 is not configured on DDRM.
DTC 0 : - DTC 1 : 2 E1	DTC 0 : 2 E1 / 1 E1 / - DTC 1 : 1 E1	MANB / CBSY	ISTB (one message channel & 1 E1 link)	E1 link should be connected to DTC 1. DDRM does not send an E1 alarm for DTC 1. DTC 0 is not configured on DDRM.
DTC 0 : - DTC 1 : 1 E1	DTC 0 : 2 E1 / 1 E1 DTC 1 : 2 E1	MANB / CYSB	ISTB (one message channel & 1 E1 link	E1 link should be connected to DTC 1. DTC 0 is not configured on DDRM.

Table 1

DMS datafill	DDRM config	DDRM Unit 0	DDRM Unit 1	Remarks
DTC 0 : - DTC 1 : -	**Not allowed configuration on DMS**			

ISN09 Table Control SW is enhanced and new optional keys are defined to configure DTC cards. New tuple will be in following format :

DTC0/1_values can be 0, 1, 2 as corresponding to SINGLE, DOUBLE, NONE in order.

DDRM needs two messaging channels at least. LCMINV allows user to datafill C-side ports of DDRM connected to PLGC and forced to datafill the first two ports. Those two ports are indicated as Messaging E1 and carry the messaging channel for units , seperately. E1-0 for unit0 , E1-1 for unit1.

At least one DTC must be datafilled otherwise add/change fails in datafill on LCMINV.

When DTC0=0/2 (Single/None) and DTC1=2/0 (None/Single,) Table Control SW produces a warning ('UNIT-.... CANNOT BE INSV/ISTB') & ('UNIT-.. TAKEOVER') accordingly.

New enhancements allows user to define DTC Number and Channel Configuration as shown below :

Table 3: LCMINV DTC vs Channel Configuration

DTC0	DTC1	DTC0 1th E1	DTC0 2nd E1	DTC1 1th E1	DTC1 2nd E1
DOUBLE	-	M	M	-	-
-	DOUBLE	-	-	M	M
DOUBLE	DOUBLE	M	S	M	S
DOUBLE	SINGLE	M	S	M	-
SINGLE	DOUBLE	M	-	M	S
SINGLE	SINGLE	M	-	M	-

Table 3: LCMINV DTC vs Channel Configuration

DTC0	DTC1	DTC0 1th E1	DTC0 2nd E1	DTC1 1th E1	DTC1 2nd E1
SINGLE	-	M	-	-	-
-	SINGLE	-	-	M	-

SINGLE : it present capacity covering 1 message channel and 29+30= 59 Speech Channels on the DTC (with HDLC)

DOUBLE: It presents the capacity covering 2 Message Channels and 29+29 Speech Channels on the 2xE1 DTC (with HDLC)

M : Messaging Channel

S: Speech Channel

DDRM has configured the channels according to the above table during RTS. If no DTC card exists on the slot phsically against the configuration, no alarm is needed to fail the RTS for unit : it is expected that DMS cannot communicate with DDRM and RTS cannot start for this specific unit.

RTS fails for the unit for which DTC Mismatch is reported. RTS logs the fail reason for related DTC.

1.1.7.1 DTC Alarm Handling

DTC Unsolcited Exception Reports cause to log the alarm and display via QueryPM FLT on DMS. Each DTC Alarm causes to down the relevant unit according to the datafill in LCMINV. Recovery message causes to cleanup the alarm : closed E1s are opened within the system recovery started by DMS.

An special (rare) exceptional condition may occur when any DTC loss the connection with other module cards : in this case DDRM is expected to close the M+S Channels of unit which the DTC is alarmed and associated with for that reason. DDRM needs to know this condition and doesnt produce virtual module alarms. DMS needs to close this link so this can be achieved to stop the carrier maintenance on this E1 so DMS disconnects the existing calls in TakeOver mode. If other DTC detects this special condition on the DTC and sent the DTC alarm , DMS will drop the unit and takeover is realized.

For the configurations with 2 DTC cards if there is a problem with one of DTC card the service facilities for DDRM node and its' subscribers are given through the remaining DTC card. It means a **Major PM** alarm for DMS. The related unit of DDRM is set to CBSY / SYSB and the state of DDRM node is changed to **ISTB**. When the problem is recovered the recovery alarm message is sent from DDRM through the available DTC card. If there is not another alarm or problem the state of DDRM node is changed to INSV again.

In case the alarm message is received for the 2nd or for the last available DTC card this means a **Critical PM** alarm for DMS. The state of DDRM node is changed to CBSY / SYSB. If it is allowed on DMS and at least one UTR card is available, ESA-mode is entered on DDRM node.The recovery alarm message is not expected for the first DTC availability. In this case the general DMS-X/ LCM messaging is expected during E1 link alignment as in the existing structure and ESA-Exit procedure is performed. But for the 2nd DTC availability the recovery message is sent through the DTC card which is given into the service previously. If there is not other alarm or problem the critical alarm indication on DMS MAP is cleared. The state of DDRM node is changed to INS.

When DTC card alarm is received and if there is no E1 link problem between this DTC card and DMS the existing calls which are already established through this DTC card are released by DMS / DDRM. Also the related E1 links are taken from the service for not to assign a speech channel.
The details of this alarm is queried via "QueryPM FLT" command on PM level.

1.1.8 Card configuration Alarms

In generic this type of alarm is reported for the problems on peripheral cards of a DDRM node. LC, LTT-TMS and UTR cards are used as peripheral cards. These type of problems are recovered on DDRM node itself.

This message identifies the shelf and slot number and it means a **Major PM** alarm for DMS. A major alarm indication is seen on DMS and the state of DDRM node is changed to **ISTB**. The service facilities of DDRM subscribers are not effected except MTA test facilities.

When the problem with the LTT -TMS cards is recovered then DDRM sends the modified DMS-X / LCM message to DMS. If there is not another alarm or problem, the alarm indication on DMS MAP is cleared and the state of DDRM node is changed to INSV. After that MTA test facilities can be run again for DDRM subscribers.

The details of this alarm is queried via "QueryPM FLT" command on PM level. MTA tests which require LTT-TMS in are effected.

If the UTR cards on DDRM are not on the same slots which are configured on DMS DDRM sends the modified DMS-X / LCM message. This message identifies the shelf and slot number of UTR Card and it means a **Minor PM** alarm for DMS. A minor alarm indication is seen on DMS and the state of DDRM node is changed to **ISTB**. The service facilities of DDRM subscribers are not effected. This modified DMS-X / LCM message is seperately received for each UTR card.

When the message is received for the last remaining UTR card then the services which are given in ESA-mode are effected. It means a **Major PM** alarm for DMS. A major alarm indication is seen on DMS MAP and the state of DDRM node is changed to ISTB.

When the problem with UTR card is recovered then DDRM sends the modified DMS-X / LCM message to DMS. If there is not another alarm or problem, the indication on DMS MAP is cleared and the state of DDRM node is changed to INSV.
MXC recovery also cleanup the LTT , TMS, UTR and LC alarms if those cards are placed on the shelf of MXC.

The details of this alarm is queried via "QueryPM FLT" command on PM level.

LC Card faults :

The card configuration of DDRM node is sent from DMS during the initializing phase. Based on this information DDRM knows the occurance of the below cases and informs DMS via a modified DMS-X / LCM message for both conditions;

- The line is defined but there is no H/W on LC slot (**etc: card-out**)
- The line is defined but there is a wrong card on LC slot (eg. UTR or LTT / TMS)

The LC Message has not include any information of above conditions. DMS treat this alarm message as Missing Card Alarm Exception in DMS and MCARD RLCM Line Fault Alarm is raised. Existing RLCM Missing Card Alarm thresholds are kept.

When this message is received from DDRM the states of related lines will be set as LO on DMS
This alarm is also sent;

- during the initializing
- at the end of RTS drwr
- at the end of TST DRWR
- when the card is out of the LC slot

This message identifies the shelf and slot number of LC for 8 ports. When this message is received from DDRM node it causes LO for the lines on the LC of the message.

As an unexpected case if the line states can not be set to LMB because of any reason after the reception of this message from DDRM then the incoming call attempt to this subscriber is ended with **"Ring Failure"** message by remote node as response to **"Ring Request"**. Also DMS Line Audits follows the status of Line.

The details of this alarm is queried via "QueryPM FLT" command on PM level.

Upon receiption of LC Recovery message LO Lines returns to IDLE and ready for new calls.

1.1.9 POC alarm

This alarm indicates that the DC voltage level failure on POC card.

The modified DMS-X / LCM message is sent from DDRM and this message identifies shelf number of the POC card. When this message is received it means that there is no standby of +/-5v, +/-12v and -48v between two shelves. It is a Minor PM alarm for DMS. A Minor PM alarm indication is seen on DMS and the state of DDRM node is changed to ISTB.

Generally shelf 1 - shelf 2 and shelf 3 - shelf 4 have standby facility for each other.

This alarm is not service efective and service facilities are not impacted for DDRM node and its's subscribers unless the standby POC card has a problem.

If both POC cards are alarmed, then the subscribers which are on the same shelves with POC cards are not given any service facilities. In this case DDRM does not send standby POC alarm but sends a Module alarm for MXC cards on the same shelves. If both POC alarms are received for one unit, it means that one of those cards has virtual alarm since POC Alarm circuit can be broken for any reason.

If GNS cards are on the same shelves with these POC cards which have the problem then Module Alarm for GNS cards are received as well. Alarm severity class for MXC and GNS cards are valid.

If POC alarm for standby POC card is received because of any reason but not any other alarm condition (e.g about DTC,MXC & GNS) occurs then POC alarm is received by DMS but subscribers are expected to continue their service facilities as before this alarm. In this case craftperson is required to check the circuits before deciding to take the alarmed POCs off.

If the problem occurs on the last available POC card then the modified DMS-X / LCM message can not be reported because E1 links go down. It means a Critical PM alarm for DMS and DDRM state is SYSB.

These type of problems are recovered on DDRM node itself. When the problem is recovered DDRM sends the modified DMS-X / LCM message to DMS if there is not another alarm or problem. The alarm indication on DMS MAP level is cleared .For the modified message format of these alarm and their recovery message see Appendix chapter of DMS_DDRM.

If a MXC recovery message for the alarmed MXC card which is on the same shelf with POC card is received then POC card alarm is reseted on DMS. In case the continuity of POC card alarm DDRM sends this alarm to DMS again.

1.1.10 - 48 v alarm

There are two -48v input of DDRM node and they have standby facility for each other. This alarm indicates that there is a problem with one of -48v inputs and its' standby facility does not exist.

DDRM sends the modified DMS-X / LCM message and it means a Minor PM alarm for DMS. A Minor PM alarm indication is seen on DMS and the state of DDRM node is changed to ISTB.

This alarm is not service effective and service facilities are not impacted for DDRM node and its's subscribers unless the standby -48v input has a problem.

If both cards are reported as alarmed, the modified DMS-X/LCM message can not be reported because E1 links go down and a Critical PM alarm is seen on DMS. The state of DDRM node is changed to SYSB on DMS MAP level.
If -48v input alarm for standby is received because of any reason but not any other alarm condition (e.g about DTC,MXC & GNS) occurs then this alarm is received by DMS but subscribers are expected to continue their service facilities as before this alarm. DMS will clear the alarm when standby 48V alarm recovery message is sent by DDRM while node status is ISTB/INSV.

These type of problems are recovered on DDRM node itself. When the problem with one of -48v input is recovered DDRM sends the modified DMS-X / LCM message to DMS.If there is not another alarm or problem the alarm indication on DMS MAP level is cleared and the state of DDRM is changed to INSV.

The recovery message is not expected from DDRM for the 2nd -48v input problem in case of all E1s are down since SBSY Test Phase clear all the alarms and node will have INSV if all 48V alarm conditions are remove. Generally, DDRM is expected to rescan the alarms after it gains the activity with RTS.

MXC recovery cleanup the 48V alarms.

1.1.11 Ring alarm

POC cards on DDRM node provide Ringing as well. POC cards on shelf 1-shelf 2 and shelf 3 -shelf 4 have standby facility for each other. If there is a problem with a Ring Generator of these POC cards then the alarm is generated. DDRM sends the modified DMS-X / LCM message and it means a **Minor PM** alarm for DMS. A **Minor PM** alarm indication is seen on DMS and the state of DDRM node is changed to ISTB.

This alarm is not service effective and service facilities are not impacted for DDRM node and it's subscribers unless the standby card has a Ringing generator problem. If then a 2nd Ring alarm is received from DDRM and it means a **Major PM** alarm for DMS. DDRM state is ISTB at this condition and ***continue to give service to the lines even if terminations are without ring.***

In this case the subscribers which are on the same shelf are not given Ringing facility. There is not a direct relation with Ringing Generator problem and MXC, GNS alarms.
If all Riging Generators have problem for ringing application then it means a **Critical PM** alarm for DMS.

These type of problems are recovered on DDRM node itself. When the problem is recovered DDRM sends the modified DMS-X / LCM message to DMS. The alarm indication on DMS MAP level is cleared (If there is not another alarm or problem).
The details of this alarm is queried via "QueryPM FLT" command on PM level.

1.1.12 ETM / TBK Alarms

For the problems with ETM card and for its recovery the modified DMS-X / LCM messages are sent from DDRM.

If there is ETM option datafill on DMS but there is no ETM module on DDRM or there is a problem with it then ETM alarm is sent by DDRM. When this alarm message is received it means a **Major PM** alarm for DMS. A Major alarm indication is seen on DMS and the state of DDRM node is changed to ISTB. The test facilities are not supported for DDRM. If a test is attempted on DMS a proper prompt is given on DMS.

If there is no ETM option datafill on DMS then DDRM does not send this alarm even if ETM module exists and / or it has problem.

When the problem with ETM is recovered then DDRM sends the modified DMS-X / LCM message to DMS. If there is no another alarm or problem the alarm indication on DMS MAP is cleared and the state of DDRM node is changed to INSV. After that MTA test facilities can run again for DDRM subscribers.

The details of this alarm is queried via "QueryPM FLT” command on PM level.

If a TBK card is not on the slot or there is a problem with a TBK card then modified DMS-X / LCM message is received from DDRM. This message identifies TBK card number and it means a **Minor PM** alarm for DMS. A Minor alarm indication is seen on DMS and the state of DDRM node is changed to ISTB. This modified DMS-X / LCM message is seperately received for each TBK card. If a test is attempted on DMS then a failure prompt is given with a proper and existing reason on DMS. If a test is attempted a failure prompt with a proper and existing reason is given on DMS.

The service facilities of DDRM subscribers are not effected except MTA test facilities.The line test facilities are not supported for the related line cards.

When the problem with TBK card is recovered then DDRM sends the modified DMS-X / LCM message to DMS. If there is no another alarm or problem the alarm indication on DMS MAP is cleared and the state of DDRM

node is changed to INSV. After that MTA test facilities can run again for DDRM subscribers.

The details of this alarm is queried via “QueryPM TBK” command on PM level.

1.1.13 Hazard Alarms

If an overvoltage problem occurs on a subscriber with overvoltage option of DDRM then DMS is informed **via modified LCM Line Message .**When this message is received from DDRM the states of related lines will be set as HZD on DMS and existing Hazard DMS MTC is triggered. HZD condition is cleared after Modified Hazard DDRM Unsolicited message is received.

Also Hazard condition on DDRM lines with the overvoltage option is expected to be reported via an alarm message by DDRM node unless ETM option is used. If ETM option is used then HAzard alarm is sent for all line types by DDRM. In the existing structure of DMS severity of Hazard alarm is office-based not PM based and the alarm severity class is defined with threshold values as office based.

1.1.14 Severity on Display

The following existing LCM display is valid also for DDRM.

Table 1 Critical DDRM Alarm Display on DMS MAP

Alarm Display	CM	MS	IOD	Net	PM	CCS	Lns	Trks
	.	.	.	.	**nLCM** *C*	.	.	.
Indications on Display	“n” indicates the number of LCMs with alarms. “*C*” shows the alarm class “critical”.							

Major DDRM Alarm Display on DMS MAP

Alarm Display	CM	MS	IOD	Net	PM	CCS	Lns	Trks
	.	.	.	.	nLCM *M*	.	.	.
Indications on Display	“n” indicates the number of LCMs with alarms. “*M*” shows the alarm class “major”.							

Line Alarm Display on DMS MAP

Alarm Display	CM	MS	IOD	Net	PM	CCS	Lns	Trks
	.	.	.	.	.	.	MCard *M*	.
Indications on Display	"*M*" shows the alarm class "major".The number of alarm conditions reaches or exceeds the major class threshold.							

Hazard Line Alarm Display on DMS MAP

Alarm Display	CM	MS	IOD	Net	PM	CCS	Lns	Trks
	.	.	.	.	.	.	HZD *M*	.
Indications on Display	"*M*" shows the alarm class "major".The number of alarm conditions reaches or exceeds the major class threshold.							

1.1.15 Existing Line alarms on DMS

The existing line alarms on DMS are valid for DDRM subscribers as well. See Table 4 on page 47.

Table 4: Supported DDRM Line Alarms

Alarm Status Code	DDRM Action	Description	Remarks
DF	No.	Two or more line circuits have SDIAG, DIAG, NDIAG, FAC, MSET, MCARD, IMIN, IMAJ, UCARD, or QDIAG type alarms that are in the same class.	
FAC	YES	The relevant facility of DIAG tests are out of service this is reported in DIAG tests : etc subscriber loop tests	
DIAG	Yes.	The threshold of line circuits that have failed the extended diagnostic has been reached or exceeded.	Raised as a result of DDRM Line Diagnostic Tests

Alarm Status Code	DDRM Action	Description	Remarks
HZD	Yes	Indicates that a line hazard such as leakage resistance or foreign line voltage has been detected on a card. It also indicates that the cut-off relay has been operated to isolate the line card.	Unsolicited Message from DDRM trigger this alarm or Raised as a result of DDRM Line Diagnostic Tests
IMAJ	Yes	The threshold of line circuits that have reported ICMO at the major rate has been reached or exceeded. ICMO (incoming message overload) is the state where LTC or LGC is receiving too many messages from line card.	This is part of results of DDRM Line Diagnostics (ltp:diag) DMS follows up these errors via Babbler Audits. If DDRM reports balling via Babbling DDRM Alarm, this is raised.
IMIN	Yes	The threshold of line circuits that have reported ICMO at the minor rate has been reached or exceeded.	This is part of results of DDRM Line Diagnostics (ltp:diag)
MCARD	Yes	The threshold of line circuits that have reported missing line cards has been reached or exceeded.	This is part of results of DDRM Line Diagnostics (ltp:diag). This is also raised by LC Alarm Message.
MSET	Yes	The threshold of line circuits that have reported missing sets has been reached or exceeded.	Raised as a result of DDRM Line Diagnostic/ Tests
PSDF	No	On or more line circuits have reported a PSPD type alarm, and one or more line circuits have reported SDIAG, DIAG, NDIAG, FAC, MSET, MCARD, IMIN, IMAJ, UCARD, or QDIAG type alarms, where all alarm types (including the PSPD type) are in the same class.	

Alarm Status Code	DDRM Action	Description	Remarks
PSPD	No	The threshold of lines with a permanent signal condition has been reached or exceeded. The cause may be either partial dialing of a digit sequence or an off-hook condition with no digits dialed.	This is triggrered with LO trunks - related to callp on PLGC
QDIAG	No	The threshold of line circuits that are in the shower queue has been reached or exceeded.	
CMIN	No	The threshold of line circuits that have reported CP errors at the minor rate has been reached or exceeded.	
CMAJ	No	The threshold of line circuits that have reported CP errors at the major rate has been reached or exceeded.	

1.1.16 The other existing RLCM specific alarms which are not used for DDRM

The existing RLCM specific alarms which are not used for DDRM are listed below;

- RMM Minor
- ESA Minor
- ESA Critical
- EXT FSP RLCE frame Major

1.1.17 LOGs

Except LC Alarms (LC Configuration, Hazard, Babbling) each DDRM Exception Report are logged with PM179: PM179 Log format has the following information:

- Message Type (recovered or alarmed)
- Card Type
- Shelf

- Slot
- If alarm is LC, HW Status Value (note that this field is valid for Babbling and Hazard for ISN09. Online, Missing and Wrong Card may be printed, however it has no meaning.) is printed as second line.

1.1.18 ALARM EXCEPTIONS

- Unexpected values in the fields of exception reports cause PM116 Logs will be produced. SW Swerrs are produced to debug the unexpected value or range. In those cases message is ignored and not registered as alarm or recovered. Printing of PM116 matches the existing behavior of DMS against the RLCM exception reports.
- Any other problems in handling messages (etc exhaust resource due to excessive messages) causes PM116 again.
- After validation, RECOVER reports are accepted if only previous alarm status is TRIGGERED otherwise the message is ignored.No swerr is printed.PM116 is logged.
- After validation, TRIGGER message are received for a card which is already marked as ALARMed, this message is ignored. No Swerr is printed. PM116 is logged.

1.1.19 DDRM OM

This component refers a standard enhancements to pre-existing defined LCM OM definition. There is no requirement to have new OM types.

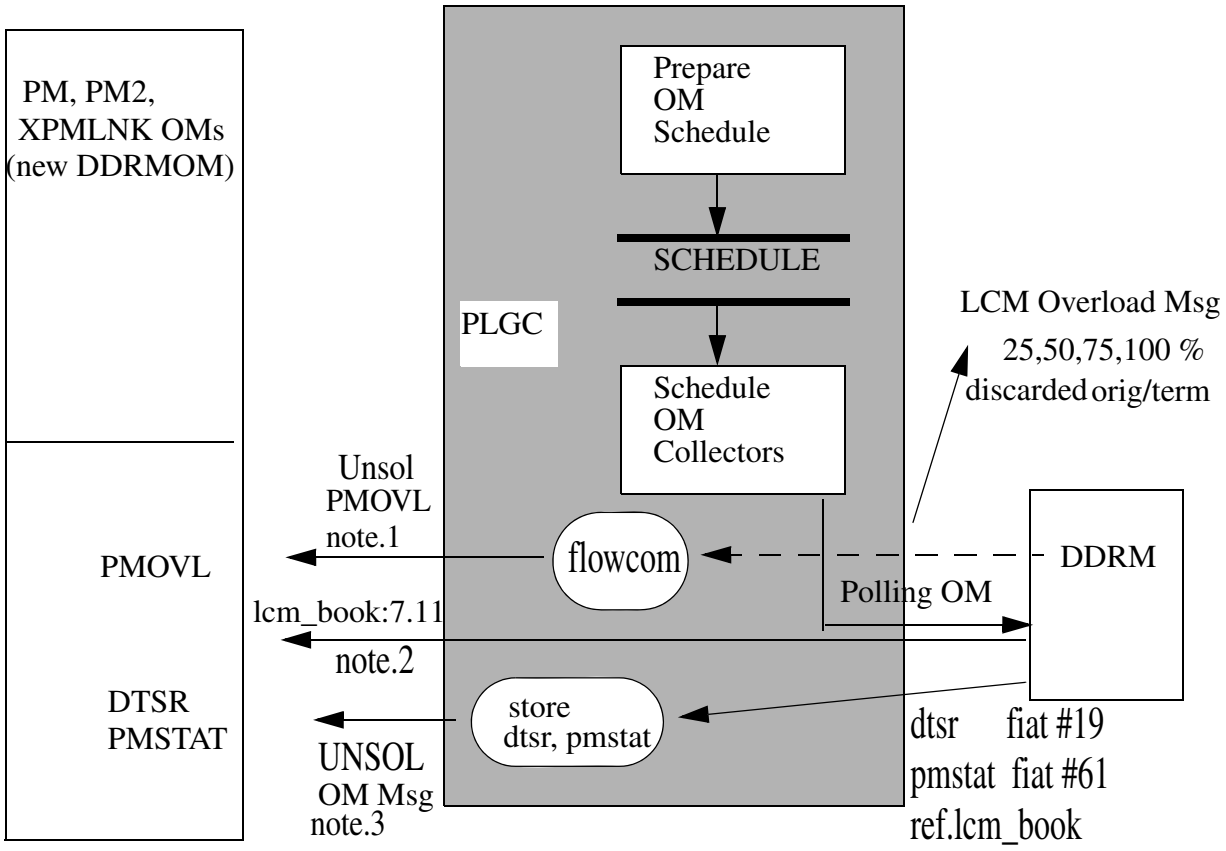
All exception alarms are pegged as PM OMs in the same way RLCM Alarms are received.

Existing DTSR and PMSTAT, PMOVL OM handling is given the following figure.

Among those OMs, Host PLGC sends regular query messages to collect the total calls for a period and delay-dial istatistics from DDRM: remote is expected to calculate the dial delays with the help of timestamps of call-origination previously sent by host to DDRM in a message. For complete description, please refer to NTP and DMS_DDRM references. DDRM doesn’t provide those delays, so DTSRs are invalid for DDRM.

DMS is ready to produce DDRM PMOVL OMs in case DDRM simulate or actually get an extion for an overload condition as it produces the relevant messages as defined for RLCMs. DMS existing handling is kept but those OM formats are changed to cover new PM type.

Figure 3 OM Design MAP



Note.1--- Per denied originitaion and terminations XPMOVL

Note2--- This unsolicited message is sent to the XPM from the LCM to indicate that the LCM is being overloaded with call originations, terminations, etc. and thus not processing all DMSX messages that are being sent to it due to a lack of call processing resources.

Note3. (DTSR : Dial Tone Statistic Request Fiat #19) & (PMSTAT: Processor Occupancy Status LCM messages (LCM_BOOK fiat: mf_pmstat_re #61)) is handled if DDRM provides or need those messages.

1.2 Hardware Requirements or Dependencies

Figure 2 Logical view of DMS host and DDRM node

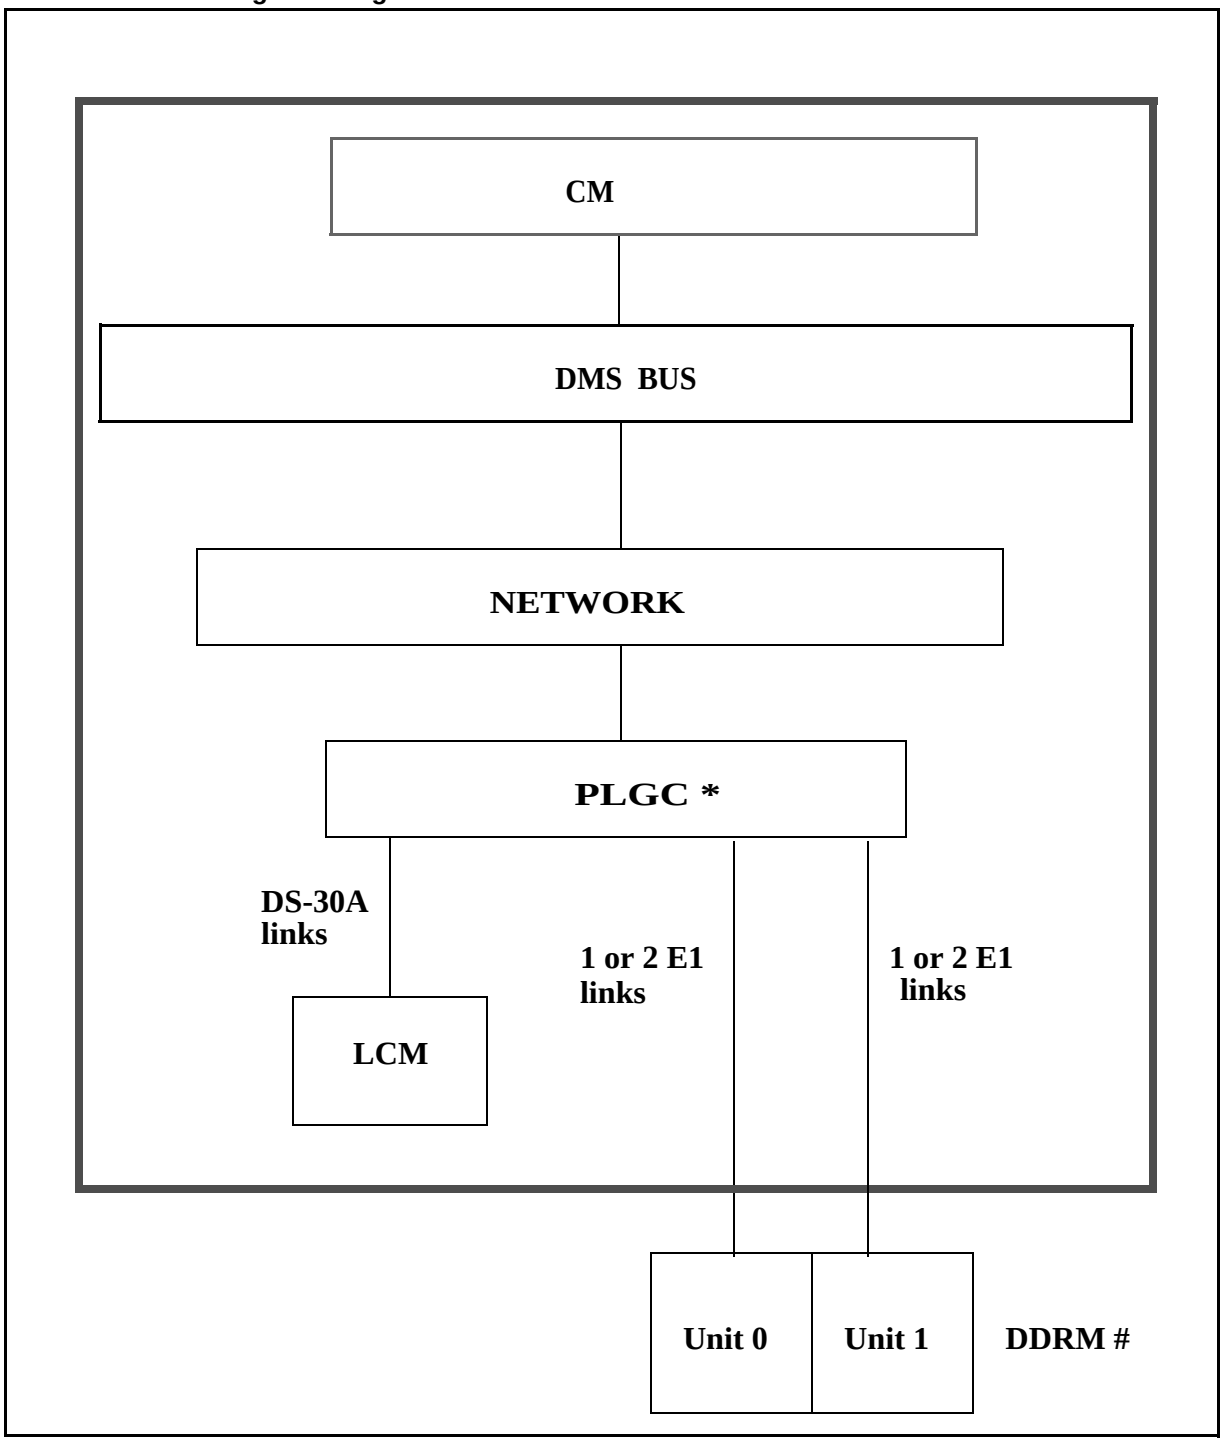


Figure 2 DDRM with one cabinet

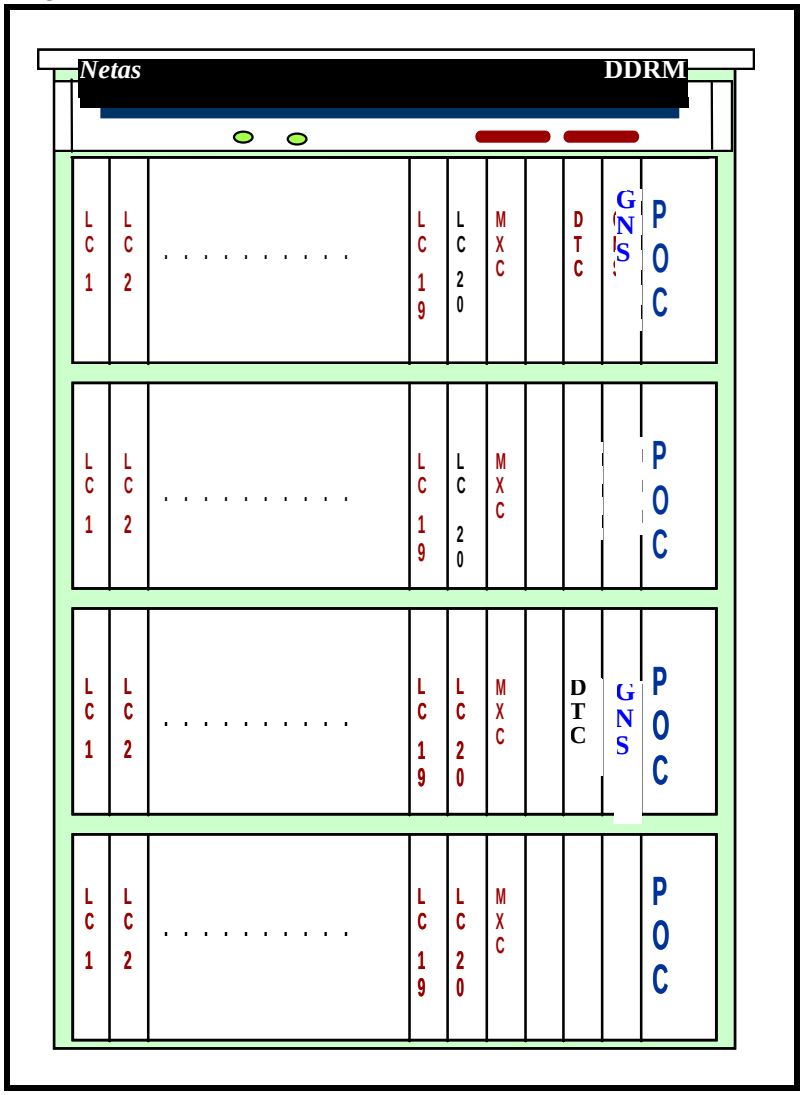


1.1 Software Requirements or Dependencies

This feature needs DDRM Hardware and DDRM SW which works at least with single E1 links at worst case. Two-links configuration are needed for recovery phase since DMS doesn't change single UNIT of DDRM.

- A00006660 - for DDRM TABLE CONTROL and resources for ALARM

- A00006661 -for DDRM Maintenance RTS to query alarms.
- A00006662 - for Definition & Maintenance - Line Audits.
- A00006666 - for XPM support and Callp to handle alarms during INSV

1.2 Limitations and restrictions

- DMS Existing Audits or no new Audit/Recovery does not detect or recover the long-term alarmed condition. CraftPerson can refresh DDRM DMS alarms by RTS or TEST if both units are out of service when the alarms remains long-term because of any missing recovery message from DDRM.

1.3 Interactions

This activity impact TEST and ESA Activities which are being implemented at ISN09: tests for allowable cards are exhibited if any LC alarm.

1.4 Glossary

Term	Description
DDRM	DMS Dicle Remote Module
DRX-4	Dicle Rural Exchange-4
DTC	Digital Trunk Card
ESA	Emergency Stand Alone
GNS	Group Network Switching
LC	Line Card
LCM	Line Concentrating Module
LTT	Line and Trunk Test Simulator
MTA	Metallic Test Access
MXC	Module Switching Controller
POC	Power Converter Card
RLCM	Remote Line Concentrating Module
TMS	Test Measurement and Signalling
ETM	External Test Module
TBK	Test Connection Card

2: Functional Description (FN): A00006664

2.1 Feature name and Feature ID

A00006664 - DDRM Line Testing

DDRM (DMS Dicle Remote Module) project as a whole provides a platform which supports DDRM node as a remote line module of DMS like an RLCM (Remote Line Concentrating Module).

This feature is responsible of support the LTP level test commands of the posted DDRM subscriber lines on a regular MMP switch for ISN09 stream.

2.2 Description

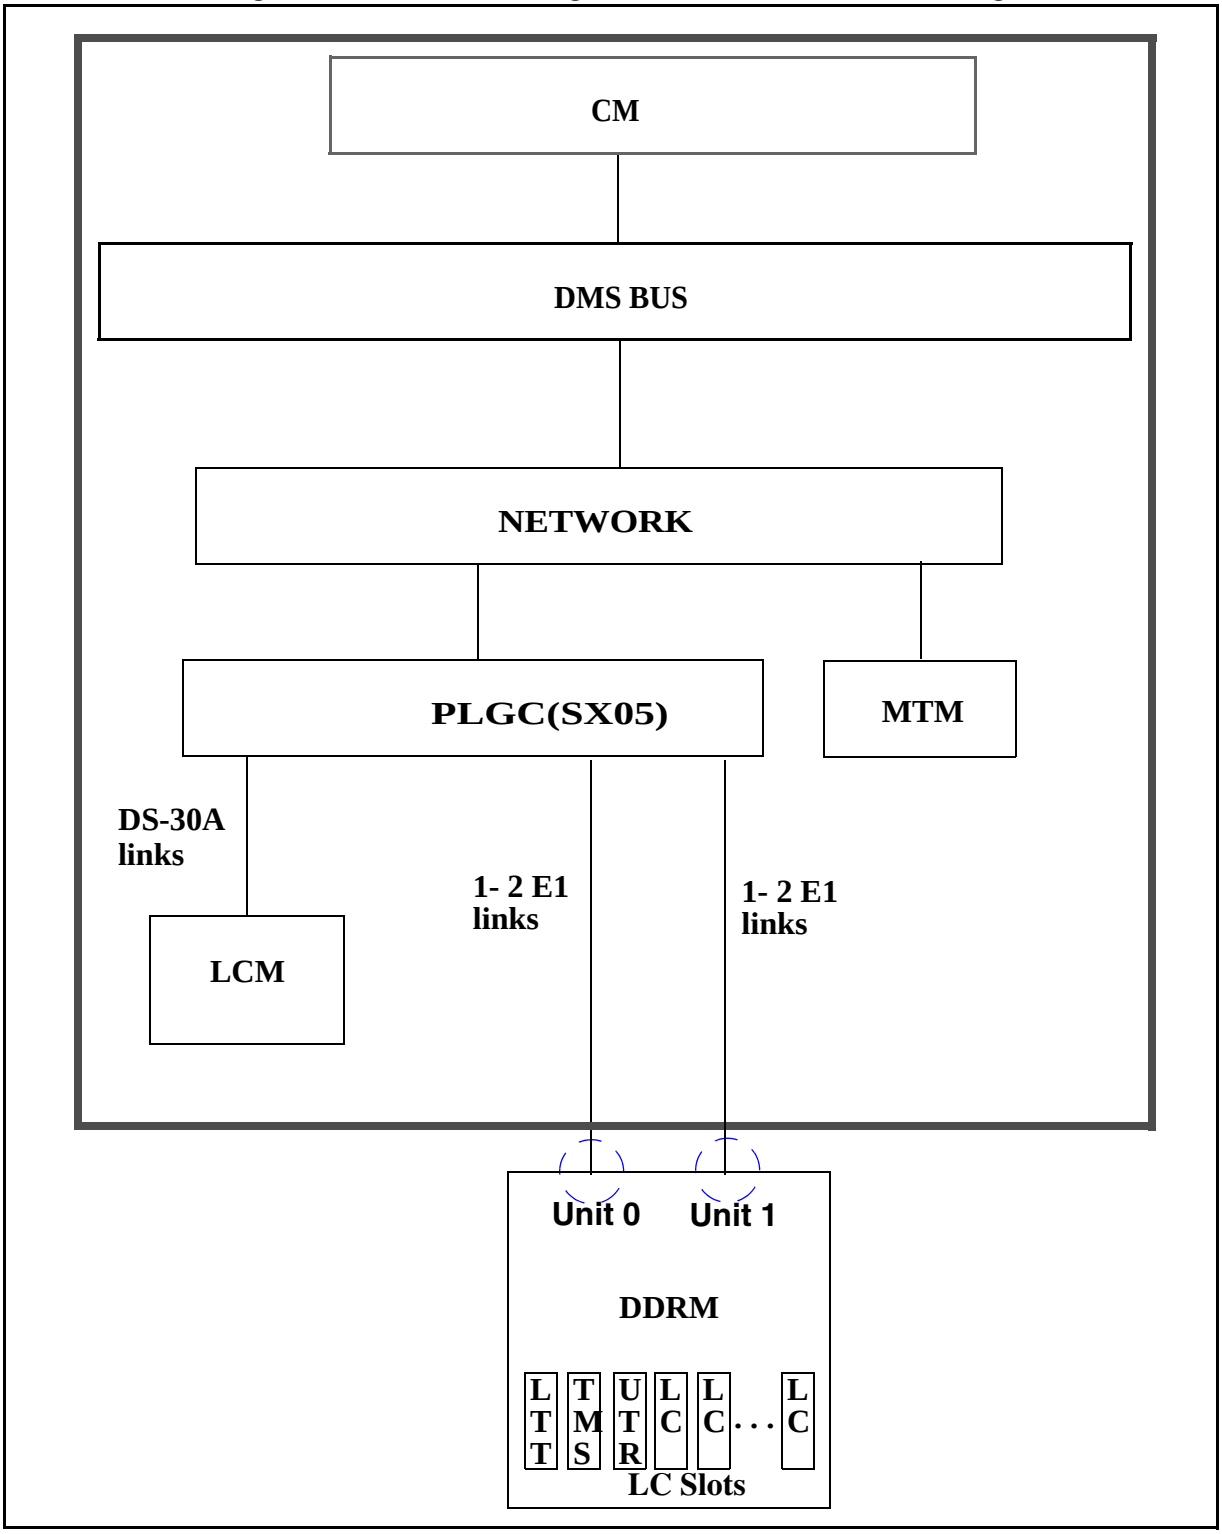
This feature provides support in DMS-MMP product for line testing available in DDRM. The main purpose of this feature is to create an interface between DMS and DDRM through E1 (PCM30) links to execute supported LTP and ALT level test commands for the posted DDRM subscriber lines.

Line test functions are accessed through the LTP (Line Test Position) level of MAPCI, facilitate the basic measurements and monitoring capabilities necessary to maintain DDRM subscriber lines from the DMS. DDRM is triggered to perform these functions by suitable DMSX messages via PCM30 interface.

Related metallic test measurements are performed by the LTT and TMS cards configured in DDRM node instead of RMM (Remote Maintenance Module) of RLCM (Remote Line Concentrating Module). Those are driven by DDRM software. The main responsibility of this feature is to form an interface between the DMS and DDRM node (i.e. requesting test proper test commands supported by DDRM, and receiving the results and interpreting them on DMS).

Functional configuration view is given in Figure 1, on page 56

Figure 1 Functional Configuration view of DDRM line testing



2.2.1 Supported DDRM Line Tests

DDRM line tests which are issued commands on LTP MAP level in DMS are applicable for only testable line card types. For other DDRM line card types, the command is prompted like that:

‘Command is not valid on this type of DDRM line.’

The test items supported by DDRM lines are listed in Table 1, on page 57.

Table 1 The line types and the supported DDRM test items by them

Test Item	DRBLCN	DRMLCN	DRBLCP	DRDLCP	DRMLCP
Line Manual Busy	+	+	+	+	+
Return to service	+	+	+	+	+
Forced Release & Manuel Busy	+	+	+	+	+
Digit Test from subscriber	+	+	+	+	+
Line Test (LNTST)				+	+
DC Voltage				+	+
AC foreign voltage				+	+
Loop resistance test				+	+
Continuity (Capacitance test)				+	+
LTA-Line Test Access	+	+	+	+	+
Tone sending to subscriber	+	+	+	+	+
Ring voltage application/test				+	+

DRBLCN: Basic Line Card

DRMLCN: Basic Line card with metering

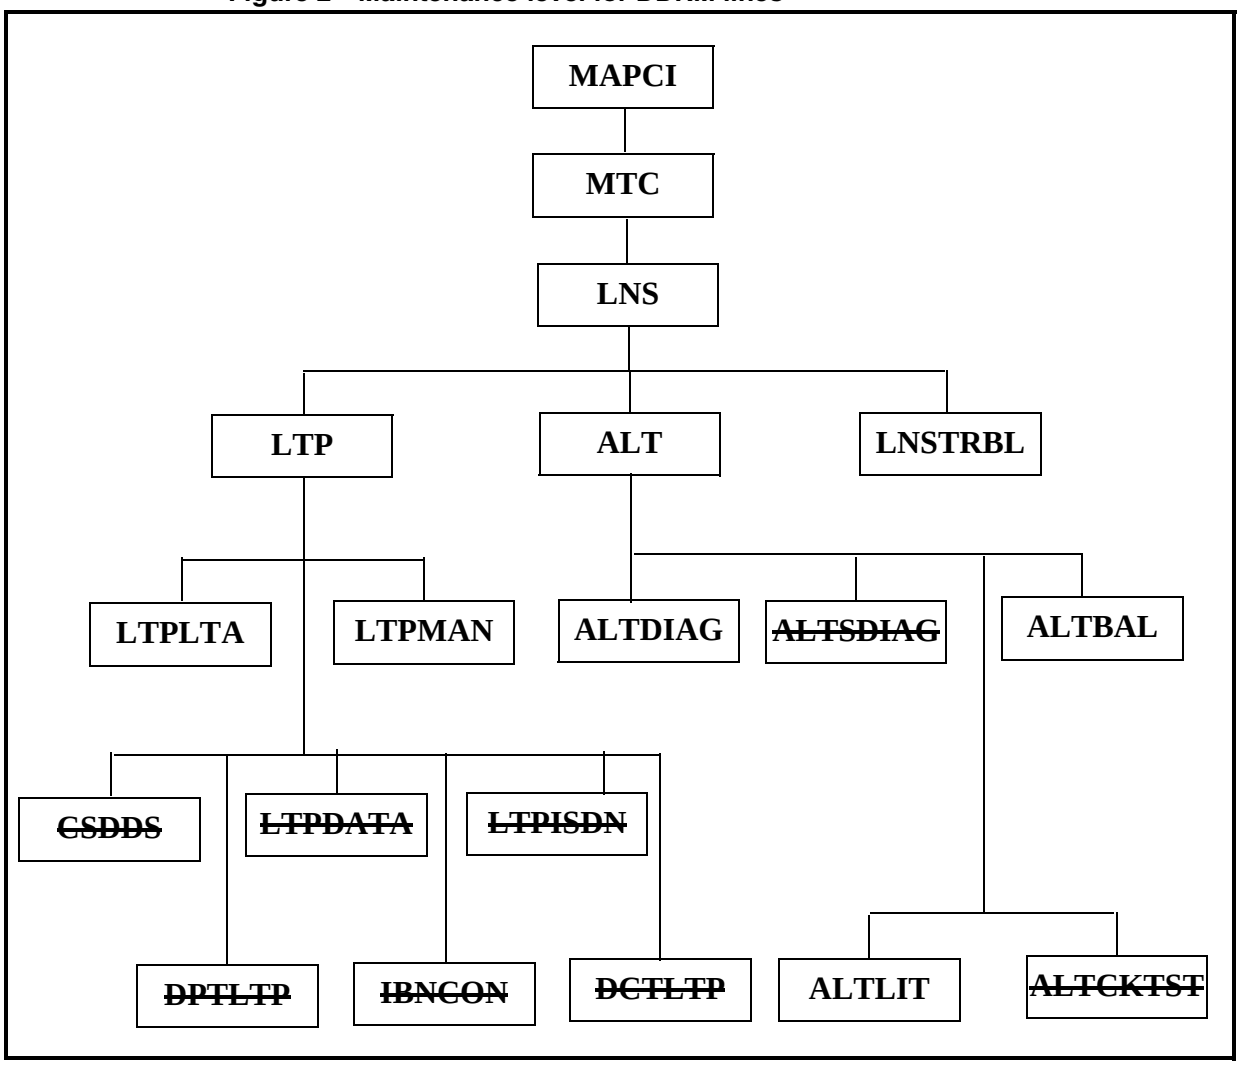
DRBLCP: Basic Line card with protection

DRDLCP: Basic Line card with test and over voltage

DRMLCP: Basic Line card with metering, test and over voltage

In DMS100-MMP product, the supported MAPCI;MTC;LNS levels are shown in Figure 2 on page 59. The levels and sublevels in strikethrough are not supported for DDRM subscriber lines.

Figure 2 Maintenance level for DDRM lines



The supported line tests for DDRM subscriber lines listed in Table 1, on page 57 are located in MAPCI;MTC;LNS;LTP and MAPCI;MTC;LNS;ALT levels.

2.2.1.1 Line Test Position (LTP) Level

Figure 3, on page 60 shows the supported LTP MAP level commands. Supported line tests listed in Figure 3, on page 44 are shown in **bold**.

Figure 3 Supported LTP level Commands (in bold)

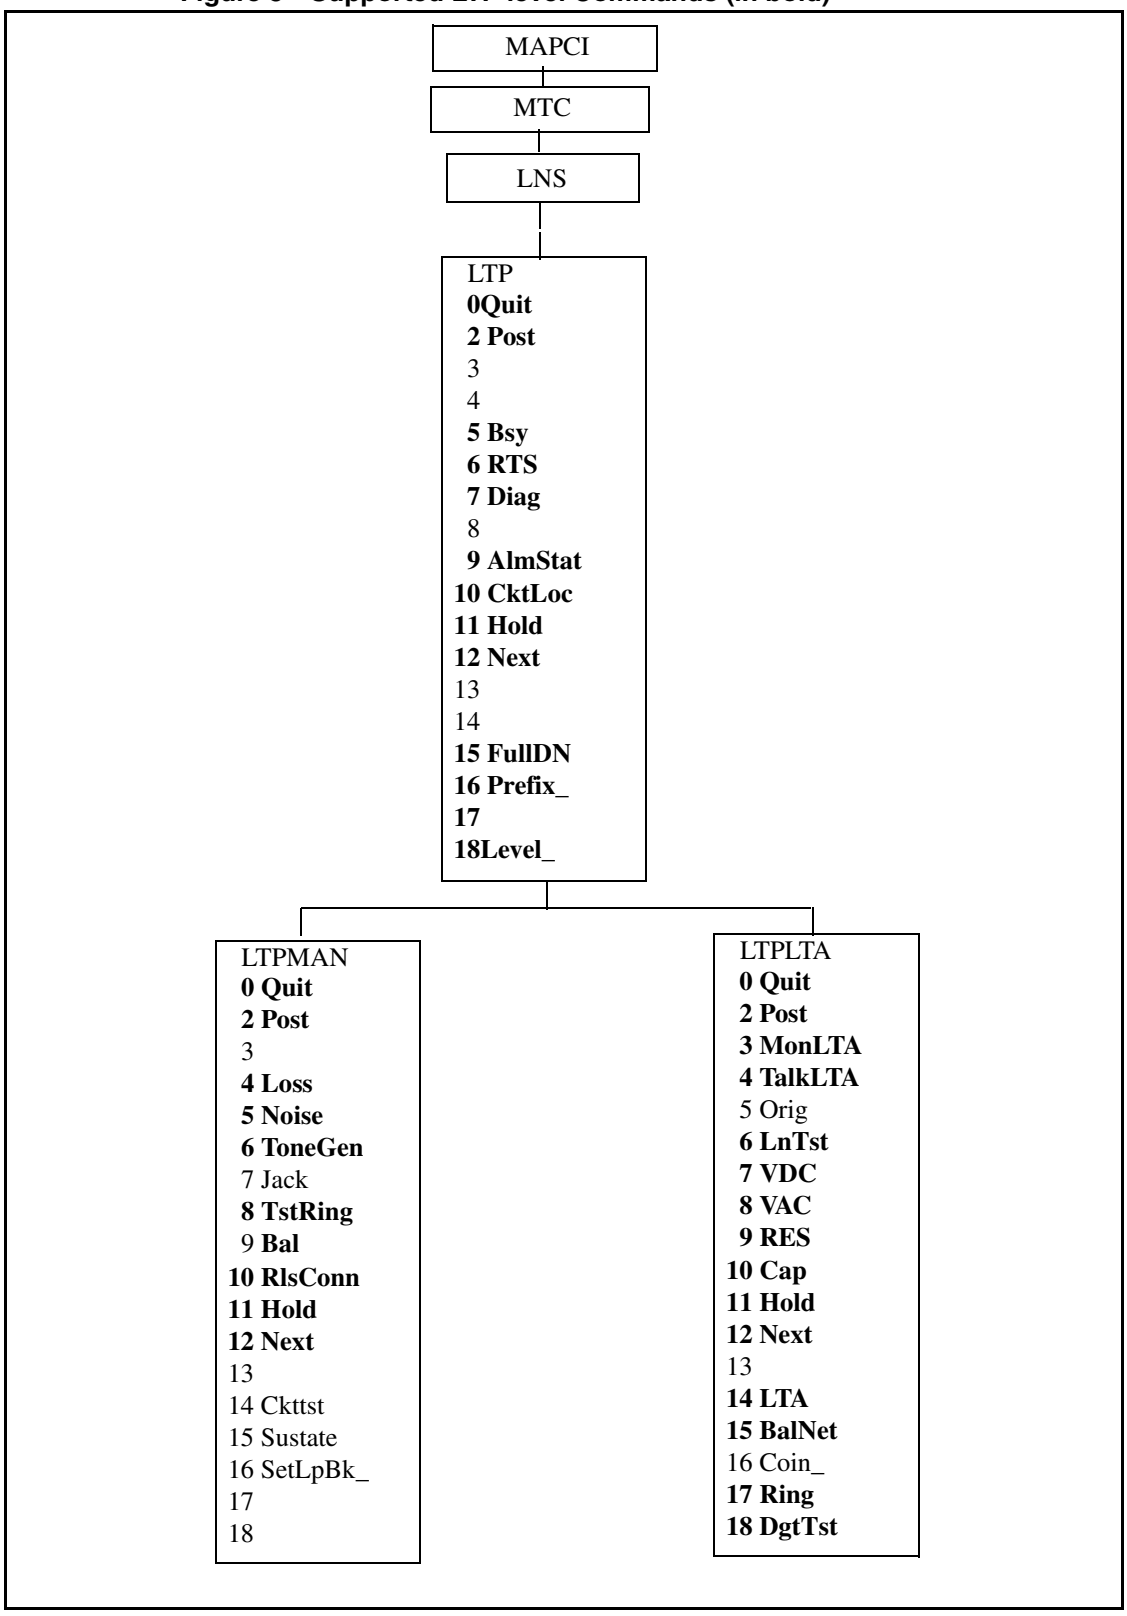


Table 2 A brief description of Supported LTP level commands for DDRM lines

Menu Item	Command	Function	Remarks
LTP 0	Quit	Return to the LNS level.	See Note 3 See Note 9
LTP 2	Post	Posts a line or set of lines to the LTP.	See Note 3 See Note 9
LTP 5	Bsy	Changes the state of the line in the control position, or optionally the complete set of posted lines, from IDL to MB.	See Note 1 See Note 9
LTP 6	RTS	The RTS command changes the state of the line in the control position, or optionally the complete set of posted lines, from MB to IDL.	See Note 1 See Note 9
LTP 7	Diag	Diagnose the posted line. The loop detector test checks the ability of a DDRM line circuit to recognize an off-hook condition on a loop-start line. Supervision circuity responses are checked by DMS-100 switch for the correct status changes. The metering test tests DDRM line cards for the presence and suitability of the signal provided by the metering tone card.	See Note 5 See Note 8
LTP 9	AlmStat	Query or set the lines (LNS) alarm thresholds.	See Note 3 See Note 9
LTP 10	CktLoc	Physical location of posted line card.	See Note 3 See Note 9
LTP 11	Hold	Moves the line in the control position to a spare hold position, and the next line from the posted set, if any, to the control position.	See Note2 See Note 3 See Note 9
LTP 12	Next	Moves the line in a specified HOLD position to the control position, or replaces the line in the control position with the next line in the posted set. Replaces, saves or drops the replaced line.	See Note 2 See Note 3 See Note 9
LTP 15	FullDN	Display full national number.	See Note 3 See Note 9
LTP 16	Prefix_	Set/Clear DN Prefix.	See Note 3 See Note 9
LTP 18	Level_	Used to enter the various LTP levels.	See Note 3
Nonmenu Command	FRLS	This command is not visible at the LTP level. The FRLS command forcibly disconnects a line circuit from test equipment or any other circuit and changes its state to MB.	See Note 9

Menu Item	Command	Function	Remarks
LTPMAN 4	Loss	The LOSS command measures the insertion loss of a test tone sent from the subscriber end of a loop to the switch.	See Note 9
LTPMAN 5	Noise	The NOISE command measures the C-message weighted circuit noise on a subscriber loop.	See Note 9
LTPMAN 6	ToneGen	The TONEGEN command transmits a tone on a subscriber loop.	See Note 6
LTPMAN 8	TstRing	The TSTRING command tests the ringing relay in the line card for proper functioning.	See Note 8 See Note 9
LTPMAN 9	BAL	BAL command performs an on-hook balance network test on a subscriber loop. The command optionally updates the balance network value and loss pad value in the line circuit according to the test results.	See Note 9
LTPMAN 10	RlsConn	The RLSCONN command releases test equipment that is connected to line.	See Note 8 See Note 9
LTPLTA 3	MonLTA	The TALKLTA command connects a monitor circuit to a subscriber line.	See Note 9
LTPLTA 4	TalkLTA	The TALKLTA command connects a talk circuit to a subscriber line.	See Note 7
LTPLTA 6	LnTst	The LNTST command performs resistance, capacitance, and voltage tests on a line.	See Note 8 See Note 9
LTPLTA 7	VDC	The VDC command performs a dc voltage measurement on a subscriber loop.	See Note 8
LTPLTA 8	VAC	The VAC command performs an ac voltage measurement on a subscriber loop.	See Note 8
LTPLTA 9	Res	The RES command performs resistance measurements on a subscriber loop.	See Note 8
LTPLTA 10	Cap	The CAP command performs a capacitance measurement on a subscriber loop.	See Note 8
LTPLTA 14	LTA	Used with RLS parameter to release monitor connections to CPB lines.	See Note 8 See Note 9
LTPLTA 15	BALNET	The BALNET command performes a balance network test on a subscriber loop that is in either the onhook or ofhook mode.	See Note 9
LTPLTA 17	Ring	The RING command will send the appropriate signalling to the DDRM which will cause ringing to be sent to the subscriber.	See Note 5
LTPLTA 18	DgtTst	The DGTTST command tests the DIGITONE pad or dial on the subscriber station.	See Note 5 See Note 8

Menu Item	Command	Function	Remarks
Note 1: The BSY, RTS commands work as hidden commands from the subtending LTP levels, and operate the same as in the root LTP level. ***Note 2:*** The Hold and Next command on the subtending LTP levels operate the same as in the root LTP level. ***Note 3:*** The existing functionality remains for this command as respect of DDRM lines ***Note 4:*** Other LTP level menu commands aren't supported by DDRM lines. Other LTP nonmenu commands aren't supported by DDRM lines as well. ***Note 5:*** No optional parameter is supported for DDRM lines. ***Note 6:*** The metallic option for ToneGen is not supported for DDRM lines. ***Note 7:*** The battery option for TalkLTA is not supported for DDRM lines. ***Note 8:*** This command uses LTT/TMS test cards. ***Note 9:*** No parameter change has been done for this command.			

The diagnostic subtests for DDRM lines differs from the other POTS line types. The following subtests are supported by DDRM lines:

- loop detector test
- Metering test (only metering lines)

Other commands which are unsupported for posted DDRM lines are prompted on MAP like that:

'**Command is not valid on a DDRM line.**'

2.2.1.2 Automatic Line Testing (ALT) Level

Figure 4, on page 64 shows the supported ALT MAP level commands. Supported line tests listed in Figure 2, on page 59 are shown in **bold**. Other sublevels apart from ALTLIT, ALTBAL and ALTDIAG are not supported for DDRM lines.

For ALT tests test results are categorized as follows for RLCM and LCM lines; PASS, FAIL, N/A and TOTAL, the sum of PASS + FAIL+ N/A . When a LIT test is run for a DDRM line, either PASS, FAIL or N/A is incremented. In case of a failure caused by incompatible line card types N/A is incremented, in all other failure scenarios FAIL is incremented.

Figure 4 Supported ALT level Commands (in bold)

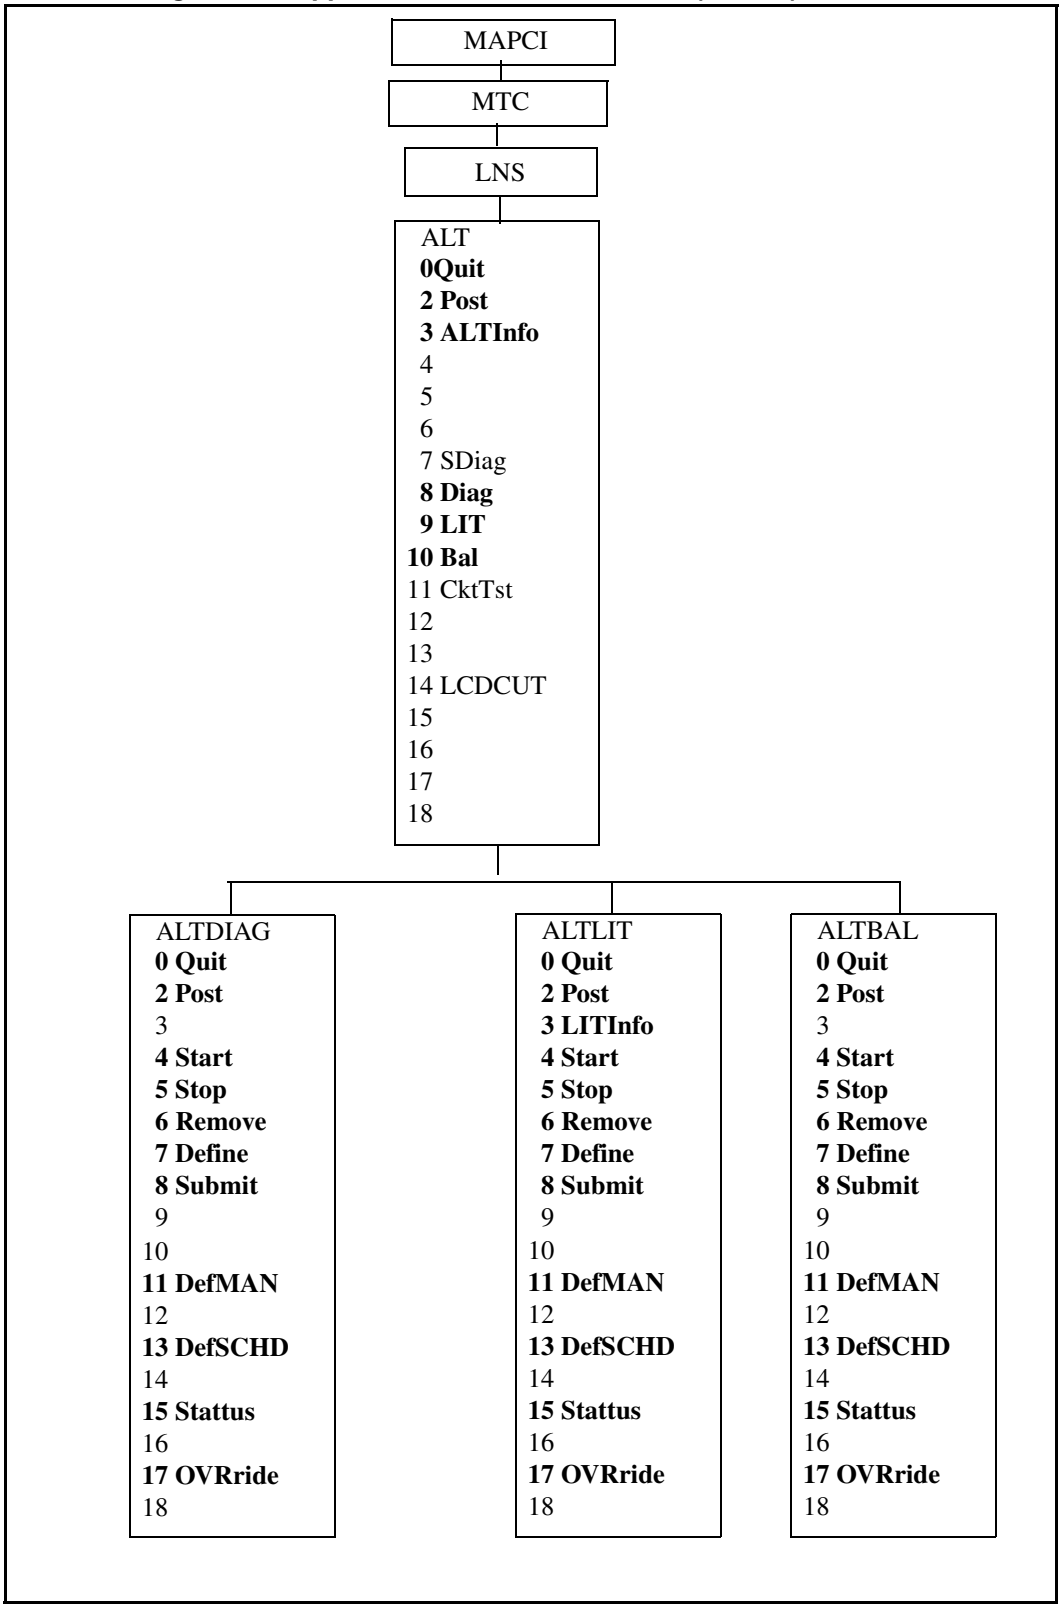

Table 3 A brief description of ALT level commands for DDRM lines

Menu Item	Command	Function	Remarks
ALT 0	Quit	The QUIT command causes the system to leave the current level and return to a higher level of the MAP.	See Note 1
ALT 2	Post	The POST command posts the scheduled ALT TESTID that is stored in memory (in Table ALTSCHED)	See Note 1
ALT 3	ALTInfo	The ALTINFO command checks test data stored in memory (Table ALTSCHED)	See Note 1
ALT 8	Diag	The DIAG command accesses the DIAG sublevel of ALT. If a TESTID is not entered as a parameter, a new TESTID must be defined with the DEFSCHD or DEFMAN command.	See Note 2
ALT 9	LIT	The LIT command accesses the LIT sublevel of ALT. If a TESTID is not entered as a parameter, a new TESTID must be defined with the DEFSCHD or DEFMAN command.	See Note 1
ALT 10	BAL	BAL command performs an on-hook balance network test on a subscriber loop. The command optionally updates the balance network value and loss pad value in the line circuit according to the test results.	See Note 1
ALTLIT 3	LITInfo	The LITINFO command displays the system default values for the LIT parameters.	See Note 1
ALTDIAG/ ALTBAL/ ALTLIT 4	Start	The START command sets the posted scheduled ALT test in a state such that it is ready to run at the next scheduled time.	See Note 1
ALTDIAG/ ALTBAL/ ALTLIT 5	Stop	The STOP command stops a test and changes the status of the TESTID.	See Note 1
ALTDIAG/ ALTBAL/ ALTLIT 6	Remove	The REMOVE command removes the data associated with the posted TESTID from memory (table ALTSCHED). If the TESTID is for a scheduled test, the system prompts for a YES or NO confirmation.	See Note 1
ALTDIAG/ ALTBAL/ ALTLIT 7	Define	The DEFINE command defines test data for the specified TESTID.	See Note 1
ALTDIAG/ ALTBAL/ ALTLIT 8	Submit	The SUBMIT command submits the defined test data for the posted TESTID into memory (table ALTSCHED).	See Note 1

Menu Item	Command	Function	Remarks
ALTDIAG/ ALTBAL/ ALTLIT 11	DefMAN	The DEFMAN command is used to assign a TESTID to the test that corresponds to the current ALT sublevel. For example, the DEFMAN command entered at the LIT level of MAP device number 7, will be assigned a TESTID of MANUAL07.	See Note 1
ALTDIAG/ ALTBAL/ ALTLIT 13	DefSCHD	The DEFSCHD command is used to assign a TESTID to the scheduled test that corresponds to the current ALT sublevel.	See Note 1
ALTDIAG/ ALTBAL/ ALTLIT 15	Stattus	The STATUS command checks the status of the posted TESTID.	See Note 1
ALTDIAG/ ALTBAL/ ALTLIT 17	OVRride	The OVRRIDE command overrides a scheduled test so that testing will not start until a specified day and time has passed.	See Note 1
Note 1: There is no change for this item. ***Note 2:*** DIAG test suits are changed for DDRM lines.			

2.2.2 Testing Procedures

DDRM line tests are categorized in 3 subset. Only Far-End Measurements require the involvement of the LTT and TMS cards. In other words measurements will be performed at DDRM. Other measurements are performed by DMS.

2.2.2.1 Near-End Measurements (LOSS, NOISE, TONEGEN)

These include the test commands which use the DMS-MTM testing facilities in LTPMAN sublevel. The result of the measurement resides till the craftperson releases the test.

Procedure for Near End Measurements

- Post DDRM line from the LTPMAN level.
- Perform the command. Observe the measurement on the MAP.
- Invoke RlsConn when complete to release test facilities.

2.2.2.2 Far-End Measurements (LNTST, VAC, VDC, RES, CAP, ALTLIT, TstRing)

Some tests require Metallic Test Access (MTA) provided by DDRM node. The LTP test commands are requested by LTP MAP level and DDRM performs them by using its LTT and TMS cards.

Procedure for Far End Measurements

- Post DDRM line from the LTPLTA level / for TstRing from LTPMAN level.
- Perform the command. Observe the measurements on the MAP.
- Invoke LTP RLS when complete to release test facilities (TstRing doesn't need manual release operation).

2.2.2.3 Line Monitoring (MonLTA, TalkLTA, Ring and DgtTst)

The LTPLTA commands MonLTA and TalkLTA establishes monitor and talk connections to DDRM subscriber lines in the MB and CPB state. If the line is in the MB state, a direct network connection between the headset and line is made. If the line is CPB, a connection between the line under test, the connected circuit, and the headset is set up through a 3-port conference circuit, and the line will enter the CPD state (DMS network connections to establish monitor/talk connections are used because of nonexistence of MONTALK card in DDRM).

The Ring command applies ringing current to a subscriber loop that has a monitor connection established. This enables the craftsperson at the switch monitoring a MB line to alert the subscriber or craftsperson in the field to go off-hook, allowing line quality to be monitored.

Procedure for DDRM line monitoring

1. Post DDRM line from LTPLTA level. If line is IDL, perform BSY command to place the line in the MB (Maintenance Busy) state.
2. Invoke MonLTA/TalkLTA command.
3. If line is CPB, connections through the 3-port circuit are made and line is monitored via the HSET. If line is MB, a network connection to the HSET is established, and the Ring command may now be entered to alert subscriber or craftsperson in the field.
4. To release connections, enter LTA RLS. The RTS command may be used for lines that are in the MB state.

   Note: DgtTst could not be invoked unless the talk connection is established. It may use DDRM testing facilities to detect digit tones.

New LTP level prompts are given in Table 4, on page 67 for DDRM lines.

Table 4 New Prompts for LTP level Test Commands for DDRM lines

No	Prompt	Description	LTP level Test Commands
1	"Command is not valid on a DDRM line."	The test command is not supported for DDRM lines.	All apart from Table 2.

Table 4 New Prompts for LTP level Test Commands for DDRM lines

No	Prompt	Description	LTP level Test Commands
2	“Command is not valid on this type of DDRM line.”	When the command is performed for unsupported line card (The test command may be supported for line card types with metering or over voltage).	LCO, Diag, TstRing, RlsConn, LnTst, VDC, VAC, Res, Cap, LTA, DgtTst
3	“Line state INVALID, must be MB or CPB”	The line state should be MB or CPB when establishing monitor or talk connection.	MonLTA, TalkLTA
4	“Conference circuit not available”	The conference circuit could not be established for monitor or talk connection.	MonLTA, TalkLTA
5	“Test could not be executed because LTT and/or TMS is not in a proper state. “	LTT/TMS test cards are not available for testing.	LCO, Diag, , RlsConn, LnTst, VDC, VAC, Res, Cap, LTA, DgtTst

2.1 Hardware Requirements or Dependencies

2.1.1 DDRM Line Cards (DRBLCN, DRMLCN, DRBLCP, DRDLCP and DRMLCP)

DDRM line tests are performed on the DDRM specific line cards as shown in Figure 1, on page 57 .

2.1.2 DDRM Test Cards (LTT, TMS and UTR)

In order to perform line test commands for DDRM lines; LTT, TMS and UTR cards should be plugged in DDRM LC slots. VDC, VAC, RES, CAP, LNTST, TstRing, LIT and DgtTst require these cards.

2.1.3 HSET Circuit (NT5X30)

The HSET trunk referenced for DDRM line monitoring is provided by the standard 5X30 101 Communications Test Line Circuit Card. TalkLTA, Ring and DgtTst commands need HSET circuit.

2.1.4 TTT Circuit (NT2X96)

The TTT trunk referenced for DDRM lines is provided by the standard 2X96 Circuit Card. ToneGen, Loss and Noise commands need TTT circuit.

2.1.5 TTU Circuit (NT2X47)

The TTU trunk referenced for DDRM lines is provided by the standard 2X47 Circuit Card. Diag command needs TTU circuit.

2.2 Software Requirements or Dependencies

This feature depends on the following features:

- AT.00006664 DDRM Node Definition and Provisioning
- AT.00006661 DDRM Node Maintenance
- AT.00006662 DDRM Line Definition and Line Maintenance
- AT.00006663 DDRM Alarms and Audits
- AT.00006666 DDRM XPM Support and Monitoring

2.3 Limitations and restrictions

- LTP MAP level support of diagnostic tests is supported by this feature. The subtests are implemented by AT.00006662.
- The state should be set to MB or CPB before establishing monitor or talk connection.
- LCO command is not allowed to the DDRM lines. Because of the fact that DDRM hardware does not support this requirement.
- For DRDLCP and DRMLCP type of DDRM lines, when VAC/VDC/CAP/RES test is applied with continuous parameter " **Continuous parameter is restricted for DDRM line.** " prompt is returned.
- Continuous parameter of diag test is not supported for DDRM lines.
- LTA command has three parameters. Namely IN, OUT, RLS. The expected behaviour in DMS is as follows; By LTA IN command mesaurements are done both on Line Card and on subscriber loop. By LTA OUT Line Card is isolated and mesaurements are done on subscriber loop. By LTA RLS the connections for tests are released. Due to the fact that DDRM is capable of performing tests only on subscriber loop, when LTA IN is performed " **LTA IN is not valid for DDRM lines, mesaurements can be done for LTA OUT only.** " prompt is returned.
- For LCM and RLCM lines 5 types of ALT subtests are available: ALTDIAG, ALTSDIAG, ALTBAL, ALTLIT, ALTCKTST. For DDRM lines ALTSDIAG is not supported because DDRM lines do not have two distinct DIAG sets. Other ALT subtests are available.
- When the LTT and/or TMS cards are not in a proper state for the tests which require the exsistence of LTT and TMS cards, " **Test could not be executed because LTT and/or TMS is not in a proper state.** " is returned.

- During the TSTRING test, ring will not be applied to the DDRM subscriber.

2.4 Interactions

2.4.1 AT.00006662 DDRM Lines Maintenance

The subtests of diagnostic are implemented by this feature.

2.4.2 AT.00006661 DDRM DDRM Node Maintenance

Existence of DDRM test cards in DDRM LC slots.

2.4.3 AT.00006663 DDRM Alarms and Audits

Existence of DDRM test cards in DDRM LC slots.

3: Functional Description (FN): A00006665

3.1 Feature name and Feature ID

A00006665 - DDRM ESA Support

3.2 Description

DDRM (DMS Dicle Remote Module), is a rural area exchange developed for Turkey Market. Because of DDRM deployment on the field, it is requested to maintain and administer DDRM related operations over DMS switches. By this way the benefits of DDRM in Turkey market will be enhanced and the demands from the customer to reuse these switches as remote modules will be satisfied.

The Emergency Stand Alone feature (ESA) allows lines attached to the same remote peripheral (DDRM) to establish calls within the remote peripheral, when the remote peripheral is disconnected from its host peripheral (PLGC).

DDRM is not equipped with a special card supporting the ESA option. The ESA software runs on the DDRM main processor.

When operating in the ESA mode, DDRM offers limited services to subscribers. Only basic line-to-line calls (for both DP and DTMF lines) are supported. Subscriber features and AMA call recording are not supported in ESA. In normal operation of DDRM UTR on PLGC is used in order to receive tones. UTRD on DDRM is needed on DDRM in ESA mode in order to support tones so if UTRD is not datafilled in LCMINV table, ESA datafill will be prevented in LCMINV. If UTRD is not existing on the DDRM although it is datafilled, alarm will be raised by the ddrm alarms and audits component. If DDRM is in ESA mode, DDRM itself will take all the actions.

When connection of E1 links between DMS and DDRM is lost for any reason DDRM enters ESA-mode if ESA related datafill is appropriate on DMS. DDRM node continues intra-remote calls in ESA-mode based on the information received from DMS with static data download.The other facilities like inter-exchange calls, supplementary services, metering and billing are not supported in ESA mode. In the existing structure of DMS; " ESA module is defined, loaded and maintained from DMS. The loading and maintenance processes are not valid any more for DDRM node. For definition process only indication of ESA and UTRD configuration is set in the inventory table where DDRM node is defined. " A dedicated channel, channel 3 of primary link is used for ESA messaging between ESA processor and host XPM, PLGC. But because of the system restrictions on DDRM channel 3 is not used any more for ESA messaging. Instead DMS-X message channel, channel 1 is used.

3.2.1 Feature Synopsis

With A00006665 DDRM ESA Support activity, the following ESA functional components are covered:

- LCMINV table control component
- DDRM ESA Entry/Exit Component.
- DDRM ESA Static Data Component
- DDRM ESA Inservice Troubles Component

Basic Differences of DDRM ESA component from RLCM ESA component could be summarized as fallows:

1) DDRM doesn't have ESA processor.

2) DDRM doesn't use channel 3 as messaging channel, instead it does use channel 1.

3) Unlike RLCM case, in DDRM case DMS doesn't download EXECS information since DDRM is supporting ESA on main processor.

4) DDRM doesn't need some tables, for ESA mode of operation, which are downloaded during static data download these are hunt group table, automatic line index table, prefix tables.

5)DDRM supplies tones by using UTRD in ESA mode, tones are supplied by tone & clock card in RLCM in ESA mode.

6) There is no need for XESAINV table in DDRM datafill on DMS since this table supports RLCM peripheral ESA processor related information.

7)For definition process only indication of ESA and UTRD configuration is set in the inventory table where DDRM node is defined.

8)UTR configuration - one LC slot on each shelf is generally used for UTR card and each shelf supports 152 subscribers. So 608 subscribers are supported for 4 shelf. It is not possible that one UTR card can serve all subscribers of a DDRM node during ESA mode. The subscribers which do not have UTR card on their shelves can not given their service facilities in ESA mode. But one UTR card is enough for line test facilites. In that case 632 subscribers aredefined for a DDRM node with 4 shelves.

3.2.2 ESA related configuration on DMS and LCMINV Table Control Changes

In the LCMINV table where DDRM node is defined there is a field which indicates ESA mode is supported or not. If the indication of ESA is Y then the related information for ESA is downloaded as static data from DMS to DDRM for basic intra-remote calls on DDRM. If the indication of ESA is N then ESA mode is not allowed on DDRM and the static data is not downloaded to DDRM. If ESA indication is changed from N to Y BSY/RTS of the RLCM is needed in order to download ESA data. XESAINV table is not needed for DDRM since it is used for ESA processor configuration in RLCM.

DMS will inform DDRM, if ESA equipment is available in the existing structure. if at least one UTRD and its datafil exists, DDRM will be ready to enter ESA mode after BSY/RTS operation. If ESA indication is N for DDRM this information is sent via a DMSX message in BSY/RTS time.

3.2.2.1 ESA related office parameters -

"LCM-ESA_ENTRY_BADCSIDE" and "RLCM_ESAENTRY_BADLINK" are used for DDRM ESA configuration. They are used to decide about ESA entry, DDRM processor will wait for defined threshold times for BADCSIDE and BADLINK conditions specified by these two parameters.

RLCM_ESA_NOTIFY_TONE is an office paramater and controls whether the subscriber hears a distinctive dial-tone burst during ESA mode. When this parameter is set to Y then ESA specific tone is expected to be applied by DDRM. Its frequency will be a multiple of 450 Hz. ESA mode is expected to be in control on DDRM side if a UTRD related alarm is received from DDRM and ESA related datafill on DMS as in the expected way.

If the ESA related configuration and datafill is appropriate for ESA, ESA field in table LCMINV is set to Y, then static data for ESA mode is downloaded in BSY/RTS time. It is expected that DDRM should route the calls based on these information and based on line states which are previously downloaded. Office parameter "RLCM_ESASDUPD_HOUR" is used to set the start time to download ESA static data to all remotes on host site. For nightly audit to run RLCM_ESASDUPD_BOOL should be set to Y in table OFCENG and the ESA field in table LCMINV for the specific DDRM should be set to Y.

The downloaded static data over DMS-X signalling channel, channel 1 are; " DN for each defined subscribers of DDRM node " Translation tables " Tones - Dial tone, Ring Back tone, Congestion tone, Busy tone. Howler tone will be applied by DDRM itself. TNs are sent for each defined subscribers of DDRM

node and sending of them are not based on ESA mode. They are sent as a step of line definition process.

3.2.3 ESA Entry

ESA mode is expected to be triggered automatically when the regular checks on communication links (monitoring the message channel to DMS, Monitoring E1 reception status etc) reveal a problem. In the existing structure of DMS there are two reasons to enter ESA mode; Badlink and Badcside. It should be noted that Badlink check is not specific for ESA. It is a generic control method to check E1 links (e.g E1 frame alignment) between host and remote. But Badcside is specific for ESA mode and a message is sent from remote site if the ESA mode indication is Y during DDRM definition on DMS. Badlink - The fault condition of unusable communication links triggers badlink. The communication links between remote node andDMSbecome unusable. The possible reasons for this fault condition are ; The links are severed between remote and the host The Peripheral side (P-side) message link (DS-1 card) of LTC is pulled out or DTC card on DDRM is pulled out.

The "RLCM_ESAENTRY_BADLINK" office parameter on remote site determines the desired delay timer between the failure of the C-side message link and the entry of ESA mode. The default value is 30 seconds and the value range is between 30 and 1000 second with 10 second intervals. If ESA-mode is entered because of Badlink problem then the existing behaviors of DMS for the state of remote nodes will be kept. Badcside this is for monitoring message channel to DMS. Remote node checks to the host site periodically by means of looparound message in order to decide on ESA enterance. Upon receiving the host looparound message, the remote side knows that remote - CC communication is possible. When a failure is detected remote node waits for a delay before entering ESA-mode which is identified with an office parameter "LCM-ESA_ENTRY_BADCSIDE". Its default value is 15 minute and the range is between 1 minute and 60 minutes with 1 minute intervals.

3.2.4 ESA Exit

When the failure reasons which trigger ESA mode entry are recovered DMS requires exit from DDRM then DDRM node performs ESA exit operations. The active calls which are already set up in ESA mode are dropped after exiting ESA. This process is called as "cold exit". Warm exit is not supported by DDRM. There are two possible types to exit from ESA; System Exit and Manual Exit.

"RLCM_XPMESAEXIT" timeout value is used to decide System / Manual Exit procedures. Its default value is 0 and the value range is between 0 and 1000 with 10 second intervals.

System exit is an automatic exit from ESA-mode which is invoked by the host site without craftsperson interference. System exit is invoked if "RLCM_XPMESAEXIT" timeout value has a value except 0. DDRM will RTS automatically and return to normal mode of operation from from ESA mode and active calls which are established in ESA mode will be dropped.

Manual exit is a procedure which is initiated by the craftsperson. Manual exit is invoked if "RLCM_XPMESAEXIT" timeout value is 0(default value). Manual exit allows the craftsperson to view the number of calls on the remote site before RTSing the unit. This feature allows the craftsperson to delay the ESA exit if there are a large number of calls currently active. When E1 links are down DDRM state is seen as Cbsy until they are up again. If E1 link is started to be restored then the state of DDRM is returned to Sysb. If nothing is done by craftsperson, it will stay in SysB situation. But If BSY / RTS of DDRM is applied by the craftperson, DDRM will return to service.

After the ESA exit procedure, ESA processor on remote node sends operational measurements(OM), peg counts and the reason for ESA-mode entry back to DMS. These messages are "ESA Operational Measurements Reply to CC" and "ESA peg Counts Reply to CC". All of these information appears in PM171 log on DMS.

Table 5: The fields in PM171 log on DMS

FIELD	DESCRIPTION
ESA ENTER REASON	Enter Reason Description
VALUE	ESA Enter reason ID
ORIG_ATT_TOTAL ORIG_ATT	total origination attempts (Received Dial Tone)
ORIG_BLK (CHNL_BLK) (CHNL_BLK)	resources unavailable for origination Channel Blocked count in dialling state
ORIG_ABND	Dialling number or hung up before finish-ing diallig
DIAL_ERR	Error in DP or DT dialling
ORIG_SB (LINK_SB)	Originating facility goes system busy
XLA_ERR	Translation error of the dialling number

Table 5: The fields in PM171 log on DMS

FIELD	DESCRIPTION
DIALLED_NUM_INV	The dialled number was not on the same RLCM or a timeout occured while dialling (took too long time to dial number
IA_TERM_ATT_TOTAL (TERM_ATT)	Termination attempt for intra-switched calls
IA_TERM_CUS (TERM_SUC)	termination successed for intra-switched (Number of calls asnwered)
IA_TERM_BLK (TERM_BLK)	intra-switched calls blocked due to lack of resources
IA_TERM_BSY	Intra-switched calls whose terminations were non-idle (busy,system busy, abond-ened etc)
IA_TERM_SB	Intra-switched calls whose terminations went system busy while processing the call (usually because of ring faults)
IA_TERM_NO_ANS	Intra-switched calls where there was no answer
RING_TMO	Ringing timeout
COIN_FLT	Coin faults or failures
RING_BLK	Ring blocake in ringing state
TEST_REG	Test register failure in ringing state
CON_FAIL	Continuinty test fail while ringing
PRE_TRIP	Ringing fault message count in talking state
NO_IPC	No Inter peripheral Connection (IPC) buffer available
PREFIX USAGE	Usage counts for up to 16 entries in the POTS Prefix table. If no POTS prefix entry has been defined then this field is black

There is another statistics called as "DTSR statistics request". This is not specific for ESA mode. The number of calls that has over 3 seconds delay before given dial tone in each class is requested by DMS. The remote site sends "DTSR statistics Request Response" to DMS by means of a DMSX message.

3.2.5 DDRM ESA Static Data Download Subcomponent

DDRM ESA static data includes:

1. ESA tables
   - node table
   - terminal type table
   - digit collection table
   - multi-ring table
2. ESA translation tables

The ESA translation table download sequence is:

- translation data collection
- translation data download

ESA translation tables required by the DDRM are:

- Line terminal data table
- Extension header table
- Extension table
- Digit translation tables (EFG and ABCD tables)
- Tone table
- Office parameter table

DDRM ESA data downloading is triggered by:

- a successful DDRM RTS
- a DDRM ESA nightly audit

3.2.6 DDRM Node Maintenance Component

This component consists of fallowing subcomponents:

1. DDRM RTS sequence — This component invokes DDRM ESA Exit during DDRM RTS (both *manual* and *system*).

2. DDRM SYSRTS sequence —
   The LCM SYSRTS sequence is activated during the C-side host RTS. This invokes the LCM RTS sequence.
3. DDRM ESA Static Data request handling — This handles maintenance requests submitted for the DDRM ESA Static Data download.
4. DDRM Nightly Audit request handling —
   This supplies the interface between DDRM Nightly Audit and the existing LCM maintenance processes.

3.2.7 ESA Inservice Troubles

If the Static Data is not updated for the DDRM ESA or a problem occurs during Static Data download, the status of DDRM is changed to the appropriate ISTB.

LCM ISTB types do not now have a value which indicates Static Data problems. This is because LCM peripherals software do not contain Static Data tables. RLCM ESA is a separate node, and its ESA Static Data ISTB is only displayed in the ESA PM level.

The ISTB reasons will include:

- Static Data mismatch with CC
- Invalid ESA translation data

3.3 Hardware Requirements or Dependencies

UTRD which receives tones in ESA mode, is needed in order to enter ESA mode.

3.4 Software Requirements or Dependencies

For successful deployment of this activity following activities are required:

- A00006660 - DDRM Node Definition and Provisioning

  ESA is defined by node definition made in LCMINV table. CM checks ESA field information and UTRD datafill and existence.. When ESA field is changed nightly audit needs to be triggered which will download ESA data If necessary.

- A00006661 - DDRM Node Maintenance

  ESA data will be downloaded by by sucesfull RTS and by nightly audit. These are triggered by node maintenance..

- A00006663 - DDRM Alarms and Audits

If UTRDis non-existent on DDRM major alarm will be raised. ESA enterence will be prevented by checking alarm status..

- A00006666 - DDRM XPM Support and Monitoring

  DDRM ESA related messages will pass through XPM.

Also:

- DDRM node, internal software

  CM part o f ESA needs proper reply messages from DDRM internal software in order to function. Also, call processing in ESA mode will be handled by DDRM ESA software.

3.5 Limitations and restrictions

DDRM ESA will not be triggered if UTRD is non-existent. Also UTRD datafill is needed in order to datafill ESA field in LCMINV table. Automatic line index, hunt group and prefix tables are not downloaded in static data since they are not needed.

4: Functional Description (FN): A00007289

4.1 Feature name and Feature ID

A00007289 - RT Selector Enhancement for Metering

4.2 Description

4.2.1 Purpose

The purpose of this feature is to optionally remove the incompatability of metering behavior between DMS-100I and DMS-100 MMP systems, when RT selector is used in XXRTE routing tables.

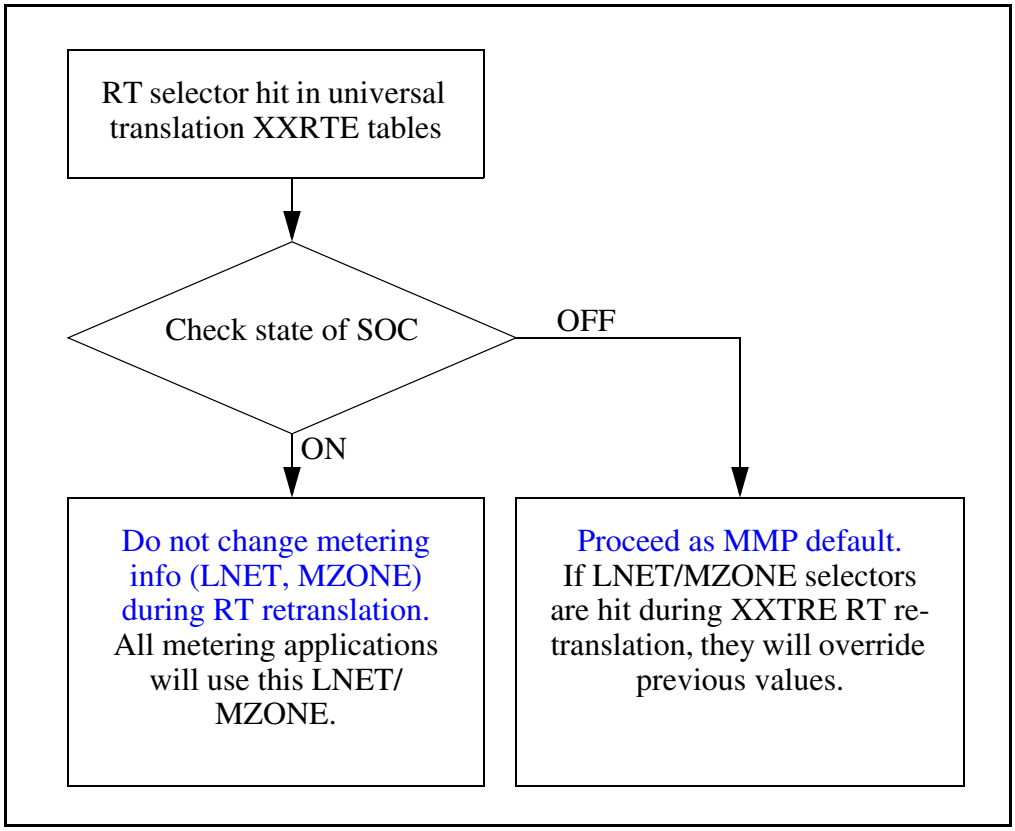
4.2.2 Introduction

The RT selector in XXRTE tables causes a re-translation to take place with new digits, which are supplied as parameters to the selector. During the translation of these new digits, it is likely that LNET/MZONE values different than those encountered before RT was hit will be encountered. Default MMP behavior is that the new LNET/MZONE will overwrite the previous ones, so that at the end of translation, the values that are last hit (i.e. the ones hit within retranslation) will be used for metering. On the other hand, DMS-100I product does not let re-translation overwrite LNET/MZONE, so at the end of the translation, the values which are hit before RT will be the ones which will be used for metering.

This activity implements a SOC optionality (METR0018). If the SOC state is ON and the translation is in XXRTE RT-based retranslation, DMS-100 MMP product will preserve LNET and MZONE during the retranslation, in the same way as DMS-100I.

4.2.3 Behavioral Diagram

Table 1 Feature flowchart



4.3 Hardware Requirements or Dependencies

This feature is meant to be used in DMS-100 MMP offices of Turk Telekom.

4.4 Software Requirements or Dependencies

This feature will work on DMS-100 MMP products, provided that the SOC is set to ON.

This feature may optionally be used in DMS-100 MMP markets that use metering.

4.5 Interactions

The effect of this feature is limited to metering behavior of RT selector in XXRTE routing tables. Other RT selectors (for example, RT selector in OFRT

table), or other selectors which cause re-translation (like GRX and IBNRT) are not effected.

Only the metering behavior of XXRTE RT selector is affected.

Metering is affected such that RT re-translation of XXRTE tables do not override LNET/MZONE.

Any application that uses/reads LNET/MZONE after/during translations will be indirectly effected (if translations use XXTRE-RT, and the SOC state is ON).

There are no changes in TRAVER behavior.

5: Functional Description (FN): A00008429

5.1 Feature name and Feature ID

A00008429 - Ring Back When Free (RBWF) Enhancements

5.2 Description

5.2.1 Introduction

Throughout this document,

- RBWF is used as a general term for RAG flavors which are Nodal RAG and BTUP Call Back When Free (CBWF) for this activity.
- The subscriber that invokes the RBWF service is known as the RAGOR. The subscriber that was busy when a call was made to it, resulting in the RBWF service being invoked against it, is known as the RAGEE.

This activity enhances the Nodal RAG (Ring Again) and BTUP Call Back When Free (CBWF) flavours of existing RAG Service (based on two new SOCs introduced by this activity).

This activity is implemented in ISN09 release and any functionality introduced by this activity is only available in INTL TDM loads.

In the “Background Information” section existing RAG functionality is summarized, and in the “Functional Overview” section RBWF enhancements introduced by this activity are explained.

5.2.2 Background Information

The RAG feature allows a RAGOR to set a Ring Again request against a RAGEE, if the RAGEE is busy, and be recalled when the RAGEE becomes idle. Once the RAGEE becomes free then the RAGOR is automatically rung back. Once the RAGOR picks up the ringing call then the RAGEE is rung and the call continues as a normal call.

The activation and deactivation of RAG feature is as follows:

1. The RAGOR encounters a busy signal. The RAGOR activates the RAG feature (either by single digit activation mechanism, or by dialling RAG feature code after FLASH). The RAGOR goes on-hook.
2. When the RAGEE becomes idle, the RAGOR receives a special ring back tone.
3. The RAGOR goes off-hook. The switch places the call, and the call continues as a normal call. The system deactivates the RAG feature.

Interrogation functionality of RAG service does not exist before this activity.

After a specified amount of time, RAG automatically reactivates if the RAGOR does not answer the ring back. To cancel a RAG request, the RAGOR can go off-hook and dial the RAG feature code.

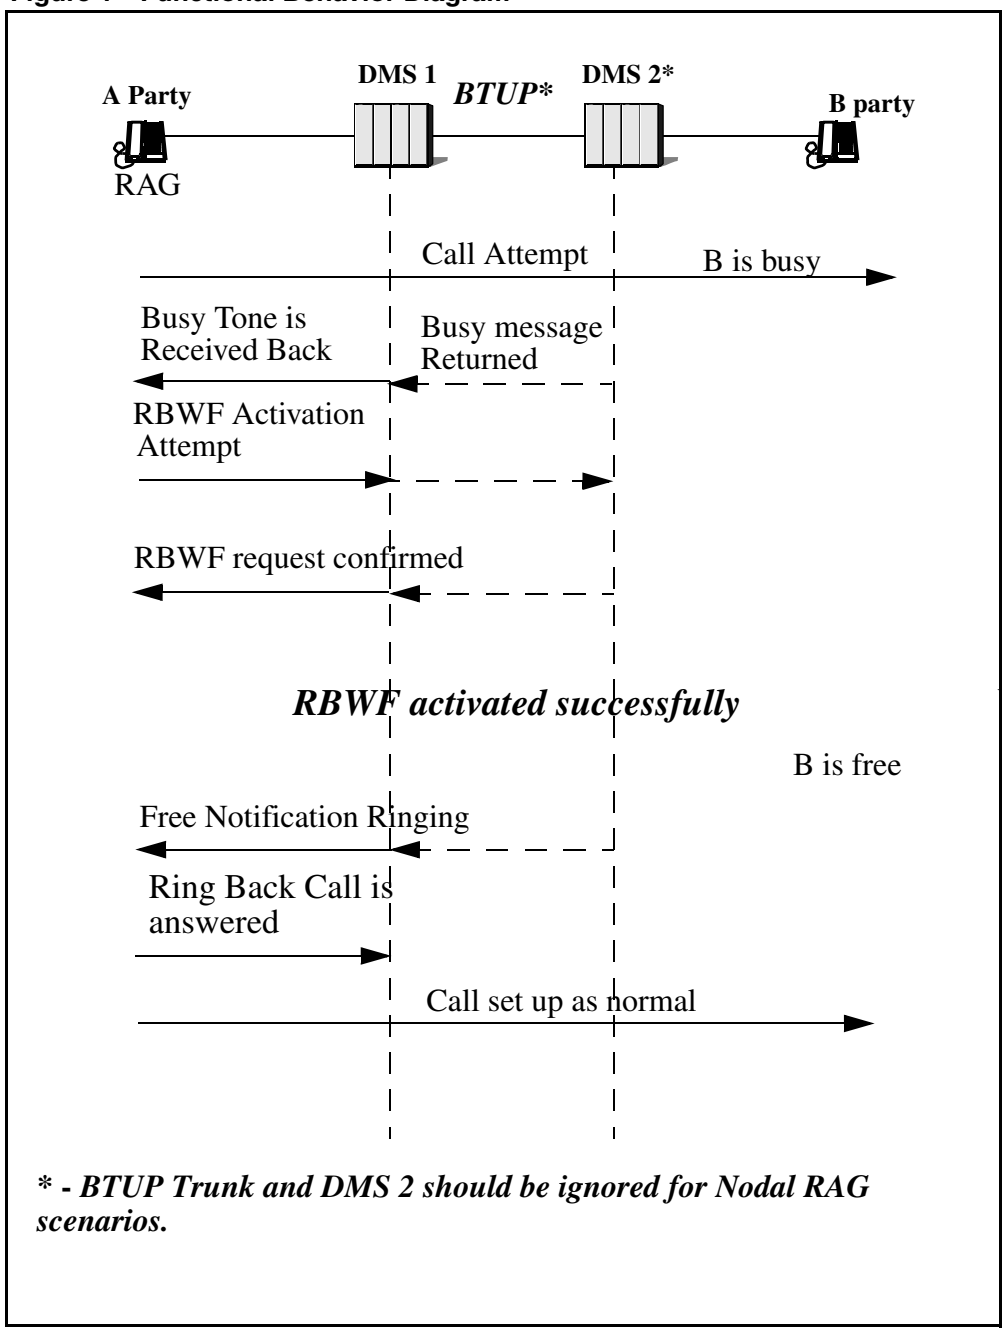
Ring Again Cancellation Timer deactivates the RAG requests when the busy party remains off-hook for a specified amount of time.This timer is datafilled in table CUSTSTN, with RAGCANTO field of RAGTIM option for nodal RAG (0, 2 TO 30 mins), and in table CUSTNTWK, with ORIGDUR (5 TO 180 mins) and TERMDUR (5 TO 185 mins) fields of NTWRAG option for BTUP CBWF.

Only one RBWF request can be active for RAGOR. If RAGOR attempts to activate a new RBWF request, when there already exists an active RBWF request, new RBWF request overwrites the existing one.

For Nodal RAG, RBWF activation is not allowed for inter-group calls, if INTRAGRP=N.

Following figure shows the activation and call setup sequence for RBWF services.

Figure 1 Functional Behavior Diagram



Please refer to related NTPs and the references given at the end of the document, for further information on existing Nodal RAG and BTUP CBWF functionality.

5.2.3 Functional Overview

This feature provides the following functionalities/enhancements to RBWF Services:

- Number of RBWF requests that can be activated by a RAGOR is increased from 1 to N, which is datafillable up to 6.
- Cancellation command results in cancellation of all active RBWF requests cancelled.
- Interrogation functionality is newly introduced by his activity, and interrogation results in announcement of all active RBWF requests of the RAGOR.
- Individual datafillable dialling sequences for RBWF deactivation, and interrogation are provided.
- Billing for nodal RBWF calls is supported.
- Nodal RBWF functionality is improved so that RBWF can work between different customer groups, regardless of the INTRAGRP flag.
- Range of existing Ring Again Cancellation Timer for Nodal RBWF calls is extended from 30 to 185 mins. This timer allows the end user to set a limitation how long each nodal ring again request can remain active at the switch. This limit is set on a customer group basis (RAGCANTO field of RAGTIM tuple in table CUSTSTN). Please note that this timer is individually started for each RBWF request, and expiry of this timer for a RBWF request causes deactivation of that request only.

RBWF enhancements implemented by this activity are controlled with two new SOC options, so that existing functionality is not affected when these SOCs are IDLE. Two new SOC options introduced by this activity are SVBI Multiple RBWF and SVBI RBWF Enh. Please refer to Section “Providing Optionality for RBWF Enhancements”.

Please note that multiple RBWF functionality is designed considering that only Nodal RAG and BTUP CBWF flavours of RBWF are used in the switch. It is strongly recommended that SVBI0037 SVBI Multiple RBWF SOC should not be turned ON in the switches where other flavours of RBWF (i.e. DPNSS, TCAP CBWF, CCBS etc) are being used. Turning this SOC ON might cause unexpected behaviour if RBWF flavours other than nodal RAG and BTUP CBWF are being used.

In addition, some new options in tables ISERVOPT and AMAOPTS are introduced in order to control the functionality. All of these options are discussed in next sections.

Please note that this activity does not change the call topology and BTUP signalling of existing RBWF services.

5.2.3.1 Providing Optionality for RBWF Enhancements

Main functionalities of this activity are controlled by two new SOC options, SVBI Multiple RBWF and SVBI RBWF Enh. Both of these SOCs are state SOCs, which can be either in SOC_ON or SOC_IDLE state.

SVBI Multiple RBWF SOC controls the following:

- Allowing N RBWF request to be activated by the RAGOR.
- Rejecting N+1th request.

Table 1 SVBI0037 Multiple RBWF SOC

SOC Group	SVBI
SOC Option Name	SVBI0037
SOC Option Title	Multiple RBWF
SOC Option Control Type	State
New SOC Option?	Yes
Option defined in DRU	WT22
Affected Products	DMS100 - MMP

If SVBI0037 Multiple RBWF SOC is turned OFF when RAGOR has more than one active RBWF requests, these requests are completed normally after SOC is turned OFF. If RAGOR attempts to activate a new request after SVBI0037 SOC is turned OFF, new RBWF request overwrites the first RBWF request activated before.

SVBI RBWF Enh SOC controls the following:

- Allowing nodal RBWF between different customer groups via ignoring INTRAGRP flag.
- Billing of nodal RBWF usage.
- Deactivation and interrogation functionalities with new dialling sequences.

  Note: If only SVBI RBWF Enh SOC is ON, then there should be at most one RBWF request to announce or cancel - however if there are more than one (because the SVBI Multiple RBWF SOC was on when they were activated) then all requests are announced / cancelled.

Table 2 SVBI0036 RBWF Enh SOC

SOC Group	SVBI
SOC Option Name	SVBI0036
SOC Option Title	RBWF Enh
SOC Option Control Type	State

Table 2 SVBI0036 RBWF Enh SOC

New SOC Option?	Yes
Option defined in DRU	WT22
Affected Products	DMS100 - MMP

Please note that datafilling of any option, which is introduced by this activity, is allowed even if these SOCs are IDLE. But new functionalities are only available when related SOC(s) is ON.

5.2.3.2 RBWF Activation, Interrogation and Cancellation Through Translation Tables

In the existing implementation, if single digit activation mechanism is not used, RBWF services are activated and deactivated via using the same dialling sequence (ex. *37#), datafilled in translation tables.

Figure 2 Existing Datafill for RAG act and deact access codes

```
TABLE IBNXLA
KEY                      RESULT
----------------------------------------
FTRSTAR  37      FEAT N N RAG
```

This activity provides different dialling sequences for RBWF activation and deactivation, and also introduces RBWF Interrogation functionality in INTL TDM product. In order to provide this, two new IBN_LOG_FEATURES “RAGD” and “RAGINT” are introduced to be used in table IBNXLA.

Access codes for RBWF act, deact and interrogation are datafillable in table IBNXLA, and following figure shows a datafill example for using *37# for activation, #37# for deactivation and *#37# for interrogation of RBWF.

Figure 3 New datafills for RBWF act, deact and interrogation access codes

```
TABLE IBNXLA
KEY                      RESULT
----------------------------------------
FTRSTAR  37      FEAT N N RAG
FTROCT   37      FEAT N N RAGD
FTRSTAR  C37     FEAT N N RAGINT
```

RAGINT and RAGD are datafillable in table IBNXLA, even if RBWF Enh SOC is IDLE. But please note that, NACK tone is given if subscriber attempts to use deact/interrogation with these dialling sequences, when RBWF Enh SOC is IDLE.

Behavior of the RBWF service during RBWF act, deact and interrogation are explained in the following flowcharts:

Figure 4 Flow Chart for RBWF Activation

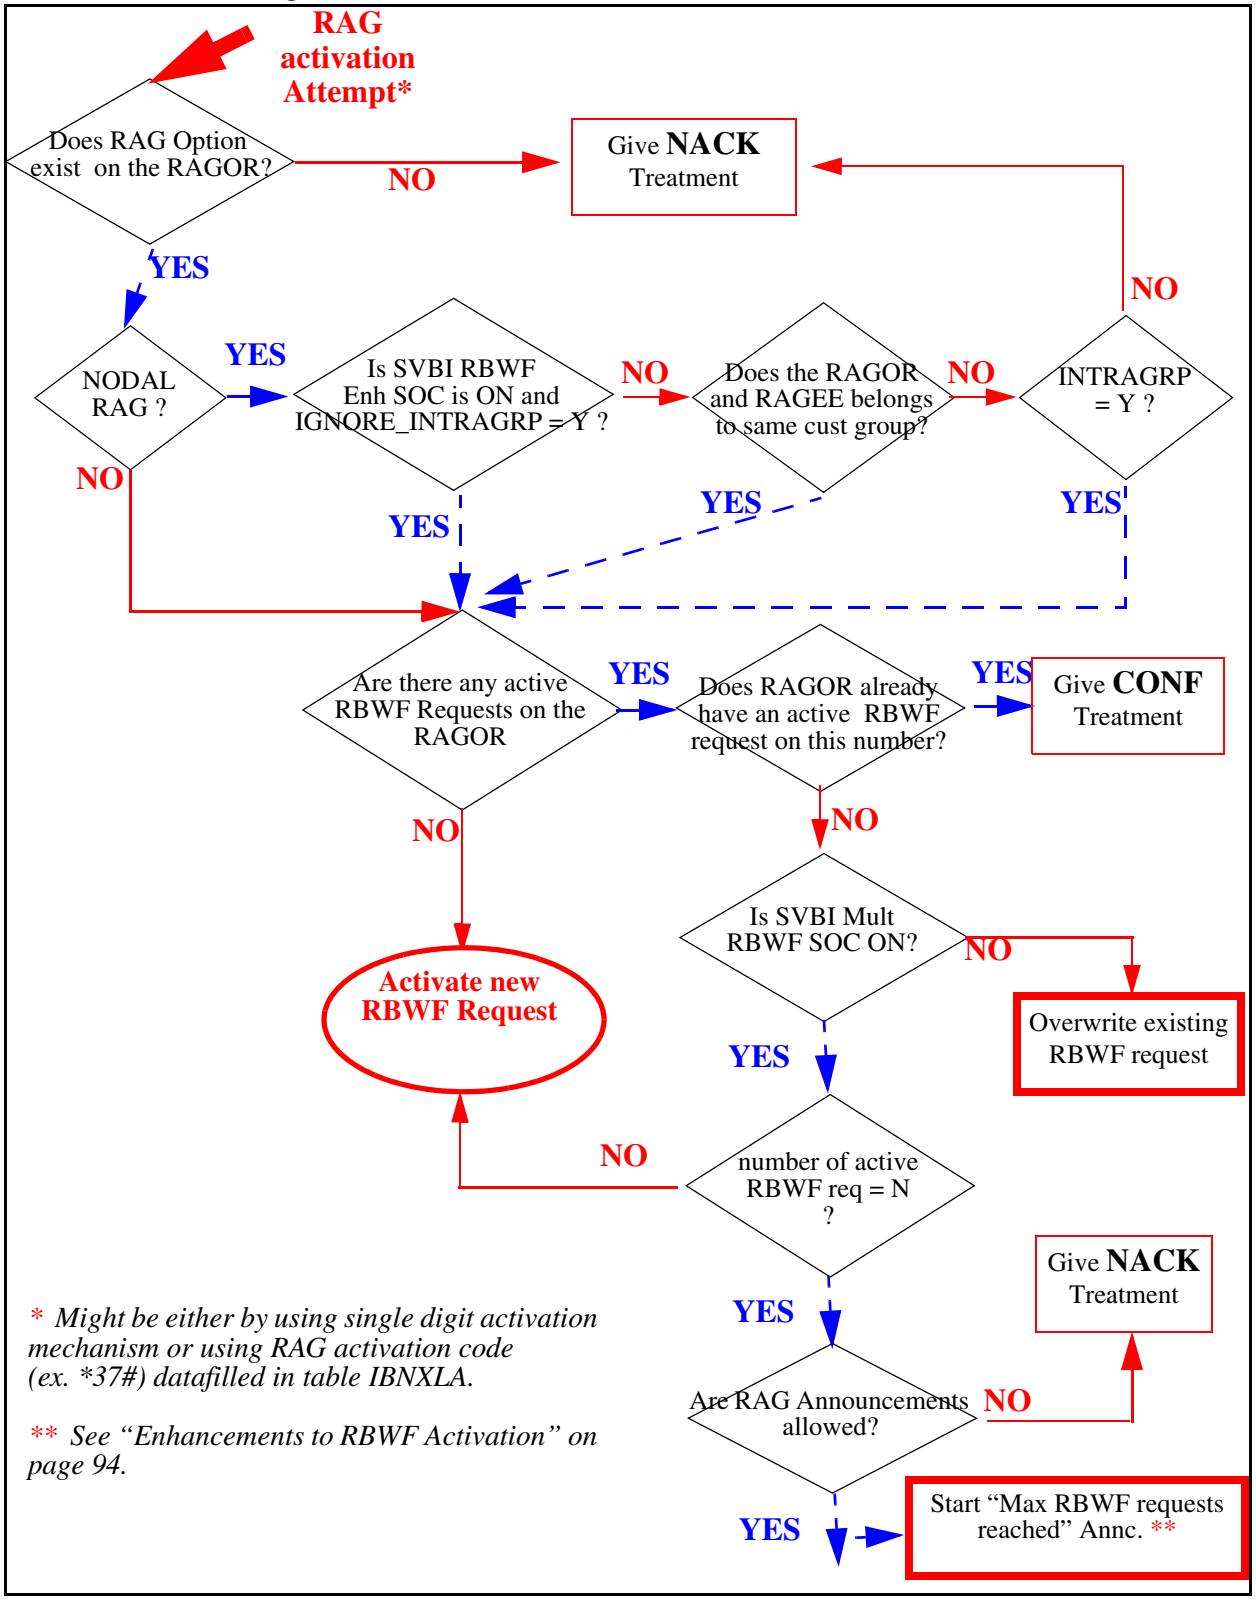


Figure 5 Flow Chart for RBWF Deactivation

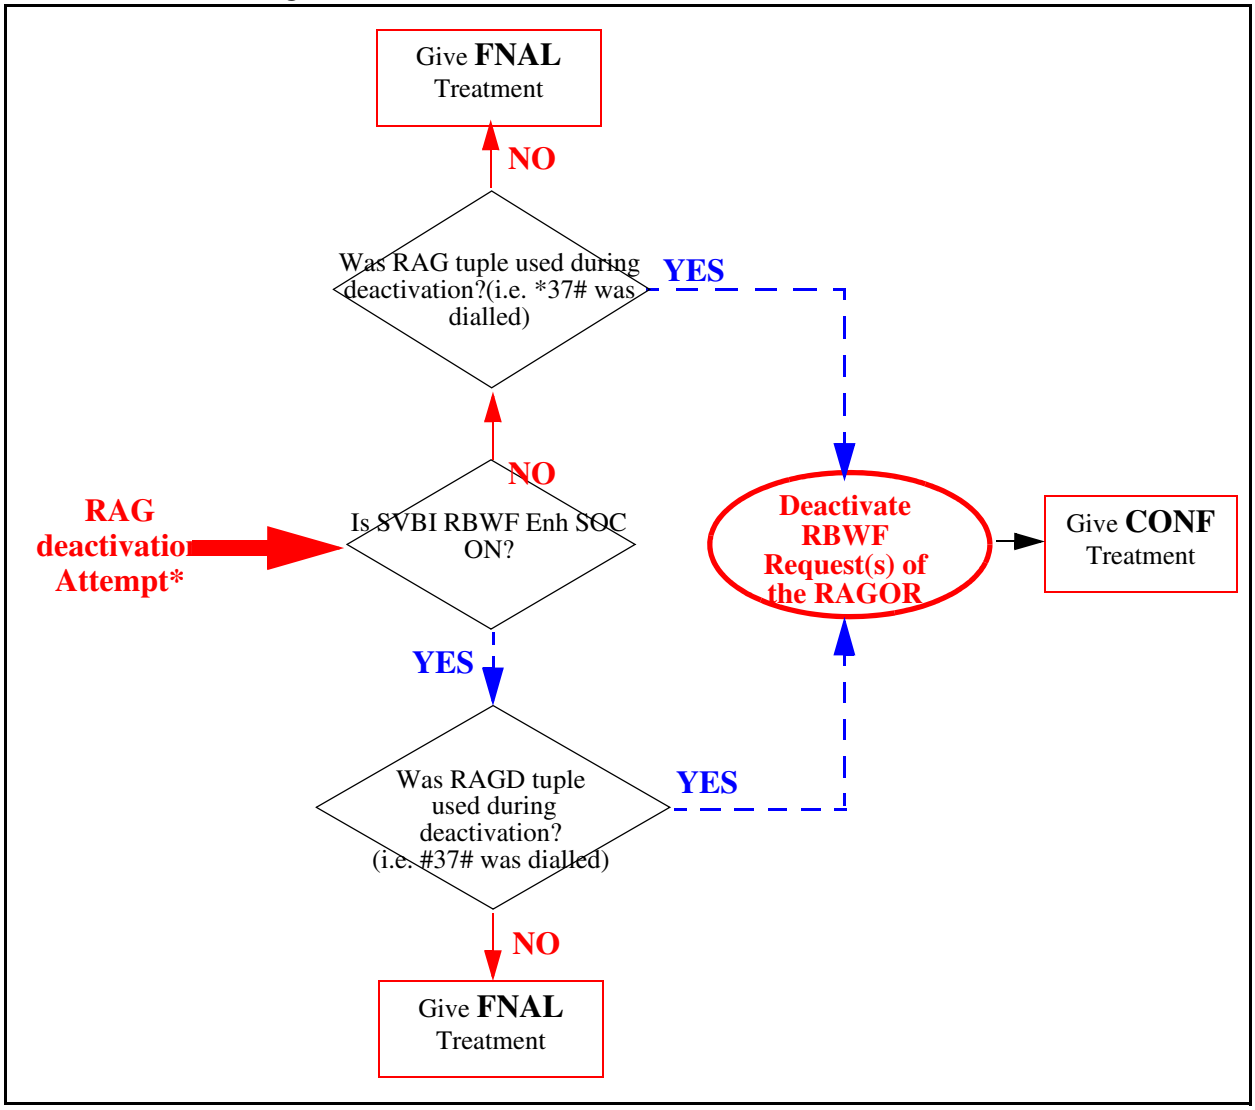

Figure 6 Flow Chart for RBWF Interrogation

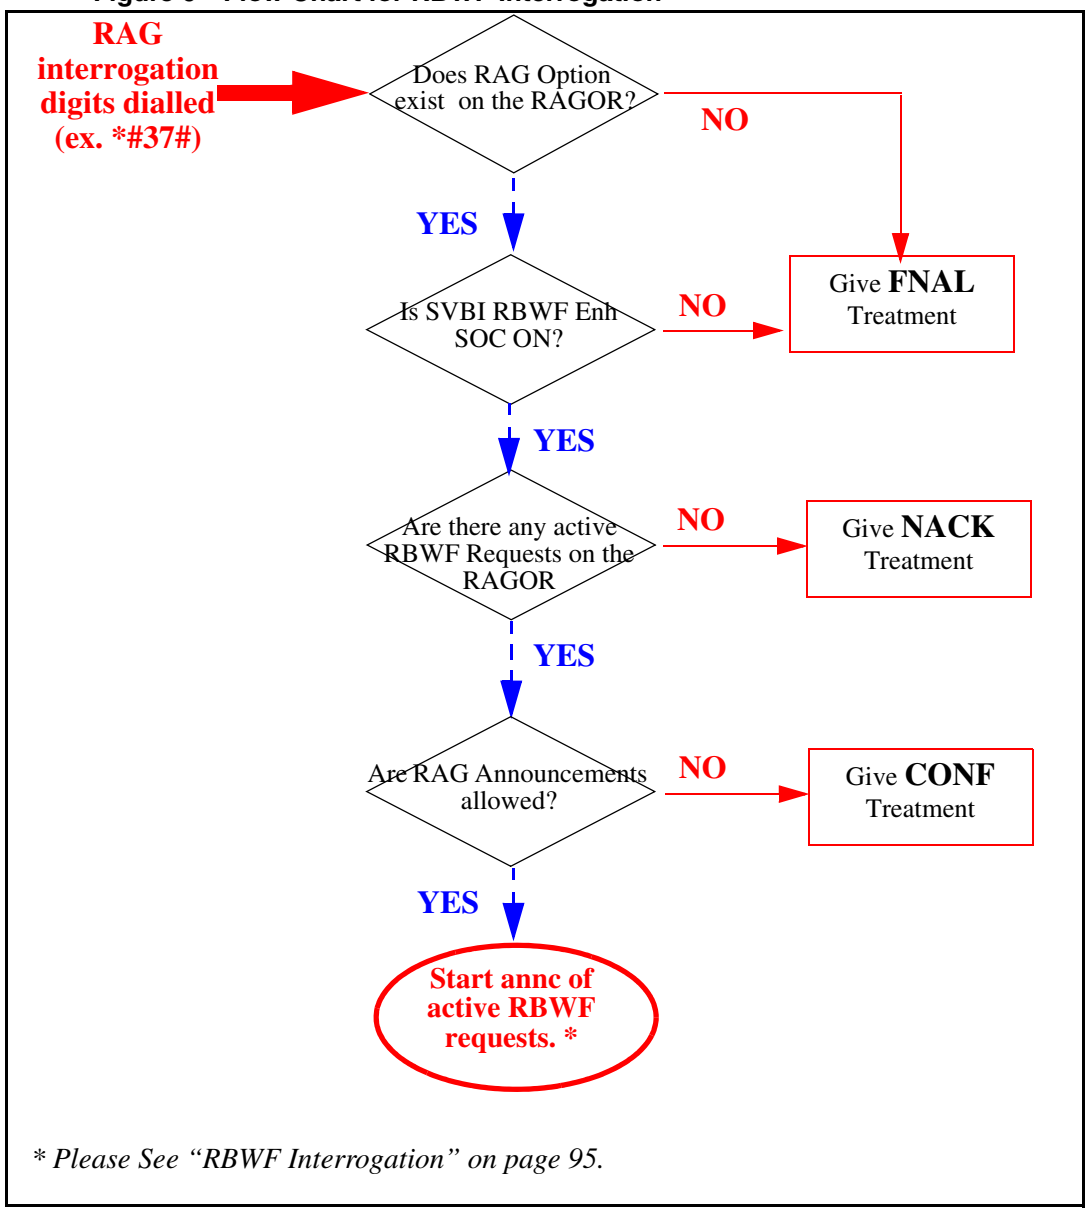


** Please See "RBWF Interrogation" on page 95.*

5.2.3.3 RBWF Activation and Cancellation on EBS Lines

In the existing implementation, RAG key on EBS sets is used for both activation and cancellation. If it is hit any time when there is an active RBWF request, RBWF cancellation is performed. Hitting RAG key when there are no RBWF requests is considered as RBWF activation.

This behaviour is changed by this activity, since hitting RAG key for activating a new RBWF request (when there already exists one), should be taken as RAG activation, not cancellation.

If SVBI0037 Multiple RBWF SOC is ON,

- **hitting RAG key when RAGOR is not involved in a call (ON-HOOK), is considered as RAG cancellation attempt.**
- **hitting RAG key, when a busy destination is encountered, is considered RAG activation attempt.**

Please note that existing behaviour is not changed if SVBI0037 Multiple RBWF SOC is IDLE.

5.2.3.4 Enhancements to RBWF Activation

In current implementation of RBWF, any RAGOR can have only one active RBWF request at a time. By this activity, a RAGOR can have N active RBWF requests, where N is datafillable in table ISERVOPT. If SVBI Multiple RBWF SOC is IDLE, RAGOR can have only one active RBWF request as it is now.

5.2.3.4.1 New Service Option for Multiple RBWF Requests

A new option RBWFENH is defined in table ISERVOPT. This option has two subfields: MAX_RBWF_REQ and IGNORE_INTRAGRP.
MAX_RBWF_REQ determines the maximum number of RBWF requests that can be activated by a RAGOR simultaneously. It takes values between 1 and 6. Its default value is 5, if not datafilled.

Please note that if SVBI Multiple RBWF SOC is IDLE, only one RBWF request is allowed as it is now, even if MAX_RBWF_REQ is different than one. If user attempts to datafill MAX_RBWF_REQ with a value greater than 1 when SVBI Multiple RBWF SOC is IDLE, a warning msg is displayed, however datafill is allowed.

Figure 7 Datafill Sample for MAX_RBWF_REQ in table ISERVOPT

```
TABLE: ISERVOPT

 RBWFENH             RBWFENH 5 Y
```

5.2.3.4.2 Increasing Number of RBWF Requests up to N

In the existing implementation, only one active RBWF request is allowed for a RAGOR.By this activity number of RBWF requests allowed for a RAGOR is increased up to N.

- *Ragging on the same number twice:*

In the existing implementation of NODAL RAG, if RAGOR attempts to rag on the same number again, just CONF tone is given without resetting the existing RBWF request (i.e. timers are not reset) . This behavior is not modified by this

activity. If current RAGEE number is one of the active RBWF requests of the RAGOR, just CONF tone is given.

In the existing implementation of BTUP CBWF, active RBWF request is cancelled when user attempts to activate a new one, even if incoming request is for the same number. This behavior is changed by this activity, as to be consistent with NODAL RAG implementation.

- *Ragging on a new number:*

In the existing implementation, if any other number is requested, active RBWF request is cancelled and new request is accepted.

By this activity, if SVBI Multiple RBWF SOC is ON, active RBWF requests are not cancelled, instead a new RBWF request is activated. If max number of RBWF requests were already reached, new request is rejected with an announcement.

5.2.3.4.3 Rejection of N+1th RBWF request

If max number of RBWF requests allowed are reached, new RBWF request of the RAGOR should be rejected if SVBI Multiple RBWF SOC is ON. If RAG announcements are allowed (datafilled in ANNC_CONF field of RAG tuple in ISERVOPT), new request is rejected with an announcement, otherwise NACK tone is given. Following is a rejection announce sample:

Figure 8 RBWF Request Rejection Announcement sample

```
"The maximum number of ringback requests are registered
against your line.No further ringback requests can be
accepted at the moment"
```

5.2.3.5 Enhancements to RBWF Deactivation

When the RAGOR attempts to cancel his/her RAG requests, via dialling the cancellation digits, all of the active RAG requests of this RAGOR are cancelled.

5.2.3.6 RBWF Interrogation

Interrogation functionality of RBWF is being introduced by this activity. If all criterias in the interrogation flowchart are met (i.e. SVBI Mult RBWF SOC is ON, RAG Annc allowed, etc), successful interrogation results in announcement of all active RBWF Requests. Provided announcement is like the following:

Figure 9 Interrogation Announcement sample for an agent having 3 active RBWF requests

```
"Telephone Number 01483 8207308 is waiting for ringback.
 Telephone Number 436 7854 is waiting for ringback.
 Telephone Number 436 7945 is waiting for ringback."
```

5.2.3.7 RBWF Announcements

RBWF announcements are custom announcements that consist of a number of simple phrases, in English, datafilled in table ANNPHLST (See Appendix for sample announcement datafill). Each simple phrase has a corresponding recording on the EDRAM card.

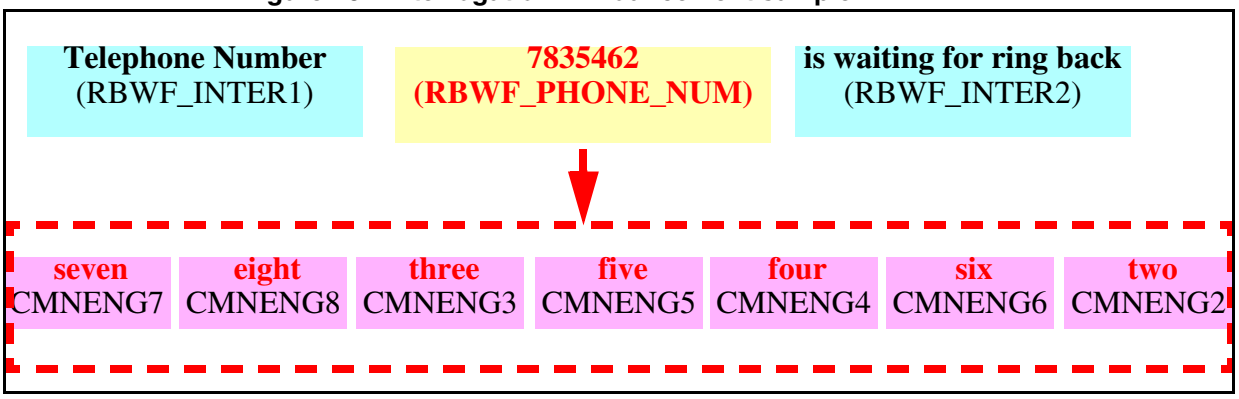
- *RBWF Interrogation Announcement*

RBWF interrogation announcement is provided as a result of successful RBWF interrogation, and includes the RAGEE telephone numbers which were activated by the RAGOR requesting the interrogation.

There are two simple phrases introduced for RBWF interrogation announcement, which are RBWF_INTER1 and RBWF_INTER2. RBWF_PHONE_NUM is a compound phrase, which corresponds to the RAGEE number. RBWF_PHONE_NUM does not have a constant recording on EDRAM, and its components (i.e. combination of simple phrases) are determined at run time according to the digits of the RAGEE number.

Tuple datafilled in ANNPHLST is repeated for “number of existing RBWF requests of RAGOR” times. Please note that announcement given stricly depends on datafill sequence.

Figure 10 Interrogation Announcement sample

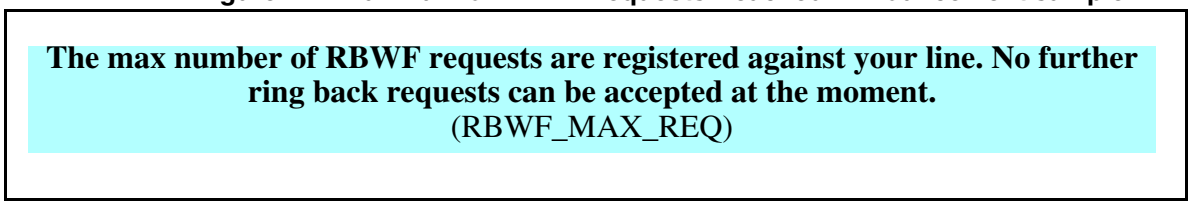


- *Max Num of RBWF Requests Reached Announcement*

This announcement is given when RAGOR attempts to initiate a new RBWF request, and RAGOR already has N active requests (N - Max Num of RBWF allowed).

There are one simple phrase introduced for RBWF request rejection announcement, which is RBWF_MAX_REQ.

Figure 11 Max Num of RBWF Requests Reached Announcement sample



Following is the list of phrases which are introduced by this activity.

Table 3 List of English Phrases introduced

Phrase Name	Recording
RBWF_INTER1	Telephone Number
RBWF_INTER2	is waiting for ring back
RBWF_PHONE_NUM	Compound Phrase - RBWF request number
RBWF_MAX_REQ	The max number of RBWF requests are registered against your line. No further ring back requests can be accepted at the moment.

For the announcement of telephone number, existing basic English phrases for digits 0 to 9 should also be recorded properly, which are the phrases CMNENG0 to CMNENG9.

Table 4 List of English Digits Phrases CMNENG0 to CMNENG9

Phrase Name	Recording
CMNENG0	Zero
CMNENG1	One
CMNENG2	Two
CMNENG3	Three
CMNENG4	Four
CMNENG5	Five
CMNENG6	Six
CMNENG7	Seven
CMNENG8	Eight
CMNENG9	Nine

Please see Appendix for sample datafill of RBWF Announcements.

5.2.3.8 Billing of Nodal RBWF Calls

Billing of BTUP CBWF calls was already implemented by an activity “AJ4955- BTUP CBWF Billing”. Billing of BTUP CBWF calls are controlled by BTUP_CBWF_BILL option in table AMAOPTS. If it is ON, service feature ID field of AMA record is marked with value “029”. Please note that 029 is a reserved value for RAG feature.

Billing of nodal RBWF calls are implemented by this activity in the same manner, via marking the Service Feature ID field with value 029. This functionality is controlled with SVBI RBWF Enh SOC and a new option, “NODAL_RAG_BILL” in table AMAOPTS.

Both SVBI RBWF Enh SOC and NODAL_RAG_BILL option must be ON in order to enable billing of Nodal RBWF calls.

Figure 12 Sample Datafill For NODAL_RAG_BILL option in Table AMAOPTS

```
TABLE AMAOPTS
OPTION                SCHEDULE
-----------------------------
NODAL_RAG_BILL        ON
```

Usage of Nodal RAG is reported in AMA record in the following scenarios:

1. RAGOR ignores ring back call
2. RAGOR answers ring back call and disconnects immediately before or after the RAGEE is rung.
3. Ringing is applied to the RAGEE and RAGEE does not answer.
4. A complete call setup occurs between RAGOR and the RAGEE, and call is disconnected by either party after the conversation ends.

Please note that for cases 2 to 4 service feature ID field of AMA record is marked with value “029”, if all criterias are met for generating AMA record (i.e. datafills, translations, SOC options for billing etc). But For case 1, AMA record is generated at any condition, independent of billing datafills.

[2]As datafilled in OFFICE_ID_ON_AMA_TAPE in OFCENG

5.2.3.9 Ignoring INTRAGRP flag for Nodal RBWF Calls

In the existing RBWF Service, Nodal RBWF between different customer groups does not work when INTRAGRP is N. By this activity RBWF Service functions independent of INTRAGRP flag.

Allowing Nodal RBWF to work between different customer groups even when INTRAGRP flag is N, is controlled with SVBI RBWF Enh SOC and IGNORE_INTRAGRP field of RBWFENH tuple in ISERVOPT.

Default value of IGNORE_INTRAGRP is Y if RBWFENH tuple is not datafilled in table ISERVOPT.

Both SVBI RBWF Enh SOC and IGNORE_INTRAGRP field of RBWFENH tuple in ISERVOPT must be Y, in order to allow Nodal RBWF to work between different customer groups regardless of INTRAGRP flag.

Figure 14 Sample Datafill For RAG tuple in table ISERVOPT

```
SOPTSKEY                                                SOPTSVAR
--------------------------------------------------------------
RBWFENH                                              RBWFENH 5 Y
>
```

5.2.3.10 Increasing Cancellation Timer for Nodal RBWF Calls

Ring again cancellation timer allows the end user to set a limit on how long a nodal or network ring again request can remain active. This value is datafillable through tables CUSTSTN for nodal RAG and CUSTNTWK for network RAG.

Currently range of nodal RAG Cancellation timer (RAGCANTO field of RAGTIM tuple) is 2 to 30, or 0 and range of network RAG Cancellation timer is 5 to 180 mins for ORIGDUR and 5 TO 185 mins for TERMDUR (fields of NTWKRAG option).

The range for RAG Cancellation Timer is extended up to 185 by this activity, so that it includes the value 45.

This functionality is not controlled by any of the SOCs or any other option.

Figure 15 Sample Datafill For RAGTIM tuple in table CUSTSTN

```
TABLE CUSTSTN
CUSTNAME     OPTNAME                                        OPTION
-------------------------------------------------------------------
CUSTRAG      RAGTIM                                  RAGTIM 8  45
```

5.3 Hardware Requirements or Dependencies

This feature uses the Enhanced Digital Recorded Announcement Machine (EDRAM) to provide the announcement as a result of successful RBWF interrogation. Simple phrases needed for RBWF announcements can be loaded into EDRAM as voice files.

5.4 Software Requirements or Dependencies

Are the same as the ones required by Nodal RAG and BTUP CBWF.

5.5 Limitations and restrictions

This activity is tested and supported for INTL TDM loads only.

All limitations and restrictions that apply to Nodal RAG and BTUP CBWF Services also applies to this activity.

5.6 Interactions

Billing Interaction

When this feature is enabled, the option UNANS_LOCAL in table AMAOPTS is overridden which controls the reporting of unanswered AMA records having Service Feature field because it is necessary to report the BTUP CBWF usage when Ragee or Ragor do not answer.

This feature interacts with AMAREQD option in table CUSTSMDR (feature AJ4226 - The option that controls the generation of AMA management reporting), in the following way:

If the translations do not provide billing trigger and feature AJ4226 (AMA Time To Answer) is active then management reported record for answered/ unanswered BTUP-CBWF calls will have the SERVICE FEATURE field marked with 029C. If neither translations nor AMAREQD trigger an AMA record then this feature does not produce an AMA record.

Other Interactions:

All interactions that appy to Nodal RAG and BTUP CBWF are also valid for this activity.

5.7 Glossary

AMA	Automatic Message Accounting
BTUP	British Telecom National User Part
CBWF	Call Back When Free
CONF	Confirmation
NACK	Negative Acknowledgement
NRAG	Network Ring Again

APPENDIX: Datafill for RBWF Announcements

This appendix describes changed datafill required for RBWF announcements on an EDRAM card. For complete information, refer to *NTP-297-1001-527 Digital Recorded Announcement Machine DRAM and EDRAM Guide*.

Table CLLI

This table is used to define new CLLIs for two announcement groups. Field TRKGRSIZE defines the total number of members in each group.

Figure 16 Table CLLI

```
TABLE CLLI
CLLI   ADNUM TRKGRSIZ                              ADMININF
-------------------------------------------------------
RBWFANN   800        4                          MULTIPLE_RBWF
```

Table ANNS

This table assigns the CLLI name defined in table CLLI to an announcement type. Field CLLI contains the CLLI name. For RBWF service, field ANTYPE must be datafilled with RBWF. Announcement is repeated for number of times defined by MAXCYC field.

Figure 17 Table ANNS

```
TABLE ANNS
CLLI  ANNARCH TRAFSNO   CYTIME MAXCYC                    DATA
-----------------------------------------------------------
RBWFANN    ALL      1       1     1       RBWF    25       1
```

Table ANNMEMS

This table contains the assignments for each announcement member in the announcement group defined in table ANNS. Each tuple here corresponds to one trunk member in its group at MAP TTP level. For custom announcement such as RBWF, hardware type must be DRAM, only one track can be datafilled in field TRACKLIST and the track number must be 0.

Figure 18 Table ANNMEMS

```
TABLE ANNMEMS
ANNMEM      HDWTYPE           CARD
-----------------------------------------------------------
RBWFANN 1   DRAM              DRA   0        DTM    0 14 $
```

Table ANNPHLST

Each tuple in this table defines one custom announcement. For RBWF Announcements, RBWFANN tuple with index 1 corresponds to Max RBWF Requests Reached, and RBWFANN tuple with index 2 corresponds to RBWF Interrogation announcements.

Figure 19 Table ANNPHLST

```
ANNPHKEY          PHSLIST
-------------------------------------------------------
RBWFANN 1         RBWF_MAX_REQ $
RBWFANN 2         RBWF_INTER1 RBWF_PHONE_NUM RBWF_INTER2 $
```

Please note that announcement provided strictly depends on the datafill of this table. Phrases are announced in the order they are datafilled in this table.

6: Functional Description (FN): A00008477

6.1 Feature name and Feature ID

A00008477 - Increase size of table MSGRTE

6.2 Description

This feature provides the expansion of the MSGRTE table size upto 100,000 tuples by adding a new table MSGRTE2.

6.2.1 Table MSGRTE2

New table MSGRTE2 is used for routing and processing of facility messages of some protocols (e.g. PRA, DPNSS, etc.) in a manner identical to that performed by the existing table MSGRTE (Please refer to FN section of AD1315 for more details about the functional model of the table MSGRTE). The selection of which table will be active is achieved by the SOC XLAS0057 as described in the section 2.2.3..

New table MSGRTE2 has the same format as the table MSGRTE, and shares the same functionality provided by the MSGRTE table. The difference, and hence the need for a new table, is that the new table supports upto 100,000 entries while the existing table has a limit of 32K-1 digilator blocks.

Table MSGRTE2 is indexed by a three field key consisting of the Network identifier (NETID), and two digit strings (FROMDIGS and TODIGS). The data in the table is a list of routes made up of one to four route elements. Each element consists of one Message Route Selector (MSGRTSEL) such as LOCAL, PRA, SS7 and DPNSS. Each selector has its own special refinement. A sample of new table MSGRTE2 is shown below in Figure 1:

Figure 1 Sample Datafill of Table MSGRTE2

```
TABLE: MSGRTE2
MSGRTKEY
MSGRTRES
-----------------------------------------------------
PUBLIC 12345 12345 ( SS7 ANSIAB_ROUTES 4 0 NEWNET NEWPUB) $
```

6.2.2 Structure of Table MSGRTE2

The structure of table MSGRTE2 is shown in Table 1.

Table 6 Structure of Table MSGRTE2

Field	Subfield or Refinement	Range of Values	Description
MSGRTKEY			*Message Route Key* This is the key to table MSGRTE2 and consists of subfields NETID and DIGRANGE.
	NETID	String up to 32 characters	*Network Identifier* Network name datafilled in table NETNAMES
	DIGRANGE		*Digit Range* This field consists of subfields FROMDIGS and TODIGS.
	FROMDIGS	Alphanumeric (vector up to 10 characters, 0 to 9, A to F)	*From Digits* Digit string for the lower bound of the digit range to which the route list applies
	TODIGS	Alphanumeric (vector up to 10 characters, 0 to 9, A to F)	*To Digits* Digit string for the upper bound of the digit range to which the route list applies
MSGRTRES			*Message Route Result.* The list of routes used to transmit messages. Up to four routes can be datafilled.
	MSGRTSEL	DPNSS, LOCAL, PRA or SS7	*Message Route Selector* • DPNSS if TCAP NRAG messages are sent over DPNSS virtual trunks. • LOCAL if the message terminates on this switch. • PRA if the message is routed out on a specified PRA-D channel. • SS7 if a the message is routed over a specific SS7 route set.

Each Message Route Selector such as DPNSS, LOCAL, PRA and SS7 has its own special refinement.

6.2.2.1 MSGRTSEL = LOCAL

If the entry for field MSGRTSEL is LOCAL, the refinement is as followed.

Table 7 Structure of LOCAL refinement

Field	Subfield or Refinement	Range of Values	Description
	DELDIGS	0 to 15	*Delete Digits* Number of deleted digits from the destination address
	PREDIGS	Numeric or N (vector of up to 11 characters)	*Prefix Digits* Digit string prefixed to the destination address

6.2.2.2 MSGRTSEL = DPNSS

If the entry for field MSGRTSEL is DPNSS, the refinement is as followed.

Table 8 Structure of DPNSS refinement

Field	Subfield or Refinement	Range of Values	Description
	ISUPTRK	Alphanumeric (up to 16 characters)	*ISUP Trunk CLLI Name*
	DELDIGS	0 to 15	*Delete digits*
	PREDIGS	Numeric or N (vector of up to 11 characters)	*Prefix digits*
	OPTIONS	NEWNET	*DPNSS Option*
	NETNAME	String up to 32 characters	*Network Identifier* Network name datafilled in table NETNAMES

6.2.2.3 MSGRTSEL = PRA

If the entry for field MSGRTSEL is PRA, the refinement is as followed.

Table 9 Structure of PRA refinement

Field	Subfield or Refinement	Range of Values	Description
	TRKCLLI	Alphanumeric (up to 16 characters)	*Trunk Common Language Location Identifier* Trunk CLLI name
	DELDIGS	0 to 15	*Delete Digits*
	PREDIGS	Numeric or N (vector of up to 11 characters)	*Prefix Digits*
	OPTIONS	NEWNET or NEWTOR	*PRA Options* • NEWNET for a new network and datafill subfield NETNAME. • NEWTOR for a new type of route and datafill subfield TYPEOFRT.
	NETNAME	String up to 32 characters	*Network Identifier* Network name datafilled in table NETNAMES
	TYPEOFRT	PUB or PVT	*Type of Route* • PUB for a public route. • PVT for a private route.

6.2.2.4 MSGRTSEL = SS7

If the entry for field MSGRTSEL is SS7, the refinement is as followed.

Table 5 Structure of SS7 refinement

Field	Subfield or Refinement	Range of Values	Description
	DPC	Alphanumeric (up to 16 characters)	*Destination Point Code*
	DELDIGS	0 to 15	*Delete Digits*
	PREDIGS	Numeric or N (vector of up to 11 characters)	*Prefix Digits*
	OPTIONS	NEWNET	*SS7 Option*
	NETNAME	String up to 32 characters	*Network Identifier* datafilled in table NETNAMES

6.2.3 Activation of the Feature

Activation of the feature is controlled by SOC XLAS0057.

MSGRTE and MSGRTE2 tables are not effective at the same time - both tables could be datafilled but only one of them will be in effect. The selection of which table will be used is achieved through the SOC option XLAS0057. When the state of the SOC option is ON, MSGRTE table will be disabled and call processing will begin to use the new table MSGRTE2. When the SOC option is IDLE, MSGRTE2 table will be disabled and the MSGRTE table will be in effect.

When the state of the SOC is changed, a warning message will be displayed to inform the user about which table is in use. When the state of the SOC option is changed to ON, following warning message will be displayed ‘Table MSGRTE will not be effective, instead MSGRTE2 table will be used.’. When the state of the SOC is changed to IDLE following message will be displayed ‘Table MSGRTE2 will not be effective, instead MSGRTE table will be used

Datafill changes can be made independently to either MSGRTE or to MSGRTE2, the system does not keep these tables syncronised. When making a change (e.g. add, delete, update) to the inactive table (as defined by status of SOC XLAS0057) then a warning message will be displayed. The warning message will not be displayed for other operations that does not cause a change (pos, list, etc.) in the table.

7: Functional Description (FN): A00008479

7.1 Feature name and Feature ID

A00008479 - IP Correlation ID Enhancement

7.2 Description

7.2.1 Feature Description

This document describes the feature for carrying the correlation ID from SSP to IP over Base ETSI ISUP V2 for several IN triggering agents.

SCP sends the correlation ID to SSP in ETC message and the correlation ID is carried by the UUI (user to user information) parameter from SSP to external IP in IAM message over Base ETSI ISUP V2.

Sending of correlation ID is required for the following interworkings:

IN Triggering Agent	Call routed to External IP over
BTUP V2/V2+	ETSI ISUP V2
ETSI ISUP V1/V2 BASE	ETSI ISUP V2
Spanish ISUP V1/V2	ETSI ISUP V2
FTUP (SSUTR2)	ETSI ISUP V2
UK ISUP	ETSI ISUP V2
Italian ISUP	ETSI ISUP V2
Belgium ISUP	ETSI ISUP V2
Portugal ISUP	ETSI ISUP V2
ETSI PRI	ETSI ISUP V2
Spanish PRI	ETSI ISUP V2
Italian PRI	ETSI ISUP V2
French PRI VN4	ETSI ISUP V2
DPNSS/DASS2	ETSI ISUP V2
POTs Lines (LCME, GPP CAS and V5.2)	ETSI ISUP V2

IN Triggering Agent	Call routed to External IP over
EBS (P-Phone) Lines	ETSI ISUP V2
ETSI BRI Lines (Direct and V5.2)	ETSI ISUP V2

This is available in ISN09 release.

This feature focuses on BASE ETSI ISUP V2. It may work for other variants of ETSI ISUP V2, but this activity (design and test) focuses on Base ETSI ISUP V2 only.

7.2.2 Desired Behavior

Figure 1 Functional Behavior of the Feature

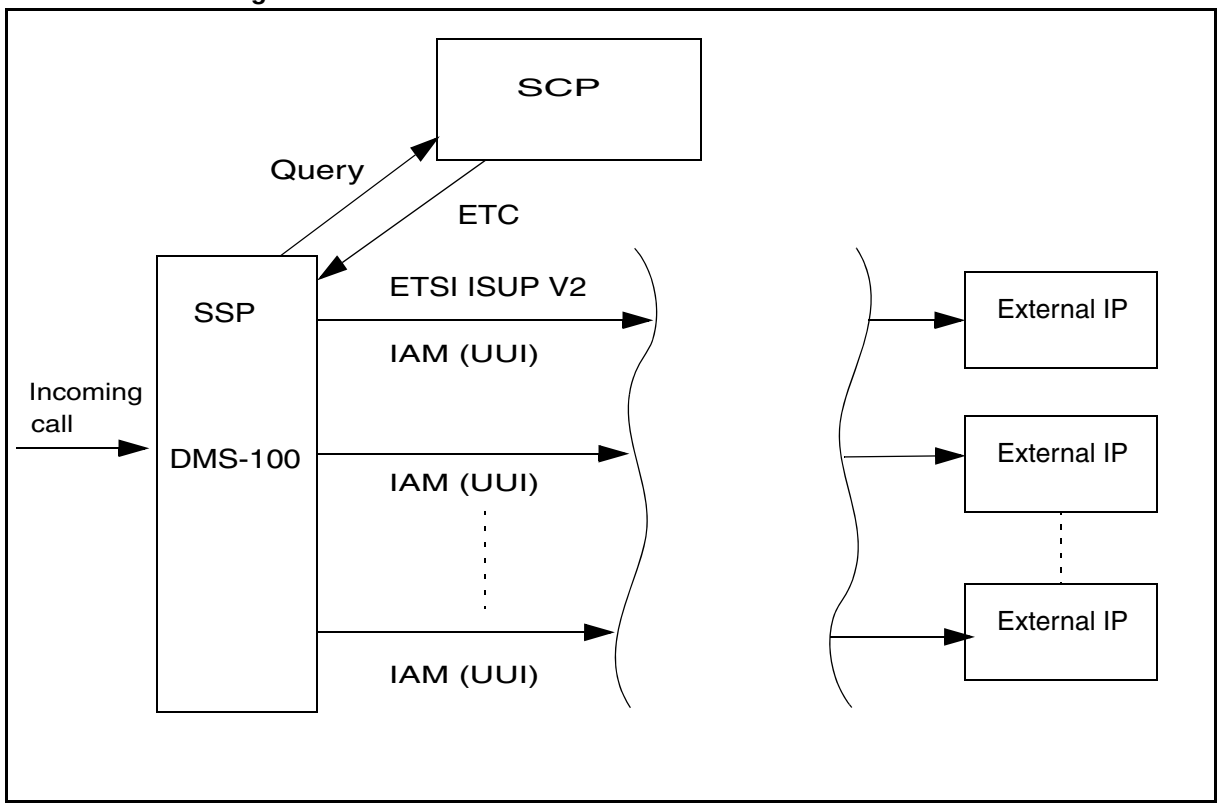

Figure 1 illustrate desired behavior of the activity. SCP sends the correlation ID to SSP in ETC message and the correlation ID is carried by the UUI (user to user information) parameter from SSP towards external IP in IAM message over Base ETSI ISUP V2.

The DMS as SSP allows receipt of correlation ID in ETC message from SCP in 2 ways:

a. embedded in the assistingSSPIPRouting address parameter

b. in a separate correlationID parameter

For this feature, the second way(b) is accepted. SSP receives the correlation ID in ETC message in a separate correlationID parameter from SCP. This is only mechanism the design supports.

Also, there are 3 mechanisms to pass the correlation ID from SSP to IP:

1) In User to User Information (UUI)

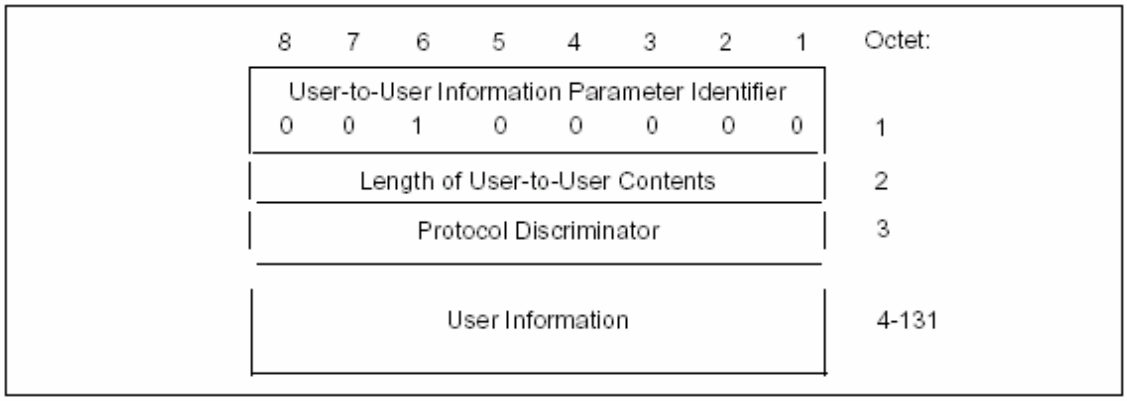
2) As a suffix to the Called Party Address (CDPN) used to route the call to the IP

3) In IAM message as a seperate optional parameter (If the "CORRELATIONID_TRANSPORT IN_CRID" is datafilled in the SERVINFO table , the correlation ID is carried in IAM message as a seperate optional parameter. This is implemented in the avtivity A00007793 in ISN08 stream. For more information ,refer to A00007793.)

For this feature, it is passed in the UUI (1). This is only mechanism the design supports. The "CORRELATIONID_TRANSPORT IN_CRID" should not be datafilled in the SERVINFO table for carring it in the User to User Information (UUI).

Figure 2 shows the UUI parameter format on ETSI ISUP V2.

Figure 2 UUI on ETSI ISUP V2



The format of the correlation ID received in the ETC message is described by the following figures. (Figure 3, Table 1, Table 2, Table 3)

Figure 3 The Format of the Correlation ID

```
EstablishTemporaryConnectionArg ::= SEQUENCE {
    assistingSSPIPRoutingAddress[0]   AssistingSSPIPRoutingAddress,
    correlationID[1]                  CorrelationID  OPTIONAL,
    legID     [2]                     LegID  OPTIONAL,
    scfID     [3]                     ScfID  OPTIONAL,
    extensions[4]                     SEQUENCE SIZE(1..numOfExtensions) OF
                                      ExtensionField   OPTIONAL,
-- ...
    }

CorrelationID:= Digits

Digits::= OCTET STRING (SIZE (minDigitsLength .. maxDigitsLength ))
```

10000 to 11110	Spare for national use		✔
1111111	Reserved for extension		✔

7.3 Hardware Requirements or Dependencies

None

7.4 Software Requirements or Dependencies

None

7.5 Limitations and restrictions

- This feature focuses on BASE ETSI ISUP V2. It may work for other variants of ETSI ISUP V2, but this activity (design and test) focuses on Base ETSI ISUP V2 only.
- For this feature, SSP receives the correlation ID in ETC message in a separate correlationID parameter from SCP. This is only mechanism the design supports.
- Correlation ID is carried from SSP to external IP in the UUI parameter. For this feature, this is only mechanism the design supports.
- The UUI parameter delivered by the IN triggering agent is replaced by the UUI parameter with the correlation ID received from the ETC message.

8: Functional Description (FN): A00008484

8.1 Feature name and Feature ID

A00008484 - IN Terminating Trigger Feature Interactions

8.2 Description

8.2.1 Introduction

The CustomNet product has remained largely unchanged for a number of years. Users are demanding the enhanced services provided on various VoIP platforms without wanting to change from their existing CustomNet service.

The whole project provides the vehicle to enhance CustomNet so the user can retain existing functionality whilst adding new functionality from various application server platforms to provide features such as:

- Presence
- Instant Messaging
- Document sharing/collaboration
- Click to Call
- Find-me/Follow-me

Most enhanced features to be delivered from the application servers can be mapped into one of three call models:

- Call Notification (supports Presence, Call Logs, etc)

This model involves informing the application servers that the user is involved in a call and with whom. It is applied on all originating calls and is the default model for terminating calls.

- Call Routing (supports Find-me/Follow-me, Call Screening, etc)

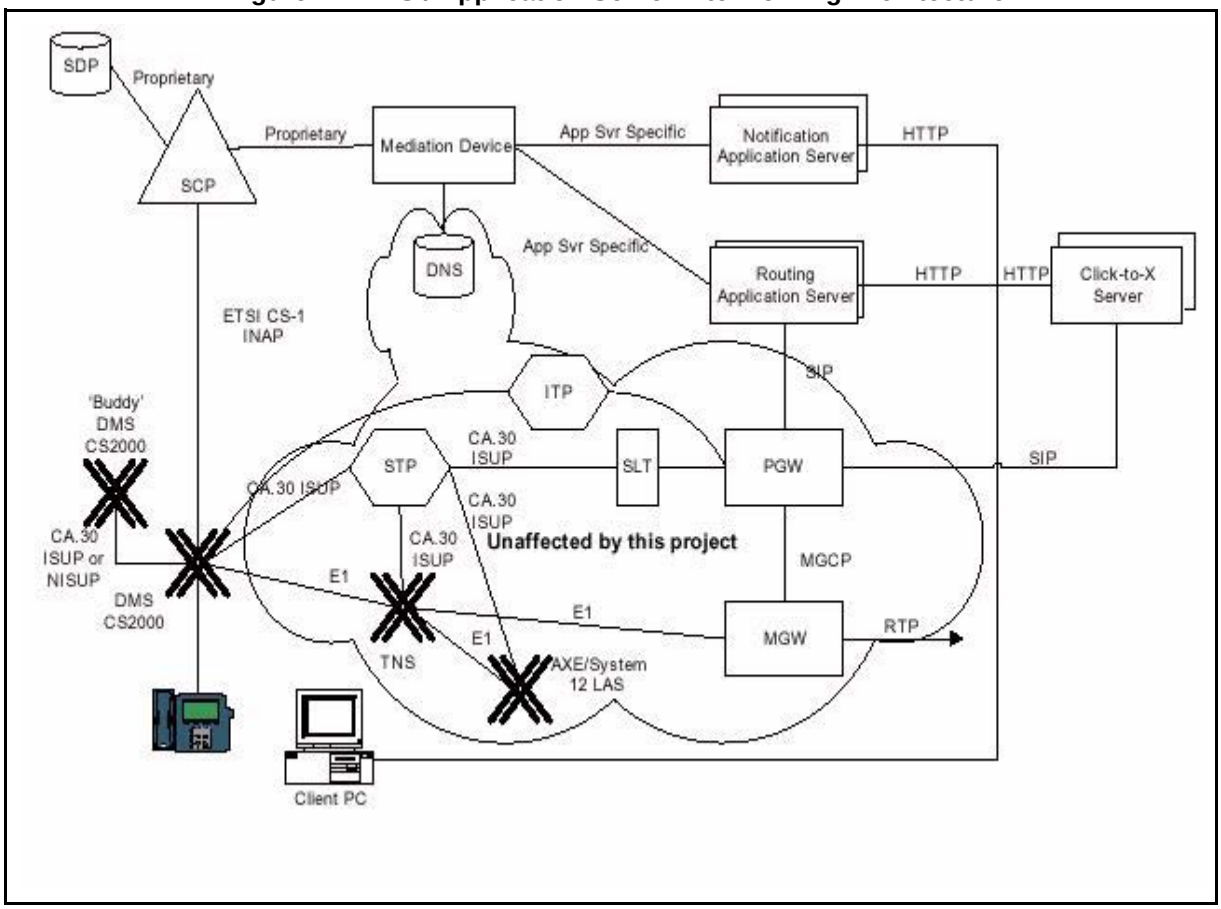
This model is only applicable for incoming calls and even then, only for a certain set of services under a limited set of conditions. The routing information must be either a single destination or a sequence (e.g. forwarding on busy or no answer).

- Click-to-X (supports Click-to-call, some forms of conferencing, etc)

Where an application server must initiate calls then this model applies.

The architecture, as seen in figure “DMS / Application Server Interworking Architecture” on page 118, consists of several elements that essentially convert events in the DMS/CS2000 switch captured through traditional IN triggers (TDP-3, originating EDPs, TDP-12, terminating EDPs) and convert them to messages for interworking with the application servers.

Figure 1 DMS / Application Server Interworking Architecture



These call models however, do not support many low-level line based features which are best supported from the access exchange which implies a co-existence between IN and non-IN features (which are listed in table “Feature list” on page 118) which is the subject of this part of the whole project.

Speed Call Long (SCL)
Speed Call Short (SCS)
Transfer, Hold & 3 way Conference (CXR)

8.2.2 Interaction Model

Since non-IN features listed may involve multi-leg calls (i.e. CXR) it is best to describe the interactions based on the scenarios where calls are a combination of basic call and IN call.

8.2.2.1 Basic Call

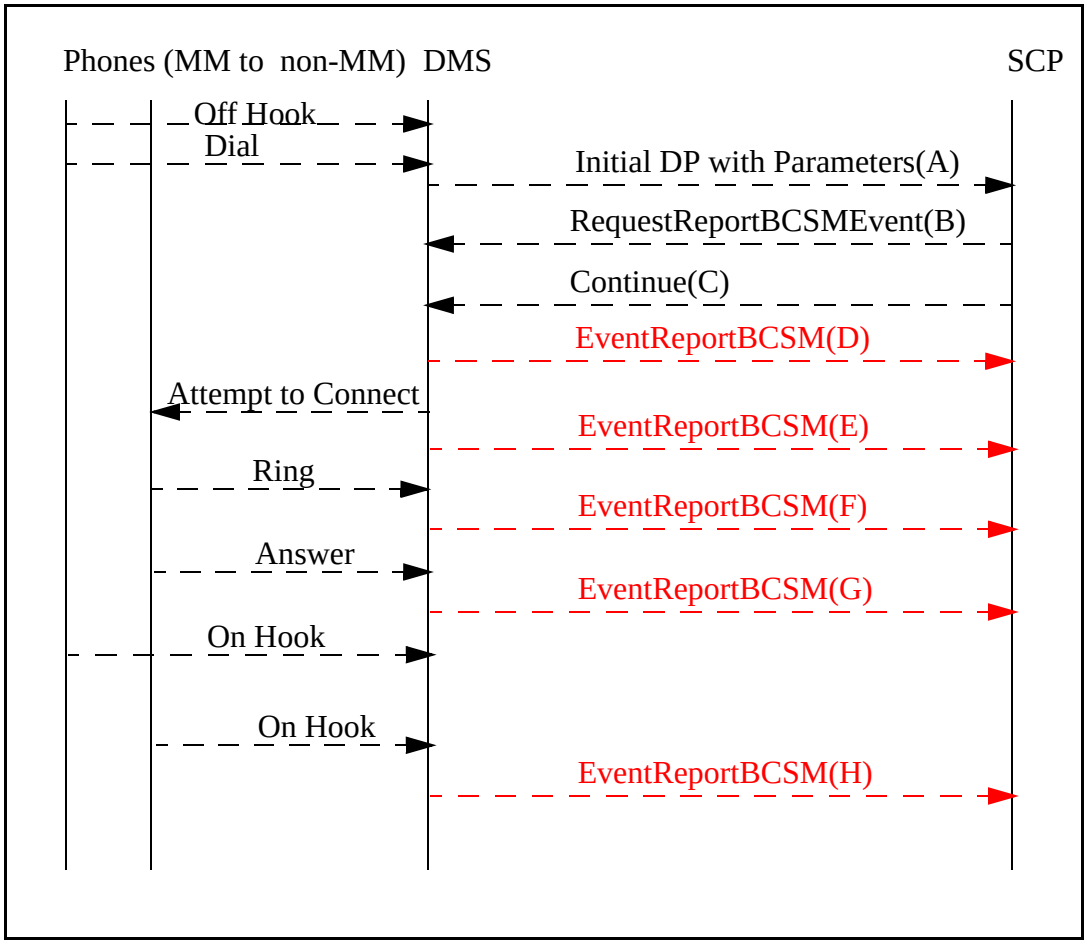
Neither TDP-3 nor TDP-12 triggering occurs.

8.2.2.2 IN Call

Multiple IN dialogs (i.e. TDP-3 and TDP-12 together) for a single call at the same time are not supported. An IN call may be thought as one of the followings:

8.2.2.2.1 MM to non-MM

In this case TDP-3 triggering occurs.



(A) Initial DP with Parameters:

The parameters sent to the SCP are SERVKEY, CLI, CDPA, EVENT_TYPE, OCN, RDN and RD_INFO.

EVENT_TYPE in this scenario is INFOANAL which means TDP-3. OCN, RDN and RD_INFO is to be used for call forward cases.

(B) RequestReportBCSMEvent:

The originating BCSM events armed by the SCP are EDP-4(N), EDP-5(N), EDP-6(N), EDP-7(N), EDP-9(N, for port1 and port 2) and EDP-10(N). Since the only functions of interest for originating calls are those associated with the Call Notification model, Notify and Continue EDPs are used for Presence, Call Logs, etc.

(C) Continue

Since the only functions of interest for originating calls are those associated with the Call Notification model, Continue is sent for Presence, Call Logs, etc.

(D) EventReportBCSM:

At this point EDP-4(Route Select Failure) or EDP-10(Abandon) may be encountered. EventReportBCSM is sent to SCP to notify that the call has ended.

(E) EventReportBCSM:

At this point EDP-5(Busy) or EDP-10(Abandon) may be encountered. EventReportBCSM is sent to SCP to notify that the call has ended.

(F) EventReportBCSM:

At this point EDP-6(No Answer) or EDP-10(Abandon) may be encountered. EventReportBCSM is sent to SCP to notify that the call has ended.

(G) EventReportBCSM:

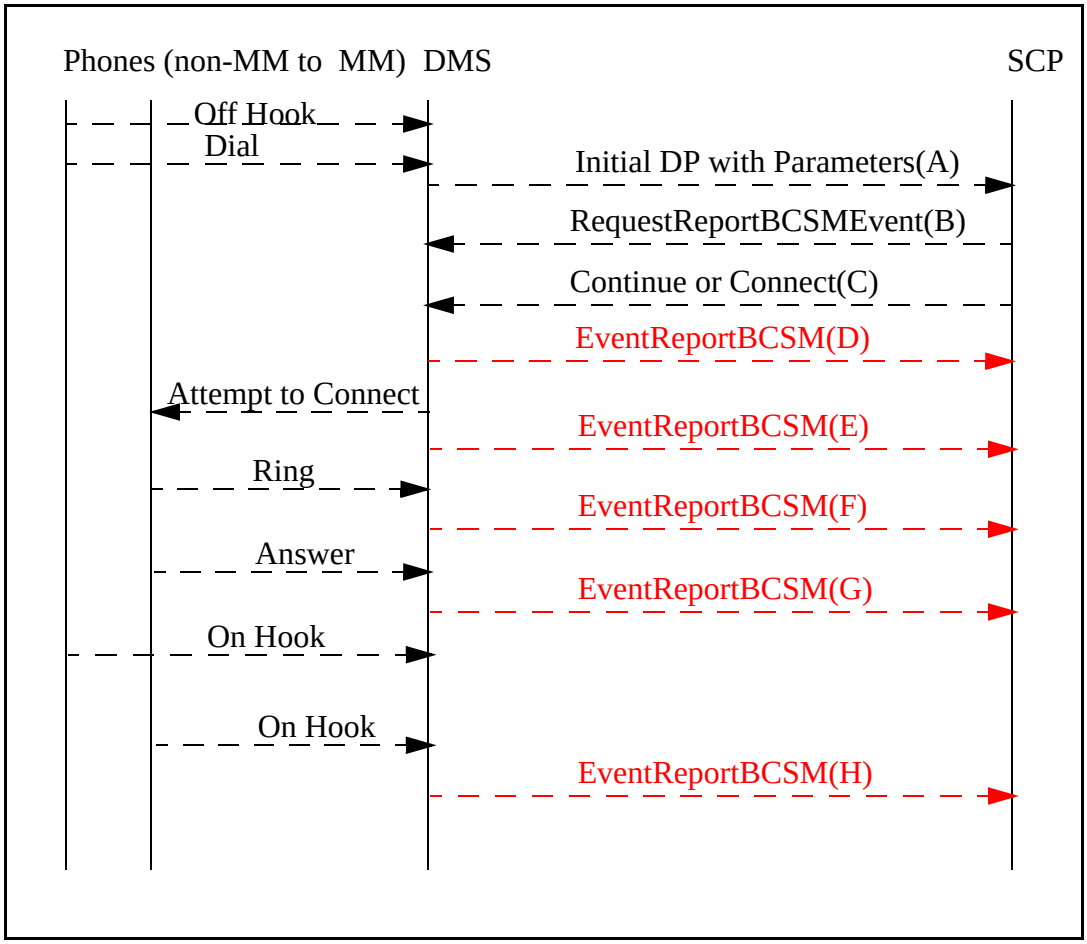
At this point call is answered and EDP-7(Answer) is encountered. EventReportBCSM is sent to SCP to notify that the call has been answered.

(H) EventReportBCSM:

At this point either the calling party or the called party on hooked and EDP-9(Disconnect) is encountered. EventReportBCSM is sent to SCP to notify that the call has been ended by the calling party(EventReportBCSMEvent for port 1) or the called party(EventReportBCSMEvent for port 2).

8.2.2.2.2 Non-MM to MM

In this case TDP-12 triggering occurs.



(A) Initial DP with Parameters:

The parameters sent to the SCP are SERVKEY, CLI, CDPA, EVENT_TYPE, OCN, RDN and RD_INFO.
EVENT_TYPE in this scenario is TERMATT which means TDP-12.
OCN, RDN and RD_INFO is to be used for call forward cases.

(B) RequestReportBCSMEvent:

If Connect is to be sent after RequestReportBCSMEvent then the originating BCSM events armed by the SCP are EDP-4(N), EDP-5(R, N), EDP-6(R, N), EDP-7(N), EDP-9(N, for port1 and port 2) and EDP-10(N). If Continue is to be sent after RequestReportBCSMEvent then the terminating BCSM events armed by the SCP are EDP-13(R, N), EDP-14(R, N), EDP-15(N), EDP-17(N, for port1 and port 2) and EDP-18(N). Terminating calls make use of both the Call Notification and Call Routing models and in order to requery Interrupted EDPs are used for busy and no answer cases along with Nofify and Continue EDPs.

(C) Continue or Connect

Terminating calls make use of both the Call Notification and Call Routing models and there are 3 possibilities for Call Routing model(Call Notification is similar to that used for originating calls except for the use of TDP-12 and terminating EDPs) as follows:

After querying the AS;

- if the destination number is that of the terminating MM user itself then the SCP issues a Continue message.
- if the destination number is not that of terminating MM user itself then the SCP issues a Connect message to connect the call directly.
- if the call is to be routed through AS then the SCP issues a Connect message with the AS as the destination number.

(D) EventReportBCSM:

At this point EDP-4(Route Select Failure) or (EDP-10, EDP-18)(Abandon) may be encountered. EventReportBCSM is sent to SCP to notify that the call has ended.

(E) EventReportBCSM:

At this point (EDP-5, EDP-13)(Busy) or (EDP-10, EDP-18)(Abandon) may be encountered. EventReportBCSM is sent to SCP to notify that the call has ended. For busy cases if the EDP is interrupted then requery is also possible.

(F) EventReportBCSM:

At this point (EDP-6, EDP-14)(No Answer) or (EDP-10, EDP-18)(Abandon) may be encountered. EventReportBCSM is sent to SCP to notify that the call has ended. For no answer cases if the EDP is interrupted then requery is also possible.

(G) EventReportBCSM:

At this point call is answered and (EDP-7, EDP-15)(Answer) is encountered. EventReportBCSM is sent to SCP to notify that the call has been answered.

(H) EventReportBCSM:

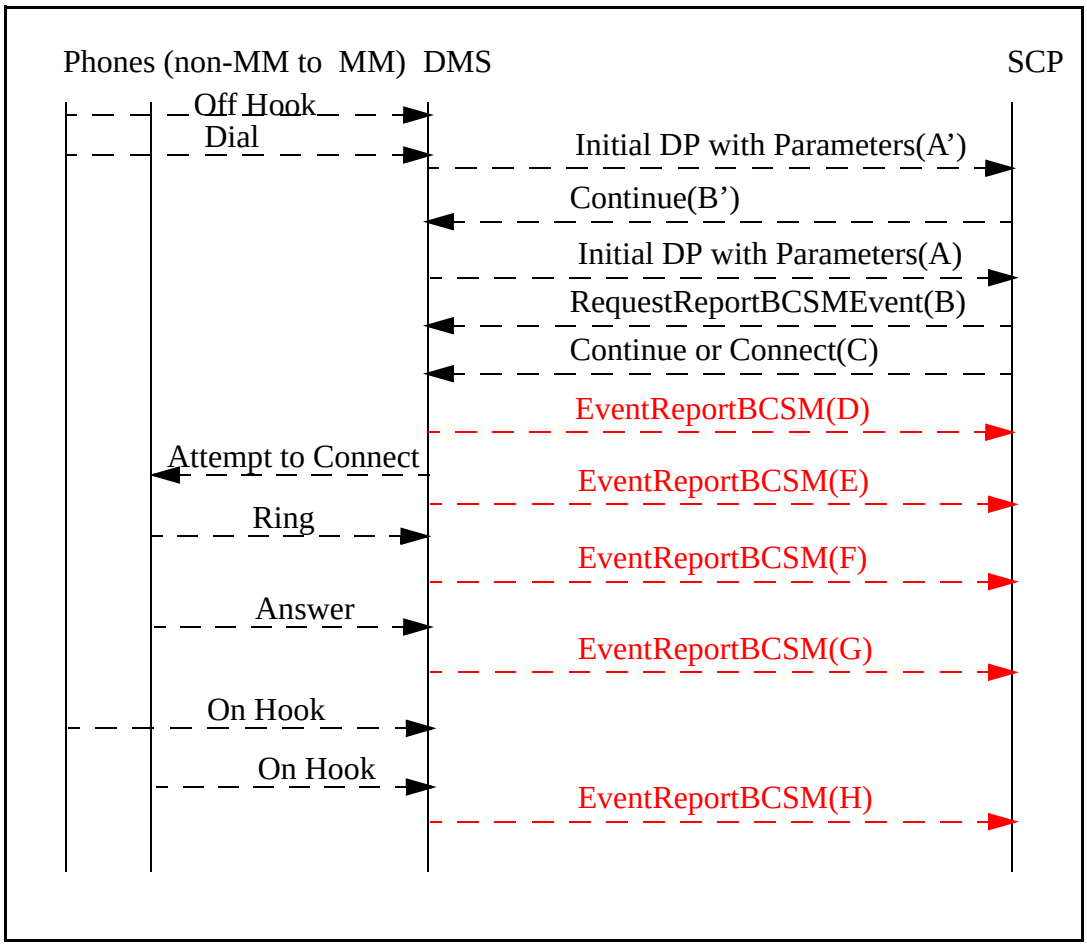
At this point either the calling party or the called party on hooked and (EDP-9, EDP-17)(Disconnect) is encountered. EventReportBCSM is sent to SCP to notify that the call has been ended by the calling

party(EventReportBCSMEvent for port 1) or the called party(EventReportBCSMEvent for port 2).

8.2.2.2.3 MM to MM

This case involves both the TDP-3 triggering and the TDP-12 triggering but since two open IN dialogs can not co-exist a workaround is proposed as follows:

After TDP-3 triggering, the SCP, by the help of the SDP, checks the calling and called parties for whether both are multimedia users in the same switch or not. If so (it is in this case) then SCP will not arm EDPs (this lets TDP-12 triggering) and the multimedia session will be provided by TDP-12 and terminating EDPs.



(A') Initial DP with Parameters:

The parameters sent to the SCP are SERVKEY, CLI, CDPA, EVENT_TYPE, OCN, RDN and RD_INFO.

EVENT_TYPE in this scenario is INFOANAL which means TDP-3.
OCN, RDN and RD_INFO is to be used for call forward cases.

(B') Continue

Since at this point, the SCP, by the help of the SDP, determines that the calling and called parties both are multimedia users in the same switch and the only functions of interest for originating calls are those associated with the Call Notification model, Continue is sent for Presence, Call Logs, etc without sending RequestReportBCSMEvent.

(A) Initial DP with Parameters:

The parameters sent to the SCP are SERVKEY, CLI, CDPA, EVENT_TYPE, OCN, RDN and RD_INFO.
EVENT_TYPE in this scenario is TERMATT which means TDP-12.
OCN, RDN and RD_INFO is to be used for call forward cases.

(B) RequestReportBCSMEvent:

If Connect is to be sent after RequestReportBCSMEvent then the originating BCSM events armed by the SCP are EDP-4(N), EDP-5(R, N), EDP-6(R, N), EDP-7(N), EDP-9(N, for port1 and port 2) and EDP-10(N). If Continue is to be sent after RequestReportBCSMEvent then the terminating BCSM events armed by the SCP are EDP-13(R, N), EDP-14(R, N), EDP-15(N), EDP-17(N, for port1 and port 2) and EDP-18(N). Terminating calls make use of both the Call Notification and Call Routing models and in order to requery Interrupted EDPs are used for busy and no answer cases along with Nofify and Continue EDPs.

(C) Continue or Connect

Terminating calls make use of both the Call Notification and Call Routing models and there are 3 possibilities for Call Routing model(Call Notification is similar to that used for originating calls except for the use of TDP-12 and terminating EDPs) as follows:

After querying the AS;

- if the destination number is that of the terminating MM user itself then the SCP issues a Continue message.
- if the destination number is not that of terminating MM user itself then the SCP issues a Connect message to connect the call directly.
- if the call is to be routed through AS then the SCP issues a Connect message with the AS as the destination number.

(D) EventReportBCSM:

At this point EDP-4(Route Select Failure) or (EDP-10, EDP-18)(Abandon) may be encountered. EventReportBCSM is sent to SCP to notify that the call has ended.

(E) EventReportBCSM:

At this point (EDP-5, EDP-13)(Busy) or (EDP-10, EDP-18)(Abandon) may be encountered. EventReportBCSM is sent to SCP to notify that the call has ended. For busy cases if the EDP is interrupted then requery is also possible.

(F) EventReportBCSM:

At this point (EDP-6, EDP-14)(No Answer) or (EDP-10, EDP-18)(Abandon) may be encountered. EventReportBCSM is sent to SCP to notify that the call has ended. For no answer cases if the EDP is interrupted then requery is also possible.

(G) EventReportBCSM:

At this point call is answered and (EDP-7, EDP-15)(Answer) is encountered. EventReportBCSM is sent to SCP to notify that the call has been answered.

(H) EventReportBCSM:

At this point either the calling party or the called party on hooked and (EDP-9, EDP-17)(Disconnect) is encountered. EventReportBCSM is sent to SCP to notify that the call has been ended by the calling party(EventReportBCSMEvent for port 1) or the called party(EventReportBCSMEvent for port 2).

As seen from the figure above, MM to MM case may be summarized in terms of the MM to non-MM and non-MM to MM cases as follows:

- MM to non-MM case (TDP-3 triggering occurs however no RequestReportBCSMEvent is sent).
- non-MM to MM case (TDP-12 triggering occurs).

8.2.3 Feature Interactions

8.2.3.1 Account Codes

No impact.

8.2.3.2 Additional Directory Number

No impact.

8.2.3.3 Authorisation Codes

No impact.

8.2.3.4 Automatic Call Back (RAG)

A off-hooks and dials B(busy) which results in the following IN call.

IN Call	
A	B(busy)

ERB(s) reported: Busy
Remaining EDP(s): If reported ERB is R then EDPs armed for port 1 remain. If reported ERB is N then no EDPs remain.

If B is busy, (EDP-5(N), EDP-13(N)) is encountered and Busy EventReportBCSM is sent to SCP to notify that the call has ended and A hears busy tone. A activates RAG and on-hooks. When B on-hooks, A rings and after A off-hooks B is called automatically as if A dials B again which results in the following IN call.

IN Call	
A	B

This is the same as a normal IN call from A to B although it is a RAG generated call.

Limitation / Restriction:

If EDP-5(R) or EDP-13(R) is used then Busy ERB is reported but the caller does not hear busy tone (since the SSP waits instructions from the SCP, like connecting to a new destination) and can not use the RAG feature. However after Busy ERB is reported, if a Continue or EDP-5(N) or EDP-13(N) followed by a Continue or a Connect to a busy destination or EDP-5(N) or EDP-13(N) followed by a Connect to a busy destination is sent then it is still possible to invoke RAG. For Connect scenarios to another busy destination RAG is activated for the second call.

8.2.3.5 Automatic Dial (AUD)

No impact.

8.2.3.6 Busy Verification

This is an MSAC related feature and IN interaction with MSAC is not supported.

8.2.3.7 Call Barring (Network Class Of Service)

No impact.

8.2.3.8 Call Forward All Calls (CFI)

There are three possible scenarios as follows:

(a) Both the original and the forwarded calls are IN calls.

A off-hooks and dials B which results in the following IN call.

IN Call(1)	
A	B

This is a normal IN call although B does not ring. The call is treated as if A called another party if forwarded call does not produce a new IN trigger.

If B has CFI to C, then B does not ring and call is immediately transferred to C and if this transfer produces a new IN dialog then the first IN dialog is aborted except a TDP-12 does not abort a previous TDP-3.

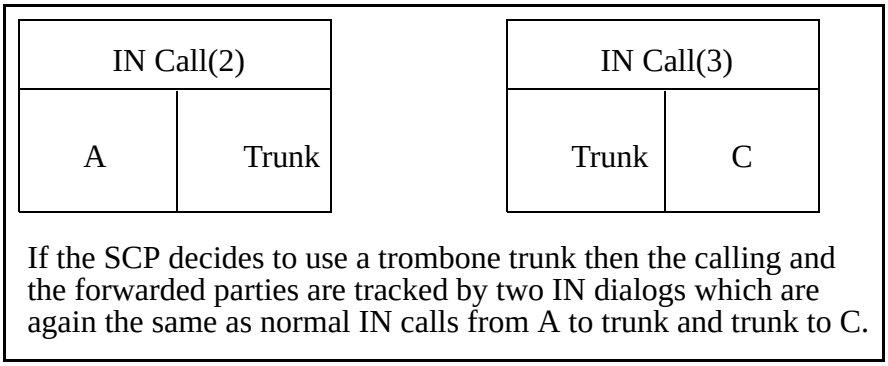
For this new IN dialog there are call forwarding parameters present.

If trombone trunking is not used:

IN Call(2)	
A	C

The forwarded call produced a new IN trigger which aborts the previous one (only TDP-3 aborts a previous dialog). This is the same as a normal IN call from A to C.

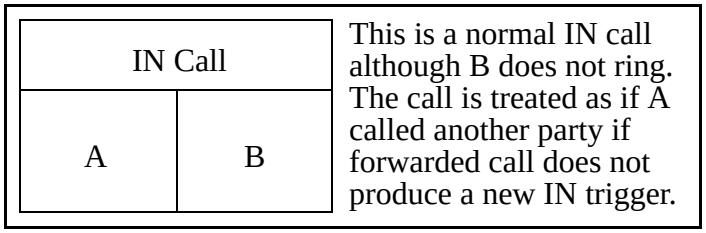
If trombone trunking is used:



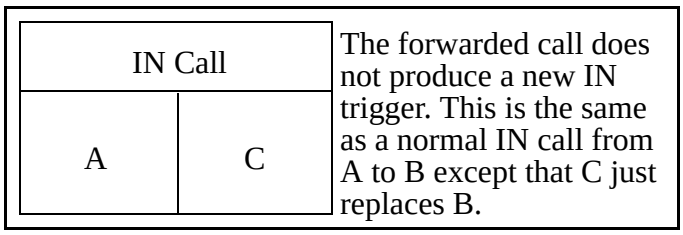
If the SCP decides to use a trombone trunk then the calling and the forwarded parties are tracked by two IN dialogs which are again the same as normal IN calls from A to trunk and trunk to C.

(b) The original call is an IN call but the forwarded call is not.

A off-hooks and dials B which results in the following IN call.



If B has CFI to C, then B does not ring and call is immediately transferred to C and if this transfer does not produce a new IN dialog then the first IN dialog is used.

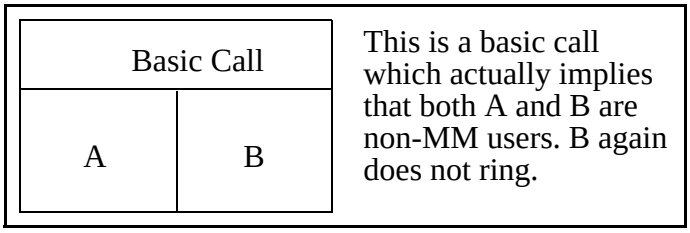


Limitation / Restriction:

SCP does not understand that C has replaced B.

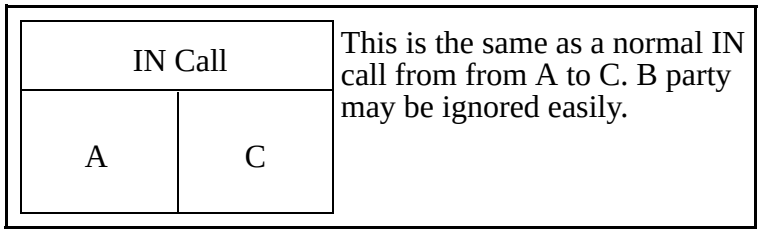
(c) The original call is not an IN call but the forwarded call is.

A off-hooks and dials B which results in the following basic call.



If B has CFI to C then B does not ring and call is immediately transferred to C and if this transfer produces an IN dialog then this IN dialog is used.

For this IN dialog there are call forwarding parameters present.



8.2.3.9 Call Forward Busy - Block Internal (CBI)

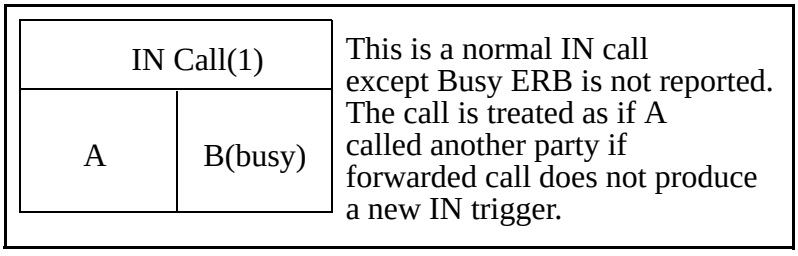
This is the same as the CFB case except that internal calls are blocked and are not forwarded. In other words, if the call is external then it is treated as CFBcase and if the call is internal it is treated as an IN call to a busy party.

8.2.3.10 Call Forward Busy (CFB)

There are three possible scenarios as follows (A, B or C may be trunks):

(a) Both the original and the forwarded calls are IN calls.

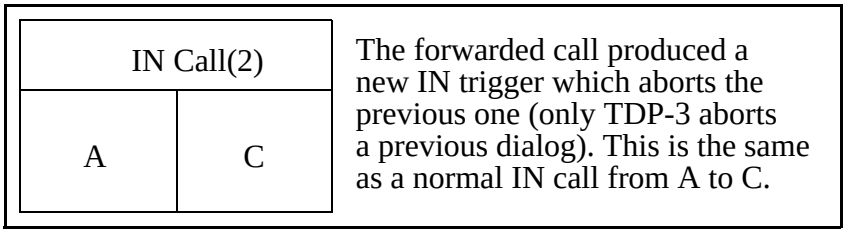
A off-hooks and dials B(busy) which results in the following IN call.



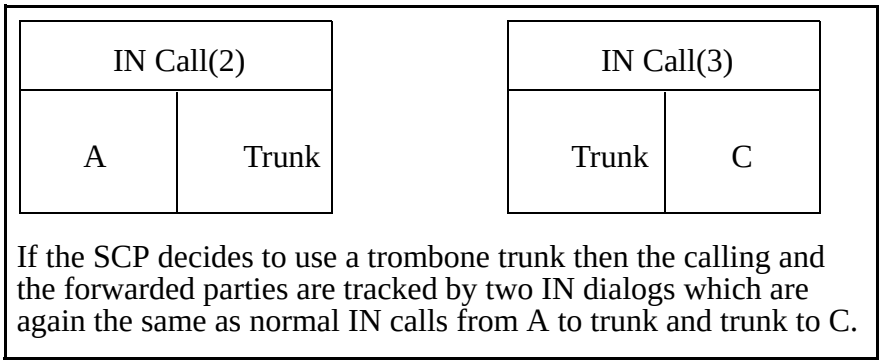
If B has CFB to C and B is busy then call is immediately transferred to C without hitting (EDP-5, EDP-13)(Busy) and if this transfer produces a new IN dialog then the first IN dialog is aborted except a TDP-12 does not abort a previous TDP-3.

For this new IN dialog there are call forwarding parameters present.

If trombone trunking is not used:

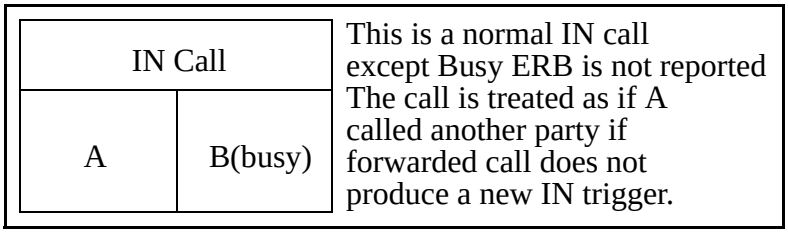


If trombone trunking is used:

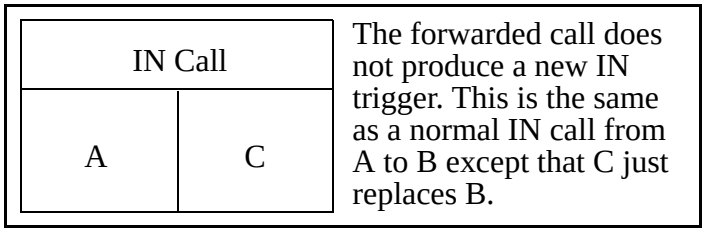


(b) The original call is an IN call but the forwarded call is not.

A off-hooks and dials B(busy) which results in the following IN call.



If B has CFB to C and B is busy then call is immediately transferred to C without hitting (EDP-5, EDP-13)(Busy) and if this transfer does not produce a new IN dialog then the first IN dialog is used. (EDP-5, EDP-13)(Busy) is still valid.

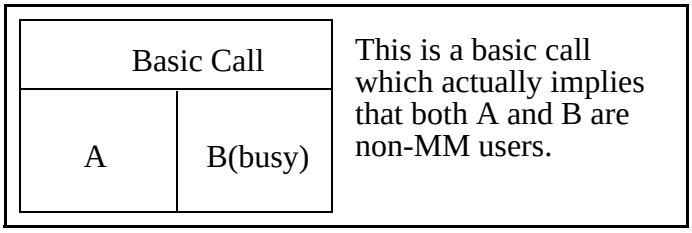


Limitation / Restriction:

SCP does not understand that C has replaced B.

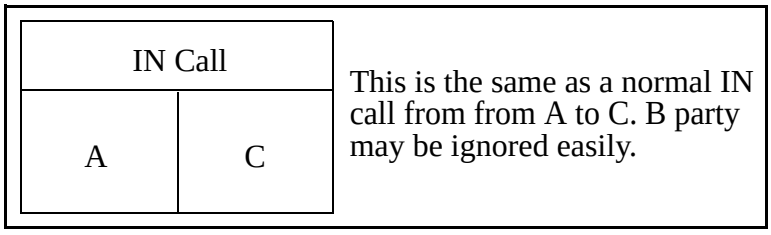
(c) The original call is not an IN call but the forwarded call is.

A off-hooks and dials B(busy) which results in the following basic call.



If B has CFB to C and B is busy then call is immediately transferred to C and if this transfer produces an IN dialog then this IN dialog is used.

For this IN dialog there are call forwarding parameters present.



8.2.3.11 Call Forward Enhancements

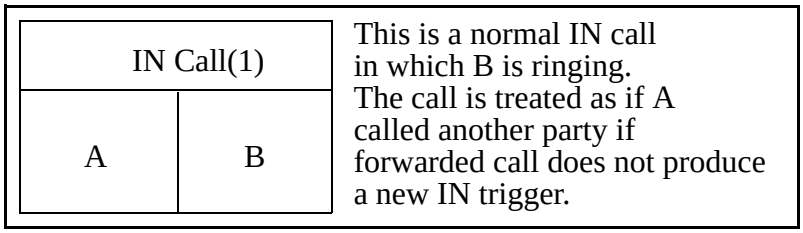
This is similar to other call forward cases as it enhances them. For the description of this feature please see Appendix section at the end of this document.

8.2.3.12 Call Forward No Answer (CFD)

There are three possible scenarios as follows (A, B or C may be trunks):

(a) Both the original and the forwarded calls are IN calls.

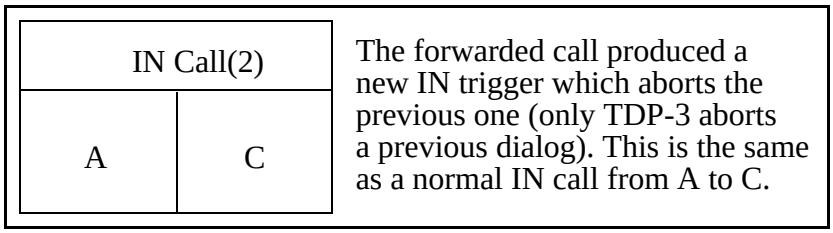
A off-hooks and dials B which results in the following IN call.



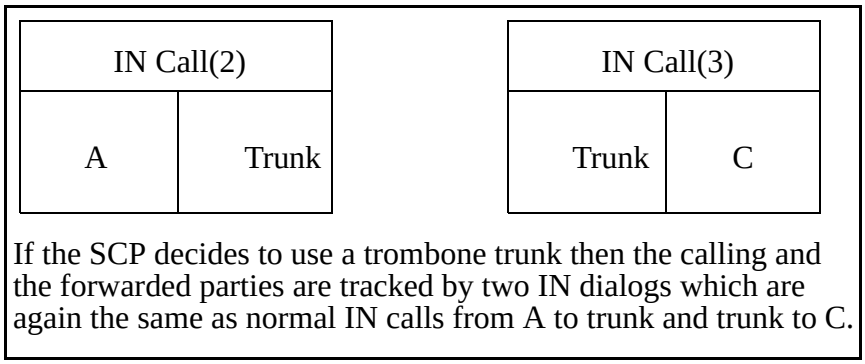
If B has CFD to C and B does not answer then call is transferred to C if EDP-6 timer > CFD timer and if this transfer produces a new IN dialog then the first IN dialog is aborted except a TDP-12 does not abort a previous TDP-3. If EDP-6 timer < CFD timer then EDP-6 has precedence and call forwarding will not occur. EDP-6 timer = CFD timer case is not supported.

For this new IN dialog there are call forwarding parameters present.

If trombone trunking is not used:

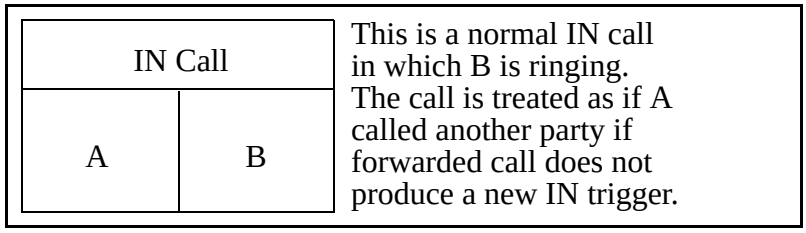


If trombone trunking is used:

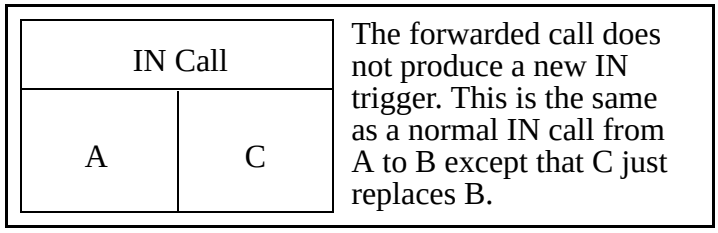


(b) The original call is an IN call but the forwarded call is not.

A off-hooks and dials B which results in the following IN call.



If B has CFD to C and B does not answer then call is transferred to C if EDP-6 timer > CFD timer and if this transfer does not produce a new IN dialog then the first IN dialog is used. EDP-6 is still valid. If EDP-6 timer < CFD timer then EDP-6 has precedence and call forwarding will not occur. EDP-6 timer = CFD timer case is not supported.

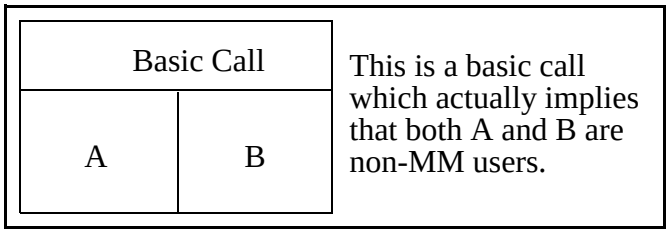


Limitation / Restriction:

SCP does not understand that C has replaced B.

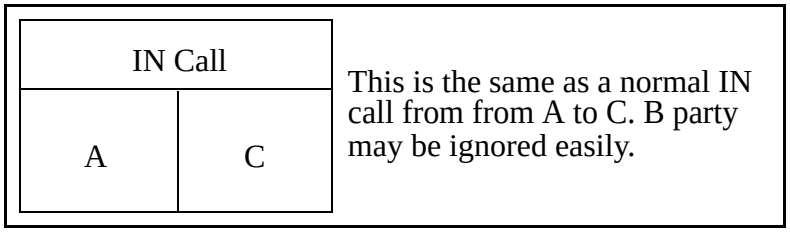
(c) The original call is not an IN call but the forwarded call is.

A off-hooks and dials B which results in the following basic call.



If B has CFD to C and C does not answer then call is immediately transferred to C and if this transfer produces an IN dialog then this IN dialog is used.

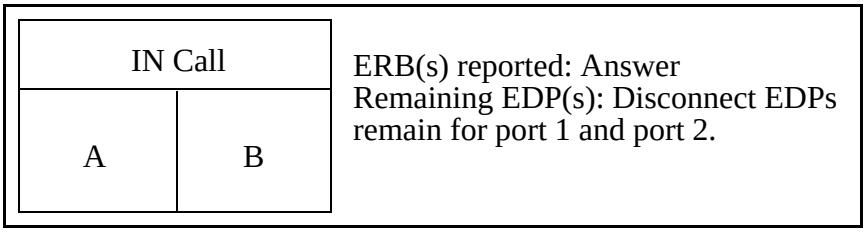
For this IN dialog there are call forwarding parameters present.



8.2.3.13 Call Hold

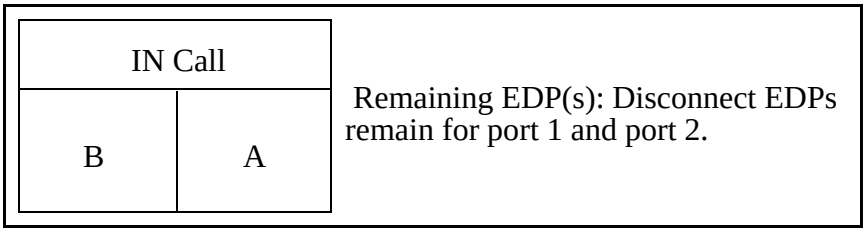
(a) The calling party activates CHD.

A and B are talking in an IN call as follows:



A activates CHD and B is on hold. If A reactivates CHD, it returns back to the original call above.

If A on-hooks the controller is migrated to port 2 if it is not already on port 2 as follows and A is rering by B and A answers. This answer does not produce a new Answer ERB since it has already been reported.



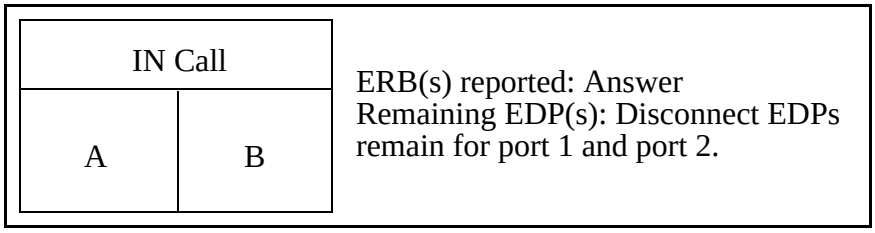
After this point if A on-hooks a Disconnect ERB is reported for port 2 and if B on-hooks a Disconnect ERB is reported for port 1.

If A does not answer the rering until timeout then a Disconnect ERB is reported for port 2.

While on hold if B on-hooks a Disconnect ERB is reported for port 1.

(b) The called party activates CHD.

A and B are talking in an IN call as follows:



B activates CHD and A is on hold. If B reactivates CHD, it returns back to the original call above.

If B on-hooks, the controller is not migrated to port 2 as it is already on port 2 and B is rering by A and B answers. This answer does not produce a new Answer ERB since it has already been reported.

After this point if A on-hooks a Disconnect ERB is reported for port 1 and if B on-hooks a Disconnect ERB is reported for port 2.

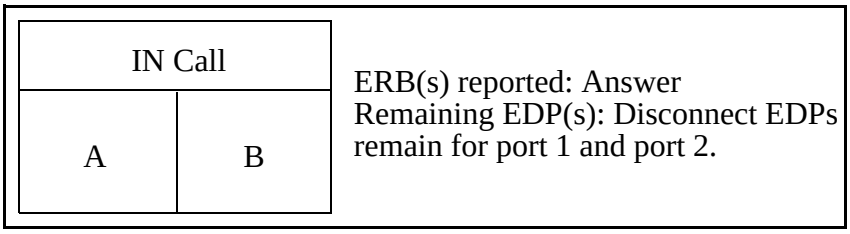
If B does not answer the rering until timeout then a Disconnect ERB is reported for port 2.

While on hold if A on-hooks a Disconnect ERB is reported for port 1.

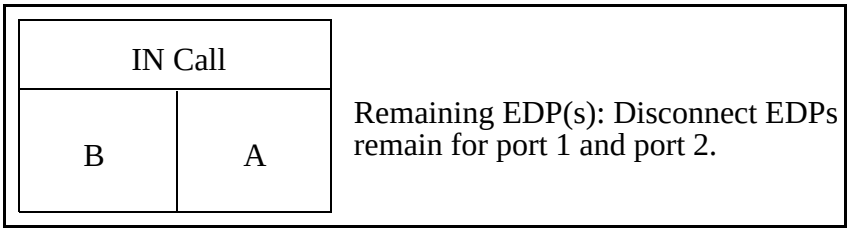
8.2.3.14 Call Park (PRK)

(a) The calling party activates PRK.

A and B are talking in an IN call as follows:



A activates PRK and B is parked. The parkee is migrated to port 1 if it is not already on port 1 as follows.



A reactivates PRK and retrieves B and after this point if A on-hooks a Disconnect ERB is reported for port 2 and if B on-hooks a Disconnect ERB is reported for port 1.

While parked if B on-hooks a Disconnect ERB is reported for port 1.

(b) The called party activates PRK.

A and B are talking in an IN call as follows:

IN Call		ERB(s) reported: Answer Remaining EDP(s): Disconnect EDPs remain for port 1 and port 2.
A	B	

B activates PRK and A is parked. The parkee is not migrated to port 1 as it is already on port 1. B activates PRK and retrieves A and after this point if A on-hooks a Disconnect ERB is reported for port 1 and if B on-hooks a Disconnect ERB is reported for port 2.

While parked if A on-hooks a Disconnect ERB is reported for port 1.

8.2.3.15 Call Pick Up Group (CPU)

A dials B which results in the following IN call.

IN Call		This is a normal IN call in which B is ringing.
A	B	

Before B answers and EDP-6 timer expires, C activates CPU and an Answer ERB is reported. After this point if A on-hooks a Disconnect ERB is reported for port 1 and if C on-hooks a Disconnect ERB is reported for port 2.

IN Call		This is the same as a normal IN call from A to B except that C just replaces B.
A	C	

Limitation / Restriction:

SCP does not understand that C has replaced B.

8.2.3.16 Calling Name Delivery

No impact.

8.2.3.17 Calling Name Display

No impact.

8.2.3.18 Calling Number Delivery

No impact.

8.2.3.19 Calling Number Display

No impact.

8.2.3.20 Camp-On (MBSCAMP)

(a) Both the call to be camped on and the call that camps on are IN calls.

A and B are talking in an IN call as follows:

IN Call(1)	
A	B

ERB(s) reported: Answer
Remaining EDP(s): Disconnect EDPs remain for port 1 and port 2.

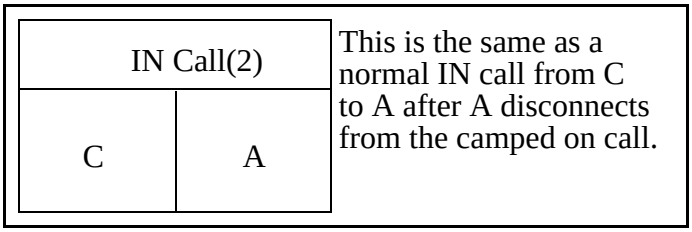
C has MBSCAMP and dials A and hears audible ringback tone instead of busy tone. A hears a special tone. Busy and No Answer ERBs are not reported.

IN Call(2)	
C	A

This is the same as a normal IN call from C to A except that Busy and No Answer ERBs are not reported and C hears ringback tone instead of busy tone.

If B on-hooks a Disconnect ERB is reported for port 2 from the first IN dialog. A on-hooks and rings. When A answers an Answer ERB is reported from the second IN dialog.

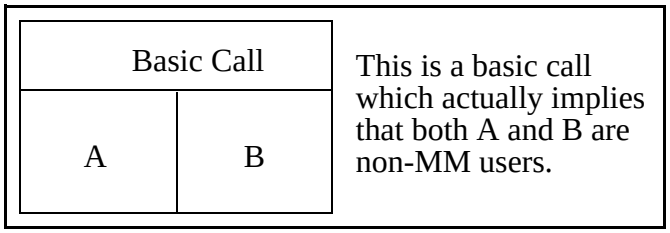
If A on-hooks a Disconnect ERB is reported for port 1 from the first IN dialog. A rings. When A answers an Answer ERB is reported from the second IN dialog.



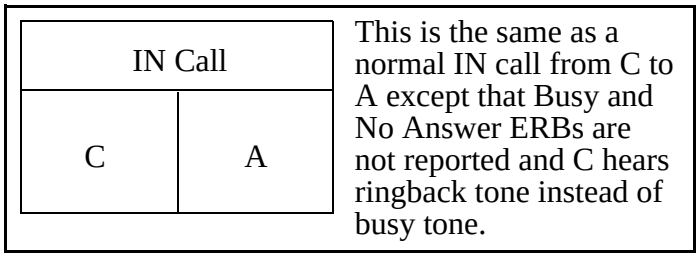
After this point if A on-hooks a Disconnect ERB is reported for port 2 and if C on-hooks a Disconnect ERB is reported for port 1.

(b) The call to be camped on is a basic call and the call that camps on is an IN call.

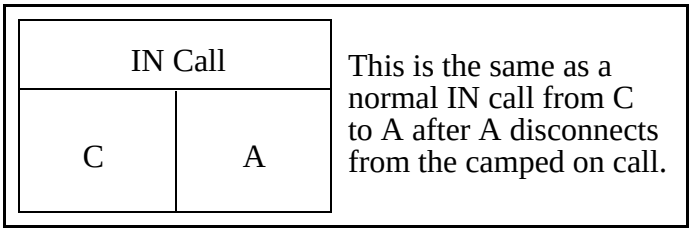
A and B are talking in a basic call as follows:



C has MBSCAMP and dials A and hears audible ringback tone instead of busy tone. A hears a special tone. Busy and No Answer ERBs are not reported.



A on-hooks. A rings. When A answers an Answer ERB is reported.



After this point if A on-hooks a Disconnect ERB is reported for port 2 and if C on-hooks a Disconnect ERB is reported for port 1.

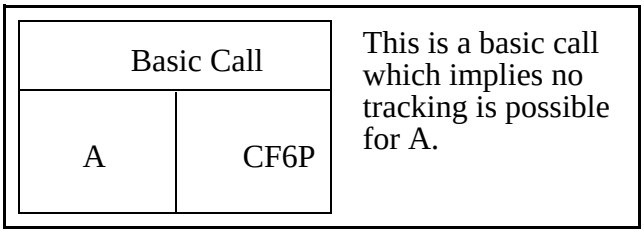
8.2.3.21 Class Of Service Restrictions

No impact.

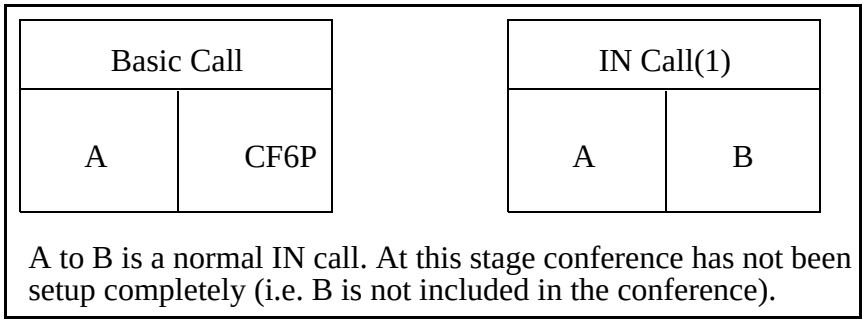
8.2.3.22 Conference 6 (CNF C06)

(a) The party which starts the conference directly activates CNF C06 without being active in a call.

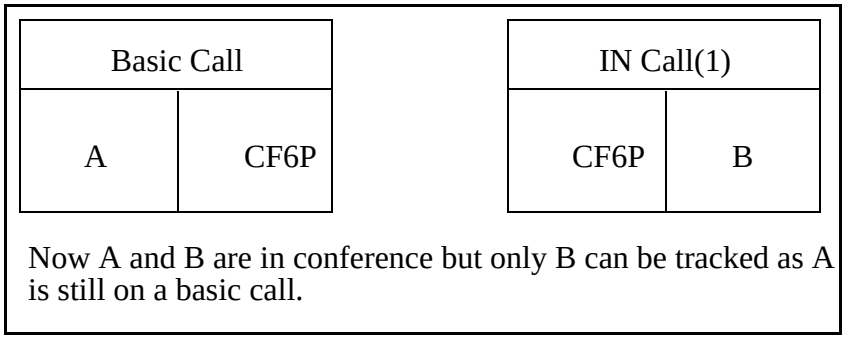
A off-hooks and activates CNF C06 which results in the following basic call:



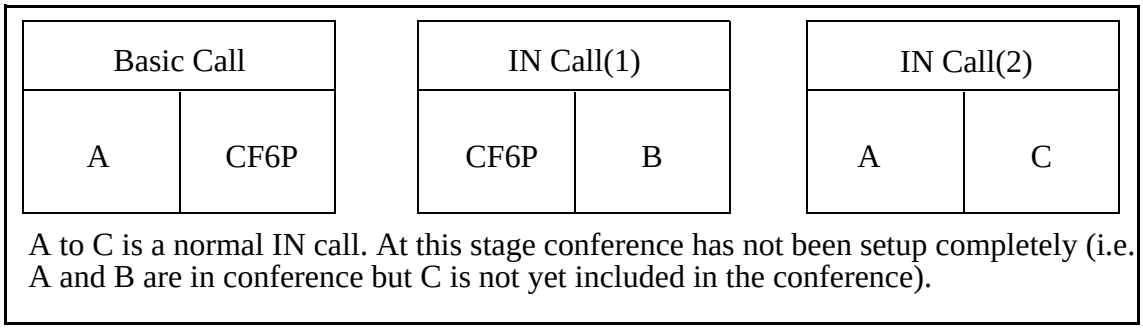
A flashes and dials B which results in the following topology:



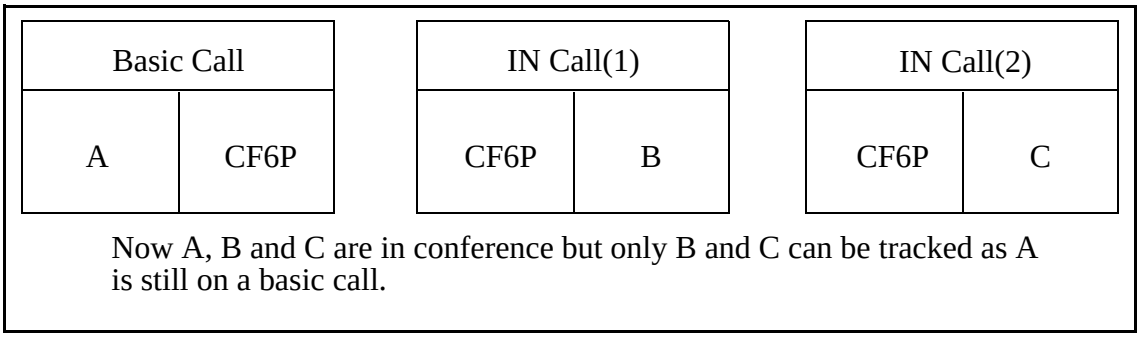
A activates CNF C06 which actually sets up the conference as follows:



A flashes and dials C which results in the following topology. This case is similar to the case above where A flashes and dials B.

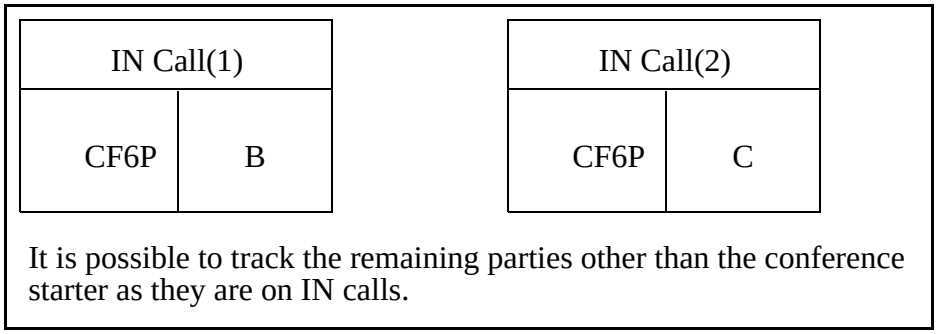


A activates CNF C06 which actually sets up the conference for all parties (i.e. C is included to the conference).



D, E and F can attend the conference in the same way.

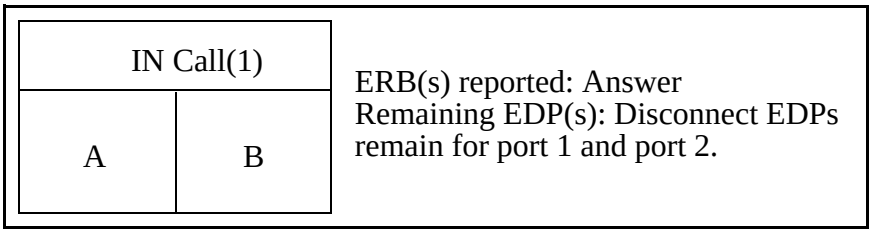
If A on-hooks no indication is sent to SCP since A is on a basic call. The remaining parties stay in conference.



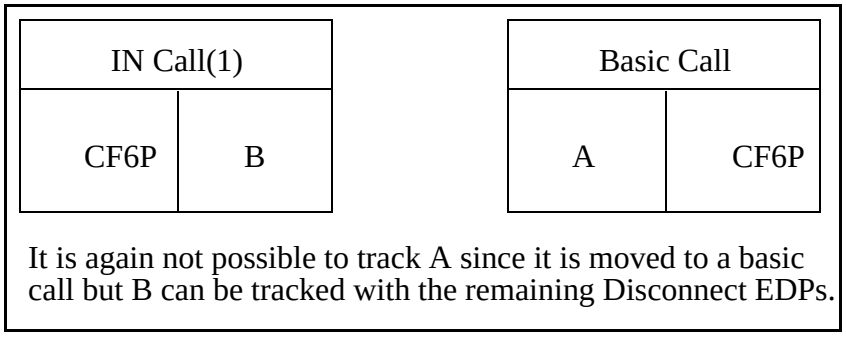
If B, C, D, E or F on-hooks a Disconnect ERB is reported for port 2.

(b) The party which starts the conference is already active in an IN call.

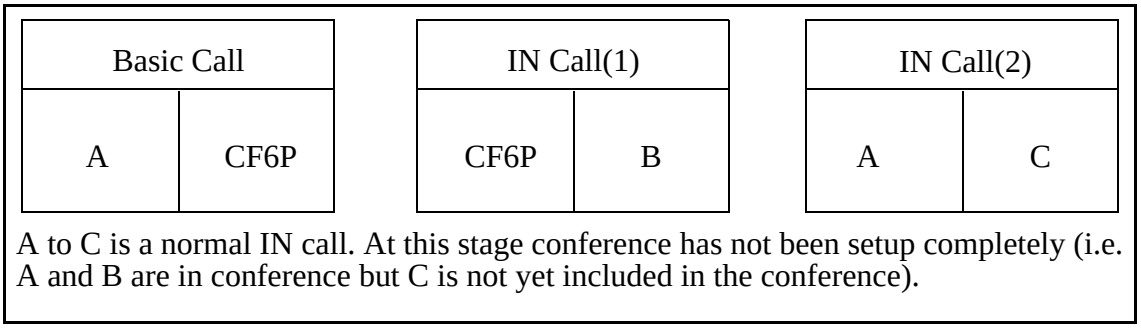
A and B are talking in an IN Call as follows:



A activates CNF C06 which immediately sets up the conference.

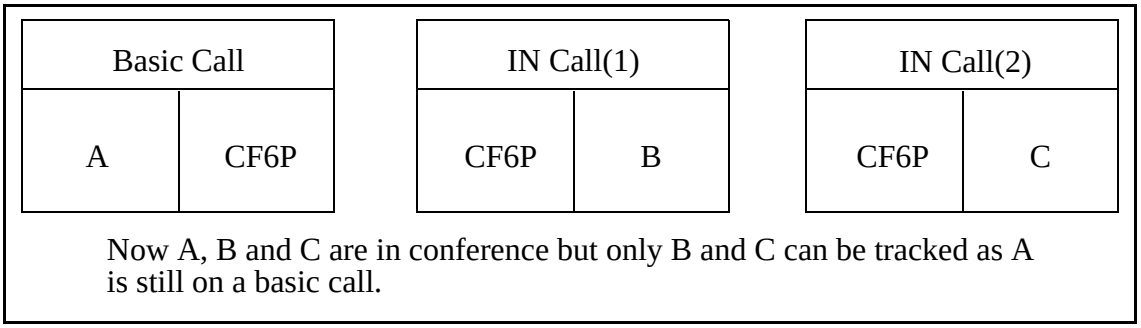


A flashes and dials C which results in the following topology. This case is similar to the case in (a) where A flashes and dials C.



A to C is a normal IN call. At this stage conference has not been setup completely (i.e. A and B are in conference but C is not yet included in the conference).

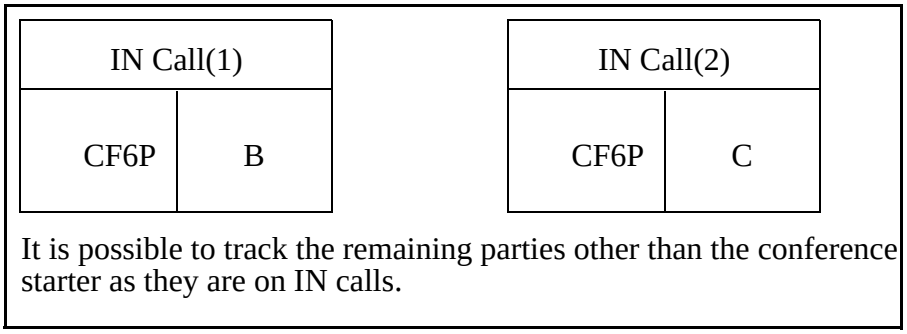
A activates CNF C06 which actually sets up the conference for all parties (i.e. C is included to the conference).



Now A, B and C are in conference but only B and C can be tracked as A is still on a basic call.

D, E and F can attend the conference in the same way.

If A on-hooks no indication is sent to SCP since A is on a basic call. The remaining parties stay in conference.



It is possible to track the remaining parties other than the conference starter as they are on IN calls.

If B, C, D, E or F on-hooks a Disconnect ERB is reported for port 2.

Limitation / Restriction:

Since the party starting the conference resides on a basic call its state is not tracked correctly. The application servers see that the party invoked multiple calls but they do not understand that whether it on-hooked or not. However it

is possible for application servers to understand whether other parties on-hooked or not. In scenarios where only 2 parties remain after the conference starter on-hooks, a Disconnect ERB is reported for port 1 for on-hooks of the remaining parties.

8.2.3.23 Console Queues

This is an MSAC related feature and IN interaction with MSAC is not supported.

8.2.3.24 Cut Through Dialling

This is an MSAC related feature and IN interaction with MSAC is not supported.

8.2.3.25 Date & Time

No impact.

8.2.3.26 Direct (ICM)

Not supported. The architecture of this feature is very different and does not pass through normal translators or terminators and hence TDP-3 and TDP-12 triggering is not possible. For the description of this feature please see Appendix section at the end of this document.

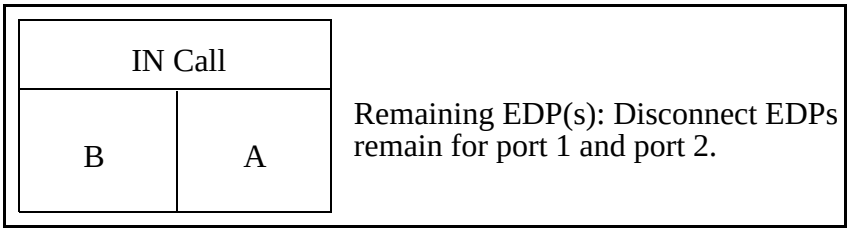
8.2.3.27 Direct Call Park (DCPK)

(a) The calling party activates DCPK.

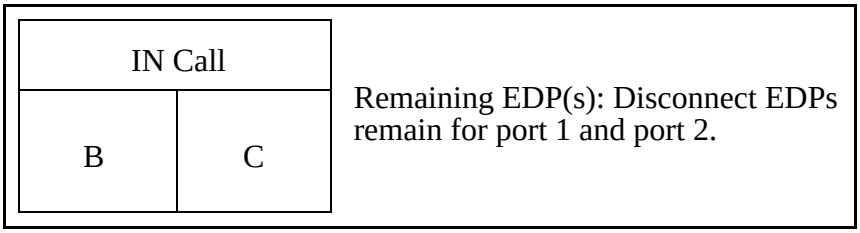
A and B are talking in an IN call as follows:

IN Call		
A	B	ERB(s) reported: Answer Remaining EDP(s): Disconnect EDPs remain for port 1 and port 2.

A activates DCPK and B is parked against C. The parkee is migrated to port 1 if it is not already on port 1 as follows.



C activates DCPK and retrieves B.

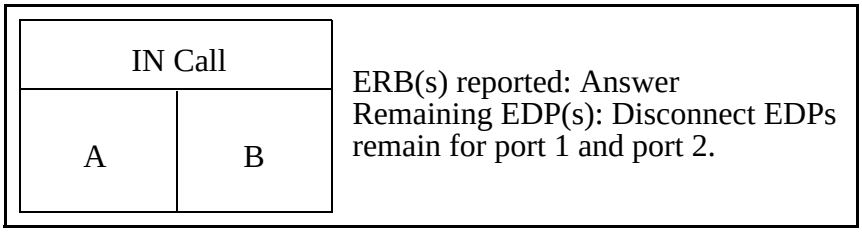


After this point if C on-hooks a Disconnect ERB is reported for port 2 and if B on-hooks a Disconnect ERB is reported for port 1.

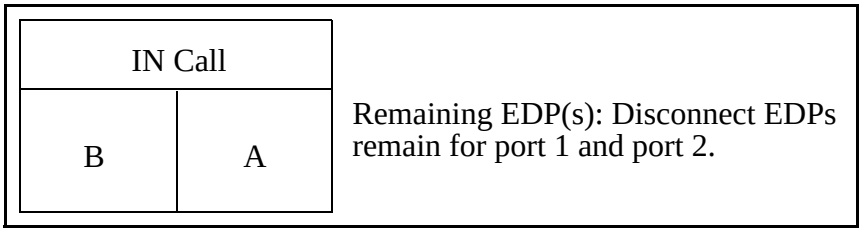
While parked if B on-hooks a Disconnect ERB is reported for port 1.

(b) The called party activates DCPK.

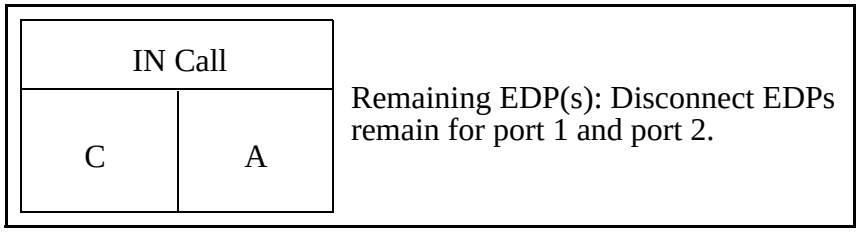
A and B are talking in an IN call as follows:



B activates DCPK and A is parked against C. The parkee is migrated to port 2 this time.



C activates DCPK and retrieves A.



After this point if A on-hooks a Disconnect ERB is reported for port 1 and if C on-hooks a Disconnect ERB is reported for port 2.

While parked if A on-hooks a Disconnect ERB is reported for port 1.

Limitation / Restriction:

SCP does not understand that C has replaced B.

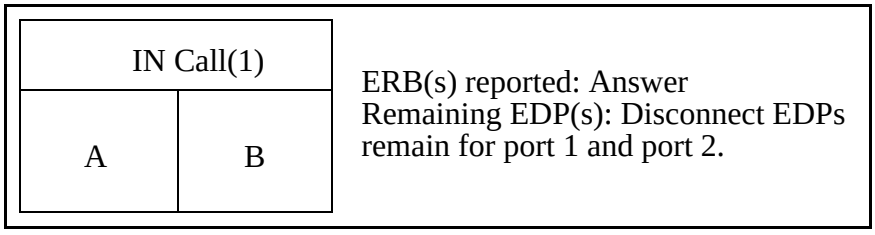
8.2.3.28 Direct Station Select/Busy Lamp Field (BLF)

For the description of this feature please see Appendix section at the end of this document.

This feature does not pass through normal translators and hence TDP-3 is not supported for BLF originated calls.

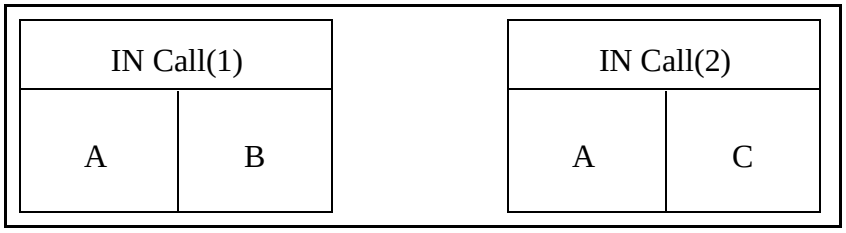
(a) BLF is used for call transfer.

A and B are talking in an IN call as follows:

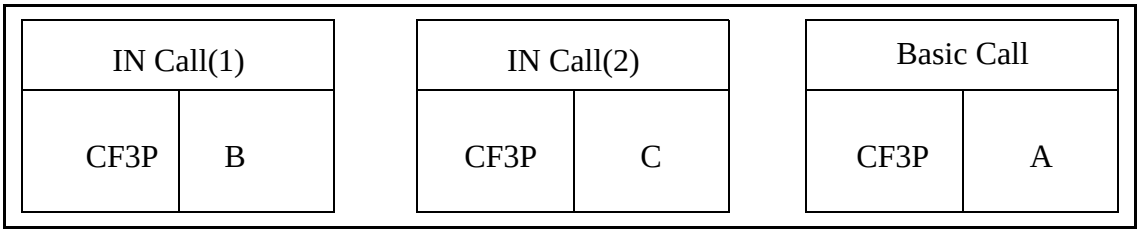


A has BLF for C and can see the status of C (i.e. when C is busy the lamp is on).

A hits Conf/Transfer key and then hits BLF key and C is dialled automatically. After this, it is similar to a CXR case.

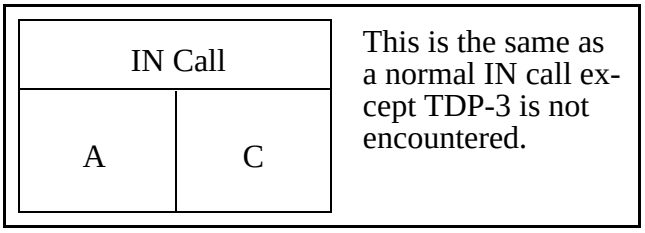


B hits Conf/Transfer key again.



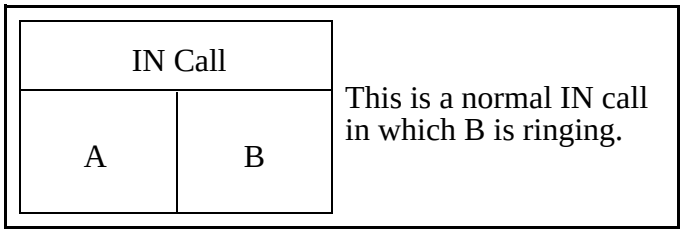
(b) BLF is used to for direct call.

A off-hooks and hits BLF key and C is dialled automatically.

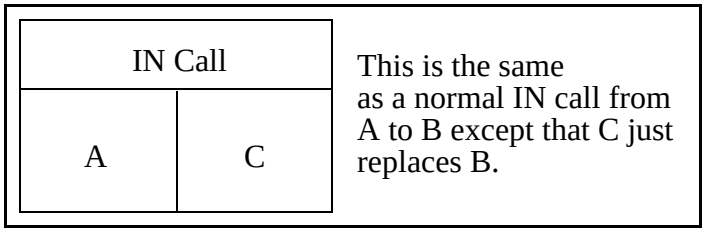


8.2.3.29 Directed Call Pickup (DCPU)

A dials B which results in the following IN call:



Before B answers and EDP-6 timer expires, C activates DCPU and an Answer ERB is reported.



After this point if A on-hooks a Disconnect ERB is reported for port 1 and if C on-hooks a Disconnect ERB is reported for port 2.

Limitation / Restriction:

SCP does not understand that C has replaced B.

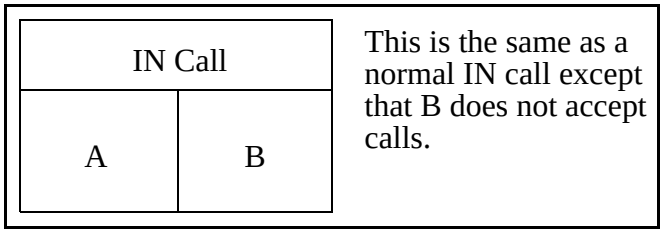
8.2.3.30 Display Queued Calls

No impact.

8.2.3.31 Do Not Disturb

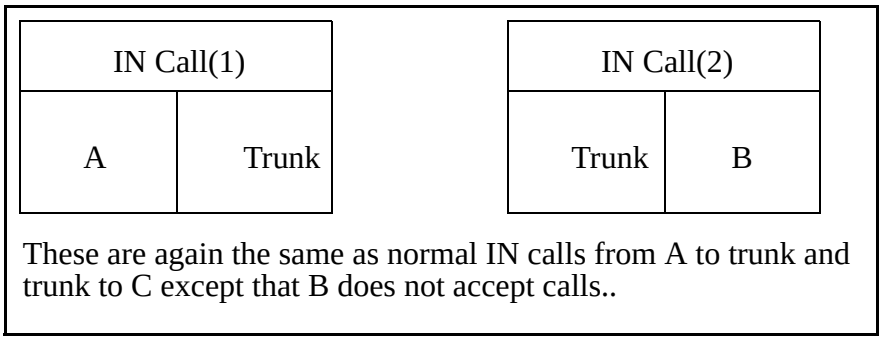
(a) Line to line call.

A dials B which results in the following IN call.



Call is not allowed to terminate and the IN dialog reports Busy ERB.

(b) Trunk to line call.



Call is not allowed to terminate and the second IN dialog reports Busy ERB. Also for the first IN dialog Busy ERB is reported to notify that the call has ended with the cause value privateNetworkServingRemoteUser.

8.2.3.32 Extend Calls

This is an MSAC related feature and IN interaction with MSAC is not supported.

8.2.3.33 Flexible Console Alerting

No impact.

8.2.3.34 Intercom Group (GIC)

Not supported. The architecture of this feature is very different and does not pass through normal translators or terminators and hence TDP-3 and TDP-12 triggering is not possible. For the description of this feature please see Appendix section at the end of this document.

8.2.3.35 Key Short Hunt (KSH)

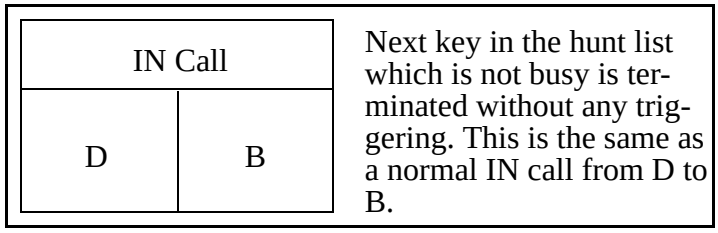
For the description of this feature please see Appendix section at the end of this document.

A(key 1), B(key 2) and C(key 3) are keys of the business set and A and B are TDP-12 triggering datafilled. A is busy. D dials A which results in the following IN call.

IN Call	
D	A

This is a normal IN call except Busy ERB is not reported. Next key in the hunt list will be tried.

Busy ERB is not reported and B rings without TDP-12 triggering and when B answers Answer ERB is reported. After this point if D on-hooks a Disconnect ERB is reported for port 1 and if B on-hooks a Disconnect ERB is reported for port 2.



Limitation / Restriction:

SCP does not understand that C has replaced B.

8.2.3.36 Last Number Redial (LNR)

No impact.

8.2.3.37 Last Number Redial from Set (LNRA)

No impact.

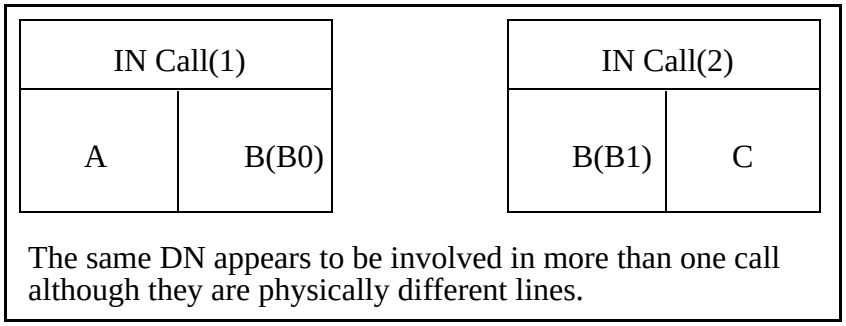
8.2.3.38 Multiple Appearance Of Directory Numbers (MDN)

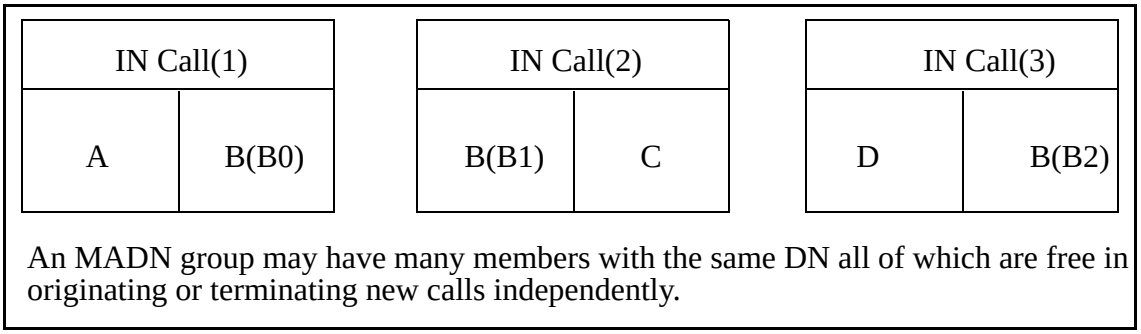
(a) SCA (Single Call Arrangement)

No impact.

(b) MCA (Multiple Call Arrangement)

All the MADN members have the same DN but when one of them is active others can also originate or can be terminated to as IN calls.



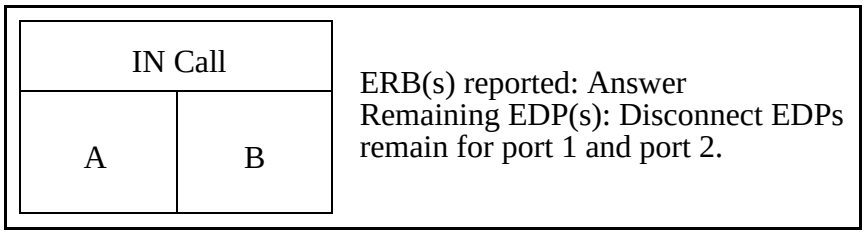


An MADN group may have many members with the same DN all of which are free in originating or terminating new calls independently.

8.2.3.39 Music on Hold (KSMOH)

(a) The calling party activates KSMOH.

A and B are talking in an IN call as follows:

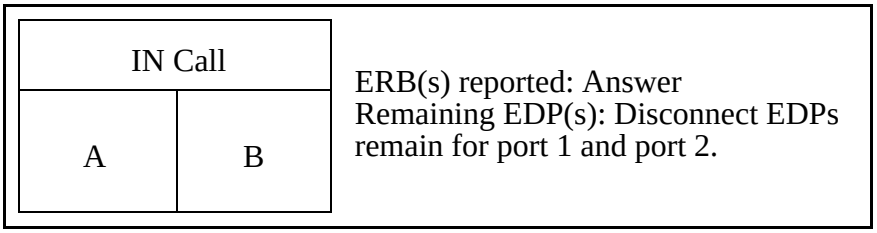


A activates KSMOH and B is on hold. A can retrieve B by pressing the DN key associated with the held call. After this point if A on-hooks a Disconnect ERB is reported for port 1 and if B on-hooks a Disconnect ERB is reported for port 2.

While on hold if B on-hooks a Disconnect ERB is reported for port 2.

(b) The called party activates KSMOH.

A and B are talking in an IN call as follows:



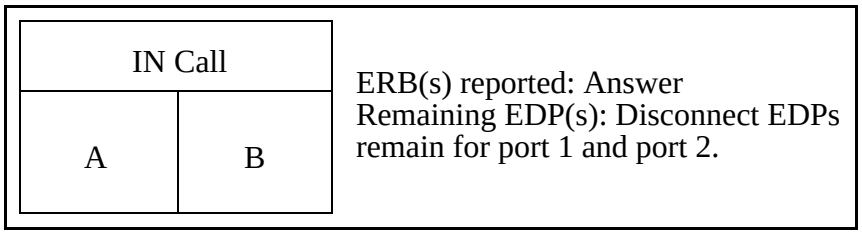
B activates KSMOH and A is on hold. B can retrieve A by pressing the DN key associated with the held call. After this point if A on-hooks a Disconnect ERB is reported for port 1 and if B on-hooks a Disconnect ERB is reported for port 2.

While on hold if A on-hooks a Disconnect ERB is reported for port 1.

8.2.3.40 Permanent Hold (HLD) Including Music on Hold

(a) The calling party activates HLD.

A and B are talking in an IN call as follows:

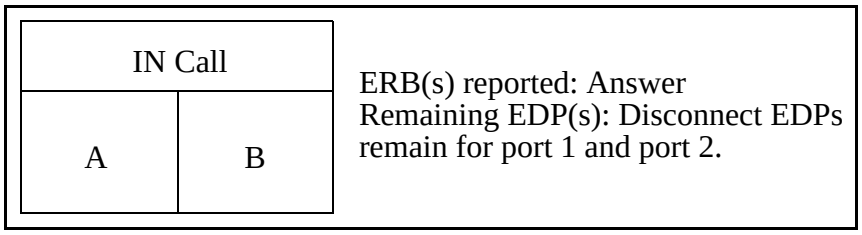


A activates HLD and on-hooks and B is on permanent hold. A off-hooks and retrieves B and after this point if B on-hooks a Disconnect ERB is reported for port 2 and if A on-hooks a Disconnect ERB is reported for port 1.

While on permanent hold if B on-hooks a Disconnect ERB is reported for port 1.

(b) The called party activates HLD.

A and B are talking in an IN call as follows:



B activates HLD and on-hooks and A is on permanent hold. B off-hooks and retrieves A and after this point if B on-hooks a Disconnect ERB is reported for port 2 and if A on-hooks a Disconnect ERB is reported for port 1.

While on permanent hold if A on-hooks a Disconnect ERB is reported for port 1.

8.2.3.41 Speed Call Long (SCL)

No impact.

8.2.3.42 Speed Call Short (SCS)

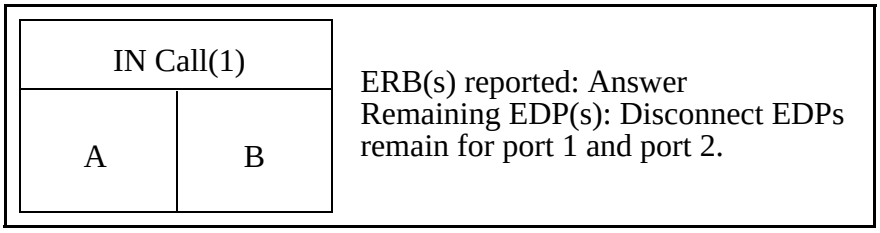
No impact.

8.2.3.43 Transfer, Hold & 3 way Conference (CXR)

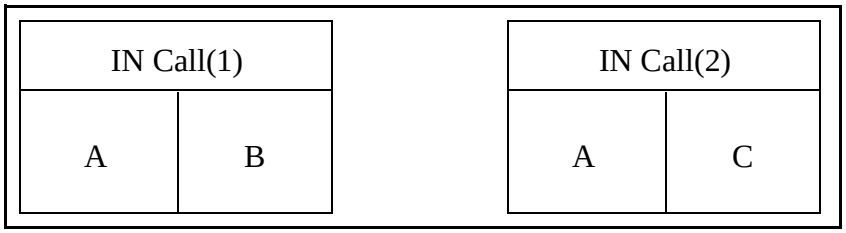
There are six scenarios as follows:

(a) Both the first call and the second call are IN calls and the calling party activates CXR.

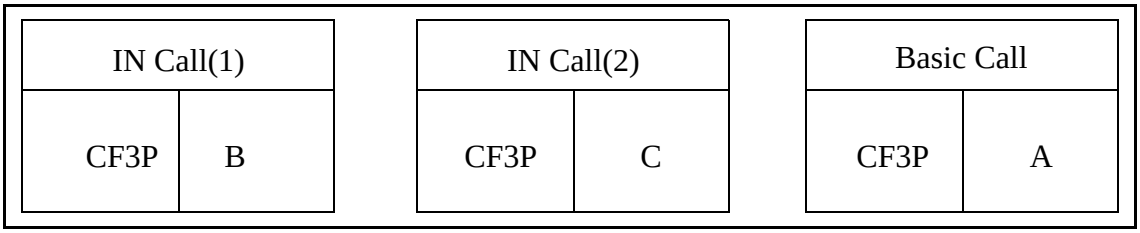
State 1



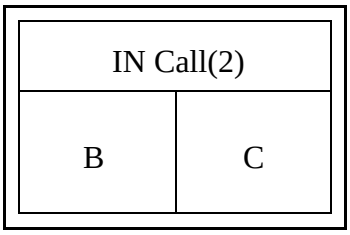
State 2



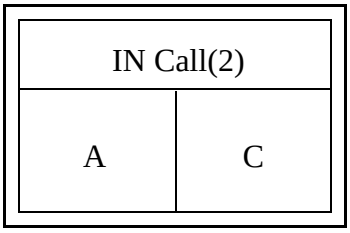
State 3



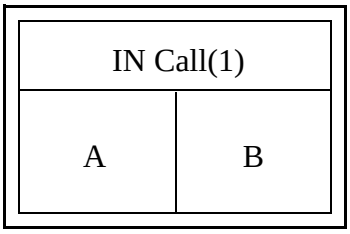
IN Call(1) -> EDP(9), EDP(17) for port 1: A on-hooked. Call was at State 2 or State 3.



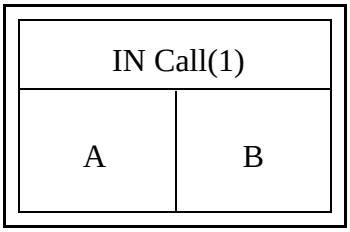
IN Call(1) -> EDP(9), EDP(17): B on-hooked. Call was at State 2 or State 3.



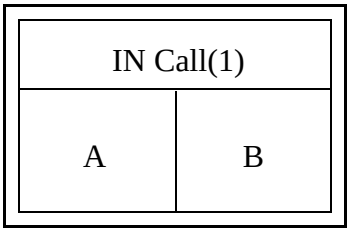
IN Call(2) -> EDP(4), EDP(5), EDP(6), EDP(13), EDP(14): Second call failed. Call was at State 2.



IN Call(2) -> EDP(9), EDP(17): C on-hooked. Call was at State 2 or State 3.

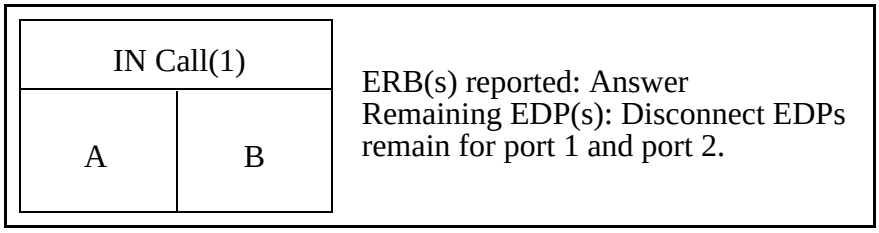


IN Call(2) -> EDP(9), EDP(17) for port 1: A flashed a second time during conference. Call was at State 3.

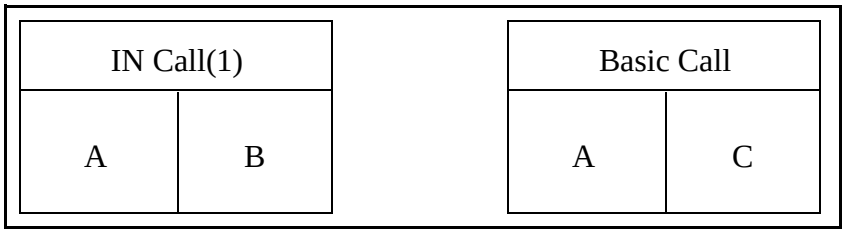


(b) The first call is an IN call, the second call is a basic call and the calling party activates CXR.

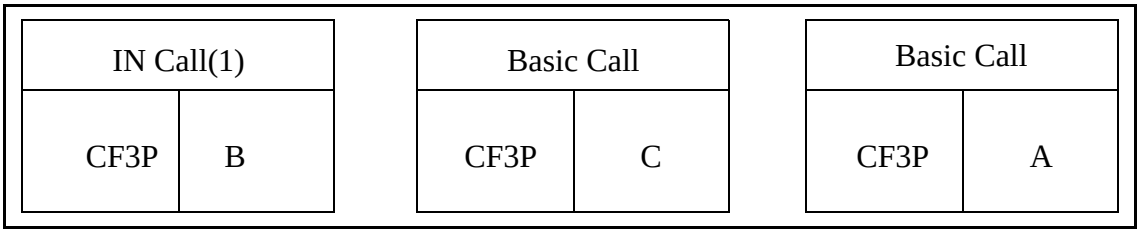
State 1



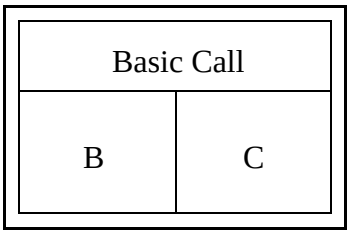
State 2



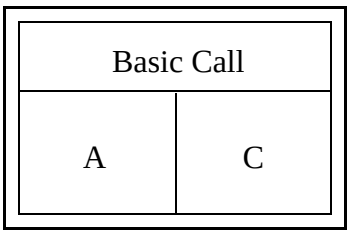
State 3



IN Call(1) -> EDP(9), EDP(17) for port 1: A on-hooked. Call was at State 2 or State 3.

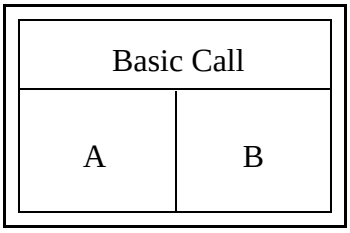


IN Call(1) -> EDP(9), EDP(17): B on-hooked. Call was at State 2 or State 3.

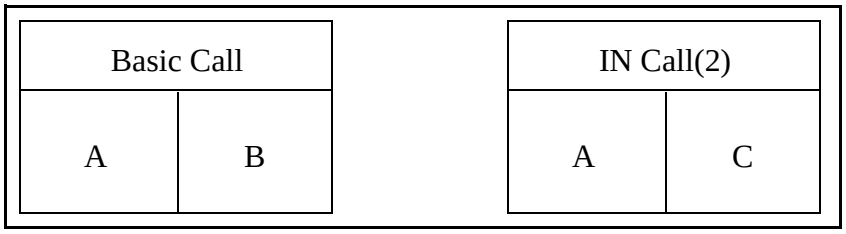


(c) The first call is a basic call, the second call is an IN call and the calling party activates CXR.

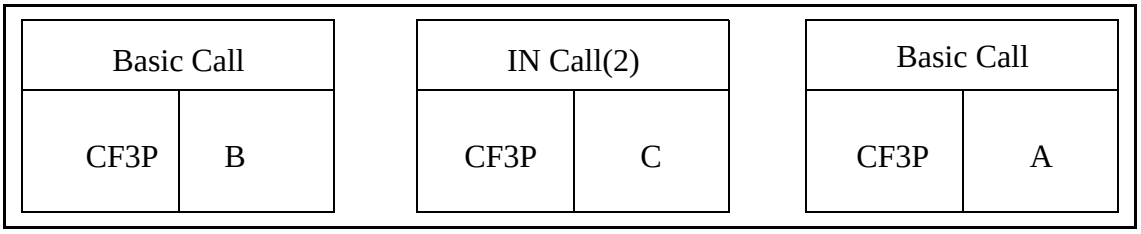
State 1



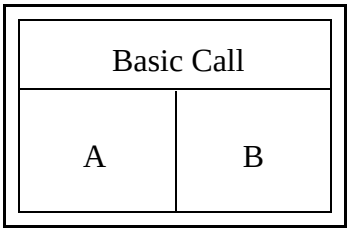
State 2



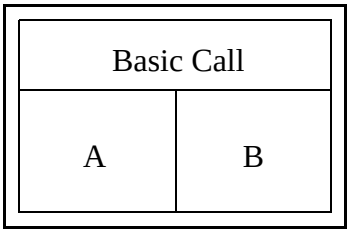
State 3



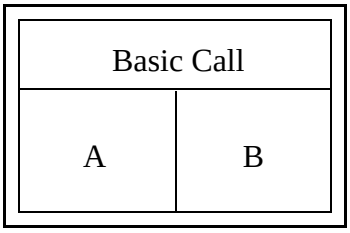
IN Call(2) -> EDP(4), EDP(5), EDP(6), EDP(13), EDP(14): Second call failed. Call was at State 2.



IN Call(2) -> EDP(9), EDP(17): C on-hooked. Call was at State 2 or State 3.

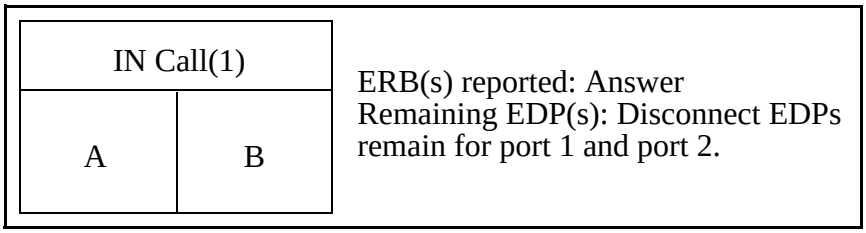


IN Call(2) -> EDP(9), EDP(17) for port 1: A flashed a second time during conference. Call was at State 3.

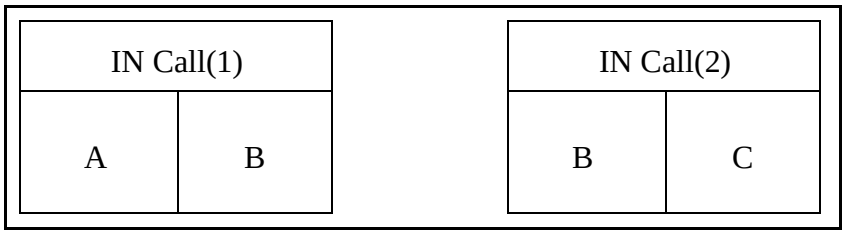


(d) Both the first call and the second call are IN calls and the called party activates CXR.

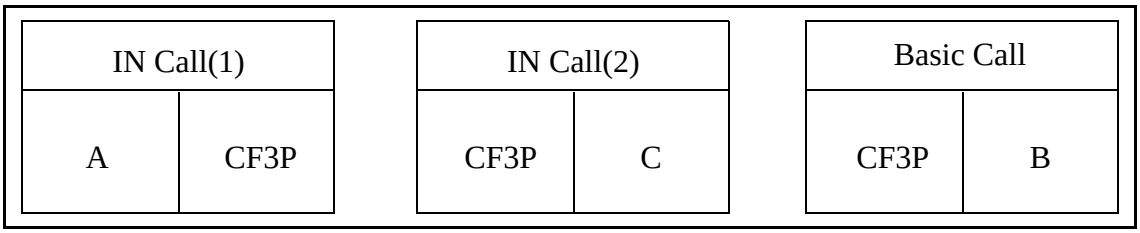
State 1



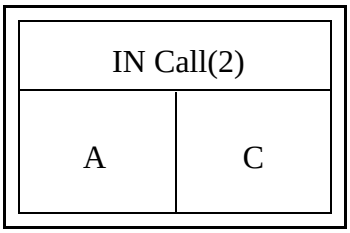
State 2



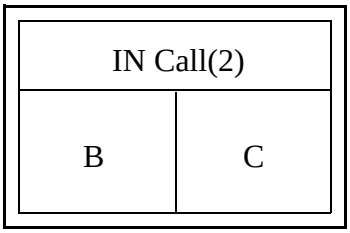
State 3



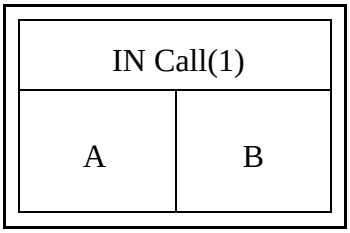
IN Call(1) -> EDP(9), EDP(17) for port 1: B on-hooked. Call was at State 2 or State 3.



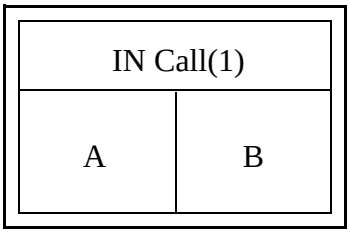
IN Call(1) -> EDP(9), EDP(17): A on-hooked. Call was at State 2 or State 3.



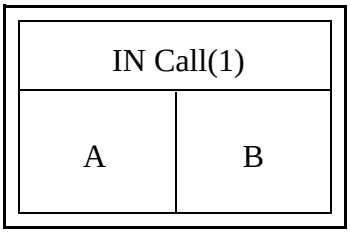
IN Call(2) -> EDP(4), EDP(5), EDP(6), EDP(13), EDP(14): Second call failed. Call was at State 2.



IN Call(2) -> EDP(9), EDP(17): C on-hooked. Call was at State 2 or State 3.

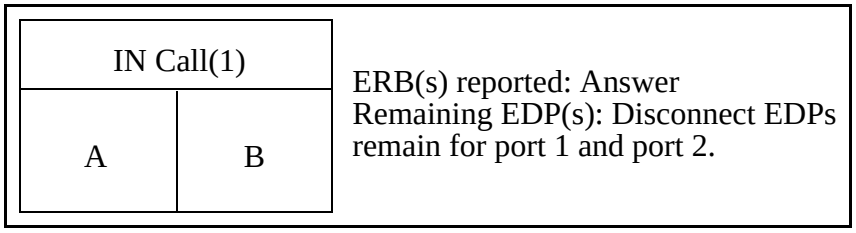


IN Call(2) -> EDP(9), EDP(17) for port 1: B flashed a second time during conference. Call was at State 3.

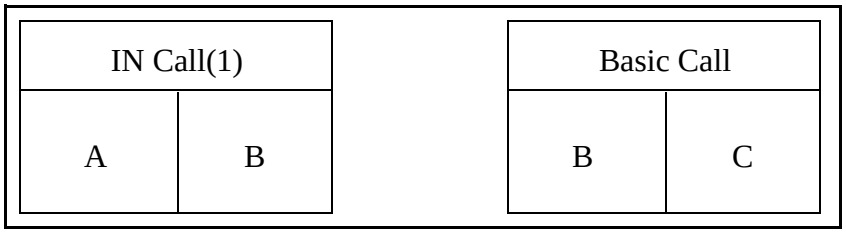


(e) The first call is an IN call, the second call is a basic call and the called party activates CXR.

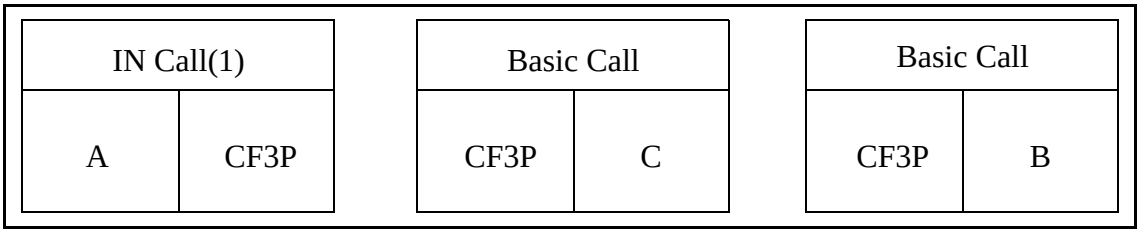
State 1



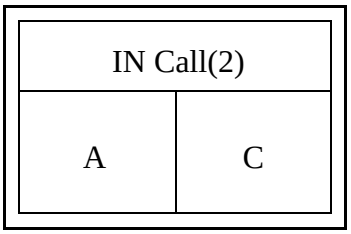
State 2



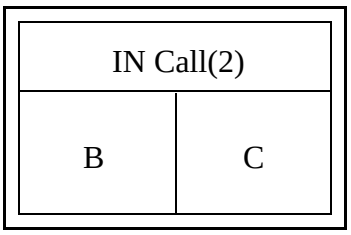
State 3



IN Call(1) -> EDP(9), EDP(17) for port 1: B on-hooked. Call was at State 2 or State 3.

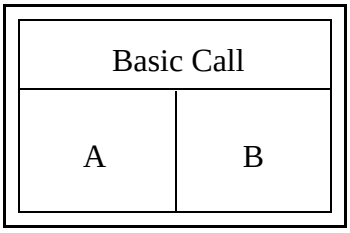


IN Call(1) -> EDP(9), EDP(17): A on-hooked. Call was at State 2 or State 3.

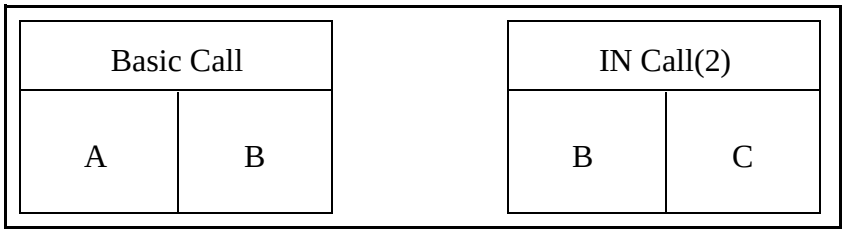


(f) The first call is a basic call, the second call is an IN call and the called party activates CXR.

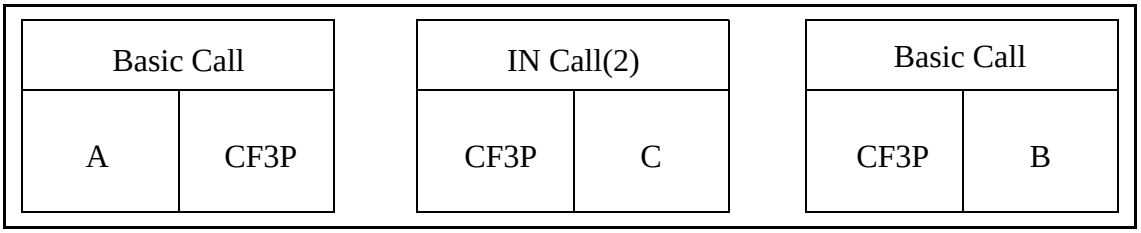
State 1



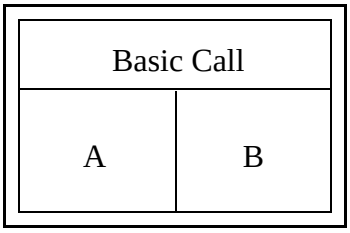
State 2



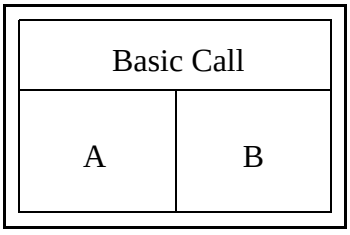
State 3



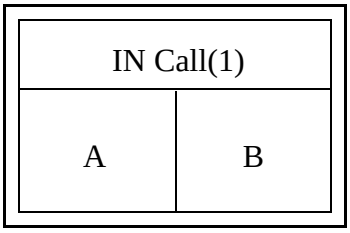
IN Call(2) -> EDP(4), EDP(5), EDP(6), EDP(13), EDP(14): Second call failed. Call was at State 2.



IN Call(2) -> EDP(9), EDP(17): C on-hooked. Call was at State 2 or State 3.



IN Call(2) -> EDP(9), EDP(17) for port 1: B flashed a second time during conference. Call was at State 3.



Limitation / Restriction:

In scenarios where there is only one IN dialog parties can not be tracked correctly.

8.2.4 Optionality

A new SERVINFO option CONV_DESK is defined which can be datafilled on a per service basis. In order for the IN triggers to behave as described above this option should be datafilled.

8.3 Hardware Requirements or Dependencies

Not applicable.

8.4 Software Requirements or Dependencies

Not applicable.

8.5 Limitations and restrictions

Limitations and restrictions are specified for each feature.

As a general limitation / restriction:

- In scenarios where IN dialog is aborted multimedia session ends.
- Only Connect, Continue, EDP-4(N), EDP-5(N), EDP-6(N), EDP-7(N), EDP-9(N), EDP-10(N), EDP-13(R, N), EDP-14(R, N), EDP-15(N), EDP-17(N), EDP-18(N) should be used.
- IN specific billing (i.e. FCI operation, SERVINFO options) is not supported.

8.6 Interactions

This is already the subject of this document.

8.8 Glossary

Term	Description
EDP	Event Detection Point
IN	Intelligent Networks
MSAC	Meridian Services Attendant Console

8.9 Appendix

8.9.1 Call Forward Enhancements

The IBN Call Forward Enhancements allows for the addition of multiple Call Forwarding and personal call screening options to a customer group. These enhancements are for customer groups only. The system cannot assign these enhancements to separate lines.

This option can allow multiple Call Forwarding for other Call Forwarding features like CFU, CFI, CFB, CFD.

The personal call screening option allows the system to transfer forwarded calls back to a base station. The system forwards the calls even if Call Forwarding is active. This option can allow personal call screening for Call Forwarding features like CFU, CFI, CFB, and CFD.

Other options in this package also include customer group transparency, ring splash for CFI and denied call forwarding.

8.9.2 Direct (ICM)

The MBS Intercom allows an end user to press the Intercom (ICM) key to terminate on a selected Meridian business set (MBS).

If directory numbers (DN) are not active on the terminating MBS, audible ringing occurs and the ICM key of the terminator flashes. The terminator can press the ICM key to answer or wait 2 s. When the terminator waits 2 s, an automatic connection occurs.

If busy DNs are on the terminating MBS, a buzzing tone occurs. The system does not make an automatic connection. Press the ICM key to answer the call. The system places the active calls on automatic hold.

You can answer the intercom call on the loudspeaker or through the handset. The entry of both sets can occur to originate or answer an intercom call on the ICM key.

8.9.3 Direct Station Select/Busy Lamp Field (BLF)

Direct Station Select/Busy Lamp Field for MBS provides the following capabilities:

- Busy lamp field (BLF) enables a Meridian business set (MBS) end user to determine if a directory number (DN) is idle or busy by monitoring the state of the lamp next to the assigned feature key. This lamp is on when the DN is busy or off when the DN is idle.
- Direct station select (DSS) enables the end user of the monitoring set to press the specified feature key to dial the monitored DN directly.

Direct Station Selection/Busy Lamp Field for MBS can be used for direct calling or transferring calls, as described in the following paragraphs.

Direct calling by an MBS end user:

While calling a monitored DN, an MBS end user notes that the lamp light associated with the DN is not lit. He or she presses a DN key and then the BLF key associated with the DN.

Transferring calls:

The procedure to transfer a call or establish a three-way call using the BLF key is the same procedure as if the monitored DN was dialed directly.

8.9.4 Intercom Group (GIC)

The MBS Group Intercom (GIC) allows an end user to terminate on a member of a selected group using abbreviated dialing. An intercom group can have a maximum size of 10 members, 1000 members, or 10 000 members. End users in a 10 member group dial a single digit, 0 to 9, to reach others members in their group. End users in a 100 member group dial a two digit number, 00 to 99. In a 1000 member group, end users dial a three digit code, 100 to 999. In a 10 000 member group, end users dial a four digit code, 0000 to 9999. A Meridian business set (MBS) can have members of several different GIC groups. A separate feature key must represent each group.

The DMS-100 switch accommodates a maximum of 4095 GIC groups. You can assign each GIC group to one large customer group. You can assign each GIC group to many customer groups.

8.9.5 Key Short Hunt (KSH)

This feature provides the capability for incoming calls to search a set of DN appearances on a business set for an idle DN to terminate.

KSH is a subset feature and must be assigned to key 1 if feature KSH is required. Either all DNs of the business set or a subset of DNs can be specified in the hunt list.

Hunting of an idle DN starts from the dialed DN, then goes up the keys of the business set as defined in the keylist. This hunt is not circular and stops once an idle DN is found or the hunt list following the dialed DN is exhausted. If the hunt list is exhausted without finding an idle DN, then an optional overflow DN or route is terminated.

The keylist can only contain standard DNs or multiple appearance DNs (MADN), but not intercom (ICM), group intercom (GIC), or private business line (PBL) DNs. A given DN cannot appear in more than one short hunt group or any other type of hunt group: multiline hunt (MLH), distributed line hunt (DLH), or directory number hunt (DNH). Any MADN member in the hunt keylist must be the primary member of that MADN group.

9: Functional Description (FN): A00008556

9.1 Feature name and Feature ID

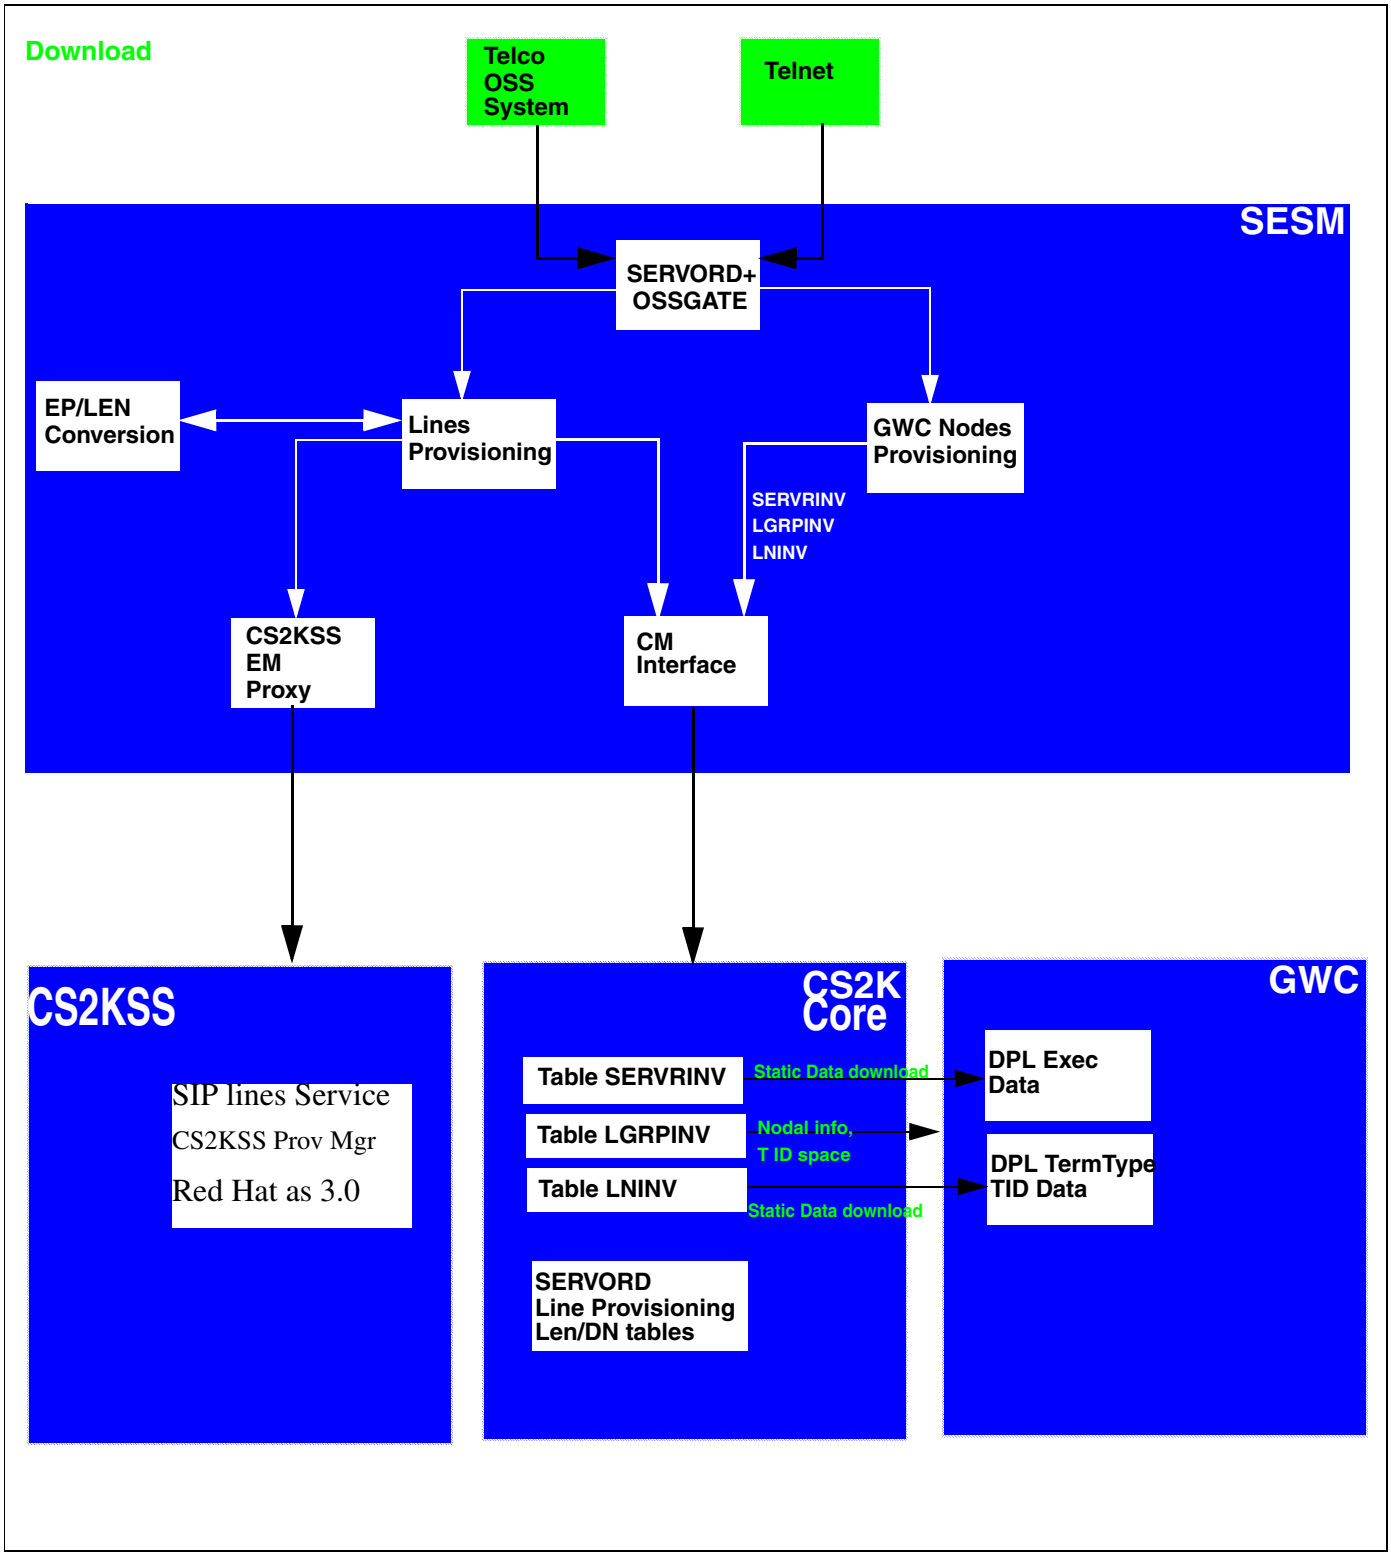
A00008556 - SIP Lines Core OAMP support

9.2 Description

The provisioning of DPL agents affects three major network components, the CS2K core, GWC, and CS2K Session Server(CS2KSS). Each of these components have their own specific provisioning requirements and each are provisioned via the appropriate application within SESM. The relationships between these components and SESM are shown in Figure 1 DPL Provisioning Component Overview below.

Refer A00008522 FN for SESM provisioning instructions.

Figure 1 DPL Provisioning Component Overview



This activity focuses on the CORE OAMP(Operation, Administration, Maintenance & Provisioning) portion of the overall SIP feature. The components in this activity are as follows:

- GWC Provisioning.
- CS2KSS-GWC Association.
- DPL Lines Provisioning.
- Journal File.
- NCAS Link Provisioning.
- Core Maintenance support.
- Tool support
- SOC support (Refer the CN section).
- NCAS Link Logs (Refer the FM section).

9.2.1 GWC provisioning:

The GWC is commissioned through the SESM. The core stores information about this commissioned GWC in the table SERVRINV. The SIP feature deals with supporting new type of agent called dynamic packet line on the GWC.

- A new term_type DPL_TERM and a new exec_lineup called DPLEX are defined for supporting the DPL agents on the GWC. The new definitions DPL_TERM and DPLEX are passed onto the core along with the GWC information when the GWC is commissioned.

- On the core side, the table SERVRINV is enhanced so that it can accept these new definitions. When the GWC is commissioned, a tuple similar to the below one is expected to be datafilled in the table SERVRINV automatically:

Table SERVRINV:

SRVRNAME SRVRADDR ***SRVREXEC*** *SRVRTONE BEARNETS SRVROPTS*
GWC 0 IP 45 46 47 48 ***(DPL_TERM DPLEX)*** *$ NORTHAA (NET_IP Y)$ $*

This table is supposed to be provisioned via SESM and not manually. The field in bold is updated to support a new entry DPL_TERM DPLEX.

9.2.2 CS2KSS-GWC Association:

Currently, a gateway controller can be associated with a maximum of 6 gateways (LGRP nodes) in CS2KSS. After the GWC is commissioned, a logical association is created in the core between the GWC and the gateways in the CS2KSS.

- The table LGRPINV stores the information about the LGRP node and the GWC which it is associated with. After the GWC information is provisioned in the table SERVRINV, the LGRP node information for corresponding LGRP nodes are datafilled in the table LGRPINV. The table LGRPINV is enhanced so that a new lgrp_type 'SSDPL' is supported. This new lgrp_type signifies that this LGRP node is associated with DPL lines.

- Currently, each LGRP node can support 1023 lines and this size will not change as a part of this feature. The information on these lines for each of the LGRP node is stored in the table LNINV. Table LNINV does not require any enhancements to support this functionality.

- A tuple with following structure is expected after the table LGRPINV is provisioned:

Table LGRPINV:

LGRP_NO	*SRVR_NAME*	***GRPTYPE***	*LGRPOPTS*
LG 1 1	*GWC 5*	***SSDPL***	*$*

This table will be provisioned via SESM and is not supposed to be datafilled manually. As shown above, a new lgrp_type 'SSDPL' is supported now for table LGRPINV.

When 1 LGRP is provisioned, corresponding 1023 lines subtending from that lgrp will be datafilled in table LNINV. As a part of this feature, the table LNINV is enhanced so that it can support only RDTLSG(North American market) and GWLPOT(International Market) cardcode for SSDPL lgrp_type. Also, the restriction has been applied to the cardcodes valid for the other lgrp_types. A sample tuple:

Table LNINV:

LEN	*CARDCODE*	*PADGRP*	*STATUS*	*GND*	*BNV*	*MNO*	*CARDINFO*
CS2KSS 1 1 10 13	RDTLSG	PKLNL	HASU	N	NL	Y	NIL

As a part of this feature the following valid cardcodes apply for different lgrp_types:

LGRP_TYPE	List of Valid Cardcodes
SSDPL	RDTLSG, GWLPOT
S	RDTLSG, RDTCON, GWLPOT, RDTEBS,GWLEBS
M	RDTEBS, GWLEBS
C	RDTLSG, RDTCON, GWLPOT
LL_3RDPTY	RDTLSG, RDTCON, GWLPOT, RDTEBS, GWLEBS
CALIX_C7	RDTLSG, RDTCON, GWLPOT, RDTEBS, GWLEBS

The table LNINV will be provisioned via SESM and is not supposed to be datafilled manually.

9.2.3 DPL Lines Provisioning:

The DPL line is differentiated from other lines by adding DPL option on that line. The table IBNFEAT is enhanced to support a new data_feature DPL. The DPL option can be added only to IBN/RES lines. Also, SERVORD+ is enhanced for accepting new DPL related options and should be used for datafilling the DPL option.

9.2.3.1 The new DPL option

As a part of supporting new DPL option, table IBNFEAT, LCCOPT and OPTOPT are enhanced.

- The table IBNFEAT have been enhanced to support the DPL data_feature. The DPL line option will have a SIP sub option. The SIP sub option of DPL will itself have a sub option of MAX_NUM_CALLS(10).
- The table control editor commands, ADD,DEL and CHA are disabled for the DPL option in table IBNFEAT much in the same manner of the PDO option.

Table IBNFEAT:

LEN DNNO DF FEATURE DATA
LG 01 1 00 14 0 ***DPL DPL Y 10***

This table will be provisioned via SESM.

- DPL option can only be added via Servord and not Table Control.

- The options incompatible with the DPL option can be datafilled in the table OPTOPT. A sample tuple:

Table OPTOPT:

DPL (BC) (CSDO) (EOF) (FIG) (FTS) (LDTPSAP) (LNPTST) (MAN) (MPB) (NDC) (NOH) (VOWDN) $

You can add options in this tuple which you want to make incompatible with option DPL. This is just a sample tuple. To see the list of supported options with DPL, please refer the interactions section of FN.

- The LCC's supporting the DPL option can be modified through the table LCCOPT. Currently, only IBN and RES lines support the DPL option. Sample tuples are as belows for IBN and RES LCC's.

Table LCCOPT:

RES (ACB) (ACRJ) (ADSI) (ADSL) (AIN) (AINDENY) (AINDN) (AMATEST) (AMSG) **(DPL)**

IBN (ACB) (ACD) (ACDNR) (ACRJ) (ADSI) (AIN) (AINDN) (ALI) (AMATEST) (AMSG) **(DPL)**

9.2.3.2 SERVORD+ Enhancements:

SERVORD+ Enhancements have been made so that it will now accept three new options related to SIP lines provisioning: DPL, SIP_PASSWORD and SIP_DATA. DPL will be seen in the core whereas the options SIP_PASSWORD and SIP_DATA will be send to the CS2KSS.

- When provisioning a SIP line all three of the options described above must be present in the SERVORD+ NEW command.
- The above options can not be added later via ADO.
- ADO and DEO of options that are compatible with DPL will be permitted. But ADO/DEO can not be used with the DPL line option.
- Only NEW, OUT and CHF will support the DPL line option. It is possible to add a DPL compatible option that does not require the DPL option in the command (such as ADO PIC). CHF can be used to

manipulate the MAX_NUM_CALLS value subfield of the DPL option. The line must not be in the CPB or call processing busy state or the change will be rejected. CHG can be used to change all but the LCC (line class code).

- DGT option is required. It will be automatically added if not present.
- Long SERVORD+ commands are supported by allowing commands to be continued on a second line by using a + sign.
- The SIP URI change will be reflected in the CS2KSS and not in the core.
- E.g. of the SERVORD+ command:

Servord+ NEW Command:

NEW $ 6212500 IBN BNR 0 0 613 NILLATA 0 LG 000 0 10 13 DPL Y 3 SIP_PASSWORD xx SIP_DATA bobby mb1

9.2.3.3 Journal File:

The Journal File (JF) subarea provides a facility for preserving Data Modification Orders (DMO) on tape so that data tables can be restored if the switch should fail. The Journal File is an optional feature of the DMS switch which preserves DMO on magnetic tape. If a switch failure occurs that requires a reload, this magnetic tape is loaded back into the machine and switch data is restored to its condition at the time of switch failure.

9.2.4 NCAS Link Provisioning:

The core communicates directly with the CS2KSS Provisioning Server through NCAS links. The CS2KSS Provisioning Server can return both static and dynamic call data stored in CS2KSS back to the core via the NCAS link

The NCAS link is going to be an instance of SCTP. The table IPAPPL provides SCTP instance for various connections in DMS. This table is enhanced to support a new application called SIPMTC (just like AIN, SMDI etc). The core can now communicate with CS2KSSs using this SCTP instance.

Table IPAPPL:

InstKey	*InstName*	*Transport*	*IPDevice*	*IPaddrs*	*port*	*optlist*
1	*a*	*sctp*	*hiop*	*198 202 188 221*	*4982*	*(application **sipmtc**)*
						(setprime 1)

The NCAS link association is going to be used for the new QSIP command.

The SIPMTC application is supported over HIOP only.

The multihoming functionality is not supported in SIPMTC application.

The port number allocated for SIPMTC application is 4982.

Multiple instances for SIPMTC are not allowed i.e. in table IPAPPL, there can be only one instance datafilled for SIPMTC.

9.2.5 Core Maintenance Activities:

On the core side, maintenance actions can be performed on the DPL lines. The maintenance operations will keep the core, gwc and cs2kss informed about each other's activities.

9.2.5.1 MAP Commands and Line State Propagation:

The DPL line can be posted on mapci; lns; ltp level.

- The line states for DPL lines on the Core include: IDL, LMB, MB, INB, CPB, CPD, SB. After the line is posted, operations like BSY, RTS, FRLS, HOLD, NEXT can be performed on the posted line. When these operations are performed, the state change of the lines is propagated to the GWC which in turn notifies CS2KSS.
- There are plans to support DIAG in the second phase of this feature, but they will not be supported in the current release. When DIAG is run on the core side, a message will be displayed: "This command is not valid for posted line.".
- At the map level, the base DPL tid will be posted. If there is any call active, then the information posted for base DPL tid will depend upon the number of call appearances active. If there is only call appearance active, then the linking information for that call appearance will be posted. However, for more than one call appearance, the linking information will not be displayed for all the call appearances. The maintenance operations on specific call appearances will be supported in later release.
- The DPL line can be posted at all the sub-levels of the LTP level: LTPLTA, IBNCON, LTPMAN, LTPDATA, LTPISDN, DCTLTP, DTPLTP. But no maintenance operations can be performed on posted DPL lines at any of these sub-levels.
- For the BSY command, the CS2KSS will be notified that this DPL client is not available for call processing. If there are no call appearances active, then the base TID will be put into MB state and no calls can be associated with this DPL agent. If there are any call appearances active, then the base TID will be put into CPD state. When all the calls are taken down, the base dpl TID will move from CPD to MB state. New calls cannot be originated/terminated on the DPL line that has been busied. The line has to be RTSed back for new calls to be originated/terminated.

- A FRLS on a DPL agent will clear all active calls for the line. If there are no active calls then the base TID, then the tid will be put to MB state. If there are active calls, a FRLS will terminate all the sessions. However, FRLS on a particular session will be supported in a later release.
- On RTS operation, the line will be put into IDL state. This operation cannot be performed when the calls are active on a DPL line.
- The maintenance operations BSY/RTS/FRLS at the MAP level are applicable for all the multiple call appearances. The Mtc operations are applied to all the VIDs.
- The HOLD command puts the posted DPL line in the hold position.
- The NEXT command moves the line in a specified HOLD position to the control position, or replaces the line in the control position with the line in a specified hold position. The NEXT command does not list the next provisioned DPL VID.
- The LGRP node can be posted at the PM level but maintenance operations cannot be performed on the entire LGRP. Thus, the state changes because of maintenance operations are propagated upwards to the core through the GWC.

Note: The maintenance operations are not supported for the SSDPL lgrp.

- When the BSY LGRP command is given for the SSDPL lgrp, the following error message is displayed:

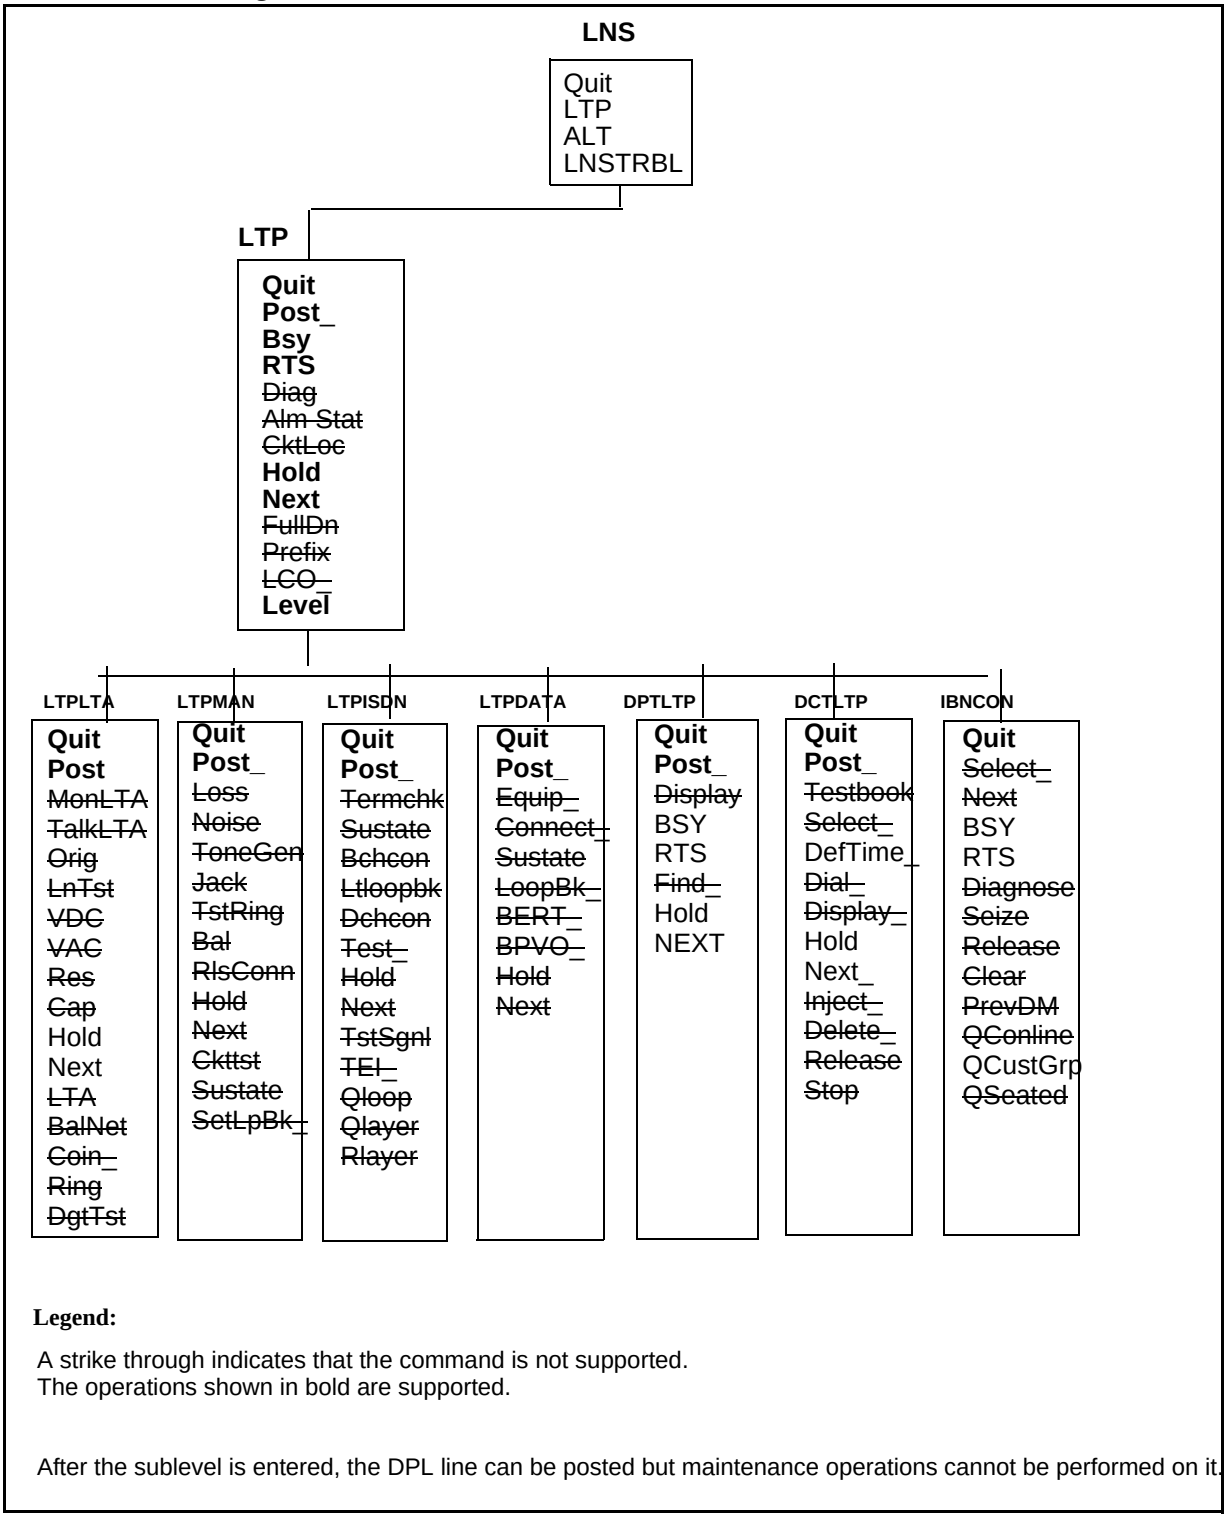
BSY COMMAND IS NOT SUPPORTED FOR THIS TYPE OF LGRP NODE.

- When the RTS command is given for the SSDPL lgrp, the following error message is given:

RTS CAN ONLY GO FROM MANB STATE.

Figure 2 Map Level below shows the MAP levels and operations which are supported and blocked for DPL lines.

Figure 2 MAP level



Legend:

A strike through indicates that the command is not supported.
The operations shown in bold are supported.

After the sublevel is entered, the DPL line can be posted but maintenance operations cannot be performed on it.

At the **LTPLTA** level, the error messages that will be seen for the unsupported maintenace commands are:

MonLTA, TalkLTA, Orig, LnTst, VDC, VAC: **This command is not valid for posted line.**
BalNet: **This command is not valid for Call Server LGRP lines.**
Coin, Ring, DgtTst: **No talk connection to posted line**

At the **LTPMAN** level, the error messages that will be seen for the unsupported maintenance commands are:

Loss, Noise, Tonegen, Jack, RlsConn : **This command is not valid for the posted line.**
Tstring: **To test the ringing function for Call Server LGRP lines, please run the DIAG command.**
Bal: **This command is not valid for Call Server LGRP lines.**
Ckttst: **CKTTST command is not valid on POTS/COIN lines.**
Sustate: **SUSTATE command is not valid on POTS/COIN lines.**
SetLpBk_ : **SETLPBK command is not valid on POTS/COIN lines.**

At the **LTPISDN** level, the error messages that will be seen for the unsupported maintenance commands are:

TERMCHK: **TERMCHK command is not valid on POTS/COIN lines.**
Sustate: **SUSTATE command is not valid on POTS/COIN lines.**
BchCon: **BCHCON command is not valid on POTS/COIN lines.**
LTLOOPBK: **LTLOOPBK command is not valid on POTS/COIN lines.**
DCHCON: **DCHCON command is not valid on POTS/COIN lines.**
TEST: **TEST command is not valid on POTS/COIN lines.**
TSTSGNL: **TSTSGNL command is not valid on POTS/COIN lines.**
TEI: **TEI command is not valid on POTS/COIN lines.**
QLOOP: **QLOOP command is not valid on POTS/COIN lines.**
QLAYER: **QLAYER command is not valid on POTS/COIN lines.**
RLAYER: **RLAYER command is not valid on POTS/COIN lines.**

At the **LTPDATA** level,

Equip, Loopbk_, BERT_, : **This command is not valid for Call Server LGRP lines.**
Connect: **CONNECT command is not valid on POTS/COIN lines.**
Sustate: **SUSTATE command is not valid on POTS/COIN lines.**
BPVO: **BPVO command is not valid on POTS/COIN lines.**

At the **DPTLTP** level,

Find_ : **CLLI entered is not of a DPT trunk**
Display: **DN not involved in a call**

At the **DCTLTP** level,

Testbook: **No testbook is active.**
Select: **SELECT command not executed. No testbook is active.**
Dial: **DIAL command not executed. No testbook is active.**
Display: **DISPLAY command not executed. No testbook is active.**
Inject: **INJECT command not executed. No testbook is active.**
Delete: **DELETE command not executed. No testbook is active.**
Release: **RELEASE command not executed. No testbook is active.**
Stop: **STOP command not executed. No testbook is active.**

At the **IBNCON** level,

Select: **That line is not associated with a console.**
Next, Diagnose, Seize, Release, Clear, PrevDm, Qconline, Qseated: **Console not selected.**

9.2.5.2 Restart and Swact Recovery:

It is desired that when Core, GWC and CS2KSS undergo restart/swact, each of the component's view of line states are in sync.

When the core undergoes restart/swact it notifies the GWC about the type of restart/swact. The GWC performs the necessary operations and also notifies the CS2KSS regarding this. The heartbeat mechanism is used to notify each other of their availability.

When the core undergoes restarts/swacts, a message is sent to GWC about the type of restart/swact. The GWC has to take action upon the type of restart/ swact that occurred.

Core Recovery:
The stable calls are the ones in the talking state. The unstable calls imply the ones not in the talking state.

- For core warm restart, GWC clears all unstable calls.
- For core cold restart, GWC clear all stable and unstable calls.
- For core warm SWACT, GWC clear unstable calls.
- For core cold SWACT, GWC clears all stable and unstable calls.
- For core reload restart, BSY GWC Node. When core recovers, RTS the GWC node.
- After the core restart is completed, a message is sent to the GWC that the core is in 'Running' state. If the GWC was BSYed, it will be RTSed. The core sends a SST320 message to RTS all the lines of an LGRP.

- If the CS2KSS is OOS before the restart, lines are put into LMB state. The availability of CS2KSS is tracked by the GWC by the heartbeat mechanism.
- Even if the line was manually BSYed before restart, the line is RTSed to IDL state after restart is over.
- When the core recovers, the endpoints appear as SB until the recovery process is complete, then they transition to IDL. However, the transition state SB cannot be tracked because by the time core recovers completely and we can post the line at the mapci level, the line would have been RTSed to IDL state.

GWC Recovery:

- When the GWC is busy, the state of the GWC in the core side will be ManB. If the GWC is OOS, the state of the GWC in the core would be SysB. When the GWC is not InSv, the LGRP will be in SysB state.
- When GWC goes down, a message is sent to the core to put the line in LMB state.
- When GWC recovers, message is sent to the core to put the line into IDL state. But since the connection between the GWC and CS2KSS is lost, the lines will be put into LMB state. When the discovery message from CS2KSS to GWC is sent, the lines of the corresponding lgrp are out into IDL state.

CS2KSS Recovery:

The maintenance operations are not supported on CS2KSS in this release. The line states are depedent upon whether CS2KSS is up or not.

- CS2KSS gateway is not provisioned on the GWC side.
  If the gateway is not provisioned on the GWC side, the lgrp state is SYSB the lines will be in INB state.

- CS2KSS gateway is provisioned but the gateway is OOS
  When the gateway is OOS, the lgrp is in SYSB state and the lines are in the LMB state. Only when the DISCOVERY message is sent to the GWC from the CS2KSS, the lines are put to IDL state.

9.2.6 Tools:

9.2.6.1 QSIP:

QSIP is a new query command at the CI level. It has been introduced as a part of
this activity. QSIP would query the SIP Line data for a particular SIP Line.

The QSIP command will display the information in the table below.

Table 10: QSIP Response FIelds

QSIP Field	Format/Value	Description
SIP URI	<user>@<domain>	The SIP URI that corresponds to the the DN in the QSIP query.
Account Status	ACTIVE/INACTIVE	The status of the subscriber's account. If the account is active, the subscriber is allowed to make calls. If the account is inactive, the subscriber is not allowed to make calls.
Registration State	Y/N	Indication if the subscriber is registered/logged-into a SIP client.
Allow Post Busy Termination	Y/N	This field suggests that the line is allowed to have termination even if it in busy in another call if value is set to Y.
Number of Contacts	<integer>	The number of unique registered destinations where the subscriber is logged into.
Contacts	List of <user>@<ip address>:<port>	Displays no more than 3 contacts. A SIP contact is IP address the subscriber registered from.
Service Package	<string>	Name of the Service Package the subscriber has on the Session Server.
Services	<string>	List of services and service data in the Service Package.

Table 10: QSIP Response FIelds

QSIP Field	Format/Value	Description
Endpt ID	<SITE>/<FFF>/<G>/<TTtt>	SITE = 1-4 Alphanumeric characters. Corresponds to provisioned SITE name in the XACore. FFF = 000-511 Corresponds to the frame number used in the logical group name in the XACore. G = 0-9 Corresponds to the group number used in the logical group name in the XACore. TTtt= 0000-1022 Corresponds to the circuit numbers (upper and lower) in the LENs defined against the logical group in the XACore.
Virtual Media Gateway	<string>	Name of Virtual Media Gateway.
Zone ID List	List of <integer>	Displays no more than 3 zone ids. The zone id allows the software to determine a media portal insersion is required or not.
Client Type	<string>	The type of client this subscriber is associated with (for example, ONT). Client Types can be defined in the Session Server ProvClient.
Static Client	Y/N	This field is set to "Y" meaning this is a wireline or fix client. The value "N" is for the future usage.
Node number and Terminal number of the VIDs of all the Active Call Appearances	List of <node> <terminal>	Lists the endpoints involved in SIP sessions.

Table 10: QSIP Response FIelds

QSIP Field	Format/Value	Description
Number of Active Sessions in CS2000 Session Server	<integer>	The number of active SIP voice sessions this subscriber is involved in at the point in time whenthe QSIP query is issued.

The QSIP command will launch a Query message to the CS2000 Session Server over the NCAS link. The CS2000 Session Server will launch a Response to the Core over the NCAS link. Upon receiving the Response from the CS2000 Session Server, the Core QSIP command will display the above SIP Lines information.

The response for the QSIP query sent is expected to arrive within a specific time
interval. The default QSIP response time interval is 15 seconds. However, the timeout can be set from 1 to 30 seconds. If any value greater than 30 or lesser than 1 is given as the timeout value, the timeout value will be set to the default timeout value of 15. Timeout is an optional parameter in the QSIP command.

The QSIP command will only display the CS2000 Session Server services that are ENABLED. There could be services provisioned on the SIP line which are DISABLED which would not be shown. However, the QSIP will display the Service Package Name which would help if it is known which services are in a particular Service Package.

If a SIP line has contacts, only the URIs of the first three contacts will be shown.

If a SIP line has more than 3 middle box ids, only 3 middle box ids will be displayed.

If QSIP cannot display the SIP data from the CS2000 Session Server a message will be printed as follows:

SIP DATA CANNOT BE DISPLAYED DUE TO <REASON>

Where <REASON> could be one of the following

- RESPONSE TIMEOUT FROM CS2000 SESSION SERVER
- BAD MESSAGE RECEIVED FROM CS2000 SESSION SERVER
- QSIP SEND REQUEST FAILURE
- The QSIP Application Error String from the QSIPReportError message received from CS2000 Session Serve

If the response from the CS2000 Session Server does not have any data for all the parameters then the following message is displayed:

- SIP DATA CANNOT BE DISPLAYED BECAUSE NO DATA RECEIVED FROM CS2000 SESSON

If the CS2000 Session Server responds with partial data , before the SIP data portion of the QSIP display begins there will be a message:
"PARTIAL DATA RECEIVED FROM THE CS2000 SESSION SERVER."
Then, the QSIP will display whatever data it can and leave the other fields blank.

If the total number of parameters, including main parameters and their sub-parameters, received in the response message from CS2000 Session Server is greater then 19 then it would be considered as an error scenarior and the following message would be displayed:

SIP DATA CANNOT BE DISPLAYED DUE TO BAD MESSAGE RECEIVED FROM CS2000 SESSION SERVER

The Allow Post Busy Termination and Node numbers and Terminal numbers of the VIDs active on the call are displayed only if some data is received in the response message from the CS2000 Session Server.

QSIP will work for all the LENs that work fine with QLEN. However, to get data the LEN should correspond to a SIP Line.

If QSIP is used with a non-SIP DN then the following message will be displayed:
QSIP SHOULD BE GIVEN FOR SIP LINES ONLY

If a non-existent DN is specified for QSIP then the following message will be displayed:
INVALID DN SPECIFIED FOR THE QSIP COMMAND

If a non-existent LEN is specified for QSIP then the following message will be displayed:
INVALID LEN SPECIFIED FOR THE QSIP COMMAND

The QSIP command’s CI format is shown below:

```
>q qsip
DISPLAY SIP LINE INFORMATION
     COMMAND FORMAT: QSIP <DR_LEN_TYPE>
      PARMS: [<TIMEOUT> {1 TO 30}]
```

- Example for QSIP (DN as a parameter)

```

9.2.6.2 QDN/QLEN/DISPCALL/PMIST/CALLTRAK:

The QDN, QLEN, DISPCALL, PMIST, and CALLTRAK tools will be supported for DPL Lines, and they will retain their same functionality and same command interfaces. There will be no impact to these tools by this activity. However, tools like CALLTRAK are tid-based, and thus when tracing on a DPL line with multiple active calls, trace data for ALL of the active calls with be captured.

9.2.6.3 DISPCALL:

DISPCALL is a tool which is used to capture the call data associated with the agent.The agent can be selected to capture the call information using following commands.They are SAVETID and SAVELEN.

The parameter for SAVETID is node number and terminal number.And parameter for SAVELEN is LEN of the agent. For DPL lines a new optional parameter KEY has been added along with the existing parameter for both SAVETID and SAVELEN.The KEY parameter holds the key value of the call appearance.The key values can be obtained form the tool DPLTEST.

IF the agent is selected with out key value for DPL lines, the tool checks for number of call appearance associated with the selected TID or LEN. IF there is only one call appearance associated with the TID/LEN then it gives the information associated with that call. IF there are multiple call appearances, then it displays the message saying multiple calls associated with this call,please enter the key value.

9.2.6.4 CALLTRAK:

CALLTRAK tool is used to capture the IO messages and procedure traces for the agent selected. For DPL lines, Since all the VIDS are allocated dynamically, and deallocated by the time the call complete, there would not be any vids associated with the agent by the time logs are displayed using the display command. So the log may not show the exact agent information.

For DPL lines, the hook has been added in the calltrak,so that it will store only the base TID in the call data and also capture all the information associated with that TID. Since only the base TID is stored in the call data, the calltrak log will not show the KEY information in the IO message for DPL lines.

Ex:

```

9.2.8 International ICAF (Document : A00009771)

For international AIN the EDP2 and EDP8 are not tested for this release SN09 , since there these EDPs require digit collection.

9.3 Hardware Requirements or Dependencies

None.

9.4 Software Requirements or Dependencies

The CORE OAMP functionality has dependencies associated with some of the other components in the overall SIP lines feature:

- SESM
- CS2KSS
- GWC
- OSSGATE
- NCAS Link

9.4.1 SESM:

SESM EM needs the enhancements in table LGRPINV for bulk provisioning and line provisioning.

9.4.2 CS2KSS:

- QSIP core client is dependent on the CS2KSS API for QSIP query.
- SCPLITE APIs should be present to support the QSIP messaging.
- The CS2KSS profile team has to provide an API to get the Registration status and the SIP URI information
- The CS2KSS callp should provide an API to give the Active sessions for a SIP Line
- The CS2KSS will need to know the syntax of the QSIP messages it will receive from and send to the Core.

9.4.3 GWC

- GWC EM requires table SERVRINV enhancements to support the new term type DPL and a new exec lineup DPLEX.
- The state changes due to the operations BSY, RTS, FRLS, HOLD, NEXT performed on SIP lines in core should be propagated to the GWC.
- When the CS2KSS or GWC are taken down, the same should be notified to the core.
- Audit messages will be sent between the CORE & GWC and the message protocol from both the parties should be understood by each other.
- Carcodes for the DPL lines are restricted to RDTLSG for the North American market whereas it is restricted to GWLPOT for the International market.

9.4.4 OSSGATE:

- It needs the IBNFEAT and servord enhancements for line provisioning and other servord+ line commands like DEO, ADO etc.

9.4.5 NCAS Link:

- It should be available for the QSIP query to take place.

9.5 Limitations and restrictions

- Since the CLTG command is applicable only to POTS and RES lines, the CLTG Servord command applies to only RES DPL lines. CHG NCOS will have to be used for providing the functionality to IBN DPL lines. The CLTG and CHG will be done via SESM.

9.6 Interactions

None.

10: Functional Description (FN): A00008721

10.1 Feature name and Feature ID

A00008721 - DUAL RCO2 Development

10.2 Description

10.2.1 Introduction

This activity introduces the DUAL Remote Switching Center Offshore (RCO2) concept into the Digital Multiplex Systems (DMS) International Market.

10.2.2 Basic DUAL RCO2 Terminology

In order to clearly explain the DUAL RCO2 concept first of all some keywords should be defined.

Interlinks: The PSide E1 links connecting the two RCO2s in a Dual pair

Spouse: The other RCO2 in the Dual pair (as opposed to "mate" which refers to the other unit of the same RCO2)

Master: The RCO2 listed first in table IRLNKINV -the one which performs the channel allocation for Interswitched calls, etc.

Slave: The RCO2 that is not the Master

Emergency Stand Alone (ESA): The state in which the RCO2s' ability to perform basic Call Processing (CallP) continues even when they are isolated from the Computing Module (CM). While in ESA, the RCO2 will perform only the most basic services, but it allows "communities of interest" served by the same RCO2 (or Dual RCO2) to maintain their ability to call within themselves even when cut off from the rest of the office for any reason.

Dual Emergency Stand Alone or Dual ESA (DESA): When both Spouses are separately in ESA mode and Interlink messaging is functioning, allowing calls to Interswitch; DESA Entry is attempted whenever ESA Entry occurs and conditions are right (e.g. the Spouse is already in ESA, as verified by an Interlink message exchange).

Forced ESA (FESA): An option that causes ESA Entry on one RCO2 to force immediate ESA Entry on the Spouse RCO2 so as to allow DESA to occur.

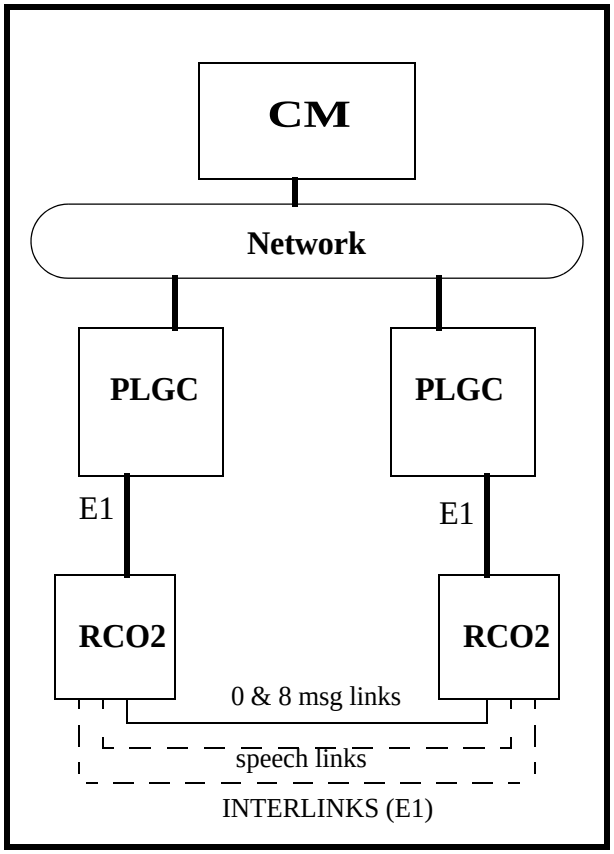
10.2.3 A General Dual RCO2 Description

A Dual RCO2 consists of two collocated RCO2 peripherals connected together by two or more P-side PCM30 links. When communication with the host (CC) is possible, interswitching occurs within the Dual RCO2 after CC call control determines that the call originating on an RCO2 can terminate on that RCO2's spouse. (The spouse RCO2 in a Dual RCO2 configuration is the RCO2 connected by interlinks to the particular RCO2 under discussion).

When communication with the CC is not possible, an RCO2 enters the ESA state. Once the RCO2 is in the ESA state, the ESA CC module handles the call processing functions previously handled by the CC. For an RCO2 which is in ESA, all calls that can be intraswitched are intraswitched. When DESA mode is achieved that coverage is expanded to incude calls that can interswitch as well.

Please refer to Figure 1 for an overview of the DUAL RCO2 interlinks.

Figure 1 Dual RCO2 Interlink Overview



10.2.4 Dual RCO2 Basics

A Dual RCO2 is made up of two collocated RCO2s connected via PSide Interlinks. There is a minimum of two Interlinks required as there must be two messaging Interlinks (no more, no less), with any additional Interlinks all considered speech Interlinks. All System maintenance for Interlinks is driven by the RCO2s, with CM providing MAP updates and the human interface (i.e. manual actions).

A Dual RCO2 consists of a Master RCO2 (the first one listed in table IRLNKINV) and a Slave RCO2. The Master makes the decisions about channel allocation and Interlink Maintenance, etc., and the Slave acts on them (this prevents contention). Each RCO2 spouse has a node table entry for the other spouse, but not for the International Line Controlling Module (ILCMs), etc., that hang off the other spouse (no need to message directly to them or their terminals). Though for Interswitching to work in DESA mode, both RCO2s receive Dialling Number (DN) info for the both RCO2s as part of ESA Data.

10.2.5 IRLNKINV Table

```
Table IRLNKINV:
RCCNAME INTERRCC IRLNKTAB ESAFORCE
-----------------------------------
REM1 RCO2 7 REM1 RCO2 8 (0 0) (8 8) (1 1) (9 9) $ Y
REM1 RCO2 8 REM1 RCO2 7 (0 0) (8 8) (1 1) (9 9) $ Y
```

Figure 2 Table IRLNKINV

Table IRLNKINV's tuples consist of;
an RCO2 name (REM1 RCO2 7), interlinked RCO2's name (REM1 RCO2 8), the interlinks and the FESA option boolean.

The first RCO2 datafilled (RCO2 7) becomes the master while the following one (RCO2 8) becomes the slave in a dual pair.

A maximum number of 14 interlinks can be datafilled between two RCO2s. Another important point about the interlinks is that interlinks 0 and 8 are reserved for messaging and must come first in the table while the other 12 are used as speech interlinks.

Please refer to Figure 3 for a table IRLNKINV datafill example.

10.2.5.1 FESA Mode

The ESAFORCE option boolean enables the FESA mode if set to Y. FESA mode is initiated when ESA Entry on one RCO2 forces immediate ESA Entry on the Spouse RCO2 so as to allow DESA to occur (note: Interswitched calls cannot survive Warm ESA Entry unless FESA is enabled).

10.2.6 IRLINK Map Screen

After posting the RCO2 by entering the mapci;mtc;pm level, a new command option, IRLINK, is introduced. The IRLINK command enables the management of interlinks by providing commands like;

BSY: used for busying an interlink
TST: used for running maintenance (out-of-service, in-service) tests on an interlink
RTS: used for bringing an interlink into service
INTERSW: used for enabling/disabling inter-switching
QUERYIR: used for querying the current status of an interlink. This command opens a new map interface where the interlinks alarm status can be monitored.

10.2.7 HUNT Groups

This activity supports MLH (Multi Line Hunt Group), DLH (Distributed Line Hunt Group) and DNH (Directory Number Hunt group) when the pilot DN (Directory Number) is located on the spouse RCC. Just like in single ESA DLH is treated as MLH and no circular hunting is allowed on DNH during dual ESA mode.

10.2.8 Logs, Alarms, and OMs

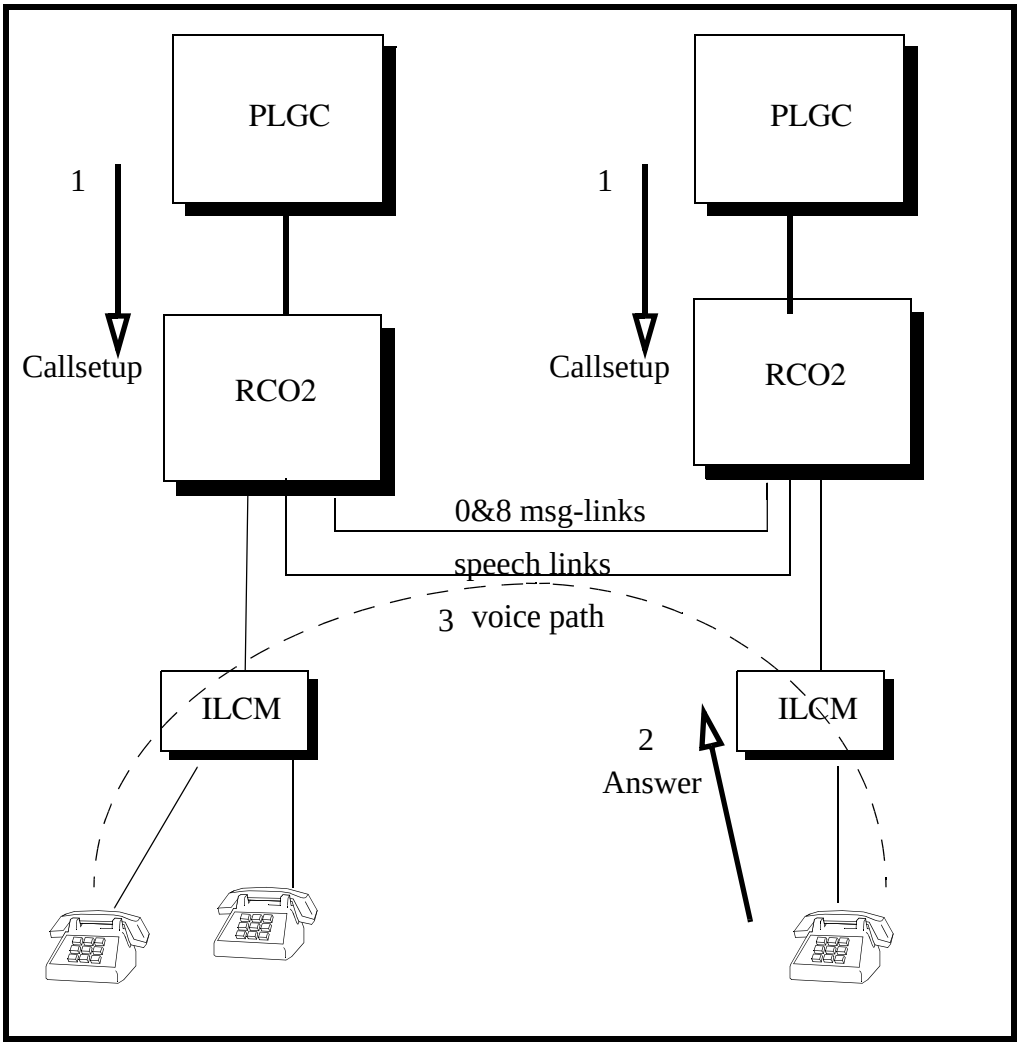
Existing PCM30 logs, alarms and OMs are valid for Dual RCO2 interlinks.

10.2.9 Some Basic Call Setup Scenarios

Some basic call setup scenarios are shown in Figures 4 to 7.

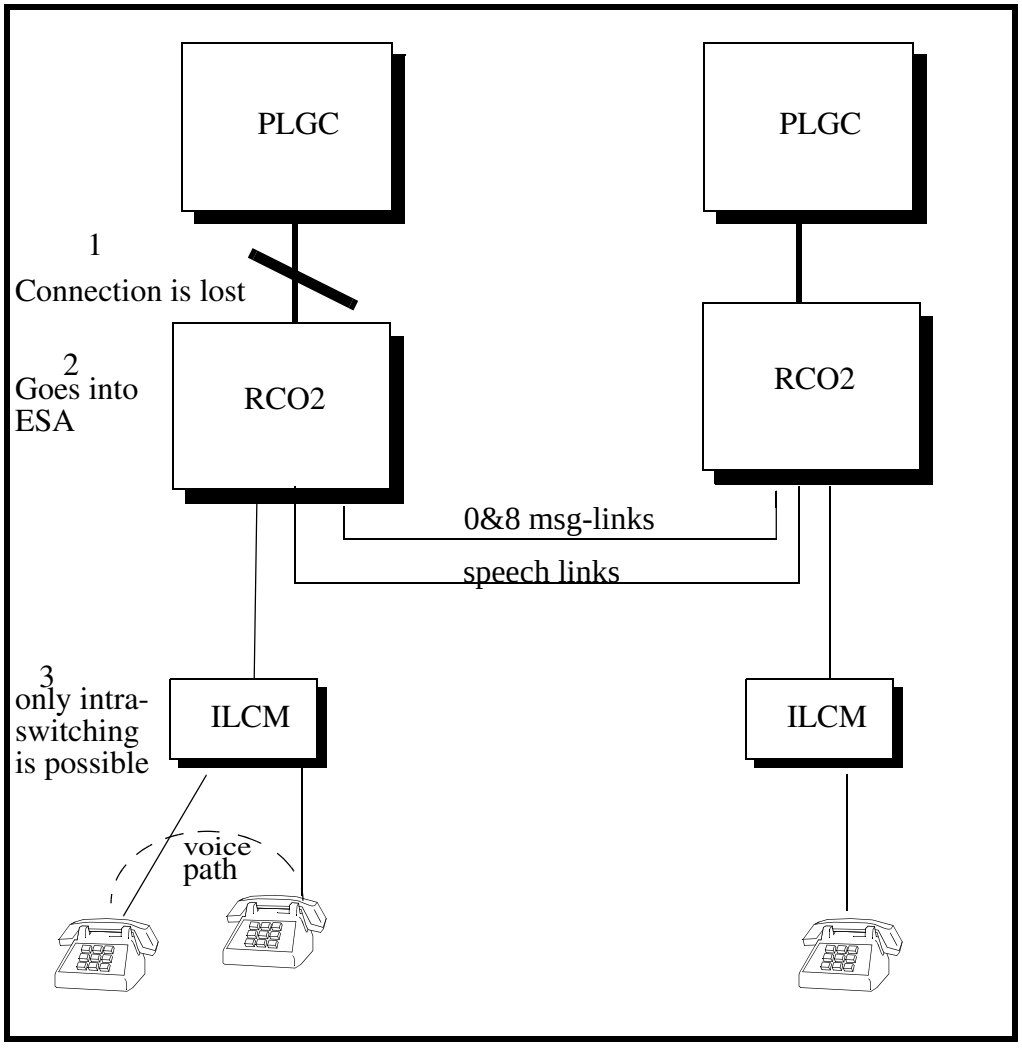
10.2.9.1 Inter- switching in Normal Mode

Figure 3 Normal Mode Inter- switched Call



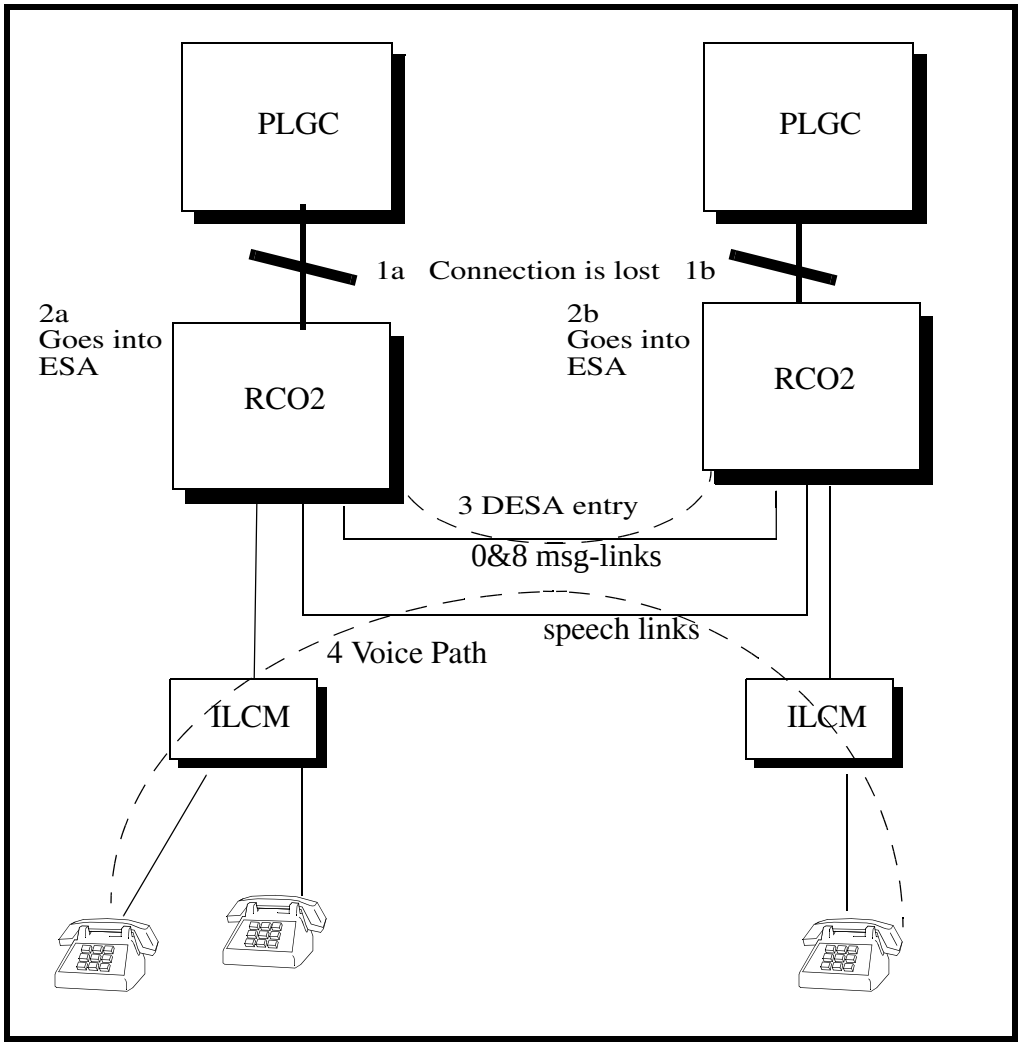
10.2.9.2 Intra- switching in ESA Mode

Figure 4 ESA Mode Intra- switched Call



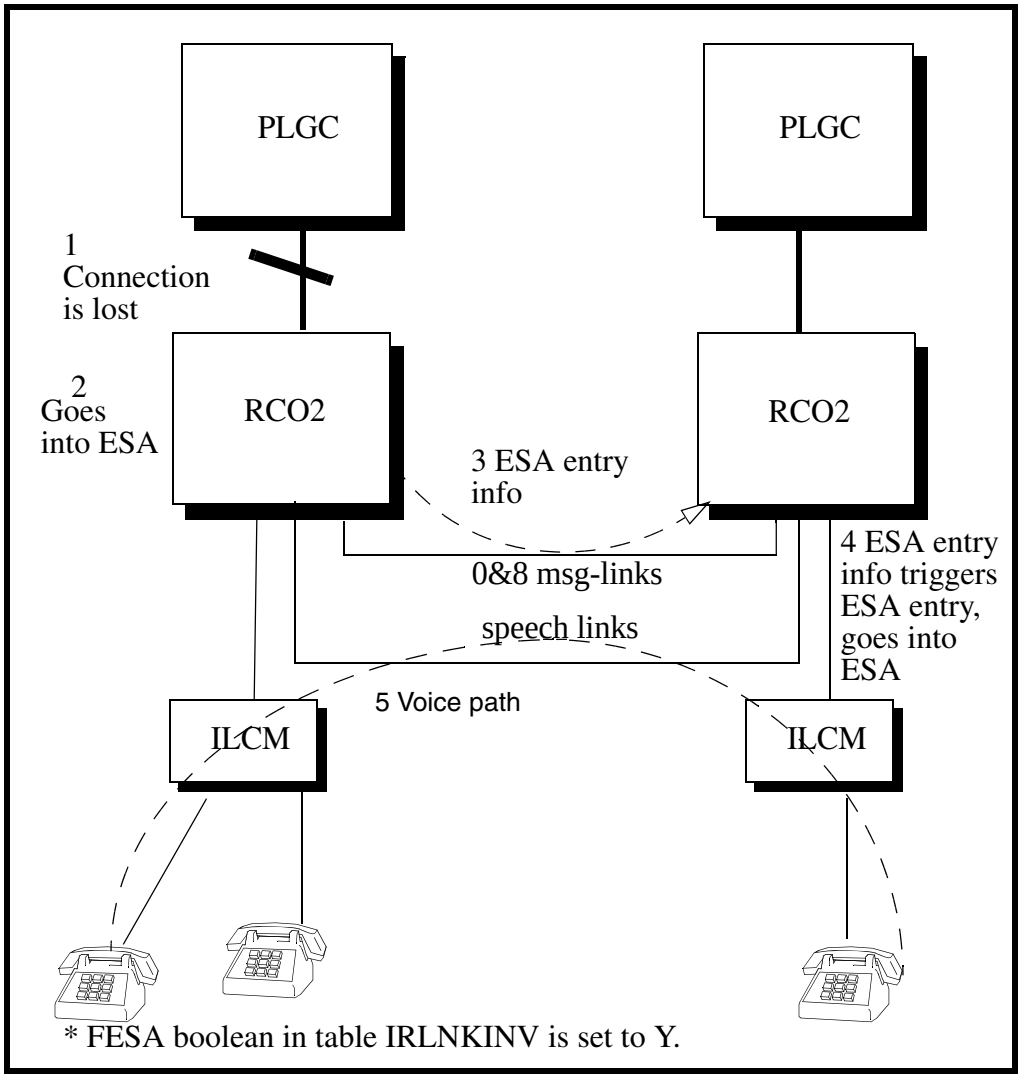
10.2.9.3 Inter-Switching in Dual ESA Mode

Figure 5 Dual ESA Mode Inter- switched Call



10.2.9.4 Inter- switching in Forced ESA Mode

Figure 6 Forced ESA Mode Inter- switched Call



10.2.10 Morocco Line cards

Morocco line cards NT6X93DA and NT6X94DA are supported for

- stand alone RCO2
- ILCM and LCME subtending from stand alone RCO2
- Dual RCO2
- ILCM and LCME subtending from Dual RCO2

Example of Table LNINV:
LEN CARDCODE PADGRP STATUS GND BNV MNO CARDINFO

REM1 07 0 00 01 **6X93DA** NPDGP HASU N NL N NIL

10.3 RCO2 ESA Office Parameters

RSC_ESA_NOTIFY_TONE: This parameter associates with the Distinctive Tone Burst for Emergency Operation feature. This parameter allows short bursts of tone preceeding standard dial tone to remote switching terminal. This tone indicates that emergency operation is in effect to users that have gone to off-hook.

This parameter is in table OFCENG and should be set to "**NO**" if no distinctive tone is required.

10.4 RCO2 ESA Translation Changes

When line translations are changed, the associated changes should be reflected to ESA callp in the RCO2. The impacted RCO2s should be posted at the "MAPCI;MTC;PM" level and "LOADPM PM CC ESADATA" command should be invoked to download the translation tuples into RCO2.

10.5 Hardware Requirements or Dependencies

Needs to be two RCO2 shelves and each of them have to be connected to different a PLGC.
Moroccan line cards NT6X93DA and NT6X94DA are supported in Extended Line Concentrating Module (LCME) as well.
Datafill example of a Dual RCO2 is given below.

Table RCCINV:

10.6 Software Requirements or Dependencies

Dual RCO2 feature works with WRI22 & ISN09 front-end software. If a feature bridging to ISN06 or ISN07 is requested, then WRI21AM should be used.

10.7 Limitations and restrictions

10.7.1 Limitations

This feature works only when a Dual RCO2 is equipped.

A host link channel is required for the setup of inter- switched calls.

One physical interlink channel is required for an inter-switched call.

10.7.2 Assumptions

Both RCO2s reside under the same Central Control (CC).

CC will attempt to interswitch only when interlinks are in service.

10.7.3 Exceptions

If there are no resources for interswitching the call, then the call is switched using host link channels.

10.7.4 Restrictions

The maximum number of DNs available for a Dual RCO2 is now limited to 12800. (2 RCO2s x 1 DN per line x 6400 lines/RCO2)

This feature is only designed to support interswitching of simple POTS calls. No translation types not supported by Feature BF0614, ESA Translations, are supported.

In addition, translations for calls terminating on trunks located on the spouse RCO2 are not supported. Neither are hunt group services, automatic lines terminating on the spouse RCO2, nor IBN extensions for terminations on the spouse RCO2.

The RCO2 interlinks cannot be displayed at the CARRIER level nor can they be displayed by the TRNSL command when an RCO2 is posted at the MAP.

The type of information displayed at the CARRIER level for peripheral-side links can be viewed for interlinks at the IRLINK level via the QUERYIR command. The QUERYIR display is not dynamically updated.

For IBN, BRI, Coin and EBS lines, only basic calls (no services supported) can be established.

When a hunt group is split across the two RCCs in a dual configuration the hunting for an idle member starts with the lines in the RCC where the

call is originated from. This alters the operation of DNH. If the dialed DN is located on the spouse RCC, seizure will first be attempted on lines on the originating RCC.

There can be a maximum of 400 hunt groups on two RCCs in dual configuration in ESA mode if at the most 200 mutually exclusive hunt groups are configured on each RCC. If hunt groups are split across the two RCCs the maximum number of hunt groups is reduced by the number of hunt groups split across RCCs.

The huntgroup members should be distrinuted on both spouses if the pilot DN is assigned in any of the spouse.

The maximun number of hunt group members is 4000 on each RCC.This number is reduced by the number of split hunt groups when configured in dual ESA.

10.8 Interactions

11: Functional Description (FN): A00009024

11.1 Feature name and Feature ID

A00009024 - ETSI BRI (Basic Rate Interface) on Succession - Phase I

11.2 Description

This feature implements the H.248 BRI on CS2K with a 3rd party gateway named Keymile. The design is based on the SN08 development which was a prep feature, A00007788.

This feature is also a prep activity and only point-to-point BRI is supported with limited set of BRI features (CLIP, CLIR, COLP, COLR, and DDI). This development is not suitable for deployment. It is not be productized nor have OAM&P support, but serve as an interim step towards full functionality to be completed in SN10.

The provisioning is performed from SESM. For BRI support on SESM, another activity (A00009521) is being developed.

Trial development is limited to PtoP. Specifically, only TEI=0 is supported. Keymile MG shall use TEI=0 only in IUA Message Headers.

H.248 is unaware of D-channels, i.e. no H.248 TerminationID for D-channels.

11.3 Hardware Requirements or Dependencies

N/A

11.4 Software Requirements or Dependencies

N/A

11.5 Limitations and restrictions

BRI point to point functionality is prepared for stable trial of basic call and service capability:

- No support for call survival in the following situations:
  - Core restart warm
  - Core warm swact
  - Core Mtc swact
  - GWC warm swact
  - Keymile GW fail-over
- There is no support for traffic
- No capacity testing
- Provisioning

- •Maximum 1024 BRI lines can be datafilled per GWC. This limitation is handled by SESM.
- •Each BRI gateway can have only 511 lines datafilled. For such gateway with >511 lines, multiple virtual LGRP should be employed. This limitation is handled by SESM.
- •Provisioning performed by PMDEBUG “gwcd regte”, or MIB browser (in case of no BRI-compatible SESM support) is get lost on unit initialization and all Core and GWC provisioning is required to be removed and re-performed.

•Max 250 loops are supported per GW, since each BRI loop is using 1 stream, and each GW is using 1 association, and we can have max 250 streams per association currently.
•Only following agent interworkings are supported:
- •BRI <--> Keymile POTS
- •BRI <--> PVG - ISUP

•Service Interworking
- •No services other than CLIP, CLIR, COLP, COLR, and DDI will be supported.
- •Other services supported by POTS and ISUP agent is not supported for BRI interworking

•No billing or metering support
•No NPI
•limited engineering rules
•limited solution documentation
•Limited OAM&P support (provisioning, SESM, et al)
•Full point to point BRI support is not provided
•BRI Point to MultiPoint support is not provided (DMS-100 Implementation of ETSI ISDN Basic Rate Interface at the S/T Reference Point).
•Specification Enhancements are not provided to include BRI multiple TEI support in: Layer 2, IUA/SCTP, H.248
•Layer 1 and 2 deactivation is not provided
•Full audit support is excluded.

11.6 Interactions

This feature is based on SN08 prep activity, A00007788

For the BRI support on SESM, another activity is being designed, A00009521

The trial functionality will be validated under A00009493.

11.7 Glossary

Term	Description

12: Functional Description (FN): A00009037

12.1 Feature name and Feature ID

A00009037 - CORE - Enhanced ESA for International MG9000

12.2 Description

This activity allows the download of information necessary to support International Emergency Stand Alone (ESA) call processing across all native (non ABI) and ABI lines served by a single MG9000 for intra and internodal ESA.

The download takes place from the CS2000 core to an MG9000 element manager. The data is generated by the core at 6:00 AM (configurable) and stored in a file called ESA_SYSTEM_SD$XML on a device specified by existing OFCENG parameter ESA_GWDATA_DEVICE. It is then downloaded by the MG9000 EM through the SDM.

This activity is CS2000 data collection activity of Intl ESA support on MG9k. So, this FN covers only data collection part on CS2k. This activity can be broken into three parts:

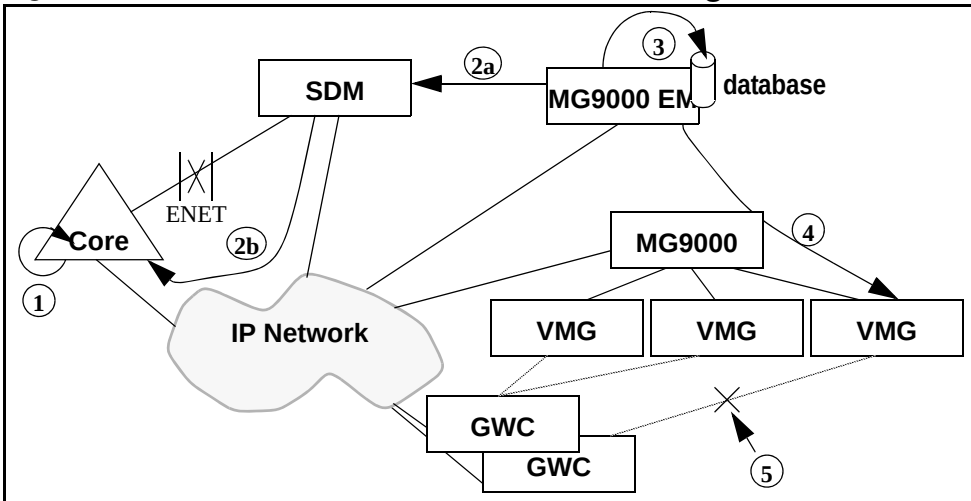
- Intl ESA Data Collection Trigger
- Intl ESA Data Format
- Intl ESA Table

12.2.1 Background Information

ESA functionality is already provided for North American dialing plan which supports 10 digit national and 7 digit subscriber numbers. However, in international markets, subscriber numbers are based on ITU-T E.164 recommendations.

Data transmission and entering ESA mode of MG9k will be same as Basic/NA ESA modes. Please see **A00002020** and **A00002380** activities FNs for more information about ESA data transmission and entering ESA mode.

Figure 1 MG9000 ESA Functional Behavior Diagram



1 Core generates ESA data file(s) at configurable time every day

2 MG9000 EM initiates ftp through SDM

3 MG9000 EM extracts data for each VMG and saves in Oracle database

4 MG9000 EM audits and updates VMG data using XML

5 VMG(s) enter ESA when communication with GWC is lost

12.2.2 Desired Behavior

In international markets, dialling plan may vary each market regardless of actual DN definition on CS2000 core. For example, DN may be defined as 10 digits (3 digits SNPA + 3 digits OFC code + 4 digits STN number) but dialling plan only use 9 digits.

To support international dialling plan, new Intl ESA table is introduced with this activity. This new table contains customer group information and the digit analysis data that applies to specified types of calls. If new table does not contain digit analysis data, default tuple is used in this new table.

New table entries are explained in following sections.

12.2.3 Project Details

This activity (A00009037- CORE - ENHANCED ESA FOR INTERNATIONAL MG9000) is one of three activities to enhance ESA for the MG9000 in the SN09 time frame. The activity addresses the core code and will be sourced into the SN09 stream.

The other features are

- “A00009021 - Enhanced ESA for International MG9000”
- “A00009282 - MG9KEM - INTERNATION ESA AND MLPP SUPPORT”

MG9000 ESA is supported by series of activities. Therefore, please also see Core portion of following activities:

- A00002020 - ESA Translation download
- A00002380 - MG9k ABI ESA

12.3 Intl ESA Data Collection Trigger

ESA data will be built by the core every 24 hours at 6:00 AM if existing office parameter in OFCENG table (ESA_GWDATAUPD_BOOL) is set or as the result of exiting manual CI command (ESACOLL under ESATOOLS directory). Changes to CS2000 line data will not be reflected in the MG9000 until the data has been

- built by the core
- downloaded by the MG9000 Element Manager (EM)
- downloaded to the MG9000

Data collection trigger time is also controlled by existing office parameter ESA_GWDATAUPD_HOUR in OFCENG table.

12.4 Intl ESA Data Format

This activity uses XML file format to store international data. XML file name would be ESA_SYSTEM_SD$XML and stored device name would be datafilled by using existing office parameter ESA_GWDATA_DEVICE. Default value for this office parameter is SFDEV. But, the maximum size of SFDEV is 5 million bytes so a disk device must be available for large offices.

Please refer to ESADATA document of activity A00002020 “ESA Translation download” to see collected ESA tables and ESA information from code and their XML formats.

But, please note that EXTN index in table IBNXLA is not collected if ESADGCOD table is not empty.

12.5 Intl ESA Table

This activity introduces new ESA table (ESADGCOD) for international markets to support international dialling plan on VMGs.

This new table contains customer group information and the digit analysis data that applies to specified types of calls. Following is an example tuple datafill for new table ESADGCOD.

Figure 2 Tuple examples for new table ESADGCOD

TABLE ESADGCOD

KEY			NUMDGTS	ADDIGS	STRIP
IBN_ESA_DEFAULT*	00	50	7	216	0
IBN_ESA_DEFAULT*	51	70	4	216783	1
IBN_ESA_DEFAULT*	71	99	10	$	0
CUST783	0000	0920	8	$	1
CUST783	10	19	8	442	2
CUST783	4	4	4	212442	0
CUST783	5	5	7	$	0
PTTPUB	00	08	8	$	1
PTTPUB	1	9	4	102216	0

* IBN_ESA_DEFAULT is used for customer groups which are not datafilled ESADGCOD table or it is used if related customer group does not have FROM-TOD digits range for dialled digits.

Table 1 Field explanations of new table ESADGCOD

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
KEY	NEW	DGNAME	alphanumeric (up to 16 chars)	Character entries can be entered up to 16 Chars. But, only “IBN_ESA_DEFAULT ” and customer group names (datafilled in CUSTENG table) can be accepted.
		FROMD	up to eight digits(0 to 9, B, or C)	From digits.
		TOD	up to eight digits(0 to 9, B, or C)	To Digits
NUMDGTS	NEW	N/A.	Number {0 to 15}	NUMDGTS:Number of digits to collect (including prefix digits).
ADDIGS	NEW	N/A.	up to fifteen digits (0 to 9, B or C)	ADDIGS: The digits stream which will be added to collected digits.
STRIP	NEW	N/A.	Number {0 to 15}	STRIP: Number of digits to be removed from collected digits.

Use of IBN_ESA_DEFAULT tuple may have following advantages:

- If switch has same dialling plan for all customer groups only IBN_ESA_DEFAULT tuple may be provisioned.
- If only a few customer groups have different dialling plan, only different dialling plans may have datafill in ESADGCOD table. The rest of the customer groups may still use IBN_ESA_DEFAULT datafill.

Figure 3 Tuple examples for table ESAPXLA

```
TABLE ESAPXLA
PXLAKEY RESULT
--------------
ESAXLA   LGRP   VMG 2 0    911   L LGRP 02 0 00 08 N 0
ESAXLA   LGRP   VMG 3 0    911   L LGRP 03 0 00 10 N 0
ESAXLA   LGRP   VMG 2 0    0911   L LGRP 02 0 00 15 N 0
```

Following table shows the dialling examples according to datafills in figure 2 (Table ESADGCOD) and figure 4 (Table ESAPXLA).

Table 2 Dialling examples and results using ESADGCODE table

Dialled Number	Used Tuple in ESADGCOD/ ESAPXLA	Result	Originating Line CUSTGRP
0550 - XXX	IBN_ESA_DEFAULT 00 - 50	216 - 0550 - XXX (Default tuple match)	CUST783
12 - XXXXXX	CUST783 10 - 19	442 - XXXXXX	CUST783
2 - XXXXXX	IBN_ESA_DEFAULT 00 - 50	216 - 2 - XXXXXX (Since CUST783 does not have FROMD - TOD for prefix 2. DEFAULT tuple is used.)	CUST783
3 - XXXXX	IBN_ESA_DEFAULT 00 - 50	Treatment (reorder). (since collected number of digits is not equal to NUMDGTS in DEFAULT tuple.)	CUST783
4 - XXX	CUST783 4 - 4	212442 - 4 - XXX	CUST783
5 - XXXXXX	CUST783 5 - 5	5 - XXXXXX	CUST783
911	ESAXLA 911	DN of LGRP 00 0 00 08 if originating DN is in VMG 2 DN of LGRP 01 0 00 10 if originating DN is in VMG 3	CUST783
0911	ESAXLA 0911	DN of LGRP 04 0 00 15 if originating DN is in VMG 2.	CUST783

12.5.1 Limitations and restrictions

- IBN_ESA_DEFAULT name should not be used in table CUSTENG. If it is used as customer group name, no default entry would be downloaded to MG9000.
- ESAPXLA table has priority over ESADGCOD table. So, if there is overlaps prefixes in tables ESAPXLA and ESADGCOD, ESAPXLA tuple is used.
- Maximum allowable tuple count in table ESADGCOD is 3000 (independent from customer group datafills)

12.6 Hardware Requirements or Dependencies

Since each VMG will include ESADGCOD data separately, XML file size may be greater that 5 million word (10 million bytes). Therefore a disk device must be available for large offices.

12.7 Software Requirements or Dependencies

All Software requirements and dependencies of activities A00002020 and A00002380 are also valid for this activity.

12.8 Limitations and restrictions

All Limitations and restrictions of activities A00002020 and A00002380 are also valid for this activity.

- EXTN table which stores EXTN information in table IBNXLA is not collected if ESADGCOD table is not EMPTY.
- ESADGCOD is supported for the lines which has Customer group information.

12.9 Interactions

The MG9000 EM downloads the ESA data file from the core daily. The time for this download should be set so the data has been freshly built. The default values in the core and MG9000 EM are set to ensure the data is downloaded soon after being built.

13: Functional Description (FN): A00009039

13.1 Feature name and Feature ID

A00009039 “International MG9000 Line Test Support”

13.2 Description

MG9000 Line Testing for International Markets is handled by two activities during ISN09 time frame:

a. A00009038 - MG9000 Line Test Support Framework

b. A00009039 - International MG9000 Line Test Support

A00009038 is responsible of providing messaging interface for the supported line test commands between LGRP and GWC.

And this feature, A00009039, provides support for MG9K Line Testing for International markets.

Line Testing and troubleshooting are done using Maintenance and Administration Position (MAP) user interface at the levels under LNS MAP level. The LNS MAP level contains the lines test position (LTP) menu commands, the automatic line testing (ALT) menu commands and the lines service trouble (LNSTRBL) commands. Messaging needed to perform these functions are handled by the AI messaging interface which is provided by activity A00009038.

Prior to this feature, only a few MAP commands, such as BSY, RTS, and FRLS, were supported for MG9K lines in International Markets.

As the primary component of this feature, support of No Test Trunk (NTT) is provided. And majority MAP commands under the LTP, ALT and LNSTRBL level for Succession MG9000 **POTS** and **EBS** lines are provided, ShowerQ support and Subscriber Premise Test support are also provided for these types of Succession lines.

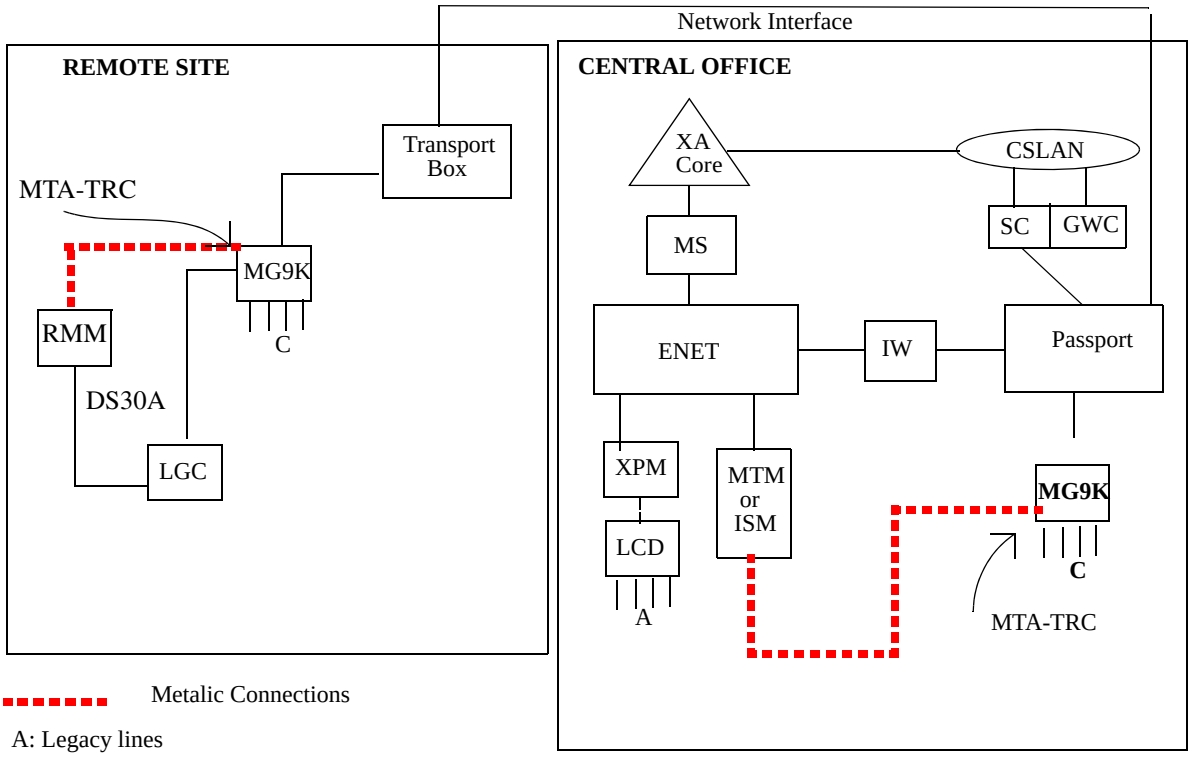
Note: Please note that Line Tests are supported already for CNA market and A00009039 will use this model as a reference.

13.2.1 Overview of Line Maintenance Commands

The following figure is a physical representation of the line types supported in this activity. With this activity, line test support is provided for only native MG9000 lines, with GWLPOTS and GWLEBS card codes. **This activity supports MAP-based line testing. MAP-based line testing uses the legacy**

DMS MTM/ISM hardware or RMM hardware for remote sites and software along with the MG 9000 Line Test System to perform MG 9000 line testing from the Maintenance and Administration Position (MAP) terminal. As shown in the Figure 1, MG9K native lines in the central office are tested by using MTM/ISM hardware. MG9K native lines in the remote side are tested by using RMM hardware.

Figure 1 Line Test Configuration for MG9000 native lines.



A: Legacy lines
C: Native MG9K lines, which include POTS, GND, , EBS types of terminals.
B
****: This solution can be used when MG9K in remote site does not have ABI interface.Normally, RMM is used with LGC connected to the MG9K with ABI interface in Remote site.**

Also, DMS legacy lines located in Peripheral Module (PLGC) can be connected to the MG9K over ABI interface. These lines are known as ABI lines. The Figure illustrates MAP-based line test configuration for ABI lines in detail.

ABI lines are tested using MTM/ISM hardware in the Central office.ABI lines in the remote site are tested using RMM hardware. The testing of ABI lines are already supported. ABI line test support is a test-only issue for this activity. To test ABI lines, Core sends the MAP based line test request to the Gateway Control (GWC). GWC encapsulates this test request into H.248 package and sends the gateway of MG9K. MG9K receives the MAP based line test request from H.248 package and then send it to the LGC. After testing, test results are sent to Core with same route.

Figure 2 Line Test Configuration for MG9K ABI lines

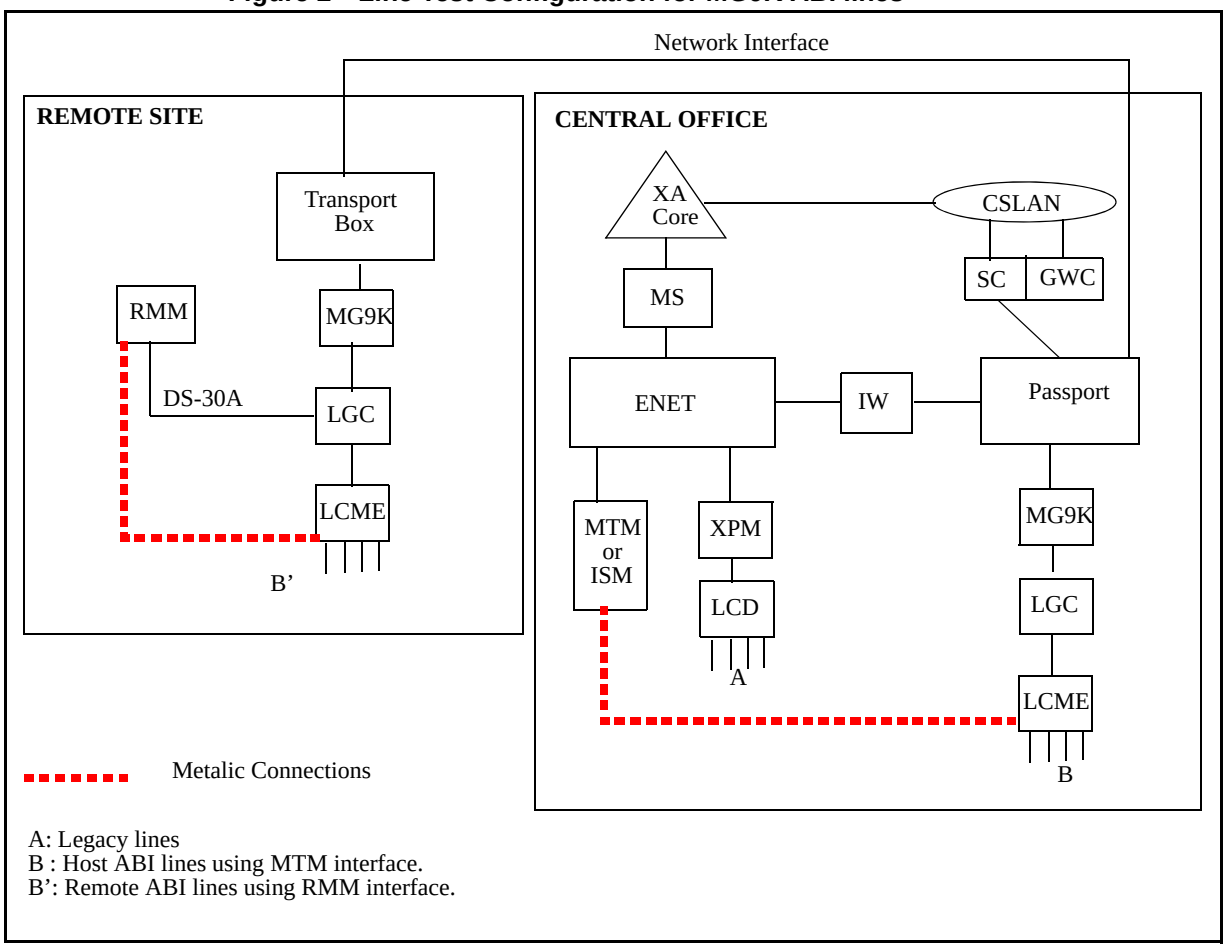


Figure 3 contains a list of the line maintenance commands shown at their respective levels. Most commands are supported for native MG9000 lines. These unsupported commands are indicated by a strike through. Check the legend for additional clarification.

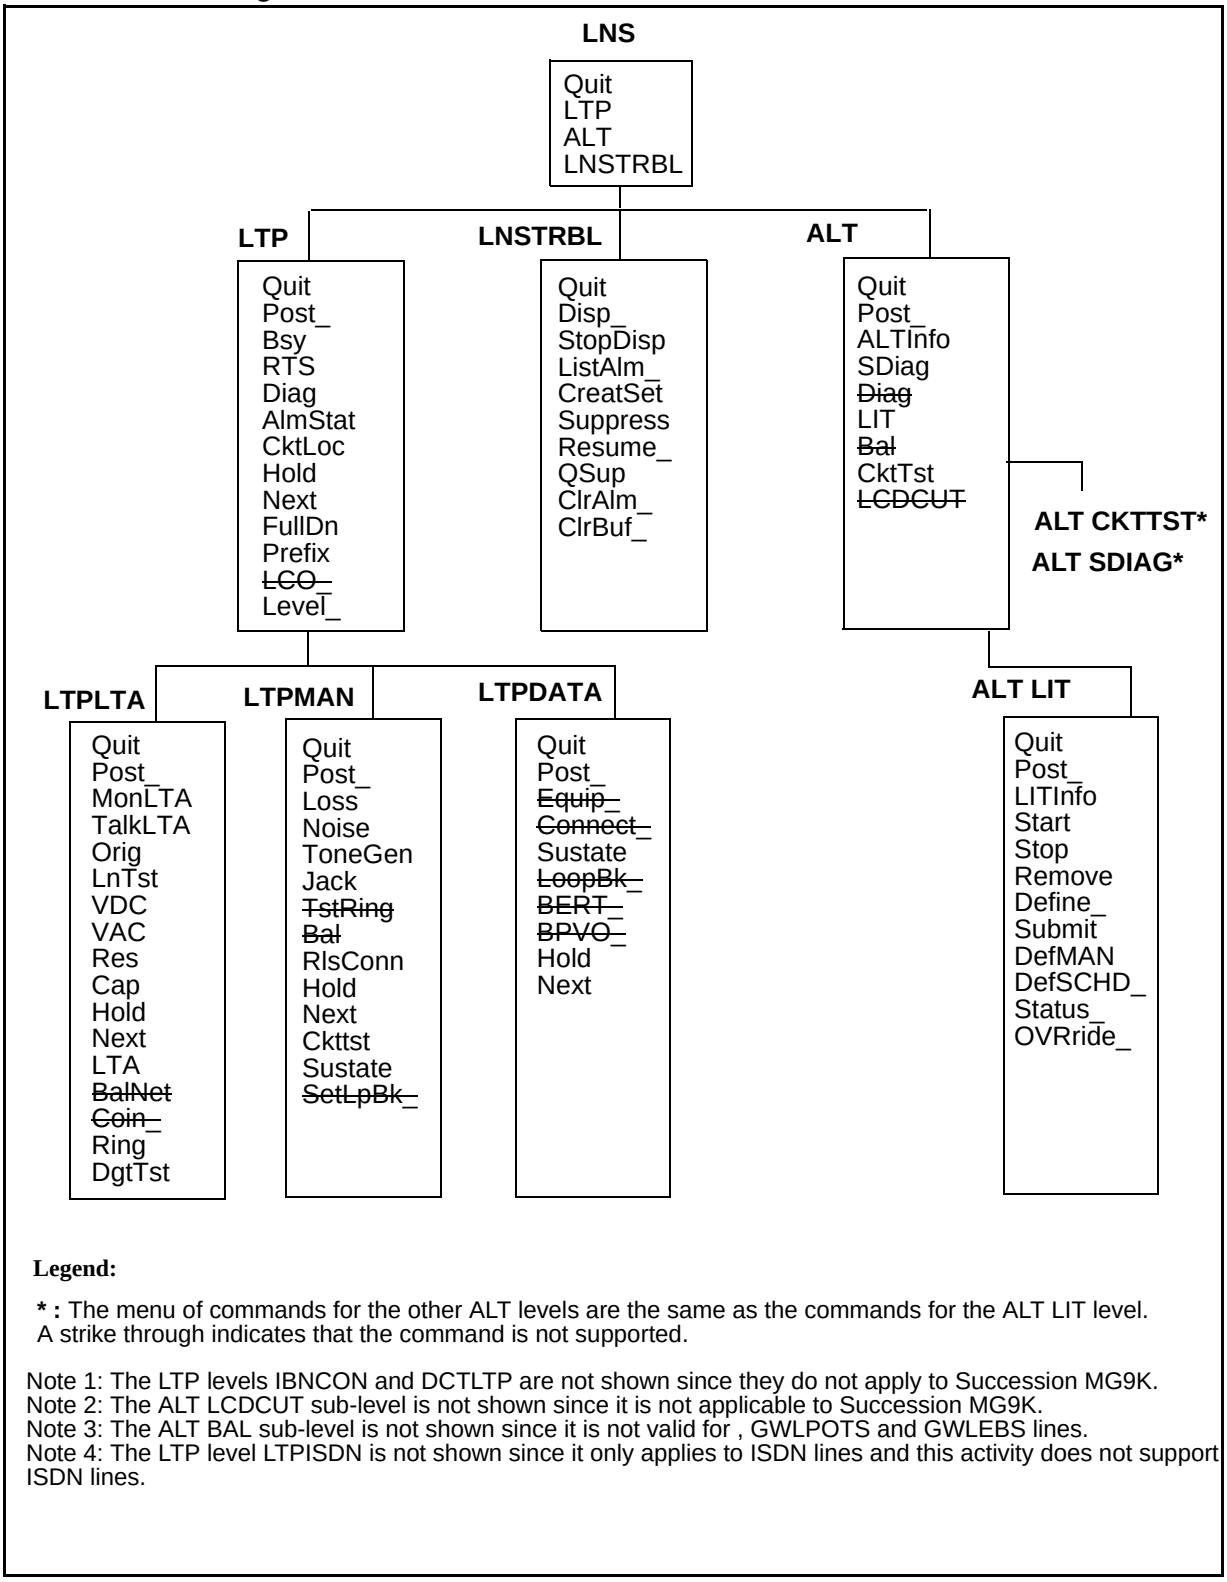
Figure 3 Line Maintenance Commands



Legend:

*** :** The menu of commands for the other ALT levels are the same as the commands for the ALT LIT level.
A strike through indicates that the command is not supported.

Note 1: The LTP levels IBNCON and DCTLTP are not shown since they do not apply to Succession MG9K.
Note 2: The ALT LCDCUT sub-level is not shown since it is not applicable to Succession MG9K.
Note 3: The ALT BAL sub-level is not shown since it is not valid for , GWLPOTS and GWLEBS lines.
Note 4: The LTP level LTPISDN is not shown since it only applies to ISDN lines and this activity does not support ISDN lines.

The following sections highlight the basic functionality provided by this activity. For more information, please refer to the DMS-100 Family Lines Maintenance Guide.

13.2.2 LTP Menu Commands

Following are the valid commands at the LTP level for native MG9000 lines:

- **Quit**: The QUIT command is used to leave the current level and return to a higher level.
- **Post**: Posts a line or set of lines to the LTP.
- **Bsy**: The BSY command changes the state of the line in the control position, or optionally all lines that are posted, to a specific state.
- **RTS**: The RTS command changes the state of the line in the control position, or optionally the complete set of posted lines, from MB to IDL.
- **Diag**: The DIAG command performs an extended diagnostic on a line in the control position that is in the MB or IDL state, and displays the results on the LTP screen.
- **AlmStat**: The ALMSTAT command triggers the alarm system of the LNS subsystem and displays the status of alarms in the full switch by type of alarm, when used without parameters. The command is used with parameters to display all or selected alarms at specified units in the host or remote sites, or to change the thresholds of the alarm classes in the full switch.
- **CktLoc**: The CKTLOC command locates and identifies the circuit card used for the line circuit in the control position, and displays circuit characteristics.
- **Hold**: The HOLD command moves the line in the control position to a spare hold position, and the next line from the posted set, if any, to the control position.
- **Next**: The NEXT command moves the line in a specified HOLD position to the control position, or replaces the line in the control position with the line in a specified hold position; and exchanges, saves, or drops the replaced line from LTP control.
- **FullDn**: The FULLDN command displays the full National Number.
- **Prefix**: The PREFIX command clears the LTP of prefix digits. Optionally it sets or changes prefix digits.
- **Level_**: The Level command gives the user access to the sublevels LTPLTA, LTPMAN, LTPDATA, IBNCON, and DCTLTP at the MAP.

13.2.2.1 LTPLTA Menu Commands

Following are the valid commands at the LTPLTA sub-level for native MG9000 lines:

- **Quit**: The QUIT command is used at the LTPLTA sublevel in the same way as it is described at the LTP level.
- **Post_**: The POST command is used in the LTPLTA sublevel in the same way as it is described at the LTP level.
- **MonLTA**: The MONLTA command connects a headset circuit to the MG9000 line in the control position for listening purposes.
- **TalkLTA**: The TALKLTA command connects a talk circuit to a subscriber on a MG9000 line, and optionally connects a talk battery so that the tester can converse with the subscriber when the CO relay is operated.
- **Orig**: The ORIG command configures the loop side of a line circuit in either the off-hook mode or the on-hook mode, or alternates between modes.

  Note: LnTst: The LNTST command performs resistance, capacitance, and voltage tests on a MG9000 line.

  Alarm: The line failure flag is not affected by this error condition.

  User Action: Measure the AC DC TIP and AC DC RING voltages using the VDC command.
- **VDC**: The VDC command performs a dc voltage measurement on a subscriber loop.
- **VAC**: The VAC command performs an ac voltage measurement on a subscriber loop.
- **RES**: The RES command performs resistance measurements on a subscriber loop.
- **CAP**: The CAP command performs a capacitance measurement on a subscriber loop.
- **Hold**: The HOLD command is used at the LTPLTA sublevel in the same way that it is described at the LTP level.
- **Next**: The NEXT command is used at the LTPLTA sublevel in the same way that it is described at the LTP level.
- **LTA**: The LTA command connects the LTA to a line card, or releases the LTA from a line card.
- **Ring**: The RING command places ringing voltage on the loop of a MG9000 line.
- **DgtTst**: The DGTTST command tests the DIGITONE pad or dial on the subscriber station.

13.2.2.2 LTPMAN Menu Commands

Following are the valid commands at the LTPMAN sub-level for native MG9000 lines:

- **Quit**: The QUIT command is used at the LTPMAN sublevel in the same way as described in the LTP level.
- **Post_**: The POST command is used at the LTPMAN sublevel in the same way as described in the LTP level.
- **Loss**: The LOSS command measures the insertion loss of a test tone sent from the subscriber end of a loop to its line circuit.
- **Noise**: The NOISE command measures the C-message weighted circuit noise on a subscriber loop.
- **ToneGen**: The TONEGEN command transmits a tone on a subscriber loop.
- **Jack**: The JACK command connects a jack-ended trunk to a subscriber line, or a jack to a subscriber loop while bypassing the line card.
- **TstRing**: The TSTRING command tests the ringing relay in the line card for proper functioning. Since this functionality is performed during the Diag command, a message referring the craftsperson to run the Diag command is displayed.
- **RlsConn**: The RLSCONN command releases test equipment that is connected to a line.
- **Hold**: The HOLD command is used at the LTPMAN sublevel in the same way that it is described at the LTP level.
- **Next**: The NEXT command is used at the LTPMAN sublevel in the same way that it is described at the LTP level.
- **Ckttst**: The CKTTST command sends test messages to test the posted line.
- **Sustate**: The SUSTATE command determines the status of the MBS that is connected to the Business Set line in the control position.

13.2.2.3 LTPDATA Menu Commands

Following are the valid commands at the LTPDATA sub-level for native MG9000 lines:

- **Quit_**: The QUIT command is used at the LTPDATA sublevel in the same way as it is described in the LTP level.
- **Post_**: The POST command is used at the LTPDATA sublevel in the same way as it is described in the LTP level.
- **Sustate**: The SUSTATE command reports on the loop status of the subscriber data line.

- **Hold**: The HOLD command is used at the LTPDATA level in the same way as it is described in the LTP level.
- **Next**: The NEXT command is used at the LTPDATA sublevel in the same way as it is described in the LTP level.

13.2.3 LNSTRBL Menu Commands

Following are the valid commands at the LNSTRBL level for native MG9000 lines:

- **Quit**: The QUIT command is used at the LNSTRBL level in the same way as it is described in the LTP level.
- **Disp_**: The DISP command displays call processing trouble entries in the upper buffer that is allocated to a LCD.
- **StopDisp**: The STOPDISP command discontinues the periodic updating of the call processing trouble displays that were initiated by the command DISP.
- **ListAlm_**: The LISTALM command displays a list of LCD that have call processing fault alarms, and the class of alarm that exists in each LCD.
- **CreatSet**: The CREATSET command posts a set of call processing trouble upper buffer entries.
- **Suppress**: The SUPPRESS command causes specified trouble types to be ignored by the buffering process and by alarm generation
- **Resume_**: The RESUME command discontinues the suppression of specified types of call processing troubles.
- **QSup**: The QSUP command lists the code number and description of the types of troubles which are currently suppressed.
- **ClrAlm_**: The CLRALM command clears the call processing alarms in a specified LCD and resets attempt and failure counters to zero.
- **ClrBuf_**: The CLRBUF command deletes part or all of the contents of the upper buffer that is allocated to a specified LCD.

13.2.4 ALT Menu Commands

Following are the valid commands at the ALT level for native MG9000 lines:

- **Quit**: The QUIT command causes the system to leave the current level and return to a higher level of the MAP.
- **Post_**: The POST command posts the scheduled ALT TESTID that is stored in memory (in Table ALTSCHED)
- **ALTInfo**: The ALTINFO command checks test data stored in memory (Table ALTSCHED)

- **SDiag**: The SDIAG command accesses the SDIAG sublevel of ALT. If a TESTID is not entered as a parameter, a new TESTID must be defined with the DEFSCHD or DEFMAN command.
- **LIT**: The LIT command accesses the LIT sublevel of ALT. If a TESTID is not entered as a parameter, a new TESTID must be defined with the DEFSCHD or DEFMAN command.
- **CktTst**: The CKTTST command accesses the CKTTST sublevel of ALT. If a TESTID is not entered as a parameter, a new TESTID must be defined with the DEFSCHD or DEFMAN command.

The following ALT commands are not supported for native MG9000 lines:

- **DIAG**
- **BAL**
- **LCDCUT**

MG9000 linecard types of GWLPOTS and GWLEBS are only supported by ALT.

13.2.4.1 ALT Sublevel Commands

Following are the valid commands at the ALT sub-levels for native MG9000 lines:

- **Quit**: The QUIT command causes the system to leave the current level and return to a higher level of the MAP.
- **Post_**: The POST command posts the scheduled ALT TESTID that is stored in memory and corresponds to the current sublevel.
- **LITInfo**: The LITINFO command displays the system default values for the LIT parameters. Note: This command only applies to the ALTLIT menu level.
- **Start**: The START command sets the posted scheduled ALT test in a state such that it is ready to run at the next scheduled time.
- **Stop**: The STOP command stops a test and changes the status of the TESTID.
- **Remove**: The REMOVE command removes the data associated with the posted TESTID from memory (table ALTSCHED). If the TESTID is for a scheduled test, the system prompts for a YES or NO confirmation.
- **Define_**: The DEFINE command defines test data for the specified TESTID.
- **Submit**: The SUBMIT command submits the defined test data for the posted TESTID into memory (table ALTSCHED).

- **DefMAN**: The DEFMAN command is used to assign a TESTID to the test that corresponds to the current ALT sublevel. For example, the DEFMAN command entered at the LIT level of MAP device number 7, will be assigned a TESTID of MANUAL07.
- **DefSCHD_**: The DEFSCHD command is used to assign a TESTID to the scheduled test that corresponds to the current ALT sublevel.
- **Status_**: The STATUS command checks the status of the posted TESTID.
- **OVRride_**: The OVERRIDE command overrides a scheduled test so that testing will not start until a specified day and time has passed.

13.2.5 ShowerQ

Failure of some conditions, such as line card not in place, test register not functioning, and message signaling not successful, causes the MG9000 line to be registered in the shower queue (a CS2000 originated diagnostic schedule) and released for a second call attempt. If any of the tests fail a second time, the MG9000 line is subjected to diagnostic tests for fault identification. Shower queue results are reported to the log system.

MG9000 linecard types of GWLPOTS and GWLEBS are supported by the ShowerQ.

For more information on the shower queue process, please refer to the DMS-100 Family Lines Maintenance Guide.

13.2.6 Subscriber Premise Tests

The silent switchman test (SSMAN), station ringer test, and the dialable short circuit test are usually conducted on subscriber premises by installation or repair personnel.

The **SSMAN test** checks the subscriber loop for facility faults. The test circuit is accessed by dialing a service code or a seven digit number. After a confirmation tone is returned, the MG9000 line is disconnected from office battery and ground for a defined interval as datafilled in table OFCENG as SILENT_SWITCHMAN_TIMEOUT, allowing facility faults to be checked.

The **station ringer test** is used to verify that a subscriber's station set is functioning correctly. The station ringer test is initiated by dialing a customer defined access code. When the station ringer test is initiated, it allows the user to verify the following set functions:

POTS

- DP or DTMF Digits
- Flash Key or Flash Hook
- RLS Key or Onhook

- Talk Key or Offhook
- Set Ringer

PPhone

- Meridian Set Function Keys
- Meridian Set Lamps
- Meridian Set Display

The result for circuit test are shown by LED displays 1, 2 and 8 turning on. The number of messages is not displayed also. The test can be exited during circuit test by pressing the “Hold” key.

The **dialable short circuit test** involves placing a short circuit to the loop of the MG9000 line when a code is dialed to access the short circuit. The short circuit persists on the line under test for a period of time as established by the operating company via OFCENG office parameter CABLE_SHORT_TIMEOUT, or for the default period of 3 min. When the short circuit ends its established duration, the subscriber’s line is returned to regular service.

For more information on the sequence of tasks for these type of tests, please refer to the NTP 297-1001-594, DMS-100 Family Lines Maintenance Guide. This document contains additional details on the subscriber premise tests and translations required to support these tests.

13.2.6.1 Note on Digit Maps

In H.248, gateways can use digit maps when collecting digits. When the collected digits match an applied digit map, the gateway will report the collected digits to the call server. The subscriber premise tests are typically provisioned with a three digit access code in translations.

When the user dials a three digit access code to initiate a subscriber premise test, it may not match the standard digits maps used with MG9000 lines. The MG9000 has a 10 second timeout and will report collected digits to the CS2000 even if the dialed digits do not match an applied digit map.

When a craftsperson is initiating the subscriber premise tests on MG9000 lines, this may cause a 10 second delay between the dialing of the access code and the application of the confirmation tone to indicate that the test is starting. For KSET lines, there is no delay between the dialing of the access code and the application of the confirmation tone since KSET lines do not use digit maps.

13.2.7 Line Diagnostics

The CS2000 line diagnostics are intended to verify that a line is capable of providing service. The CS2000 line diagnostics are integrated with the embedded MG9000 circuit diagnostics. When an MG9000 circuit is diagnosed from the CS2000, the embedded MG9000 line diagnostics are executed and additional network tests are performed to ensure that the circuit is providing service. The following shows the tests the CS2000 line diagnostics will perform for MG9000 lines, and compares the MG9000 line diagnostics to the diagnostics supported for HOST lines.

Table 17: CS2000 Line Diagnostics

Test	CS2000 lines (TDM)	MG9K Lines
Provisioning Data	Note 1	x
Missing Card Test	x	Note 2
Trans Hybrid Loss	x	x
Attenuation Pad	x	x
Weighted and Notch Noise	x	x
Flux Cancellation / Echo Return	x	Note 3
Offhook Detection	x	x
Onhook Detection	x	x
Ringing	x	x
Ground Start	x	x
PPhone Provisioning Audit	x	x
Battery Feed	x	Note 4
Talk Battery	X	Note 4
Cutoff Relay	x	Note 4
Test Access Relay	x	Note 4
Facility Check	x	Note 4

X - denotes tests that are supported

1. H.248 gateways have provisioning that must match the provisioning in the CS2000 to provide service. HOST lines do not have remote provisioning data and the provisioning data test is not required.

2. The MG9000 does not support a missing card tests. MG9000 lines can affect the CS2000 line state. If the linecard is missing or disabled, the CS2000 line state will be set to SB to indicate that the line is in a trouble condition.

3. The MG9000 has echo cancellers for all line types; therefore, a echo return test is not performed at this time.
4. MG9000 line diagnostics do not include facility and linecard relay tests.

13.3 Configuration Requirements

13.3.1 Hardware Requirements

13.3.1.1 CS2000 Hardware

The following hardware is required to provide the CS2000 line test support:

13.3.1.1.1 Trunk Modules

The CS2000 supports an array of test heads and supporting hardware. These circuit packs are contained in trunk modules. Examples of the supported trunk modules are the TM8, ISM, MTM and RMM.

If test hardware is RMM, the following items should be provided:

- A DS30A card has been inserted into the host peripheral (LTC, LGC,RLCM or RC02) in the appropriate slot
- The host XPM and the RMM are connected via a DS30A cable
- The software for this activity is installed in the XACore
- The required LGC load (if the RMM is connected to an LGC) is installed in the XPM.

13.3.1.1.2 Test Circuits

The following CS2000 test heads and supporting hardware are required to support MG9000 line testing:

- NT4X45AA EDTU (or NT1x90/NT2x96 TTT, NT2x47/NT2x56 TTU, NT4x23 DTU)
- NT4X97AA/4X98BA/BB MTU
- NT2X90AD MONTALK Circuit
- NT5X30AA 101 Communication Test Line (HSET)
- NT1X54AA Jack Ended Trunk (JACK)
- NT2X90AD INC/OC Test Trunk (Analog Test Trunk Interface)
- NTFX44: ILTA (Improved Loop Test Accessory) is provisionable in ISM shelf and is designed to be used with some external test units.

The CS2000 also requires the following supporting equipment for MLT test trunks:

- NT2X57 SD Card

Additional details on the circuit packs listed above are provided in TAM-1001-018 DMS-100 Family Quick Reference Guide. This is available through Helmsman.

13.3.1.1.3 MTA Matrix

The CS2000 supports two types of test heads: transmission test heads and metallic test heads. The transmission test heads connect to the line under test through the bearer network. The metallic test heads connect to the line under test through a metallic test access matrix.

The metallic test access matrix is a matrix with the metallic test heads connected to the horizontal leads on the matrix and the line concentrating devices connected to the vertical leads on the matrix. This matrix allows any test head to be cross connected to any line, thus allowing the test heads to be shared across all line access devices.

The CS2000 supports the following cards for implementing the MTA matrix:

- NT3X09BA 8x8 Matrix Card

The trunk modules also contain the MTA matrix cards.

13.3.1.1.4 Horizontal Connectivity

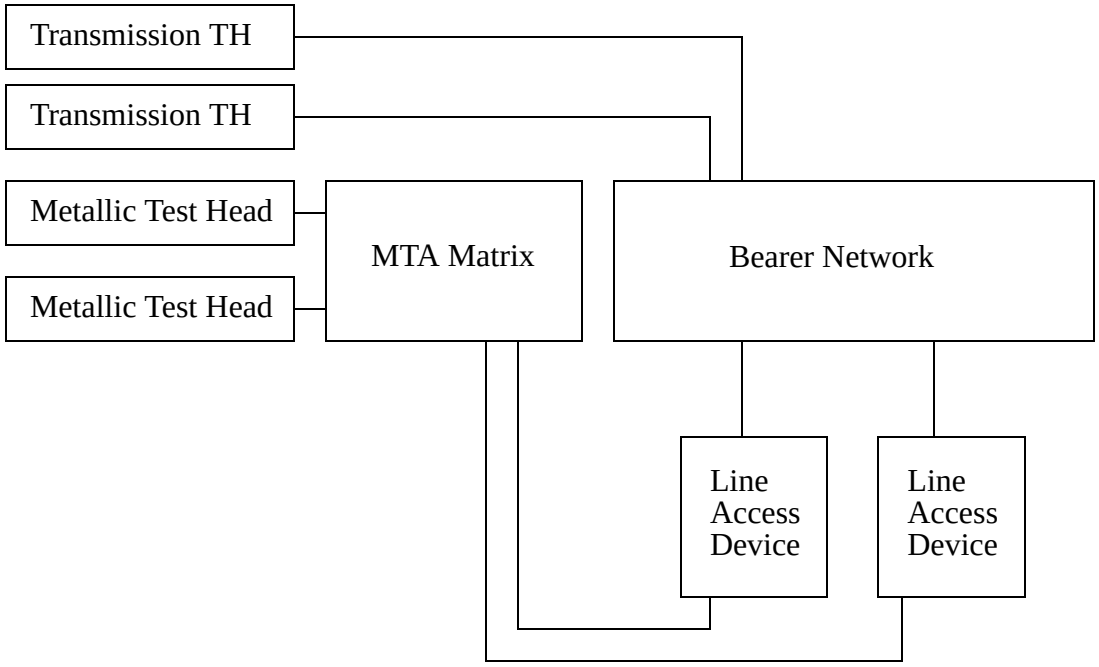
As noted above, the metallic test heads must be wired to the horizontal leads on the MTA matrix.

13.3.1.1.5 Vertical Connectivity

As notes above, the test access ports on the line concentrating devices must be wired to the vertical leads on the MTA matrix.

13.3.1.1.6 Test Configuration Diagram

The following diagrams illustrate the hardware configuration required to support CS2000 based line testing for MG9000 lines.



The above diagram is a logical view of the test equipment.

- The transmission test heads have access to the bearer network. These test heads are connected to the line access devices through the bearer network.
- The metallic test heads are connected to the horizontal leads on the MTA matrix. The line access devices are connected to the vertical leads on the MTA matrix. In this configuration, any metallic test head can be cross connected to any line on any line access device.

The following figure gives a more detailed view of the physical implementation.

13.3.1.2 MG9000 Hardware

The MG9000 requires the following hardware to support the MG9K line test content provided by activities A00009038 and A00009039:

- MTA-TRC pack per node per frame
- SIC card per shelf.

13.3.2 Software Requirements

There are 5 types of equipment/connectivity datafilled required to support the CS2000 line test functionality provided by activity A00009039.

- First the trunk modules that contain the CS2000 test equipment are provisioned.
- Second, the CS2000 test heads and supporting hardware are provisioned.
- Third, the MTA (Metallic Test Access) matrix for the CS2000 is provisioned.
- Fourth, the metallic test head connectivity to the horizontals on the MTA matrix are provisioned.
- Fifth, the line concentrating device connectivity to the verticals on the MTA matrix are provisioned.

Note that additional datafill is required for individual line test applications. For example, the subscriber premise tests are supported for MG9000 lines (DSCKT, SSMAN, Station Ringer). The subscriber premise tests require translations in the CS2000 to function correctly.

This document does not provide details on the provisioning and translations required for the individual line test applications. The provisioning and translations for individual line test applications are already documented in NTP 297-1001-594 DMS-100 Family Line Maintenance Guide, and the existing provisioning and translations methods apply to LGRP lines on the CS2000.

13.3.2.1 Trunk Module Provisioning

The trunk modules are provisioned in table TMINV and RMMINV. The CS2000 uses the same trunk module provisioning as the DMS-100. NTP 297-1001-594 DMS-100 Family Line Maintenance Guide provide details on trunk module provisioning for the CS2000.

13.3.2.2 Test Head and Supporting Hardware Provisioning

The test heads and supporting hardware are provisioned in tables TRKGRP and TRKMEM. The CS2000 uses the same test head provisioning as the DMS-100. NTP 297-1001-594 DMS-100 Family Line Maintenance Guide provides details on test head provisioning for the CS2000.

13.3.2.3 MTA Matrix Provisioning

The MTA matrix is provisioned in table MTAMDRVE. The CS2000 uses the same MTA matrix provisioning as the DMS-100. NTP 297-1001-594 DMS-100 Family Line Maintenance Guide provides details on MTA matrix provisioning for the CS2000.

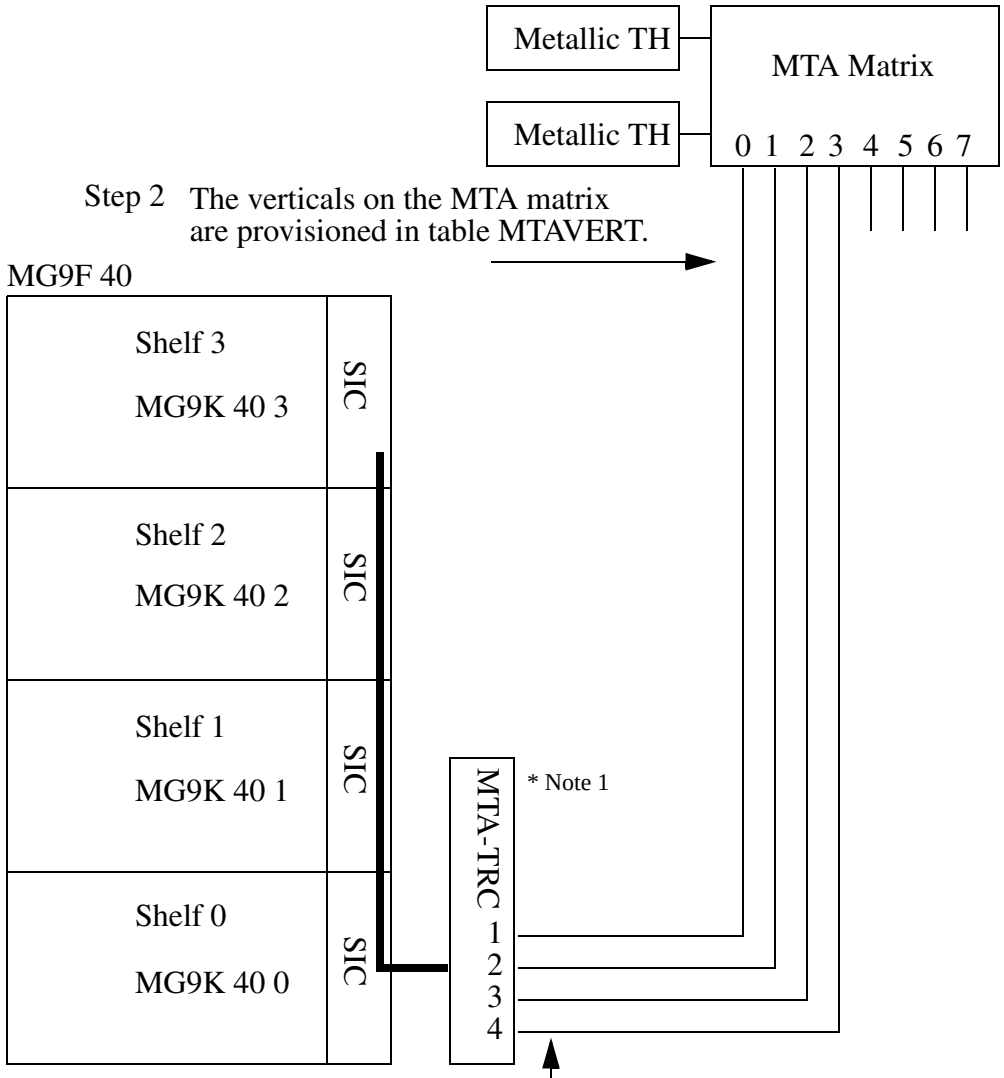
13.3.2.4 Horizontal Connectivity Provisioning

The horizontal connectivity is provisioned in table MTAHORIZ. The CS2000 uses the same horizontal connectivity provisioning as the DMS-100. NTP 297-1001-594 DMS-100 Family Line Maintenance Guide provides details on the horizontal connectivity provisioning for the CS2000.

13.3.2.5 Vertical Connectivity Provisioning

Vertical connectivity provisioning for LGRPs differs from the vertical connectivity provisioning for existing DMS-100 peripherals. Additional details on LGRP vertical connectivity are provided below.

Table LGRPINV and MTAVERT are used to provision the metallic connections from MG9000 shelves to verticals on the MTA matrix. The following figure shows examples of provisioning these tables for MG9000 to MTA matrix connectivity.



*Note 1: In single-shelf MG9Ks, the MTA-TRC card will be located in Slot 9. For multi-self and multi frame MG9Ks, it will be located in a subtended shelf. In frames with master shelves MTA-TRC card will be located in Slot 2 of first subtended shelf. In adjacent frames without master shelves, the MTA-TRC card will be located in slot 2 of shelf 0.

Step1 The metallic test access points on the MG9000 are provisioned in table LGRPINV with a designation of the attached vertical on the MTA matrix.

Table LGRPINV

```
MG9K 40 0  GWC 0  S  MTSTAPT  MG9K  (0  1) $
MG9K 40 1  GWC 0  S  MTSTAPT  MG9K  (1  2) $
MG9K 40 2  GWC 0  S  MTSTAPT  MG9K  (2  3) $
MG9K 40 3  GWC 0  S  MTSTAPT  MG9K  (3  4) $
```

Table MTAVERT

```
0  G  (O  MG9K  40  0) $
1  G  (O  MG9K  40  1) $
2  G  (O  MG9K  40  2) $
3  G  (O  MG9K  40  3) $
```

Vertical Metallic Test Access Point

Provisioning Rules for MG9000 Verticals

1. The metallic test access connections for the MG9000s are provisioned in table LGRPINV first, and then in table MTAVERT.
2. Table LGRPINV allows up to 8 metallic test access points (with verticals) to be provisioned per LGRP. This is for future flexibility to increase the number of simultaneous tests per MG9000. **At this time, the user should only provision a single metallic test access point per LGRP in table LGRPINV (each LGRP being a single MG9000 shelf**).
3. LGRPs are assigned to verticals in table MTAVERT. Before an LGRP is assigned to a vertical in table MTAVERT, the tuple for the LGRP in table LGRPINV must have a metallic test access point associated to the vertical.

As noted in the rules, only a one metallic test access point and vertical should be assigned to an LGRP. A single physical MG9000 can support up to 16 shelves; however, a single physical MG9000 can only support 8 metallic test access points. When an MG9000 grows beyond 8 shelves, verticals must be shared across multiple shelves. The provisioning recommendations are as follows:

a. For MG9000 nodes that have 8 or less shelves, each shelf on the MG9000 should be assigned to a unique metallic test access point and vertical.

b. As an MG9000 grows beyond 8 shelves, the metallic test access points and verticals used on shelves 0-7 should be reused on shelves 8-15 in sequential fashion.

Example 1: All 8 metallic test access points assigned to verticals.
The following shows example provisioning for table LGRPINV and MTAVERT for a 16 shelf MG9000. In the example given, the MG9000 node is in the MG9K site and it occupies frame 40 41 42 and 43. This example shows all 8 metallic test access points wired to verticals on the MTA matrix.

TABLE: LGRPINV

```

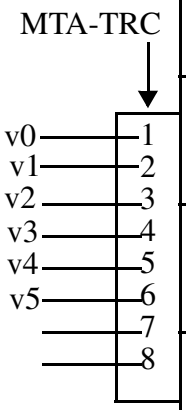
5  G  ( O MG9K 41 1 ) (O MG9K 42 3) $
```

In this example, a single vertical can be shared by up to 1536 lines.



MG9K 40 3	MG9K 41 3	MG9K 42 3	MG9K 43 3
MG9K 40 2	MG9K 41 2	MG9K 42 2	MG9K 43 2
MG9K 40 1	MG9K 41 1	MG9K 42 1	MG9K 43 1
MG9K 40 0	MG9K 41 0	MG9K 42 0	MG9K 43 0

13.3.2.6 Provisioning Example

13.3.2.6.1 Trunk Module Provisioning

First, the trunk modules must be provisioned. This includes shelves such as the TM8, MTMs and RMMs. In the example given, RMMs are not shown. However, RMMs can be used in the remote sites for MG9000 line testing. The sample datafill given shows a single MTM and TM8 shelf for this CS2000.

Note: all tables are shown in packeted format.

TABLE: TMINV

13.3.2.6.2 Test Head and Supporting Hardware Provisioning

The test heads and supporting hardware are provisioned next. These circuits are provisioned through tables TRKGRP and TRKMEM. The following test heads and interface circuits are required to support MG9000 line testing:

- NT4X45AA EDTU (or NT1x90/NT2x96 TTT, NT2x47/NT2x56 TTU, NT4x23 DTU)

- NT4X97/NT4X98 MTU
- NT2X90AD MONTALK Circuit
- NT5X30AA 101 Communication Test Line (HSET)
- NT1X54AA Jack Ended Trunk (JACK)
- NT2X90AD INC/OC Test Trunk (Analog Test Trunk Interface)

13.3.2.6.3 MTA Matrix Provisioning

After the test heads and supporting circuits are provisioned, the MTA (Metallic Test Access) matrix is provisioned for the CS2000. The MTA matrix is provisioned through table MTAMDRVE. This example shows an MTA matrix with a single MTA matrix card. The CS2000 supports an MTA matrix that is significantly larger. The MTA matrix for a CS2000 is created by linking together multiple MTA cards in both the vertical and horizontal directions.

TABLE: MTAMDRVE

```
MTAMEM VERT HORIZ TMTYPE TMNO TMCKTNO MTACARD
-----------------------------------------
0 0 0 MTM 0 6 3X09BA
```

13.3.2.6.4 Horizontal Connectivity Provisioning

After provisioning the MTA matrix for the office, the test heads are assigned to horizontals on the MTA matrix. The example shows a pair of MTU (Metallic Test Units) connected to the first two horizontals on the MTA matrix along with a single analog test trunk for supporting external test systems such as: Access Care, 4TEL and Loop Care.

TABLE: MTAHORIZ

```
HORIZ HORIZGRP HORIZAGT MTAGRP
------------------------------
0 0 L MTU 0 Y (0 0) $
1 0 L MTU 1 N (0 1) $
3 0 T LTDESK 0 (0 3) $
```

13.3.2.6.5 Vertical Connectivity Provisioning

After provisioning the test head connectivity to the horizontals on the MTA matrix, the line concentrating devices are assigned to verticals on the MTA matrix. For LGRPs, verticals are assigned to specific MG9000 metallic test access points and shelves through tables LGRPINV and MTAVERT.

The following example shows two separate LGRPs. For MG9K 77 1, the entry in LGRPINV associates vertical 0 with metallic test access point 1 on the gateway. For MG9K 40 2, the entry in LGRPINV associates vertical 1 with metallic test access point 1 on the gateway.

13.4 Line States

This section provides information on the MG9000 lines states. This includes the interfaces for checking the line states and what they represent.

13.4.1 CS2000 Line States

The following is a list of CS2000 line states and their meaning. This is the complete list of CS2000 line states. Not all states are currently used for MG9000 lines. The states that are not used for MG9000 lines are in italic.

- CPB (Call processing busy)
  - — The line is in use by a subscriber (call processing is taking place).
- CPD (Call processing deload)
  - — The line is in use by a subscriber, and a maintenance request to place the line in the deloaded (DEL) state is pending. The state changes momentarily to DEL when call processing ends, and then to state MB.
- *CUT (Cutoff)*
  - — *The cutoff relay in the line circuit is operated, disconnecting the subscriber loop from the line circuit.*
  - — *Not used for MG9000 lines.*
- DEL (Deloaded)
  - — The line is removed from availability for call processing by a maintenance order, in preparation for testing activity. This is a temporary state after the state CPD and before the state MB.
- *DMB (Applicable to ISDN lines. See Integrated Services Digital Network)*
  - — *Basic Rate Interface Maintenance Guide, 297-2401-501.*
  - — *Not used for MG9000 lines.*
- *HAZ (Hazard)*
  - — *A line hazard condition (foreign line voltage, leakage resistance) has been detected; the line's cutoff relay is operated.*
  - — *Not used for MG9000 lines.*
- IDL (Idle)
  - — The line is in service and available to process calls.
- INB (Installation busy)
  - — The line is not available for call processing for one or more of the following reasons:
    - – some required data has not been assigned
    - – a data change has been made

– a LTP operator has entered an instruction

During this state tests can be conducted.

- LMB (Line module busy)
  - — Call processing cannot take place because the LGRP that represent the MG9000 shelf for the posted line is out of service.
- LO (Lock-out)
  - — The line has been removed from service by the CS2000, preventing call processing. Manual action is required to change the state.
- MB (Maintenance busy)
  - — The line has been removed from service by maintenance personnel or by the CS2000. Call processing cannot take place.
- NEQ (Not equipped)
  - — The LEN has not been datafilled. Call processing cannot take place.
- PLO (PSPD lock-out)
  - — This is a particular variety of the state LO. The line has been removed from service by the CS2000 because of a PSPD condition. Call processing cannot take place until the condition no longer exists and the CS2000 restores the line state to IDL.
- SB
  - — The line has been removed from service by the CS2000. There are a range of error conditions that can cause an MG9000 line to be set to the SB state in the CS2000. If the CS2000 can set the line to the SB state if it detects an error condition for the line. The CS2000 can also set the line to the SB state if it receive an indication from the GWC that the line is not capable of providing service. This could represent a data error in the GWC or MG9000, or it could represent a fault condition for the line at the MG9000 such as an overcurrent protection condition. For lines in the SB state, the craftsperson should check the state of the circuit at the MG9000 EM.
- *SZ*
  - — *Future line state*
  - — *Not used for MG9000 lines.*

13.4.2 MG9000 Line States

The state of the MG9000 circuits are checked at the MG9000 EM. The MG9000 EM shows the status of the physical line circuit and it shows the status of the H.248 line termination.

13.4.2.1 Line Circuit

The state of the physical line circuit is checked by opening the line card at the MG9000 EM and then opening the port on the line card. The following state information is shown for the MG9000 physical line circuit.

- Administrative Status
  - The administrative status shows the requested user state. The values can be locked and unlocked.
    - Locked indicates that the circuit has been manually taken out of service.
    - Unlocked indicates that the circuit has not been manually taken out of service.
- Operational Status
  - The operational status shows the current service state. The values can be enabled, disabled.
    - Enabled indicates that the circuit is in the working state.
    - Disabled indicates that the circuit is not in the working state.
- Fault State
  - This state indicates that the line maintenance subsystem on the MG9000 has determined that the selected circuit is in a fault condition and is not providing service. The CS2000 state will be set to SB.
- Protection State
  - This state indicates that excess voltage/current was detected for the selected circuit. MG9000 line maintenance has placed the circuit in the protect state. Lines in this state will not provide subscriber service. When MG9000 lines are in the protection state, the CS2000 line state is set to SB.
- Babble State
  - This state indicates that the line maintenance subsystem on the MG9000 has determined that the selected circuit is a babbler. The circuit is generating excessive circuit state indications. Line maintenance will disable babbling circuits to protect the MG9000. Lines in this state will not provide subscriber service. When line maintenance takes the circuit to the disabled state, the CS2000 line state will be set to SB.
- Cut Off Relay
  - This state indicates that the cut off relay has been operated for the selected circuit. The user will not have service when the cutoff relay is operated to disconnect the loop for the circuit.

13.4.2.2 H.248 Line Termination

The state of the H.248 line termination is shown at the Switched Lines Services Manager on the MG9000 EM. The H.248 line termination represent the logical call processing service for the subscriber circuit. The state of the H.248 line termination is tied to the CS2000 line state.

If the service is turned down on the CS2000, the CS2000 will set the H.248 line to the disabled state. When service is restored for a line at the CS2000, the CS2000 will set the H.248 line termination to the enabled state.

The H.248 line termination state is also dependent on the physical line circuit. If the physical line circuit is in the disabled state (not able to provide service), the gateway will move the H.248 line termination to disabled state. This will in turn set the CS2000 line state to the SB state.

The Switched Lines Services Manager shows the following state information for the H.248 line terminations:

- Operational Status
  - The operational status shows the current service state of the H.248 line termination. The values can be enabled, disabled and test.
    - Enabled indicates that the H.248 line termination is in the working state and providing service.
    - Disabled indicates that the H.248 line termination is not in the working state and is not providing service.
    - Test indicates that the line is currently under test.
- Termination Test Status
  - For terminations that are under test, the termination test status provides additional information. The value can be Not Testing, Testing via Call Server, Testing via EM.
    - Not Testing indicates that the line is not currently under test.
    - Testing via Call Server indicates that the line is currently under test from the Call Server.
    - Testing via EM indicates that the line is currently under test from the MG9000 Element Manger.

13.5 Line Options Support

The following line options affect the CS2000 line test subsystem are supported for MG9000 lines:

- No Double Connect (NDC)

  The No Double Connect (NDC) option prevents a line from being connected to a verification or test circuit when the line is off-hook.

- No Hazard Test (NHT)

  The No Hazard Test (NHT) option does not allow the user to test the line for a line hazard condition. Line hazard conditions are low resistance or high voltage on the subscriber loop.

- No Line Insulation Test (NLT)

  The No Line Insulation Test (NLT) option allows the automatic line insulation test to skip a line.

13.6 Diagnostic Users Guide

13.6.1 Diagnostic Results

The line diagnostic results are delivered through a combination of the following:

- Printing results at the MAP
- Generating the appropriate logs
- Setting or clearing alarm flags for the line

13.6.1.1 Line Log

The MG9000 line diagnostic uses the following existing logs:

The LINE100 log indicates a line diagnostic has passed.

```
RTP206BH ***+LINE100 MAR21 08:06:49 3600 PASS LN_DIAG
        MG9K 05 0 02 21    DN 6195200000
        DIAGNOSTIC RESULT   Card Diagnostic OK
        ACTION REQUIRED  None
        CARD TYPE  GWLPOTS
```

The LINE101 indicates that a line diagnostic has failed.

```
RTP206BH ***+LINE101 MAR05 14:55:55 6900 FAIL  LN_DIAG
    MG9K 05 0 02 21              DN   6195200000
    DIAGNOSTIC RESULT   Test failed:  Single-party ringing
    ACTION REQUIRED    Replace card
    CARD TYPE   GWLPOTS
```

13.6.1.2 Alarm Flags

Various errors and actions in the CS2000 can mark failure flags against an MG9000 line. These failure flags provide information to the craftsperson on lines that are in trouble and need corrective action. The alarm flags supported for MG9000 lines are listed below.

- D - Long diagnostic has failed
- S - Short diagnostic has failed

- N - Needs long diagnostic
- Q - Line is in the ShowerQ
- L - Line has failed loop signaling at the linecard
- l - Line has failed loop signalling at the terminal

13.6.2 Line State Supported for the Line Diagnostics

13.6.2.1 For LTP Diags

The LTP diagnostic is supported on MG9000 lines in the following state:

- INB
- DMB
- MB
- LO
- IDL
- HAZ

13.6.2.2 ALT SDIAG

ALT SDIAG will test lines in the following states:

- INB
- MB
- IDL

13.6.2.3 ShowerQ

The ShowerQ tests lines in the following states:

- INB
- MB
- SB
- IDL
- LO
- DMB
- CUT
- PLO
- HAZ

13.6.3 Diagnostic Results

This section shows the most common diagnostic result indications and the actions the user should take for each result.

13.6.3.1 Diagnostic Passed

Display / Log

RTP206BH ***+LINE100 MAR21 08:06:49 3600 PASS LN_DIAG
MG9K 05 0 02 21 DN 6195200000
DIAGNOSTIC RESULT Card Diagnostic OK
ACTION REQUIRED None
CARD TYPE GWLPOTS

Description

- The line tested is functioning correctly.

Alarm

- When a circuit diagnostic passes for a given line, all diagnostic failure flags for the line will be cleared.

Users Action

- No user action is required.

13.6.3.2 CS2000 Software Errors

Display / Log

RTP206BH ***+LINE101 MAR05 14:55:55 6900 FAIL LN_DIAG
MG9K 05 0 02 21 DN 6195200000
DIAGNOSTIC RESULT Call server software error
ACTION REQUIRED Check Logs
CARD TYPE GWLEBS

Description

- A CS2000 software error has occurred.

Alarm

- The line failure flag is not affected.

Users Action

- Capture the CS2000 SWERR log and try the test again.

13.6.3.3 GWC Processing Errors

Display / Log

```
RTP206BH ***+LINE101 MAR05 14:55:55 6900 FAIL  LN_DIAG
    MG9K 05 0 02 21              DN   6195200000
    DIAGNOSTIC RESULT   GWC processing error
    ACTION REQUIRED   Chk GWC logs
    CARD TYPE   GWLPOTS
```

Description

- A gateway controller software error has occurred.

Alarm

- The line failure flag is not affected.

Users Action

- Capture the GWC logs and try the test again.

13.6.3.4 GWC Provisioning Faults Detected

13.6.3.4.1 Missing Node Data

Display / Log

```
RTP206BH ***+LINE101 MAR05 14:55:55 6900 FAIL  LN_DIAG
    MG9K 05 0 02 21              DN   6195200000
    DIAGNOSTIC RESULT   Node data missing in GWC
    ACTION REQUIRED   Chk GWC data
    CARD TYPE   GWLPOTS
```

Description

- In H.248, a node is represented by a termination called the root termination. The Gateway Controllers can support many MG9000 shelves. Each MG9000 shelf is provisioned in the GWC and represented as a root termination. This logical node is also referred to as the VMG (Virtual Media Gateway) in the MG9000 documentation. This diagnostic result indicates that there is a provisioning problem in the GWC. The GWC is missing the node provisioning data for the MG9000 shelf. This will prevent the entire MG9000 shelf from providing service.

Alarm

- The line failure flag for the line is set to D to indicate that the linecard diagnostic has failed. Lines marked with the D failure flag have been identified by the CS2000 as lines that are not capable of providing service and required user maintenance.
- The following command line will print a report containing all the lines served by the CS2000 with a D failure flag:

  mapci nodisp;mtc;lns;ltp;post df d print

- The following command line will print a report containing all the lines served by the CS2000 with any failure flag set:

  mapci nodisp;mtc;lns;ltp;post df print

Users Action

- Check the node provisioning data for the GWC.

13.6.3.4.2 Missing Line Data

Display / Log

```
RTP206BH ***+LINE101 MAR05 14:55:55 6900 FAIL  LN_DIAG
    MG9K 05 0 02 21              DN   6195200000
    DIAGNOSTIC RESULT   Line data missing in GWC
    ACTION REQUIRED   Chk GWC data
    CARD TYPE   GWLPOTS
```

Description

- The line termination for the line under test does not exist in the GWC. In H.248, each line is represented by a line termination. For MG9000 lines to provide service, the line termination must be provisioned in the GWC and it must be provisioned at the MG9000. This diagnostic failure indicates that the provisioning data for the line under test is missing in the GWC. The line will not provide service with this error condition.

Alarm

- The line failure flag for the line is set to D to indicate that the linecard diagnostic has failed. Lines marked with the D failure flag have been identified by the CS2000 as lines that are not capable of providing service and required user maintenance.
- The following command line will print a report containing all the lines served by the CS2000 with a D failure flag:

  mapci nodisp;mtc;lns;ltp;post df d print

- The following command line will print a report containing all the lines served by the CS2000 with any failure flag set:

  mapci nodisp;mtc;lns;ltp;post df print

Users Action

- Check the line provisioning data in the GWC.

13.6.3.5 Node State Faults Detected in the GWC

Display / Log

RTP206BH ***+LINE101 MAR05 14:55:55 6900 FAIL LN_DIAG
MG9K 05 0 02 21 DN 6195200000
DIAGNOSTIC RESULT Gateway is out of service in GWC
ACTION REQUIRED Chk GW state
CARD TYPE GWLPOTS

Description.

- A Gateway Controller can support many MG9000 shelves. Each MG9000 shelf is represented as a unique node in the Gateway Controller. This node is referred to as the root termination in H.248, and it also referred to at the VMG in the MG9000 documentation. The fault indicates that the node that represents the MG9000 shelf state is Out of Service in the Gateway Controller. When this occurs, the lines should be transitioned to the LMB state in the CS2000. If the line is not in the LMB state, this indicates that a node state mismatch exists between the C2000 and the Gateway Controller.

Alarm

- The line failure flag is not affected by this error condition.

Users Action

- The user should check the line state in the CS2000. If the line state is not LMB and this diagnostic error persists, the user should attempt to correct the MG9000 shelf state mismatch between the CS2000 and the Gateway Controller.

13.6.3.6 Line Termination is Out of Service in the GWC

Display / Log

RTP206BH ***+LINE101 MAR05 14:55:55 6900 FAIL LN_DIAG
MG9K 05 0 02 21 DN 6195200000
DIAGNOSTIC RESULT Line out of service in GWC
ACTION REQUIRED Chk ln state
CARD TYPE GWLPOTS

Description

- The H.248 line termination for the line under test is in an out of service state in the GWC.

Alarm

- The line failure flag is not affected by this error condition.

Users Action

- The user should check the state of the line circuit at the MG9000 element manager to ensure that the line circuit is in the enabled state.

- If the line circuit is in the enabled stated at the MG9000 EM, the user should BSY and RTS the line to attempt to bring the line termination back to a working state. After the BSY and RTS, repeat the diagnostic. If the problem persists, contact the next level of support.

13.6.3.7 Gateway Controller to Gateway Messaging Error

Display / Log

```
RTP206BH ***+LINE101 MAR05 14:55:55 6900 FAIL  LN_DIAG
    MG9K 05 0 02 21              DN   6195200000
    DIAGNOSTIC RESULT   No response from gateway
    ACTION REQUIRED   Try again
    CARD TYPE   GWLPOTS
```

Description

- This indicates that the Gateway Controller timed out waiting on a response from a test request sent to the gateway.

Alarm

- The line failure flag is not affected by this error condition.

Users Action

- The users should try the diagnostic again. If this problem persists, it indicates a messaging problem between the Gateway Controller and the Gateway that could affect call processing.

13.6.3.8 Gateway Processing Error

Display / Log

```
RTP206BH ***+LINE101 MAR05 14:55:55 6900 FAIL  LN_DIAG
    MG9K 05 0 02 21              DN   6195200000
    DIAGNOSTIC RESULT   Gateway processing error
    ACTION REQUIRED   Chk GW logs
    CARD TYPE   GWLPOTS
```

Description

- This indicates that the gateway failed to process a line test request.

Alarm

- The line failure flag is not affected by this error condition.

Users Action

- The users should check the MG9000 logs for SWERRs and try the test again. If this problem persists, contact the next level of support.

13.6.3.9 Gateway Test Resources Unavailable

Display / Log

```
RTP206BH ***+LINE101 MAR05 14:55:55 6900 FAIL  LN_DIAG
    MG9K 05 0 02 21              DN   6195200000
    DIAGNOSTIC RESULT   Test resources unavailable at gateway
    ACTION REQUIRED   Chk Gateway
    CARD TYPE   GWLPOTS
```

Description

- This indicates that the MG9000 line test resources are out of service.

Alarm

- The line failure flag is not affected by this error condition.

Users Action

- The user should check the state of the line test hardware at the gateway. For the MG9000, the users should check the state of the MTA-TRC pack and the SIC cards. Those cards provide the line test functions within the MG9000.

13.6.3.10 Gateway Test Resource Busy

Display / Log

```
RTP206BH ***+LINE101 MAR05 14:55:55 6900 FAIL  LN_DIAG
    MG9K 05 0 02 21              DN   6195200000
    DIAGNOSTIC RESULT   Test resources busy at gateway
    ACTION REQUIRED   Try Again
    CARD TYPE   GWLPOTS
```

Description

- This indicates that the MG9000 line test resources are currently in use.

Alarm

- The line failure flag is not affected by this error condition.

Users Action

- This does not indicate any type of equipment fault. The line test resources in the gateway are all currently in use. The user should attempt the test again.

13.6.3.11 Line Provisioning Mismatch in the Gateway

Display / Log

RTP206BH ***+LINE101 MAR05 14:55:55 6900 FAIL LN_DIAG
MG9K 05 0 02 21 DN 6195200000
DIAGNOSTIC RESULT Line data mismatch in gateway
ACTION REQUIRED Chk GW data
CARD TYPE GWLPOTS

Description

- The H.248 line terminations in the MG9000 can be provisioned as POTS, coin and PPhone services. This error indicates that the diagnostic detected a mismatch between the line termination provisioning data in the MG9000 and the provisioning data in table LNINV.

Alarm

- The line failure flag for the line is set to D to indicate that the linecard diagnostic has failed. Lines marked with the D failure flag have been identified by the CS2000 as lines that are not capable of providing service and required user maintenance.
- The following command line will print a report containing all the lines served by the CS2000 with a D failure flag:

  mapci nodisp;mtc;lns;ltp;post df d print
- The following command line will print a report containing all the lines served by the CS2000 with any failure flag set:

  mapci nodisp;mtc;lns;ltp;post df print

Users Action

- The users should correct the line data mismatch at the MG9000.

13.6.3.12 Line Provisioning Missing in the Gateway

Display / Log

RTP206BH ***+LINE101 MAR05 14:55:55 6900 FAIL LN_DIAG

    DIAGNOSTIC RESULT   Test failed:  On-hook
    ACTION REQUIRED    Replace card
    CARD TYPE   GWLPOTS
```

Description

- Indicates that the linecard does not detect and report subscriber onhook condition correctly.

Alarm

- The line failure flag for the line is set to D to indicate that the linecard diagnostic has failed. Lines marked with the D failure flag have been identified by the CS2000 as lines that are not capable of providing service and required user maintenance.
- The following command line will print a report containing all the lines served by the CS2000 with a D failure flag:

  mapci nodisp;mtc;lns;ltp;post df d print
- The following command line will print a report containing all the lines served by the CS2000 with any failure flag set:

  mapci nodisp;mtc;lns;ltp;post df print

Users Action

- The line circuit should be replaced or the subscriber should be moved to another circuit.

13.6.3.13.3 Single Party Ringing Failure

Display / Log

```
RTP206BH ***+LINE101 MAR05 14:55:55 6900 FAIL  LN_DIAG
    MG9K 05 0 02 21              DN   6195200000
    DIAGNOSTIC RESULT   Test failed:  Single-party ringing
    ACTION REQUIRED    Replace card
    CARD TYPE   GWLPOTS
```

Description

- Indicates that the linecard does generate the correct ringing voltage and frequency.

Alarm

- The line failure flag for the line is set D to indicated that the linecard diagnostic has failed. Lines marked with the D failure flag have been identified by the CS2000 as lines that are not capable of providing service and required user maintenance.
- The following command line will print a report containing all the lines served by the CS2000 with a D failure flag:

  mapci nodisp;mtc;lns;ltp;post df d print
- The following command line will print a report containing all the lines served by the CS2000 with any failure flag set:

  mapci nodisp;mtc;lns;ltp;post df print

Users Action

- The line circuit should be replaced or the subscriber should be moved to another circuit.

13.6.3.13.4 Transhybrid Loss Failure

Display / Log

```
RTPU07BC ***+LINE101 OCT26 09:40:48 6900 FAIL LN_DIAG
    MG9K 05 0 02 21    DN 2145201001
    DIAGNOSTIC RESULT  -11.6-10.7  0.6  1.4 THL Test
    ACTION REQUIRED  Replace Card
    CARD TYPE  GWLPOTS
```

Description

- The transhybrid loss test passes a series of tones through a linecard in both directions to verify that the linecard will encode and decode speech correctly for voice frequencies. This test also verifies the hybrid circuit in the linecard is not defective. The transhybrid loss tests uses the following frequencies: 304, 704, 1504 and 4305 Hz. The above display/log indicates that the transhybrid loss test has failed. The measured transhybrid loss at each test frequency is displayed in the diagnostic failure log.
- The transhybrid loss test will fail if too much loss or gain is detected when the tones are passed through the line under test. Different linecard have different transmission characteristics. The following shows the ranges that are considered a test pass for the MG9000 linecards.

POTS-32 and 8x8 DSL

	304 Hz	704 Hz	1504 Hz	3204 Hz
Minimum (Loaded)	Not Supported	Not Supported	Not Supported	Not Supported
Maximum (Loaded)	Not Supported	Not Supported	Not Supported	Not Supported
Minimum (Non-Loaded)	-5.0 dB	-4.5 dB	-4.5 dB	-5.0 dB
Maximum (Non-Loaded)	1.0 dB	1.5 dB	1.5 dB	1.0 dB

SAA-12

	304 Hz	704 Hz	1504 Hz	3204 Hz
Minimum (Loaded)	Not Supported	Not Supported	Not Supported	Not Supported
Maximum (Loaded)	Not Supported	Not Supported	Not Supported	Not Supported
Minimum (Non-Loaded)	-8.0 dB	-7.5 dB	-7.0 dB	-7.5 dB
Maximum (Non-Loaded)	-2.0 dB	-1.5 dB	-1.0 dB	-1.5 dB

- The example log shows a linecard that does not pass low frequency tones correctly.

Alarm

- The line failure flag for the line is set to D to indicate that the linecard diagnostic has failed. Lines marked with the D failure flag have been identified by the CS2000 as lines that are not capable of providing service and required user maintenance.
- The following command line will print a report containing all the lines served by the CS2000 with a D failure flag:

  mapci nodisp;mtc;lns;ltp;post df d print
- The following command line will print a report containing all the lines served by the CS2000 with any failure flag set:

  mapci nodisp;mtc;lns;ltp;post df print

User Action

- If the diagnostic failure shows excess loss or gain in the linecard, the linecard should be replaced or the subscriber should be moved to another circuit.

User Notes

- The MG9000 does not supported loaded lines. If a MG9000 line is provisioned as a loaded line in table LNINV, the transhybrid loss test will fail. If this occurs, the user should correct the provisioning error in table LNINV.

13.6.3.13.5 Continuity Failure

Display / Log

```
RTP206BH ***+LINE101 MAR05 14:55:55 6900 FAIL  LN_DIAG
    MG9K 05 0 02 21              DN   6195200000
    DIAGNOSTIC RESULT   Bearer continuity not detected
    ACTION REQUIRED   Try Again
    CARD TYPE   GWLPOTS
```

Description

- When the transhybrid loss test indicate -88.8 for all frequencies, then it may not be the linecard. It is more likely a bearer path problem.

Alarm

- The line failure flag is not affected by this error condition.

Users Action

- The user should attempt the test again. If multiple lines show the same behavior, the user should troubleshoot the bearer network connection faults.

13.6.3.13.6 Weighted or Notched Noise Failure

Display / Log

```
RTPU07BC ***+LINE101 OCT26 09:50:13 6200 FAIL LN_DIAG
      MG9K 00 0 00 14    DN 2145201001
      DIAGNOSTIC RESULT  Noise Level 44.1DB Notch Noise
      ACTION REQUIRED  Replace Card
      CARD TYPE  GWLPOTS

RTPU07BC ***+LINE101 OCT26 09:53:55 7100 FAIL LN_DIAG
      MG9K 00 0 00 14    DN 2145201001
      DIAGNOSTIC RESULT  Noise Level  36.5DB Weight Noise
```

ACTION REQUIRED Replace Card
CARD TYPE GWLPOTS

Description

- The weighted or notched noise tests have failed for the linecard. The noise limits for the MG9000 linecards are as follows:

  Notched Noise must be less than 42.0 dB

  Weighted Noise must be less than 30.0 dB

Alarm

- The line failure flag for the line is set to D to indicate that the linecard diagnostic has failed. Lines marked with the D failure flag have been identified by the CS2000 as lines that are not capable of providing service and required user maintenance.
- The following command line will print a report containing all the lines served by the CS2000 with a D failure flag:

  mapci nodisp;mtc;lns;ltp;post df d print
- The following command line will print a report containing all the lines served by the CS2000 with any failure flag set:

  mapci nodisp;mtc;lns;ltp;post df print

User Action

- The linecard should be replaced or the subscriber should be moved to another circuit.

13.6.3.13.7 Linecard Pads Failure

Display / Log

RTPU07BC ***+LINE101 OCT26 09:44:19 2700 FAIL LN_DIAG
MG9K 00 0 00 14 DN 2145201001
DIAGNOSTIC RESULT -.7 -2.2 -.4 -.4 Pad 1DB Test
ACTION REQUIRED Replace Card
CARD TYPE GWLPOTS

Description

- Indicates that linecard pad test failed. The CS2000 supports per call gain control, referred to as padding. This linecard pad test will verify that the CS2000 can adjust the pads in an MG9000 linecard. The linecard pad test measures the gain applied by a linecard when a 1, 3, 5, and 7 dB pad are applied to the line under test. The linecard pad test verifies that the correct gain in applied at 304, 704, 1504 and 4305 Hz.

- The example log given shows a diagnostic that failed the 1dB pad test. The diagnostic will allow a 1 dB variance from the requested gain. In the example given, the 704 Hz frequency had a loss of -2.2 dB when a -1.0 dB pad was requested.

Alarm

- The line failure flag for the line is set to D to indicate that the linecard diagnostic has failed. Lines marked with the D failure flag have been identified by the CS2000 as lines that are not capable of providing service and required user maintenance.
- The following command line will print a report containing all the lines served by the CS2000 with a D failure flag:

  mapci nodisp;mtc;lns;ltp;post df d print
- The following command line will print a report containing all the lines served by the CS2000 with any failure flag set:

  mapci nodisp;mtc;lns;ltp;post df print

User Action

- The linecard should be replaced or the subscriber should be moved to another circuit.

13.6.3.13.8 Linecard Messaging Failure

Display / Log

```
RTPU07BC ***+LINE101 OCT26 09:44:19 2700 FAIL LN_DIAG
     MG9K 00 0 00 14    DN 2145201001
     DIAGNOSTIC RESULT  No Signalling to Card 5/10
     ACTION REQUIRED  Replace Card
     CARD TYPE  GWLEBS
```

Description

- PPhones, also referred to as EBS (Electronic Business Sets) lines, use out of band signaling. This signalling is called OPCODE signalling. The linecard diagnostic for an MG9000 PPhone line will verify the OPCODE signaling to the linecard and to the PPhone set itself. The given diagnostic error log indicates that the OPCODE signaling test to the linecard has failed.
- The diagnostic failure log also contains the number of OPCODE message sent to the of message received back from the linecard.

Alarm

- The line failure flag for the line is set to L to indicate that the linecard diagnostic has failed the OPCODE signaling test to the linecard itself.

Lines marked with the L failure flag have been identified by the CS2000 as lines that are not capable of providing service and required user maintenance.

- The following command line will print a report containing all the lines served by the CS2000 with a L failure flag:

  mapci nodisp;mtc;lns;ltp;post df lcard print

- The following command line will print a report containing all the lines served by the CS2000 with any failure flag set:

  mapci nodisp;mtc;lns;ltp;post df print

User Action

- The user can use the CKTTST command to perform additional manual OPCODE signaling tests on the suspect line.
- The linecard should be replaced or the subscriber should be moved to another circuit.

13.6.3.13.9 Mainset Messaging Failure

Display / Log

```
RTPU07BC ***+LINE101 OCT26 09:44:19 2700 FAIL LN_DIAG
    MG9K 00 0 00 14    DN 2145201001
    DIAGNOSTIC RESULT  No Signalling to Set 5/10
    ACTION REQUIRED  Chk Card&Set
    CARD TYPE  GWLEBS
```

Description

- PPhones, also referred to as EBS (Electronic Business Sets) lines, use out of band signaling instead of analog signaling. This signalling is called OPCODE signalling. The linecard diagnostic for an MG9000 PPhone line will verify the OPCODE signaling to the linecard and to the PPhone set itself. The given diagnostic error log indicates that the OPCODE signaling test to the set has failed.
- The diagnostic failure log also contains the number of OPCODE message sent to and received back from the set.

Alarm

- The line failure flag for the line is set to l to indicate that the linecard diagnostic has failed the OPCODE signaling test to the phone set. Lines marked with the l failure flag have been identified by the CS2000 as lines that are not providing service. For this failure flag, there is a working PPhone assigned to the line under test, and the CS2000 can not successfully exchange OPCODE messages with a set on the loop.

- The following command line will print a report containing all the lines served by the CS2000 with a l failure flag:

  mapci nodisp;mtc;lns;ltp;post df lset print

- The following command line will print a report containing all the lines served by the CS2000 with any failure flag set:

  mapci nodisp;mtc;lns;ltp;post df print

User Action

- The user should verify that the set is connected to the loop.
- The user can use the CKTTST command to perform additional manual OPCODE signaling tests.
- If the CKTTST command verifies that the signaling to the mainset is not working and the set is connected to the loop, the user should replace the linecard. If the problem persists, the set should be replaced.
- The user can use the Station Ringer test to verify that the new set is fully functional from the subscriber premise.

13.6.3.13.10 Addon / Extension Provisioning Mismatch

     DIAGNOSTIC RESULT  Addon Not Datafilled
     ACTION REQUIRED   Sustate
     CARD TYPE  GWLEBS
```

Description

- The linecard diagnostic on an MG9000 PPhone line will audit the hardware on the loop and compare the hardware to the provisioning in the CS2000. The CS2000 can support up to 3 addons and 3 extensions per PPhone line. If the line diagnostic finds a mismatch between the hardware and the provisioning in the CS2000, the diagnostic will fail.
- The first example log shows a line that has an extension provisioned in the CS2000 but can not be detected on the loop.
- The second example log shows a line that has an addon provisioned in the CS2000 but can not be detected on the loop.
- The third example log shows a line where the diagnostic has detected an extension on the loop being testing, which is not provisioned in the CS2000.
- The fourth example log shows a line where the diagnostic has detected an addon on the loop being testing, which is not provisioned in the CS2000.

Alarm

- The line failure flag for the line is set to D to indicate that the linecard diagnostic has failed. Lines marked with the D failure flag have been identified by the CS2000 as lines that are not capable of providing service and required user maintenance.
- The following command line will print a report containing all the lines served by the CS2000 with a D failure flag:

  mapci nodisp;mtc;lns;ltp;post df d print
- The following command line will print a report containing all the lines served by the CS2000 with any failure flag set:

  mapci nodisp;mtc;lns;ltp;post df print

User Action

- The user should use the SUSTATE command to evaluate the CS2000 provisioning versus the hardware connected to the line. Once the mismatch is identified, the provisioning or hardware error should be corrected.

13.6.4 Multicircuit Linecards

13.6.4.1 Managing Faulty Circuits

When the diagnostics detect a fault that requires intervention by a craftsperson, the CS2000 will raise a failure flag against the line. See the list of supported diagnostic failure flags listed in section “3.6.1.2 Alarm Flags” on page 209.

The diagnostic failure flag can be cleared by replacing the linecard and reexecuting the diagnostic. When the diagnostic passes, the CS2000 will

automatically clear the failure flag. For multicircuit linecards, the user may not replace the entire pack if only one a few circuit on the linecard are defective. In this scenario, the user will not be able to clear the diagnostic failure flag by reexecuting the diagnostic.

The following procedure should be used to manage individual defective circuits on a multicircuit linecard.

- If a subscriber is assigned to the defective circuit, move the subscriber off the defective circuit to a working circuit.
- Select the circuit at the gateway element manager.
- Lock the individual defective circuit. If a circuit is in the locked state, the CS2000 will not attempt to test the line. The CS2000 will also not be able to return the line to the IDL state if service is reassigned to the defective circuit by mistake.
- Enter the LGLTT (LGRP Line Test Tool). Type LGLTT at the CI prompt. Use the ClrFlag command to clear the failure flag against the line. See section “3.13.2 LGLTT” on page 241.
- Post the line at the LTP level of the map. Verify that the failure flag has been cleared for the circuit. Verify that the DIAG command is not allowed for the line.

Note: the user must track the defective circuits to ensure that they are not unlocked at the gateway element manager. The user must also manage the defective circuits in their inventory system to ensure that service is not assigned to the defective circuit again.

13.7 Routine Maintenance

The following NTPs provide extensive information on the recommended routing maintenance and trouble shooting procedures for CS2000 lines:

297-1001-594	DMS-100 Family Lines Maintenance Guide
297-8991-500	Maintenance and Operations Manual
297-1421-503	Subscriber Services Maintenance Guide

This section provides some specific recommendations for MG9000 lines.

13.7.1 Subscriber Service

ALT SDIAG should schedule and executed on MG9000 lines. ALT SDIAG will routinely run the line diagnostics to detect functional, state or provisioning errors that would prevent subscriber service.

13.7.2 Facility Tests

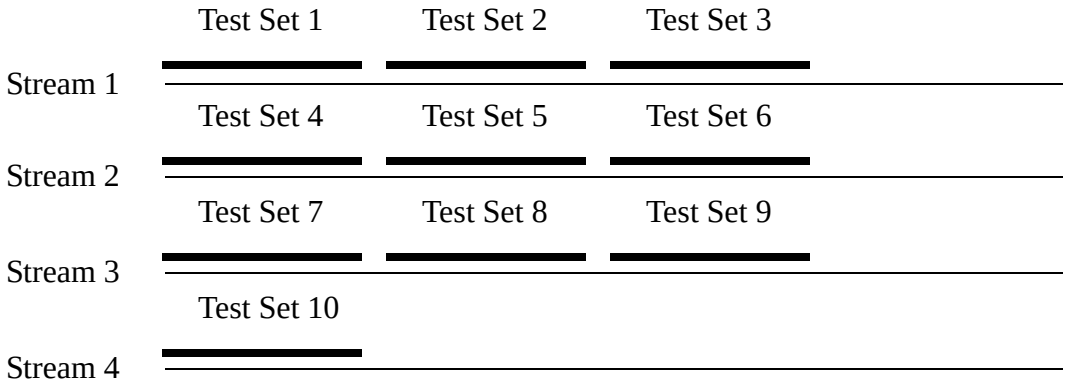
ALT LIT or a loop testing system should be scheduled to routinely test subscriber loops.

13.7.3 ALT Provisioning Recommendations for MG9000 Lines

13.7.3.0.1 MG90000 Tests Sets

ALT is designed to provide as much testing concurrency as possible. The user enters into ALT the range of LENs to test, which can span multiple nodes. ALT will run through the range of LENs to determine the "test sets" for the range of LENs.

ALT then creates a set of "test streams". The test streams represent the resources that can be used to perform ALT tests. ALT will attempt to create as many streams a possible and divide the test sets up among the streams for maximum testing concurrency. This is illustrated in the diagram below. The diagram shows a configuration where ALT calculates 10 possible test sets for a range of LENs and divides the test sets over 4 test streams.



ALT SDIAG

Each MG9000 shelf is represented as an LGRP in the call server. As stated above, ALT test sets are calculated on a per node basis. A single MG9000 frame is represented in the call server as four distinct nodes. Therefore, a single MG9000 frame will be divided into 4 separate ALT test sets (one for each shelf).

ALT SDIAG, is dependent on the TTU resources in the MTM and the MTA-TRC resources in the MG9000. The TTU resources are required to perform transmission tests on the MG9000 linecards, and the MTA-TRC pack provides the supervision and ringing test resources. When ALT SDIAG is calculating the test streams for MG9000 lines, it will calculate the test streams based on the available TTUs. Specifically, ALT will create a single test stream for each TTU available for ALT SDIAG testing.

The combination of the way ALT test sets and ALT test streams are calculated can create a resource contention in the MG9000. A given MG9000 frame has a single MTA-TRC pack. Each MTA-TRC pack only provides two TRC circuits. Therefore, for a single MG9000 frame, only two MG9000 linecard diagnostics can be executed simultaneously.

The following example illustrates the issue:

- A craftsperson requests ALT to perform diagnostics for all the MG9000 lines in a single frame.
- Each MG9000 shelf is represented in the core as an LGRP. As stated above, each node in the CS2000 is assigned to a unique test set. Therefore, each MG9000 shelf will be assigned to a unique test set.
- As the linecard diagnostic only requires a TTU in the CS2000, ALT will attempt to create 4 test streams, one for each test set, and assign a TTU to each stream.
- ALT will then assign each test set, one for each shelf, to the 4 test streams.
- Once the test sets are assigned to test streams, ALT will begin processing the ALT test streams in parallel. This will create a scenario where ALT is attempting linecard diagnostic on all 4 shelves in a MG9000 frame concurrently. As the MG9000 can only support 2 simultaneous linecard diagnostics, there will be resources contention in the MG9000. Two of the ALT test streams will execute correctly, and two of the ALT test streams will fail due to unavailable resources at the MG9000.

To avoid the resource contention, the user should create tests on a per MG9000 shelf basis and ensure that ALT SDIAG is not scheduled on more than shelves shelf per frame concurrently.

ALT LIT

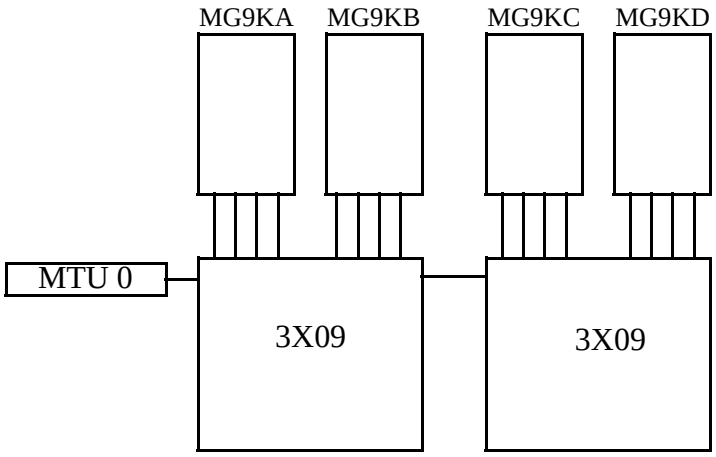
ALT LIT requires an MTU to test the subscriber’s loop. ALT uses the “dedicated” MTUs in the switch. There are two test configuration options which are supported for MG9000 lines. If the customer uses the WTA (Wideband Test Access) panel, there will be a single dedicated MTU for a pair of 3X09s. If the customer wires the test equipment together through the MDF (Main Distribution Frame) a dedicated MTU can be assigned to each 3X09. These configurations are shown in the following diagrams.

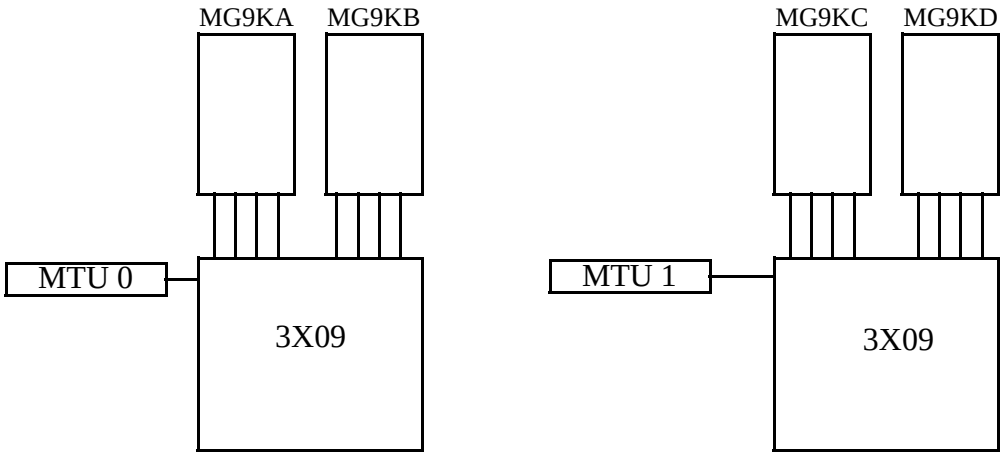
As documented in the engineering rules, a MG9000 node should not span across multiple 3X09 circuit packs. Therefore, in either configuration shown, a given MG9000 can only use one possible dedicated MTU for performing ALT LIT tests.

When ALT LIT creates its test streams, it will create a test stream for each MTU in the switch that has the ALT option set to Y. As ALT LIT is assigning

MG9000 test sets to the test streams, the engineering rules will ensure that the MG9000 test sets for a single MG9000 (one for each shelf) will go into the same test stream, because all the shelves for a given MG9000 must use the same MTU. Therefore, all the shelves in a MG9000 physical node will be tested in a serial fashion. This will ensure that there is no contention for MG9000 resources while ALT LIT is testing MG9000 lines.

Note: the option the customer chooses to deploy for the 3X09 configurations will be dependent on the maintenance window that is allowed for ALT LIT testing.





ALT CKTTST

ALT CKTTST performs messaging to the MG9000 to check the ability to loopback PPhone messages at the linecard or phone set. For the MG9000, each shelf is represented as a node in the core. Each MG9000 LGRP will be considered a single test set. There is no test equipment required to perform a CKTTST, therefore, ALT can create a unique test stream for each test set up to the maximum number of ALT test streams allowed.

ALT CKTTST can run concurrently across all MG9000 shelves in the office

13.8 Trouble Shooting

The following NTPs provide extensive information on the recommended routing maintenance and trouble shooting procedures for CS2000 lines:

297-1001-594	DMS-100 Family Lines Maintenance Guide
297-8991-500	Maintenance and Operations Manual
297-1421-503	Subscriber Services Maintenance Guide

This section provides some specific recommendations for MG9000 lines.

13.8.1 No Dial Tone

- Determine if the problem is outside plant. Use a loop testing system such as Access Care to perform a detailed loop test.

- If the fault is outside plant, dispatch outside plant personnel.
- If the fault is not outside plant, post the line at the CS2000 and check the CS2000 line state.
- If the line is an manually busy state, stop trouble shooting.
- If the line is in the SB state, that can indicated that the CS2000 has taken the line to the SB state, or it could indicated that the Gateway has taken the line to the SB state.
  - The user can attempt to BSY and RTS the line. If the line returns to the IDL state, verify that dial tone is restored.
  - If the line remains SB, check the line at the MG9000 EM. Check the line circuit for faults. The line circuit must be in the enabled state before the CS2000 line state will return to IDL. If there is a circuit fault at the MG9000, resolve the MG9000 circuit fault. Once resolved and the line circuit is restored to the enabled state, verify that the line has returned to the IDL state in the CS2000. Verify that dial tone is restored.
- If the CS2000 line state is IDL and there is not dial tone, execute the DIAG command on the line. The DIAG command will verify the line provisioning date in the CS2000, GWC and the MG9000. Once the provisioning data is verified, the DIAG will request the MG9000 to execute the embedded circuit diagnostics. This will execute the following tests:
  - Offhook detection
  - Onhook detection
  - Ringing
  - For PPhone lines, OPCODE signaling is verified instead of analog signaling.
- If the line diagnostic fails, resolve the issue reported in the diagnostic.
- If the line diagnostic passes check for dial tone at T/R pair coming off the face place on the linecard. If dial tone does not exist and the line diagnostic passes for the line, escalate to the next level of support. The TALKLTA and ORIG commands can be used to remotely pull dial tone from the T/R of the linecard.

13.8.2 Poor Speech Quality

- Determine if the problem is outside plant. Use a loop testing system such as Access Care to perform a detailed loop test.
- If the fault is outside plant, dispatch outside plant personnel.
- Post the line at the CS2000 MAP position and execute the DIAG command. This will verify the transmission characteristics of the line.

- If the DIAG fails, move the subscriber to a different circuit.
- If the DIAG passes, the TONGEN, LOSS and NOISE commands can be used to perform manual transmission tests on the subscribers linecard and loop.
- If the problem can not be isolated, escalate to the next level of support.

13.8.3 Line Does Not Ring

- Determine if the problem is outside plant. Use a loop testing system such as Access Care to perform a detailed loop test.
- If the fault is outside plant, dispatch outside plant personnel.
- If the fault is not outside plant, post the line at the CS2000 and check the CS2000 line state.
- If the line is an manually busy state, stop trouble shooting.
- If the line is in the SB state, that can indicated that the CS2000 has taken the line to the SB state, or it could indicated that the Gateway has taken the line to the SB state.
  - The user can attempt to BSY and RTS the line. If the line returns to the IDL state, verify that dial tone is restored.
  - If the line remains SB, check the line at the MG9000 EM. Check the line circuit for faults. The line circuit must be in the enabled state before the CS2000 line state will return to IDL. If there is a circuit fault at the MG9000, resolve the MG9000 circuit fault. Once resolved and the line circuit is restore to the enabled state, verify that the line has returned to the IDL state in the CS2000. Verify that dial tone is restored.
- If the CS2000 line state is IDL terminating calls will not RING the line, execute the DIAG command on the line. The DIAG command will verify the line provisioning date in the CS2000, GWC and the MG9000. Once the provisioning data is verified, the DIAG will request the MG9000 to execute the embedded circuit diagnostics. This will execute the following tests:
  - Offhook detection
  - Onhook detection
  - Ringing
  - For PPhone lines, OPCODE signaling is verified instead of analog signaling.
- If the line diagnostic fails, resolve the issue reported in the diagnostic.

- If the line diagnostic passes check for ringing voltage at T/R pair coming off the face place on the linecard. If ringing voltage does not exist and the line diagnostic passes for the line, escalate to the next level of support.

13.8.4 Call Not Completed Correctly

- Use TRAVER to verify that translations will correctly route the dialed digits for the line being tested.
- If the translations are verified to be good, determine if the problem is outside plant. Use a loop testing system such as Access Care to perform a detailed loop test.
- If the fault is outside plant, dispatch outside plant personnel.
- Post the line at the CS2000 MAPCI. Execute the DIAG command on the line. This will execute the following tests:
  - — Offhook detection
  - — Onhook detection
  - — Ringing
  - — For PPhone lines, OPCODE signaling is verified instead of analog signaling.
  - — Transhybrid Loss
  - — Weighed and Notched Noise
  - — Padding

  The diagnostic will verify the transmission characteristics of the linecard.
- If the line diagnostic fails, resolve the issue reported in the diagnostic.
- If the diagnostic passes, test the lines ability to collect and report digits to the CS2000. The TALKLTA, ORIG commands be used to simulate a test call. The TALKLTA, DGTTST commands can be used to capture and observe any digits actually collected for the line under test.
- If the diagnostic passes for the line under test, and manual trouble shooting can not isolate the problem, escalate to the next level of support.

13.8.5 PPhone Lines Not Functioning Correctly

- Determine if the problem is outside plant. Use a loop testing system such as Access Care to perform a detailed loop test.
- If the fault is outside plant, dispatch outside plant personnel.
- Post the line at the CS2000 MAPCI. Execute the DIAG command on the line. This will execute the following tests:
  - — Offhook detection (analog lines)

— Onhook detection (analog lines)

— Ringing (analog lines)

— OPCODE signaling (for PPhone lines)

— Transhybrid Loss (for analog lines)

— Weighed and Notched Noise (for analog lines)

— Padding (for analog lines)

The line diagnostic on a PPhone line will verify the provisioning in the CS2000 matches the set hardware, and it will verify the signaling between the CS2000, the linecard and the PPhone set.

- The Station Ringer test can be executed on site to verify the PPhone set itself.
- If the issue can not be isolated, escalate to the next level of support.

13.9 Logs

13.9.1 Existing Logs Applicable to CS2000 Line Test

NTP 297-1001-594 DMS-100 Family Lines Maintenance Guides, section 3 contains the line maintenance related logs for the CS2000.

13.9.2 Modified Logs

13.9.2.1 ALT SDIAG

There are two types of diagnostics supported by the ALT (Automatic Line Test) subsystem: long diagnostics and short diagnostics. The long diagnostics use external metallic test resources to test the line, and traditionally have provided more coverage than the short diagnostics which do not use external metallic test equipment.

For LGRP lines, the linecard diagnostics are not dependent on external metallic test equipment; therefore, only short diagnostics are supported. Note, the short diagnostics do not provide a reduced fault coverage for LGRP lines. They have been designed to provide the same fault coverage as the manual linecard diagnostics without the use of external metallic test equipment.

ALT SDIAG has been modified to use the ALT101 log for LGRP lines. As stated above, ALT SDIAG provides full fault coverage for LGRP lines so it has been modified to give a more detailed report on the diagnostic failures for LGRP lines. The following shows an example ALT101 log for an LGRP line that has failed diagnostics.

```
RTPU07BC      ALT101 NOV18 11:35:35 7900 FAIL ALT
       SLOA 77 1 19 18          NO DIRN    1st CYCLE
       TEST TYPE SDIAG DIAGNOSTIC RESULT Test failed: Off-hook
       ACTION REQUIRED  Replace card  CARD TYPE  GWLPOTS
```

13.10 OMs

13.10.1 Line Troubles

NTP 297-1001-594 DMS-100 Family Lines Maintenance Guides provides recommendations for CS2000 OMs the users should monitor for lines troubles.

13.10.2 Equipment Troubles

NTP 297-1001-595 DMS-100 Family Trunks Maintenance Guide provides information on CS2000 OMs for the CS2000 test equipment.

13.11 Alarms

MG9000 lines support the CS2000 line failure flags in the SN06.2 release. This enables the ALMSTAT command for MG9000 lines. The ALMSTAT command allows the user to query the line alarms for an office. The user can also set thresholds for updating office alarms for excessive line failures.

13.11.1 ALMSTAT QUERY

The following shows sample output of an almstat query.

```
                OFFICE LINE FAILURE TOTALS

                          OFFICE   OFFICE OFFICE OFFICE

13.11.2 ALMSTAT SET

The user can also use the ALMSTAT command to set the thresholds for the MINOR, MAJOR and CRITICAL office alarms.

13.12 User Error Responses

The complete list of user error responses are located in the configuration section under activity A00001890. Following are some of the more common error responses.

13.12.1 Line State Errors

When testing an MG9000 line, the line terminations is set to the TEST state. If the CS2000 fails to set to the termination to the TEST state, the user will get one of the following error responses.

Failed to determine the termination state

The CS2000 failed to determine the current state of the line at the gateway. The user should attempt the test again. If the problem persists, the users should contact the next level of support.

Failed to put the termination in the test state

The CS2000 requested the gateway to place the line in the TEST state and the request was not successful. The user should check the state of the line termination in the gateway.

The line is an ESA call

The CS2000 has determined that the line is involved in ESA call.

The line is out of service at the gateway

The CS2000 has determined that the line is in an out of service state at the gateway. The users should check the state of the line at the element manager for the gateway to isolate the fault on the gateway.

13.12.2 Line Test Provisioning Errors

Unable to determine metallic test equipment provisioned
Verify the MTSTAPT option exists for the entry in table LGRPINV

When a line test was attempted on an MG9000 line, the CS2000 failed to access the metallic test point provisioning data for the MG9000 in table LGRPINV. Check the provisioning in table LGRPINV.

Unable to get the test point index from LGRPINV
Test cannot be performed

When a line test was attempted on an MG9000 line, the CS2000 failed to access the metallic test point provisioning data for the MG9000 in table LGRPINV. Check the provisioning in table LGRPINV.

Vertical is not datafilled in MTAVERT
Test cannot be performed

When a line test was attempted on an MG9000 line, the CS2000 failed to access the vertical provisioning data for the MG9000 in table MTAVERT. Check the provisioning in table MTAVERT.

13.13 Tools

13.13.1 NFF

The No Fault Found utility allows the user to capture and query results from individual tests performed during the line diagnostics. The NFF utility is entered by typing NFF at the CS2000 CI prompt. The following shows the command help reference.

```
No Fault Diagnostic (NFF) utility.

This allows the intermediate results of the line
diagnostics to be sent to a file.

Valid commands are:

NFF START (fd) (fn) - Start recording NFF tst result onto
                      specified device and file name.
NFF STOP            - Stop NFF recording and close file
NFF QUERY           - Query the NFF recording status,
                      device and file name.
NFF PRINT           - Print the closed NFF file.

Parms: <Function> {START <device_name> DEVICE name
                   <file_name  > STRING,
                  STOP,
                  QUERY,
                  PRINT}
```

13.13.1.1 NFF Results for an MG9000 line

The following shows the data provided by the NFF utility for an MG9000 line.

```
>mapci nodisp;mtc;lns;ltp;post l ud17 5 3 2 0

     Actual      -22    -16    -15    -18    db*10
     Min         -50    -45    -45    -50    db*10
-
Test pads in line card result:
                 304    704   1504   3204    Hz
     1 db pad:   -10    -10    -10    -10    db*10
     3 db pad:   -30    -30    -30    -30    db*10
     7 db pad:   -70    -70    -70    -70    db*10
     0 db pad:     0      0      0      0    db*10
-
     Noise test result:  56   db*10 noise level
-
     Noise test result:  282   db*10 noise level
```

13.13.2 LGLTT

The LGRP Line Test Tool (LGLTT) can be used to clear the failure flag against a defective MG9000 circuit. To do so, enter the ClrFlag command at the CS2000 CI prompt, followed by the DN or LEN of the defective circuit. Below is an example of the use of the command:

```
CI:
>
>lgltt
LGRP Line Test Tool (LGLTT):
>help
LGRP Line Test Tool (LGLTT)
Commands:
  Help     - Display summary
  ClrFlag  - Clear failure flag for a given MG9000 DN/LEN
  Quit     - To return to CI
>clrflag sloa 77 1 19 10
>clrflag 5202090
>quit
```

13.14 Restart Behavior

All CS2000 line test activities are terminated by element restarts.

- After a CORE restart, any line test in progress is aborted and the line is returned to the IDLE state.
- After a Gateway Controller restart, any line test in progress times out and a failure message is displayed at the MAP. If the line test requires manual

action at the CORE, the line test will remain in the test state until that action is complete.

- After a Gateway restart, any line test in progress is aborted and a failure message is displayed at the MAP.

13.15 Limitations and restrictions

- The CS2000 line test functionality is only supported for MG9000 lines.
- The CS2000 line test functionality is only supported for MG9000 lines when using the following cardcodes: GWLPOT and GWLEBS.

13.16 Interactions

Not applicable.

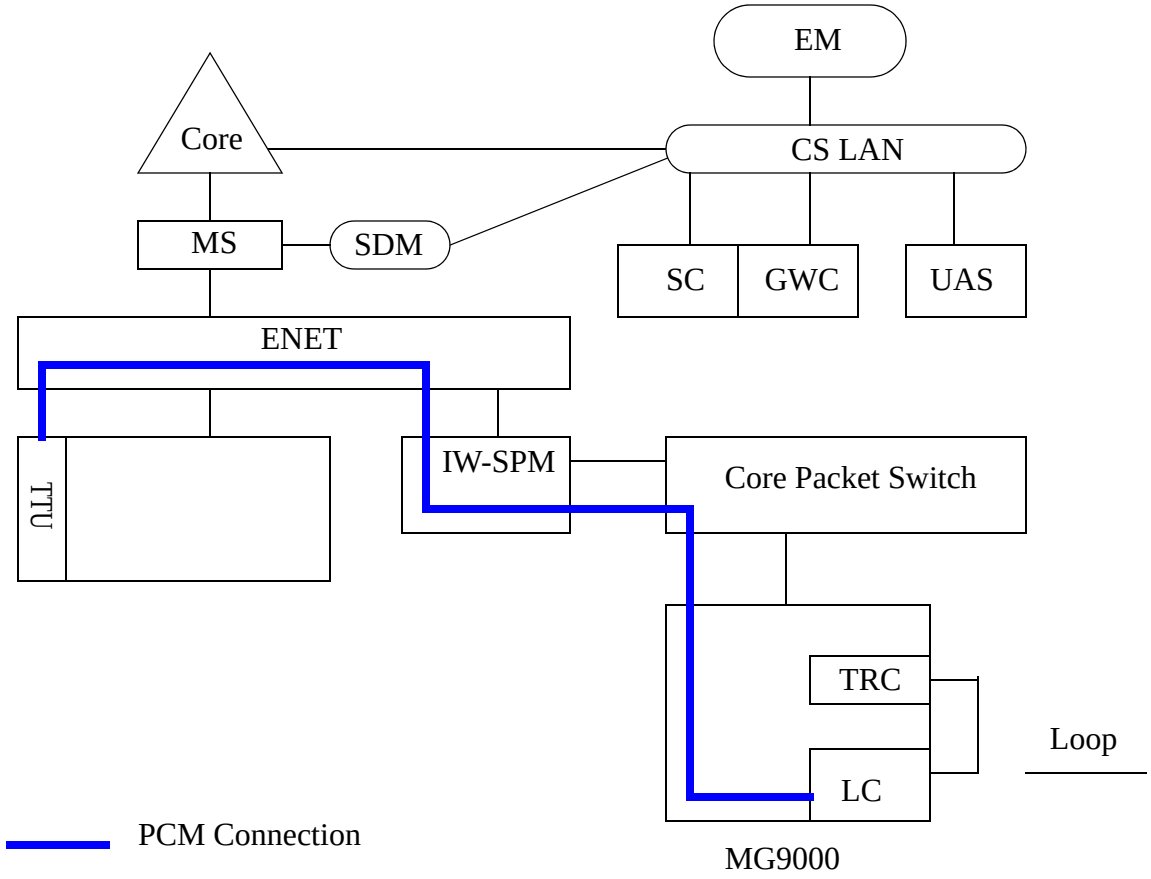
Appendix 1: Test Configuration Diagrams

This appendix contains configuration diagrams for the various CS2000 line test functions. This information is intended to aid in trouble shooting testing issues. The commands that are not listed do not require any test equipment. For example the SUSTATE command does not require line test equipment so a configuration diagram is not shown.

DIAG

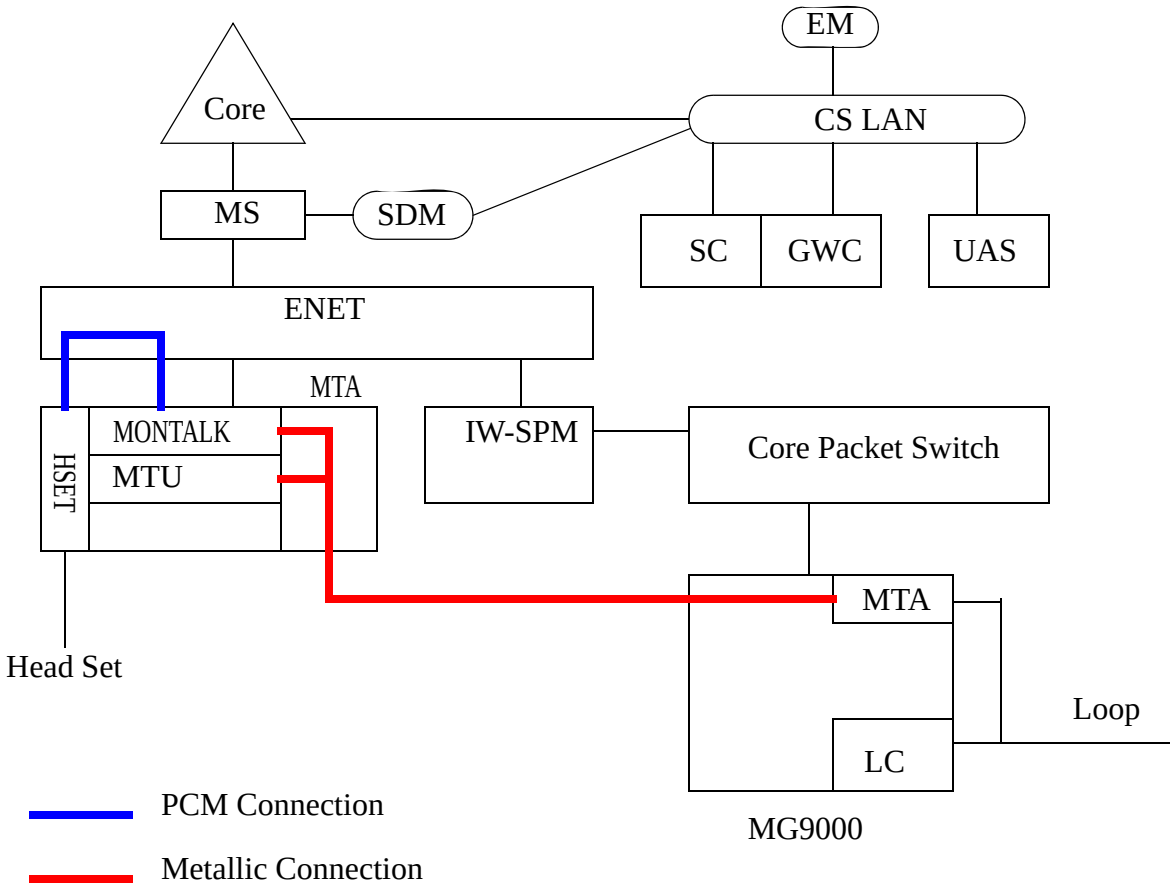
For POTS lines, a TTU located in an ISM/MTM shelf is used during the linecard diagnostic.



The transmission tests are not supported for PPhone lines. Therefore, no external test equipment is required when executing a diagnostic on a MG9000 PPhone line.

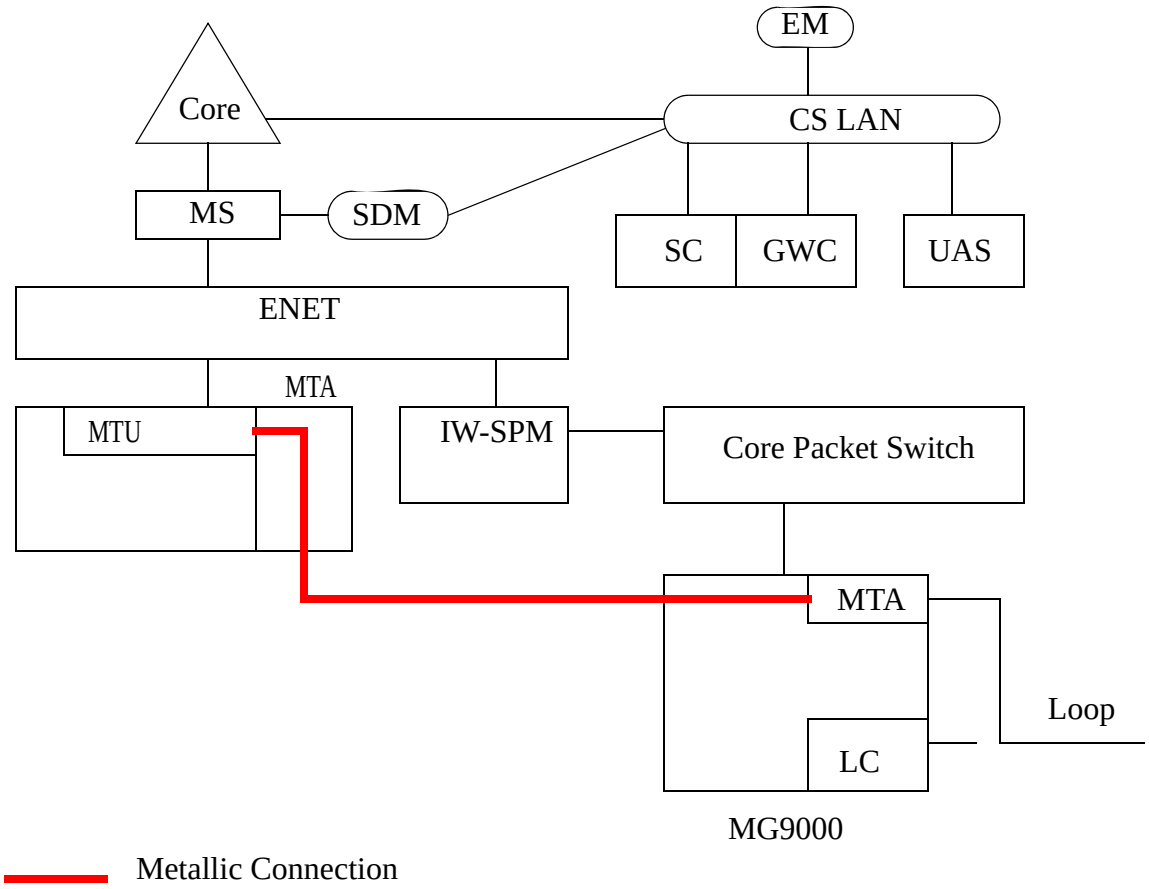
MONLTA, TALKLTA, ORIG, RING, DGTTST

The following diagram shows the configuration used when the above listed commands are performed on an MG9000 line.



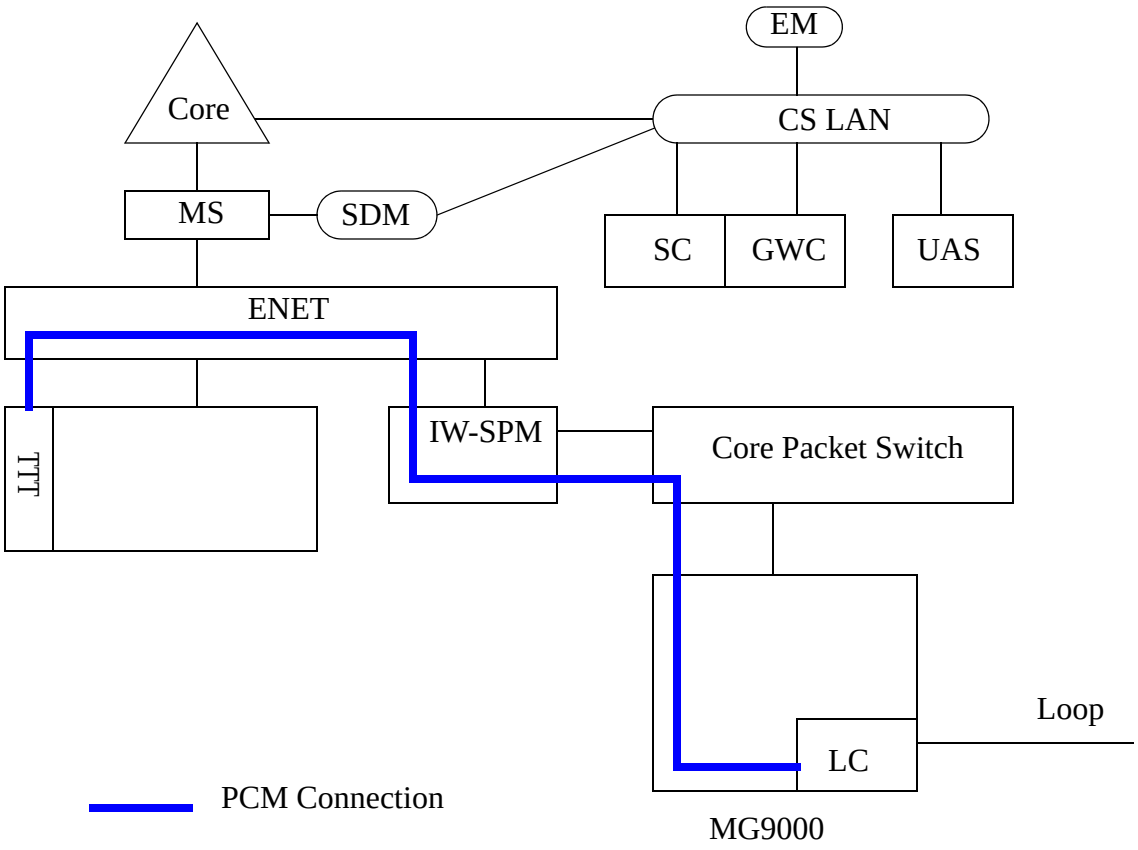
LNTST, VDC, VAC, RES, CAP, LTA

The following diagram shows the configuration used when the above listed commands are performed on an MG9000 line.



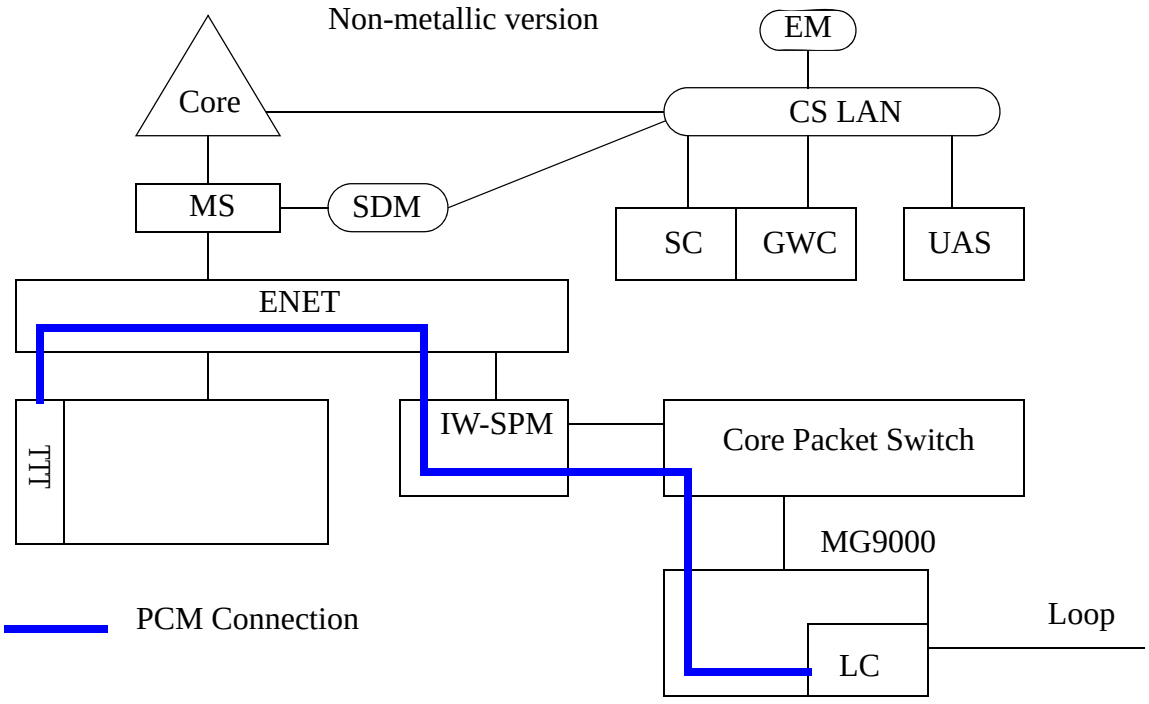
LOSS, NOISE

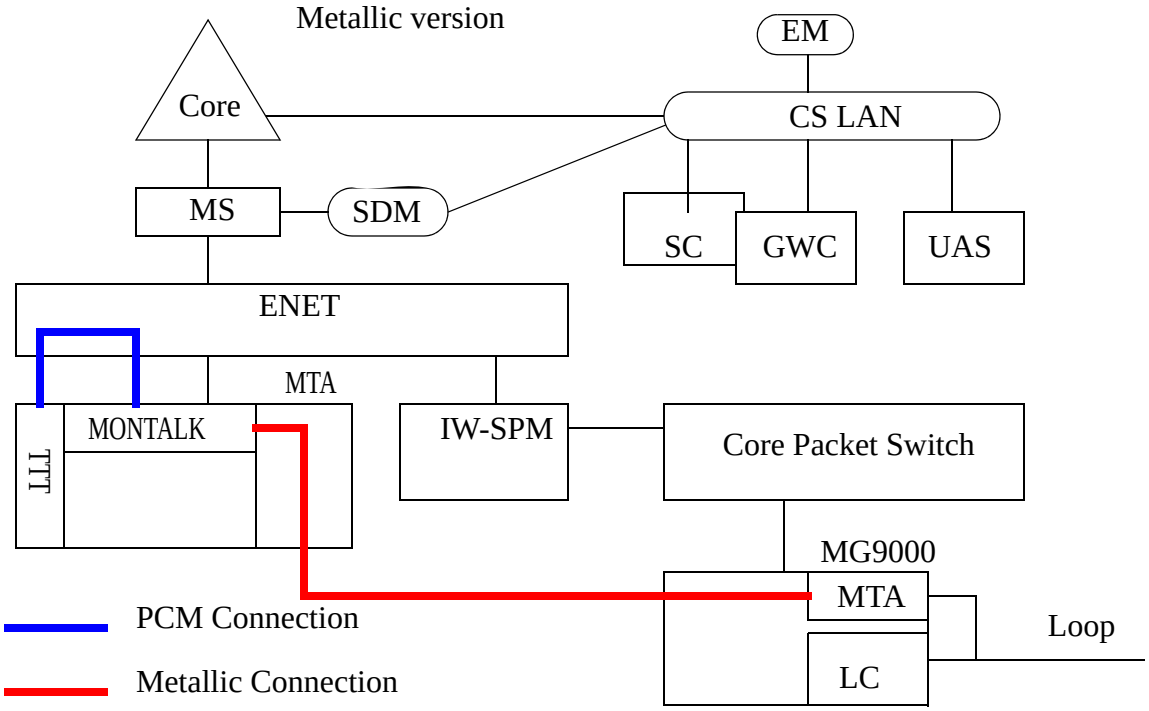
The following diagram shows the configuration used when the above listed commands are performed on an MG9000 line.



TONEGEN

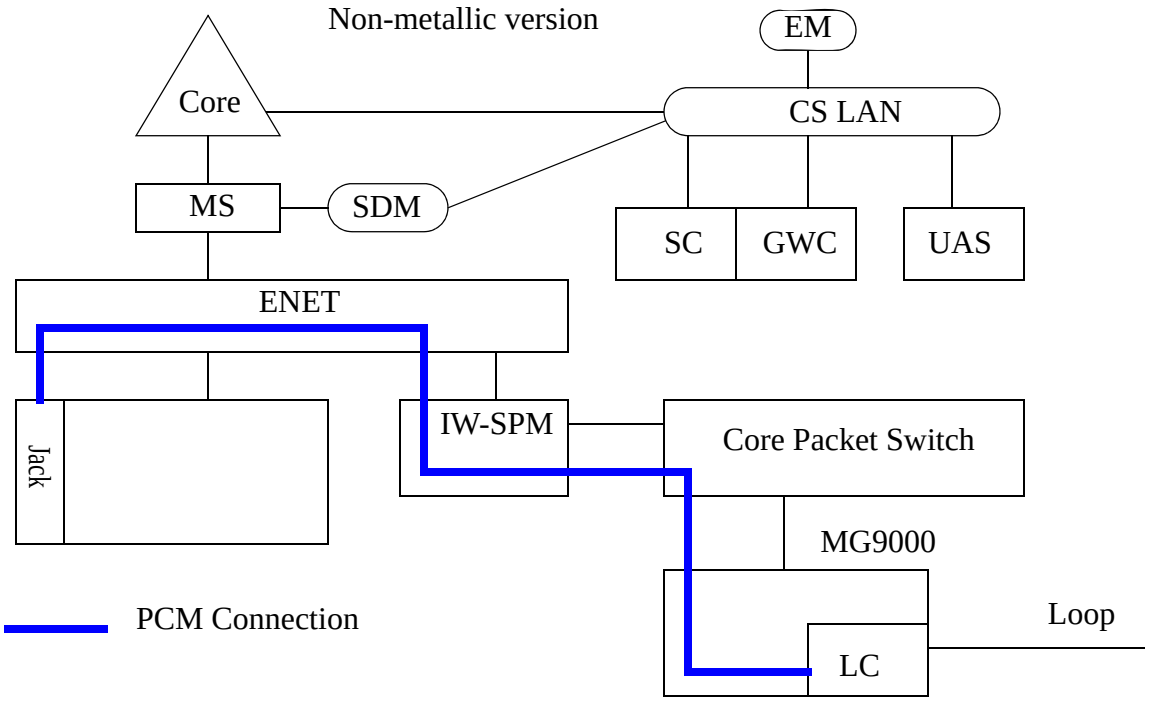
There are two versions of the TONEGEN command, the metallic and non-metallic version.

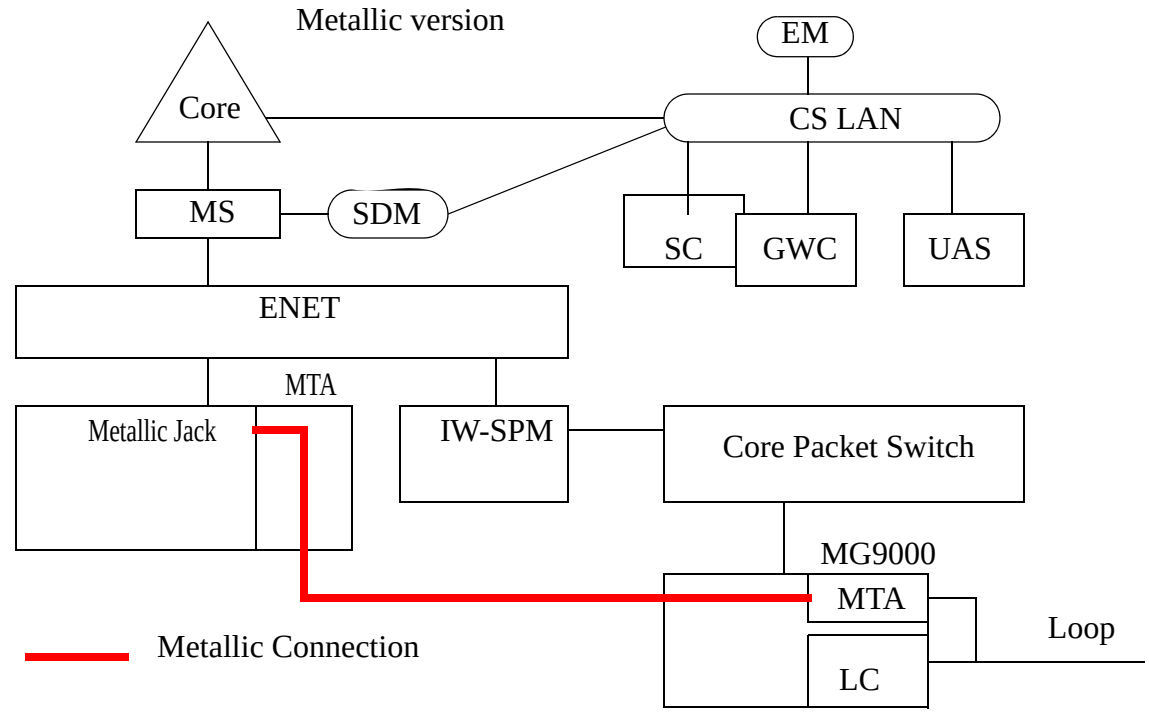




JACK

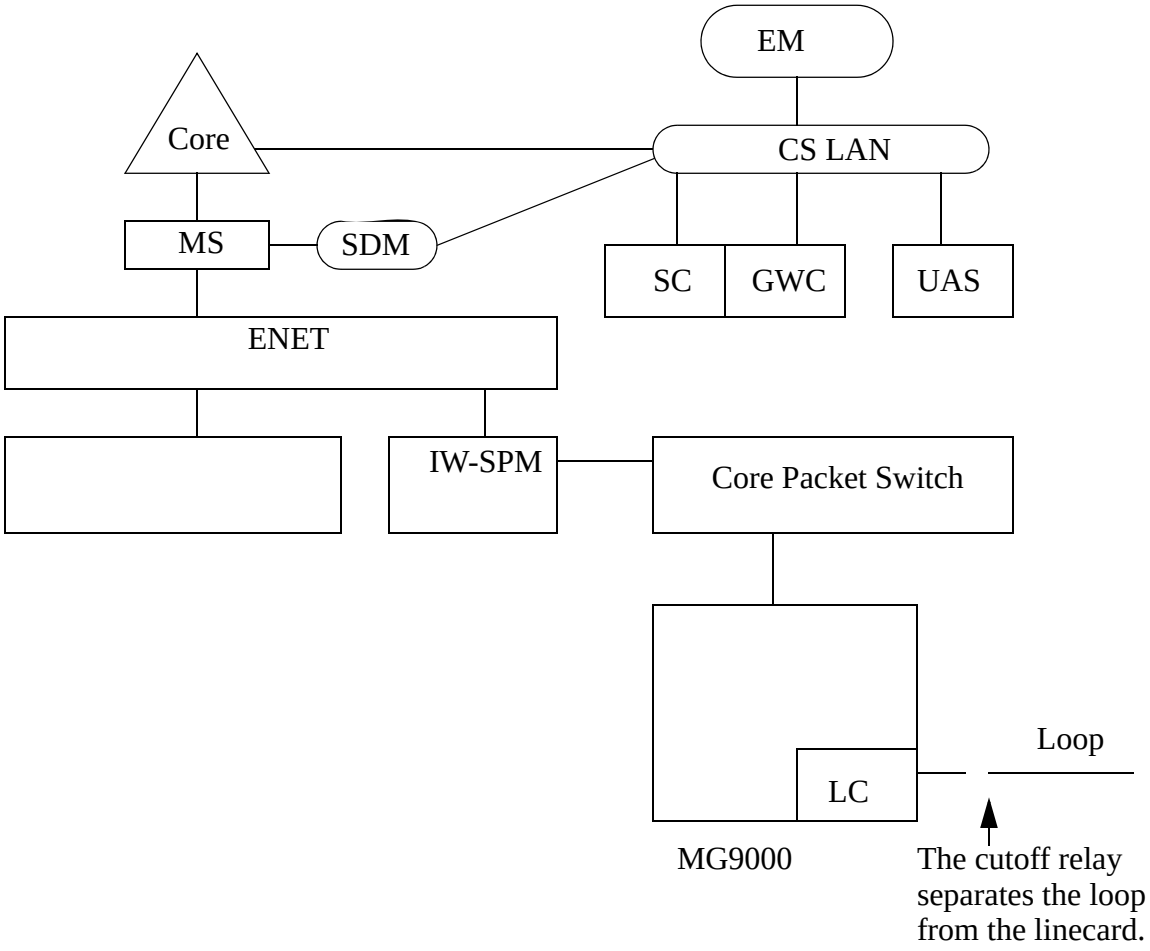
There are two versions of the JACK command, the metallic and non-metallic version





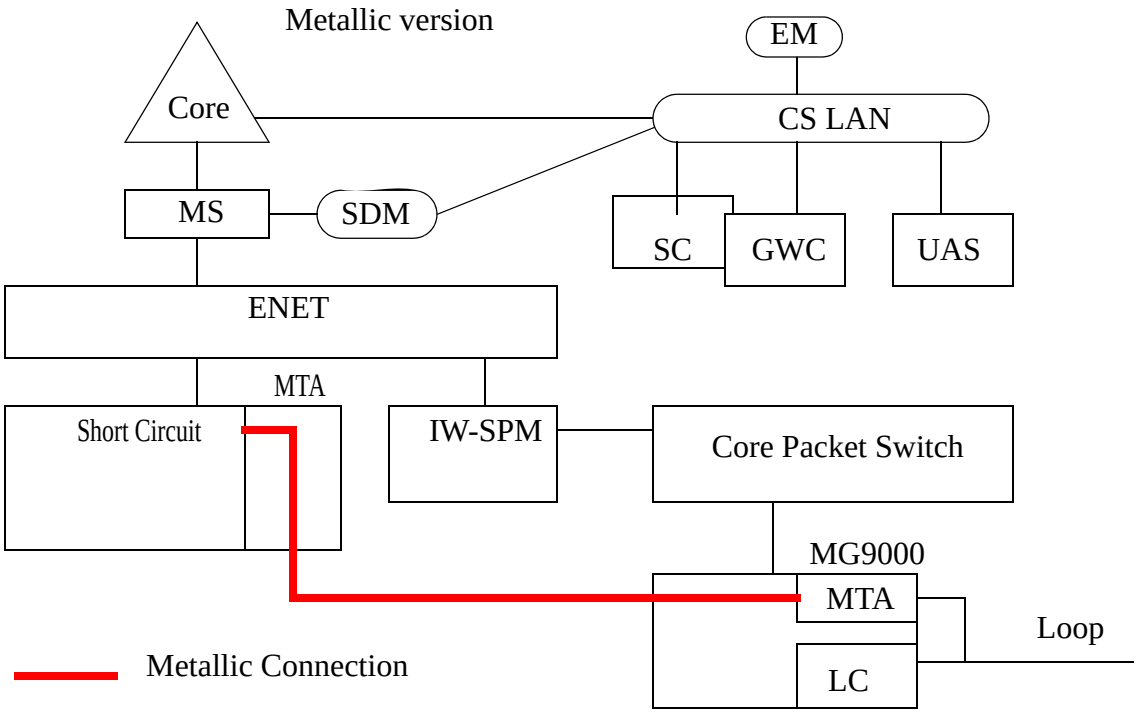
SSMAN

The silent switchman test allows a craftsperson to dial an access code and have the switch automatically apply an open condition to the subscriber loop for a provisioned period of time. No external test equipment is used. However, the metallic test resources in the MG9000 are used. Therefore the SSMAN test can be blocked if the metallic test resources in the MG9000 are already in use.



DSCKT

The dialable short circuit allows a craftsperson to dial an access code and have the switch automatically apply a short to the subscriber loop for a provisioned period of time.



ALT SDIAG

ALT SDIAG for MG9000 lines use the same equipment as LTP DIAG. Refer to the DIAG section for the test equipment configuration diagram.

ALT LIT

ALT LIT use the same equipment as the LNTST, VDC, VAC, RES, CAP commands. Refer to the test configuration diagrams for those commands.

ShowerQ

The ShowerQ diagnostic runs the same diagnostic as the LTP and ALT diagnostics; therefore, the same equipment is used. Refer to the DIAG section for the test equipment configuration diagram.

14: Functional Description (FN): A00009097

14.1 Feature name and Feature ID

A00009097 - IUP ACI Handling Enhancement

14.2 Description

14.2.1 Feature description

This activity will provide below functionality for supported incoming BTUP calls:

The handling of ACI request for FCLI (IRC 1 and ICC 0; please refer to "APPENDIX A" on page 296 for IRC/ ICC values) sent to the previous node, is enhanced for scenarios where the requested FCLI data is not received.

When ACI request for FCLI is sent to the previous node, if FCLI data is not received as

- CFN message is received as response [Section 2.2.1.1 "Confusion message is received" on page 292],
- timer T14 expired as no ACI response is received [Section 2.2.1.2 "Timer T14 expired" on page 293],
- ACI with PCLI (ICC 3, IRC 0) or null ACI (ICC 0, IRC 0) [1] ,
- invalid ACI [2] (ICC reserved value) or
- ACI with unpermitted ICC values for FCLI request [3] is received as response,

the call will be allowed to proceed (BTUP protocol on incoming side will always let the call continue) unless prevented by terminating protocol/service/ feature or for billing/screening purposes as FCLI is essential.

Before the introduction of this feature, value of CBI in incoming BTUP IAM/ IFAM affected the call failure/proceeding for receipt of CFN or T14 expiry as response to ACI request for FCLI (eg. for BTUP-PRI/DPNSS calls, call failed if CBI was Y and call proceeded if CBI was N) [Reference 2 sections

[1]Please refer to APPENDIX B."1. ACI response with PCLI or Null ACI is received" on page 297.
[2]Please refer to APPENDIX B."2. Invalid ACI is received" on page 298.
[3]Please refer to APPENDIX B."3. ACI response with unpermitted ICC values for FCLI request, is received" on page 299.
For above items,, incoming BTUP side lets the call to continue unless prevented by terminating protocol/ service. This functionality already exists and no change will be done.

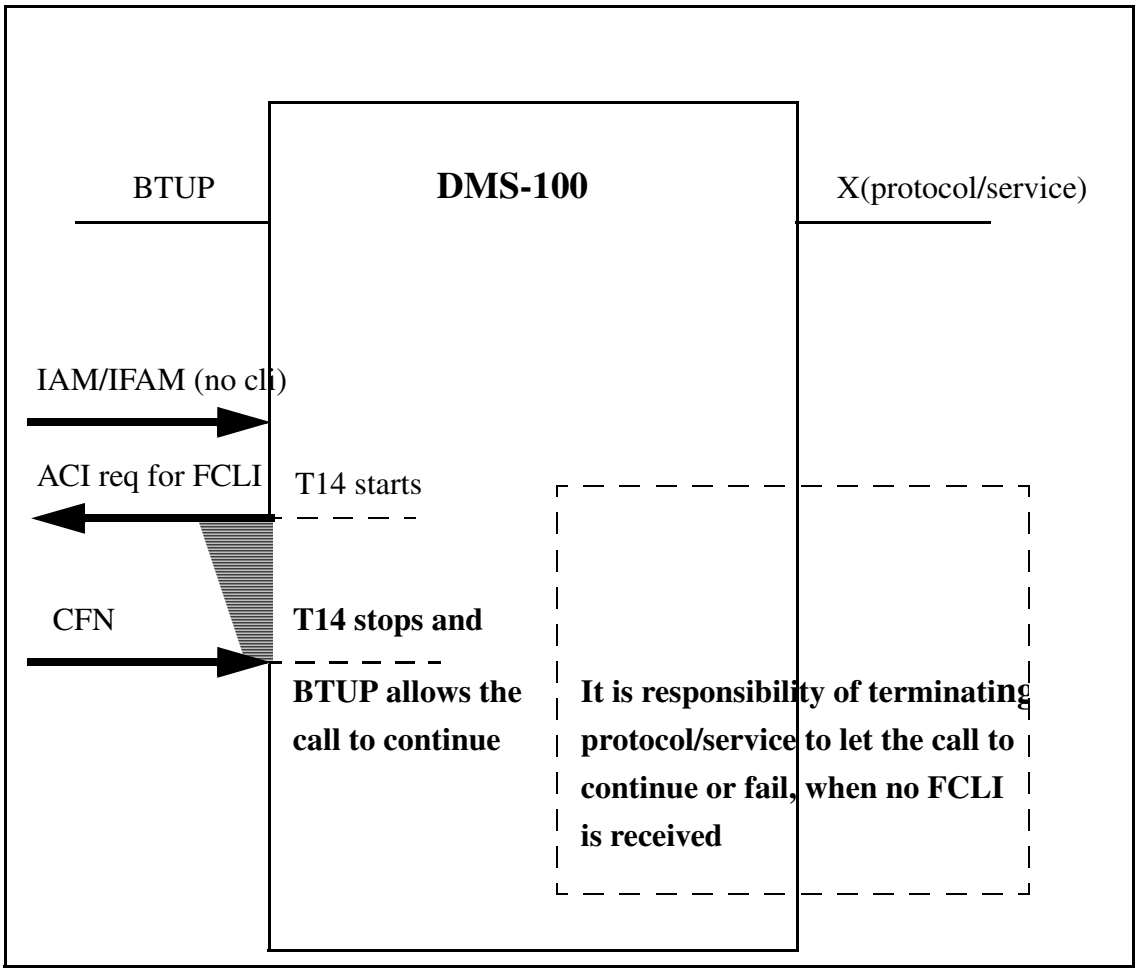
3.2.2.5.60 and 3.2.2.5.70 Nortel Notes] . New implementation will work for all CBI values and call proceeding/failure will not depend on the value of CBI in incoming BTUP IAM/IFAM.

Each of the above scenarios are explained under subsections below and in Appendix B.

14.2.1.1 Confusion message is received

When ACI request for FCLI is sent to the previous node, if CFN message is received as response, call will proceed without FCLI unless prevented by terminating protocol/service.

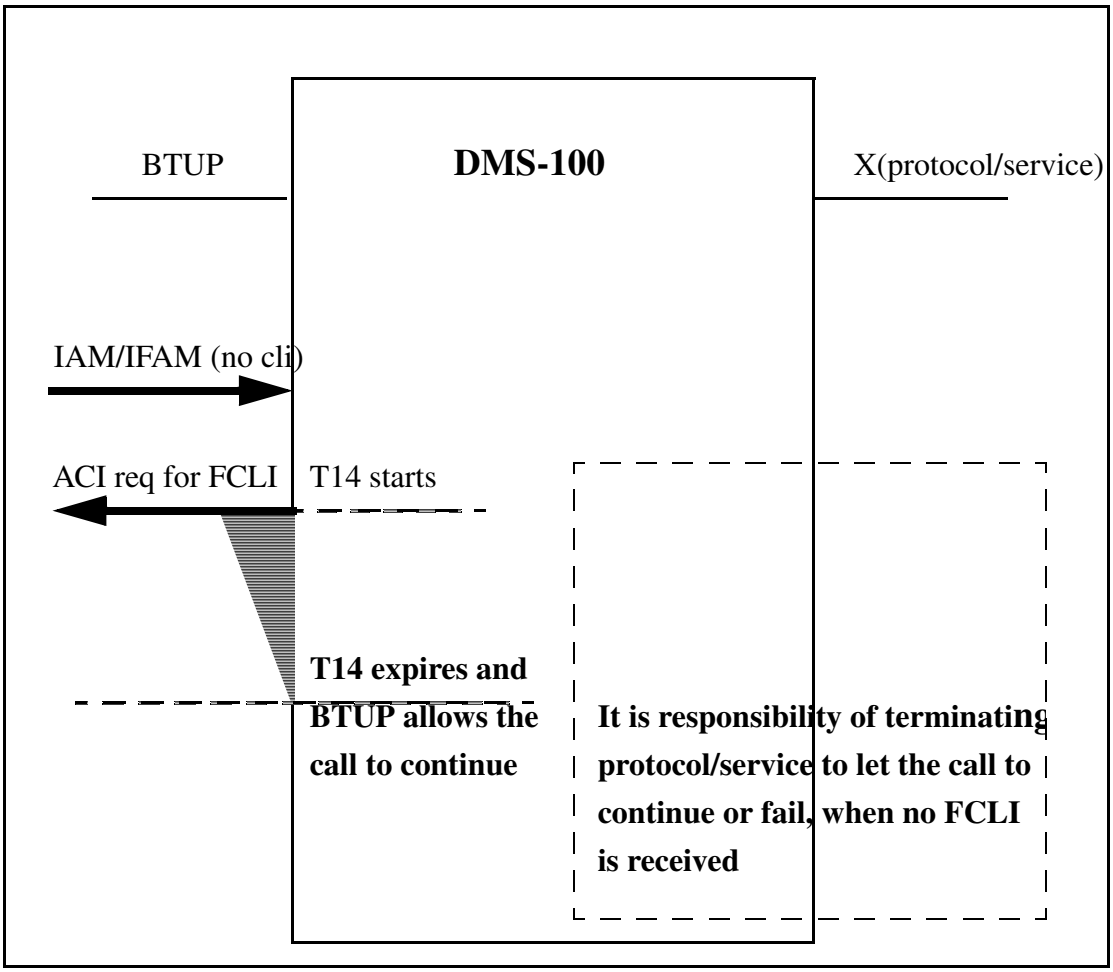
Figure 1 Call is allowed to continue on BTUP side, if CFN is received as response to ACI request for FCLI.



14.2.1.2 Timer T14 expired

When ACI request for FCLI is sent to the previous node, if T14 expired as FCLI data is not received , call will proceed without FCLI unless prevented by terminating protocol/service.

Figure 2 Call is allowed to continue on BTUP side, if T14 expired as ACI response with FCLI is not received.



14.3 Hardware Requirements or Dependencies

None.

14.4 Software Requirements or Dependencies

None

14.5 Limitations and restrictions

If FCLI is not received, the billing records will not contain FCLI under orig open digits parameter.

It's the responsibility of the terminating protocol/service to decide on whether to allow the call to continue or fail, if FCLI is not received. This is not in the scope of this activity.

14.6 Interactions

By the introduction of this feature, the calls will continue without FCLI for the given scenarios. The existing behaviour for supported incoming BTUP to X (protocol/service) calls without FCLI, will not be changed.

References for some of the X protocols/services (for BTUP-X interworking scenarios) which are planned to be tested, are given in section 2.8 Recommended Reading/References.

14.7 Glossary

00001011 [11]Last Diverting Line Identity

00001100 [12]Presentation Number Line Identification

00001101 [13] to 11111111 [255] reserved

APPENDIX B

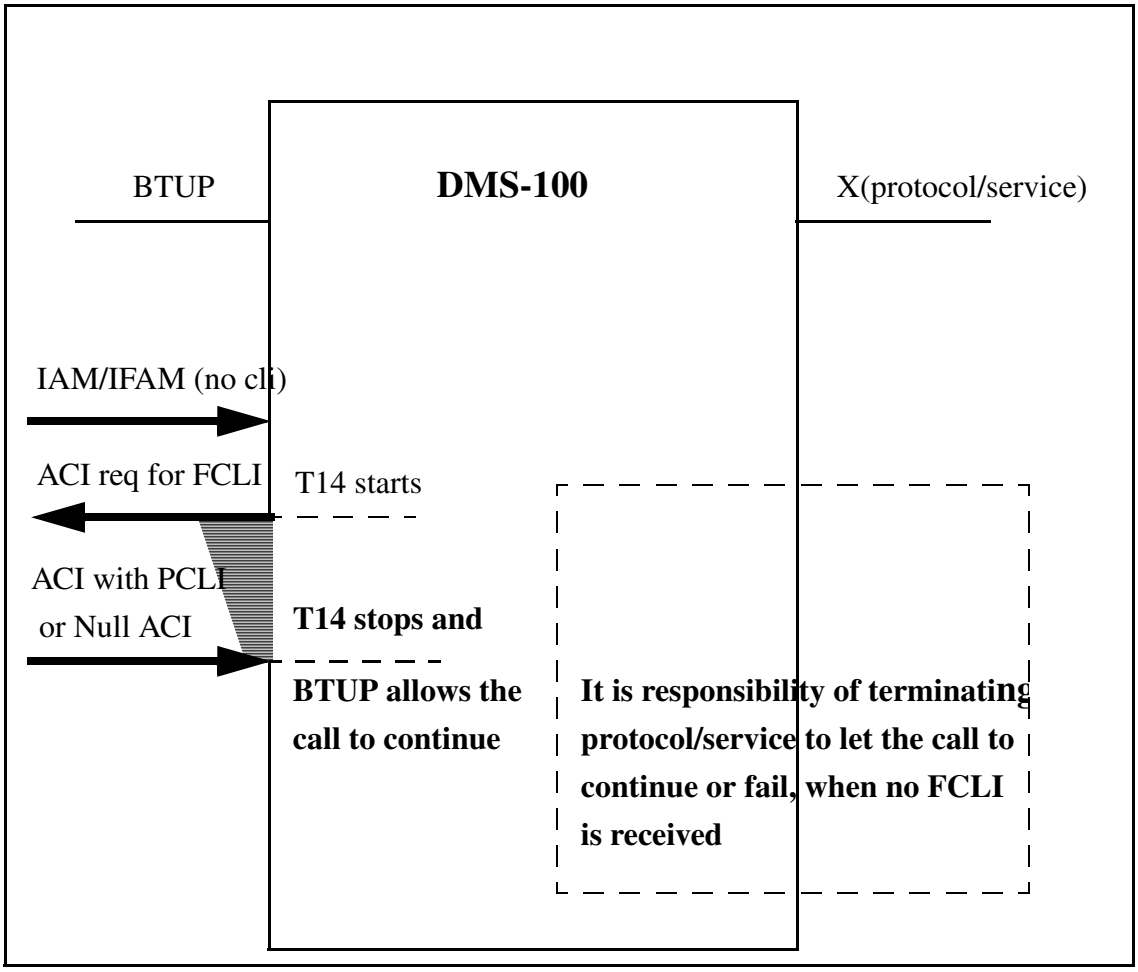
The existing behaviour for some scenarios, is provided below as background for this feature. The functionality will remain unchanged for these scenarios.

1. ACI response with PCLI or Null ACI is received

When ACI with FCLI is sent to the previous node, if ACI response with PCLI or Null ACI is received, T14 stops. Call proceeds/fails depending on the terminating protocol/service.

This is the existing behaviour, no change will be done.

Figure 3 Call is allowed to continue on BTUP side, if ACI response with PCLI or Null ACI is received as response to ACI request for FCLI.

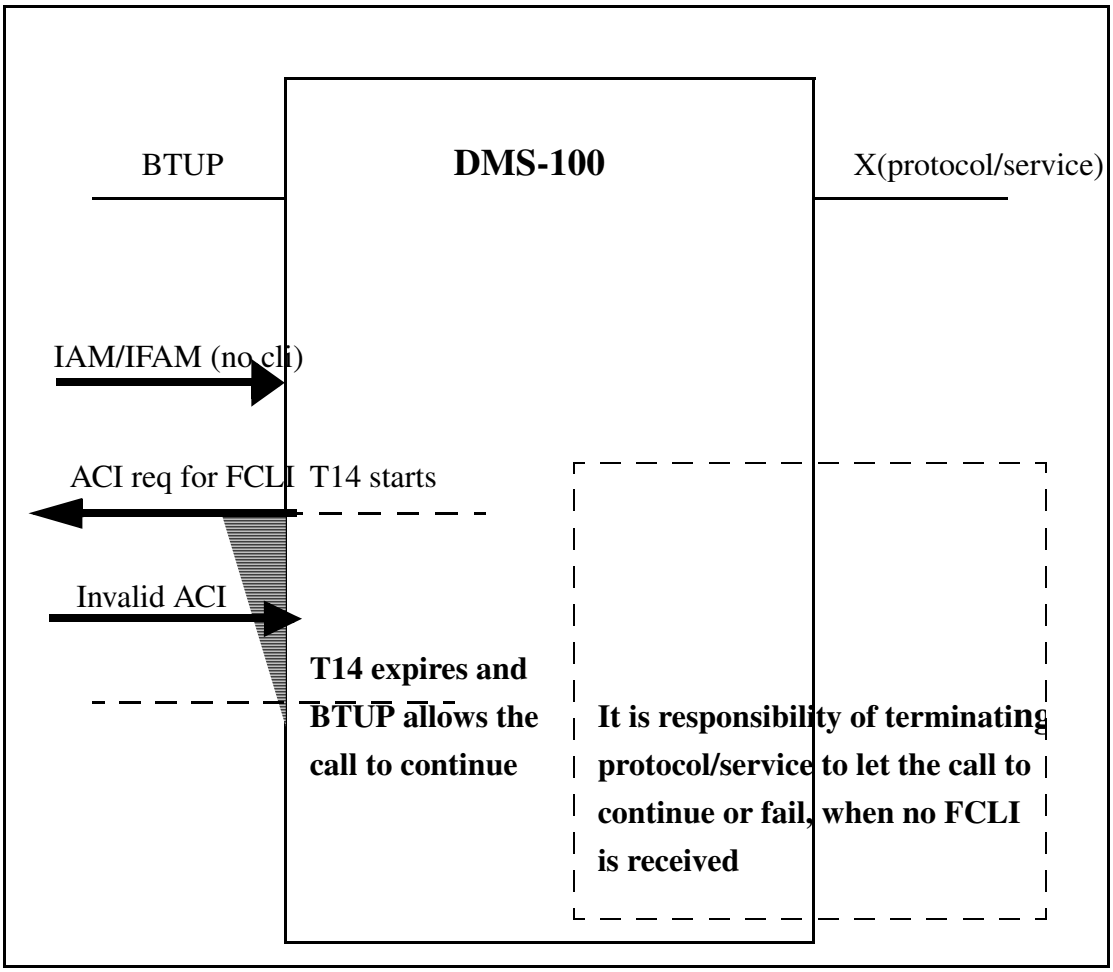


2. Invalid ACI is received

When ACI with FCLI is sent to the previous node, if invalid ACI (ICC reserved value) is received as response, timer T14 doesn't stop. When T14 expires, call proceeds without FCLI unless prevented by terminating protocol/service. So, response is ignored as per Reference 1/2 section 3.2.2.5.50 .

This is the existing behaviour, no change will be done.

Figure 4 Call is allowed to continue on BTUP side, if T14 expired as invalid ACI is received as response to ACI request for FCLI.



3. ACI response with unpermitted ICC values for FCLI request, is received

According Reference 1/ 2 Section 4.3.2, when ACI request for FCLI is sent backward, an ACI response with ICC 0, 1 or 3 is expected. Thus, unpermitted ICC values for ACI response are 2, 4-9, 11 and 12 . For these scenarios, T14 stops and call continues accordingly (same behaviour as given in Figure 3).

15: Functional Description (FN): A00009120

15.1 Feature name and Feature ID

A0009120 Multi-Time Zone Enhancments

15.2 Description

In order to support networks that span Multiple Time Zones (MTZ) features in the Succession/CS2K products must be enhanced. Feature A59038784 introduced a framework to support MTZ and DST (Daylight Savings Times) for subscriber visible services. This feature extends this functionality to the following:

1. Time of Day (TOD) Routing
2. Selected Malicious Call Trace (MCT/MCH) Logs LINE 125 & 126, MCT 103 &105

Currently with the TDM based MMP/DMS products, a callserver is allocated within each time zone. However, with the introduction of Succession/CS2K products, the callserver and the line gateways aren't bound by this limitation and can be located in different time zones. This means that line features/logs/ billing that use or display the local time must be able to modify the callserver time based on the time zone they are located in.

Activity A59038784 introduced a framework for multiple time zones and DST (Daylight Savings Time) for subscriber visible services, supporting IBN and RES lines. The activity introduced a line option, MTZ, which when assigned to a subscriber line provides an index into table MULTITM. Table MULTITM contains information as to the time difference based on the time zone and DST data.

Activity A00005734, Multiple time zone option for KSET lines expanded the functionaility to KSET lines with the M5216 Line Class Code. This allows for the support of CICM lines together with those on the MG9K.

Line features/logs are all currently based on the switch/callserver time, this feature uses the framework to obtain offsets from the switch time and hence the ability to calculate local time for Time of Day (TOD) Routing and select Malicious Call Trace logs. A separate activity will extend this functionality to billing.

There is no Software Optionality Control (SOC) for this activity.

The MTZ framework provides support for core based IBN, RES and M5216 KSET lines, this activity has the same limitation. However, it is assumed that this confers support for succession access lines CICM, MG9K, IADs, MTA and MG9K ABI together with SIP lines.

This activitiy is broken down into the following design components:

15.2.1 TOD Routing:

The desired behavior of the TOD Routing support with MTZ will be able to do TOD routing when MTZ exsists. This will allow a call to route based on the Time of Day even if multiple time zones and DST are present. When TOD routing occurs, a time is scheduled when to route the call. This feature will check if MTZ exists, convert the time given by the user on the individual line from the timezone they are in, into the CM clock time. The call will then be scheduled to route based on that converted time. If MTZ does not exsist, the TOD routing behavior before this feature will occur.

The TOD system is based on datafill of five tables, DAYTYPES, TODHEAD, DAYOWEEK, DAYOYEAR and TIMEODAY.

Table 1:

Table Name	Function
DAYTYPES	Defines the DAYTYPES(such as weekday, weekend, midweek etc) to be used by the other tables
TODHEAD	Defines the name (TODNAME) and the DAYTYPE for the TOD system entry.
DAYOWEEK	This table is used to map the day of the week into a DAYTYPE.
DAYOYEAR	This table is used to map the specified day of year into the DAYTYPE. This overrides the entry in DAYOWEEK based on the TODNAME.
TIMEODAY	The first four tables exist only to allow you to get to the TIMEODAY table. This table defines the actual result for the time, DAYTYPE and TODNAME.

To achieve TOD Routing, datafill of TOD routing must be done in one of the routing tables IBNRT(X), OFR(X), RTEREF of HNPACONT or FNPACONT

Table 2: TOD Route Datafill in routing tables IBNRTE, OFRT,RTEREF

Table Fields	Definition	Datafill
RTE	Route Ref Index	{0-1023}
IBNRTESEL/ RTESEL	Route Selector	CND (Condtitinal Route)
CNDSEL	Conditional Selector	TOD (Time of Day)
TODNAME	TOD Name Datafilled in the TODHEAD table	TOD Name
TIMES	ibn_time_range (results of TOD system will be resolved into this type)	{0 -15}
RTETYPE	CND_RTE_TYPE	{ST,T,SK}
{RTEREF, TABNAME -index, , SKIPNUM}	Route Ref Index Routing Table Name Number of Routes to skip	{0-1023} {Routing tables} {0-7}
INDEX	Route ref index	{0-1023}

Table 3: Example of TOD route datafill:

Table IBNRTE/OFRT

RTE: 1005

IBNRTESEL: CND

```

15.2.2 MCT Logs

There are a number of MCT logs supported by the CS2K both in the North American and International market, however, not all of these logs need to be modified for multiple time zones. The following logs have been identified by the customer as requiring support for MTZ:

LINE125
LINE126
MCT103
MCT105

For each of these logs a new field, LOCAL TIME, will be added, this field will display the local time for that subscriber line based on the switch time modified by the value in table MUTITM if assigned to that line. This feature doesn't impact when or where these logs are output.

The log report format for LINE125 is as follows:

LINE125 mmmdd hh:mm:ss ssdd INFO TRACE_ON_MALICIOUS_CALL_INI...

len DN dn INCOMING TRUNK = CKT trkid

CALLID = callid

CALLING NUMBER = dn

SOURCE = source

LOCAL TIME = <Time>

An example of log report LINE125 follows:

LINE125 APR01 12:00:00 2112 INFO TRACE_ON_MALICIOUS_CALL_INITIATED

HOST 00 0 19 20 DN 2557811999

INCOMING TRUNK = CKT ICCAMA 15

CALLID = 123456

CALLING NUMBER = 2149975015

SOURCE = CALLING NUMBER

LOCAL TIME = 10:00:00

The format for log report LINE126 is as follows:

LINE126 mmmdd hh:mm:ss ssdd INFO TRACE_ON_MALICIOUS_CALL_ INITIATED

len DN dn

CALLING LINE = LEN len DN dn onitxt

CALLID = callid

LOCAL TIME = <Time>

An example of log report LINE126 follows.

LINE126 APR01 12:00:00 2112 INFO TRACE_ON_MALICIOUS_CALL_INITIATED

HOST 00 0 19 20 DN 2557811999

CALLING LINE = LEN HOST 05 1 15 16 DN 7812001

CALLID = 123456

LOCAL TIME = 10:00:00

The log report format for MCT 103 is as follows:

MCT103 mmmdd hh:mm:ss ssdd INFO TRACE_ONMALICIOUS_CALL_ACTIVATED

CALLING_PARTY : <cli> <originating agent>

CALLED_PARTY : <full number><terminating agent>

CALLING_PARTY_CATEGORY : <cpc>

LOCAL TIME = <Time>

An example of log report MCT 103 follows:

MCT103 APR01 12:00:00 2112 INFO TRACE_ON_MALICIOUS_CALL_ACTIVATED

CALLING_PARTY : CKT ICATUPTRUNK 1

CALLED_PARTY : 2762345 LEN HOST 00 0 01 10

CALING_PARTY_CATEGORY : 16

LOCAL TIME = 10:00:00

The log report format for MCT 105 is as follows:

CALLED_PARTY : 2762345 CKT ICATUPTRUNK 12

LOCAL TIME = 10:00:00

15.3 Hardware Requirements or Dependencies

N/A

15.4 Software Requirements or Dependencies

SN09

15.5 Limitations and restrictions

The limitations and restrictions specified in activity A59038784 are also applicable to this activity.

In addition the following limitations and restrictions apply:

- Multitime Zone enhancments will not be supported if the MTZ option is not on the subscriber’s line.
- The feature is only supported on IBN/RES and M5216 KSET sets.
- MTZ is only supported by the LINE125, LINE126, MCT103 and MCT105 logs.
- The new field ‘LOCAL TIME’ will be present in all LINE125, LINE126, MCT103 and MCT105 logs irrespective of whether the subscriber is in a different time zone than the callserver. In these cases the local time will be the same as the switch time.

15.6 Interactions

This feature interacts with the existing features Multi-Time Zone, A59038784 and .A00005734, Multiple time zone option for KSET lines.

16: Functional Description (FN): A00009143

16.1 Feature name and Feature ID

A00009143: FTUP & SPIROU NAOC to VN4/VN6/ETSI PRI & H323 AOC Interworking

16.2 Description

16.2.1 Summary

This activity extends the functionality implemented in SN08 with A00006730 - French NAOC on Succession CS2K. Please refer to Figure 7, "French NAOC Support on the originating exchange" and Figure 11, "French NAOC Support on the transit exchange" for further details of this extension. The current activity implements the components for the French market by using ***FTUP(SSUTR2)*** and ***SPIROU*** as interconnect protocol between different exchanges.

This activity also extends the functionality implemented in SN08 with A00005822 - AOC Support over H323 which provides a solution to deliver AOC services to the originating agents connected to the CS2K over H323. Please refer to Figure 12, "Nodal AOC Support on the Originating Exchange" for further details of this extension. The current activity implements the AOC support over PVG for VN4 and VN6 PRI originating agents.

The supported items as an extension to activity A00006730 - French NAOC on Succession CS2K are:

- Charge message interworking to ISDN originators on the originating exchange.
  - — reception and validation of ITX charge messages.
  - — generation of Advice of Charge (AOC) messages to ***VN4 PRI*** and ***VN6 PRI*** originating agents from backwards charges received in either ***FTUP(SSUTR2)*** or ***SPIROU*** ITX charge messages (French NAOC).
  - — generation of Advice of Charge (AOC) messages to ***ETSI PRI*** and ***H.323*** originating agents from backwards charges received in ***FTUP(SSUTR2)*** ITX charge messages.
  - — error scenarios and their responses.
- Optional ITX charge recording to AMA for ***FTUP(SSUTR2)*** or ***SPIROU*** agents.

- Tandeming ITX and TXA messages between ***FTUP(SSUTR2) <-> FTUP(SSUTR2), FTUP(SSUTR2) <-> SPIROU, SPIROU <-> FTUP(SSUTR2)*** trunks at the transit exchange.

  Note: Transit of ITX/TXA messages from SPIROU to SPIROU is supported with activity A00006730-French NAOC on Succession CS2K.

- AOC using functional protocol for ***ETSI PRI*** and ***H.323*** originating agents.
- AOC using keypad protocol for ***VN4 PRI*** and ***VN6 PRI*** originating agents.

The supported items as an extension to activity A00005822 - AOC Support over H323 are:

- Nodal AOC (combined CDP and CGP scenario) support over PVG for ***VN4 PRI*** and ***VN6 PRI*** originating agents on CS2K.

  Note: A00005822 addresses two AOC Services: ***AOC-D*** and ***AOC-E***. These are also supported by this activity.

The verification items in the scope of French NAOC on CS2K are:

- Acknowledging the reception of ITX messages received over ***FTUP(SSUTR2)*** via TXA messages for ***VN4 PRI, VN6 PRI***, ***ETSI PRI, H.323*** originating agents.
- Acknowledging the reception of ITX messages received over ***SPIROU*** via TXA messages for ***VN4 PRI, VN6 PRI*** originating agents.
- French NAOC feature interaction support with the 2CLI feature.
- French NAOC feature interaction support with the Number Portability feature.
- Processing ITX/TXA charge messages received over SIP-T (FTUP) or SIP-T (SPIROU).

The verification items in the scope of Nodal AOC on CS2K are:

- Nodal AOC support for H323 to FTUP(SSUTR2) and H323 to SPIROU interworkings.
- Nodal AOC support for ETSI PRI to FTUP(SSUTR2) and ETSI PRI to SPIROU interworkings.

16.2.2 Background information

Network **A**dvice **O**f **C**harge (NAOC) implements the tariffing of calls in a deregulated telecom market. It can operate

- in a **single carrier environment**, where tariffs are sent between different nodes within the same carrier's network.

- in a **multiple carrier environment**,
  - — where tariffs have to be exchanged between different network operators.
  - — where all the tariffs are available on the originating local exchange and there is no need to receive and process tariffs between different operators.

If the originating exchange does not know the tariff to be applied, it has to receive the tariff information over the network from an other exchange.

From the point of view of the **NAOC** service there are two different types of nodes involved in the tariffing of a call in a multiple carrier environment:

1. **CDP** - The main function of the **Charge Determination Point** is to determine which tariff should be applied. The CDP is located in the network of the carrier chosen by carrier selection.

   The tariff information is either sent in an charge message over the network (CDP and CGP on the different exchanges) or passed internally to the CGP interface (CDP and CGP on the same exchange).

2. **CGP** - The **Charge Generation Point** is an exchange where the received charging information is converted into a format that is delivered to the subscriber.

   The CGP is located in the Originating Local Exchange (OLE) that receives the charging information from the **CDP** and routes this information to an originator who has subscribed the **AOC** service.

Operators can be classified in 3 categories from an NAOC point of view.

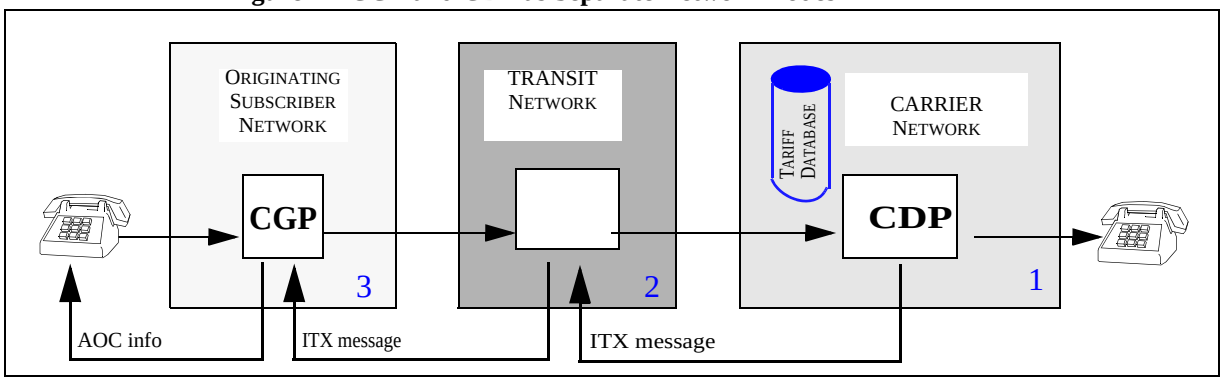
3. ***indirect access operators*** (carrier operators) responsible to generate charge messages (ITX messages) and to feed them in backward direction into another operator's network.
4. ***transit operators*** responsible for receiving the charging messages and tandeming them in backward direction.
5. ***originating operators*** responsible for receiving the charging message on an originating local exchange (OLE), converting them into AOC information and applying them to the supported originating agents.

Based on these types of network nodes, there are two scenarios which have been considered for **NAOC**:

- **CDP** and **CGP** are located in different networks, so that the **CDP** has to send the tariff information over the network boundaries to the **CGP**. Please refer to Figure 1, "CGP and CDP as Separate Network Nodes". This

scenario is dressed by the current activity as an extension to activity A00006730.

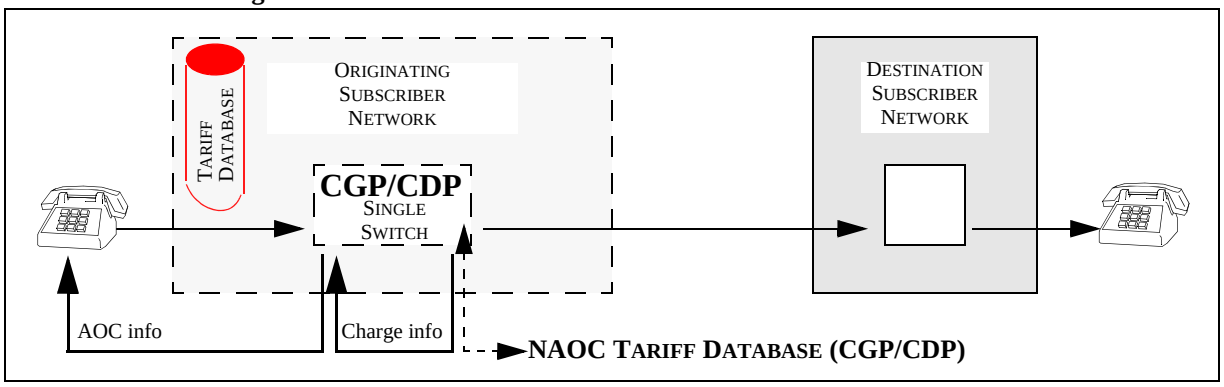
Figure 1 CGP and CDP as Separate Network Nodes



Note: ***ITX message generation*** (CDP functionality) is not supported by this activity while ITX message reception and transit are supported.

- **CDP** and **CGP** are located on the same exchange (**combined CGP/CDP scenario**). Tariff information is retrieved internally from the local tariff database and can be pulsed out to the subscriber. Please refer to Figure 2, "Combined CGP and CDP". This scenario is addressed by the current activity as an extension to activity A00005822.

Figure 2 Combined CGP and CDP



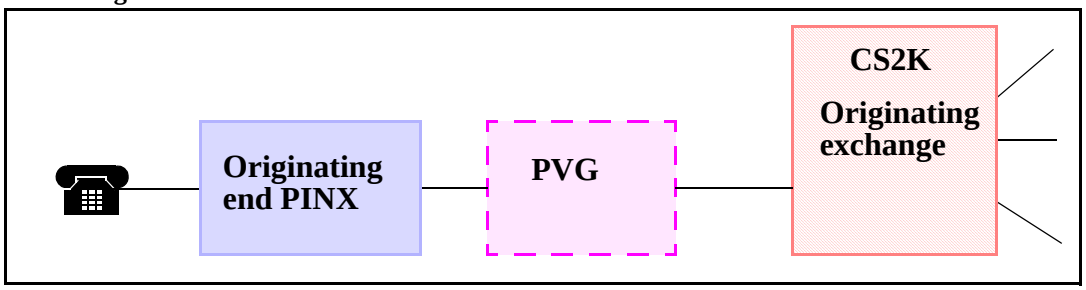
Advice **O**f **C**harge (**AOC**) gives the CS2K Call Server the ability to send network incurred charges to the ISDN subscriber within call control or facility messages.

The AOC service is delivered in three flavors:

AOC-S	Advice Of Charge at call Setup
AOC-D	Advice Of Charge During the call
AOC-E	Advice Of Charge at the End of the call

This activity addresses two AOC services: ***AOC-D*** and ***AOC-E*** like in A00005822. These services are deployed for originating agents connected to the CS2K over PVG. Please refer to Figure 3, "AOC over PVG". For the AOC calculation, the CS2K node has to be configured to determine and apply the tariffs (nodal configuration or combined CGP/CDP).

Figure 3 AOC over PVG



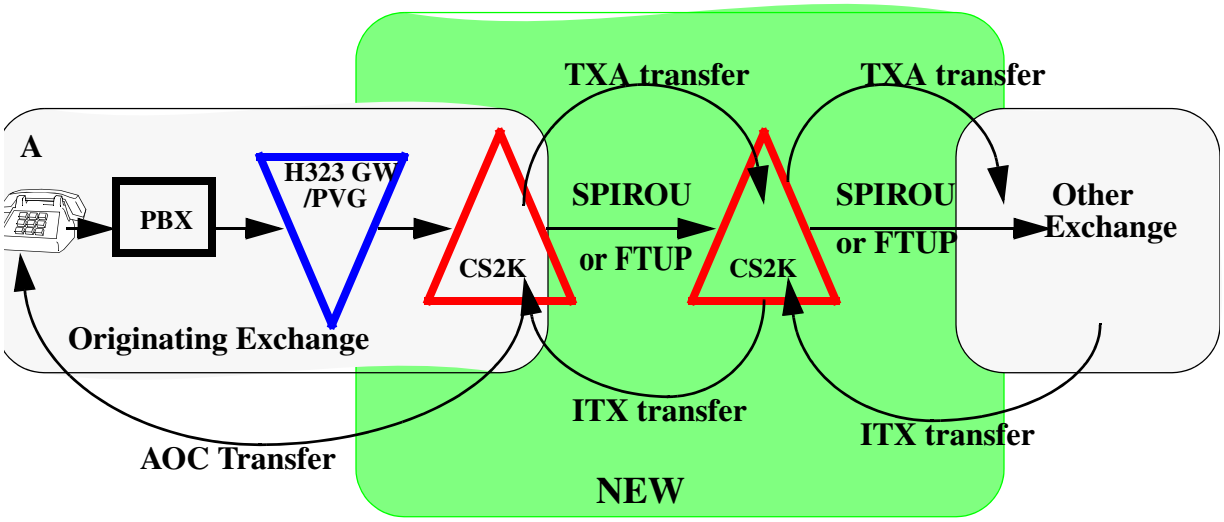
16.2.3 Feature description

'French NAOC' allows service provider to receive charging information over the signalling system during the call and hence to control the billing for the call.

FTUP(SSUTR2) & SPIROU supports the capabilities in the charging service, using nationally defined messages ITX (Charge Unit) and TXA (Charging Acknowledgement). Please refer to Figure 4, "New functionality does bridging between AOC and FTUP/SPIROU NAOC" for further details.

- The following applications are supported on the CS2K for FTUP(SSUTR2) & SPIROU agents in the scope of **French NAOC** support:
  - — ***Charge message interworking to ISDN originators*** on the originating exchange. Please refer to Section 16.2.3.1.
  - — ***Charge message billing***: Allows an alternate operator to receive ITX messages and use them to bill the calls. Please refer to Section 16.2.3.2.
  - — ***Charge message tandeming*** between ***FTUP(SSUTR2) <-> FTUP(SSUTR2), FTUP(SSUTR2) <-> SPIROU, SPIROU <-> FTUP(SSUTR2)*** trunks on the transit exchange. Please refer to Section 16.2.3.3.
  - — AOC using ***functional protocol*** for ***ETSI PRI*** and ***H.323*** originating agents. Please refer to Section 16.2.3.4.
  - — AOC using ***keypad protocol*** for ***VN4 PRI*** and ***VN6 PRI*** originating agents. Please refer to Section 16.2.3.5.
- Verifications for **French NAOC** support (listed in Section 16.2.1) provided by this activity can be found in Section 16.2.3.6.

Figure 4 New functionality does bridging between AOC and FTUP/SPIROU NAOC



- '**Nodal AOC**' (combined CDP and CGP) described in Figure 2, "Combined CGP and CDP" is supported for ***VN4 PRI*** and ***VN6 PRI*** originating agents over PVG gateway on CS2K. Please refer to Section 16.2.3.7 for further details.

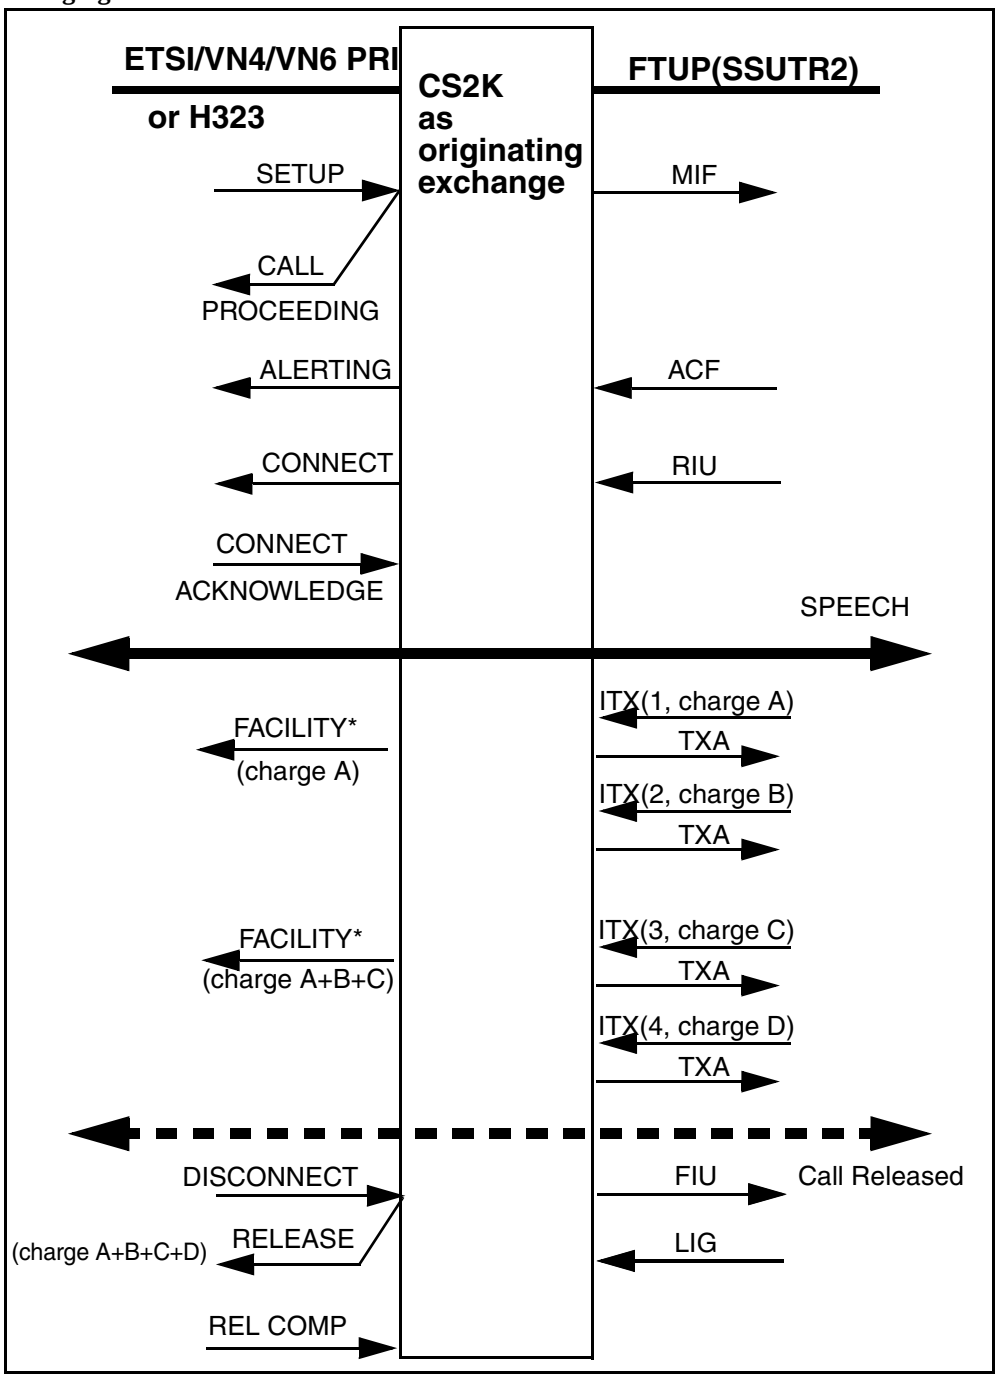
16.2.3.1 Charge message interworking to ISDN originators for French NAOC Support

Allows an alternate operator to present charge information from ITX messages received over FTUP(SSUTR2) or SPIROU trunks to ISDN users using the Advice of Charge (AOC) service. The supported functionalities are:

- reception and validation of ITX messages.
- generation of Advice of Charge (AOC) messages to ***VN4 PRI*** and ***VN6 PRI*** originating agents from Backwards charges received in either ***FTUP(SSUTR2)*** or ***SPIROU*** ITX messages (French NAOC).
- generation of Advice of Charge (AOC) messages to ***ETSI PRI*** and ***H.323*** originating agents from Backwards charges received in ***FTUP(SSUTR2)*** ITX messages.
- error scenarios and their responses. For more information see "ANNEX B: Handling receipt of ITX messages" on page 329.

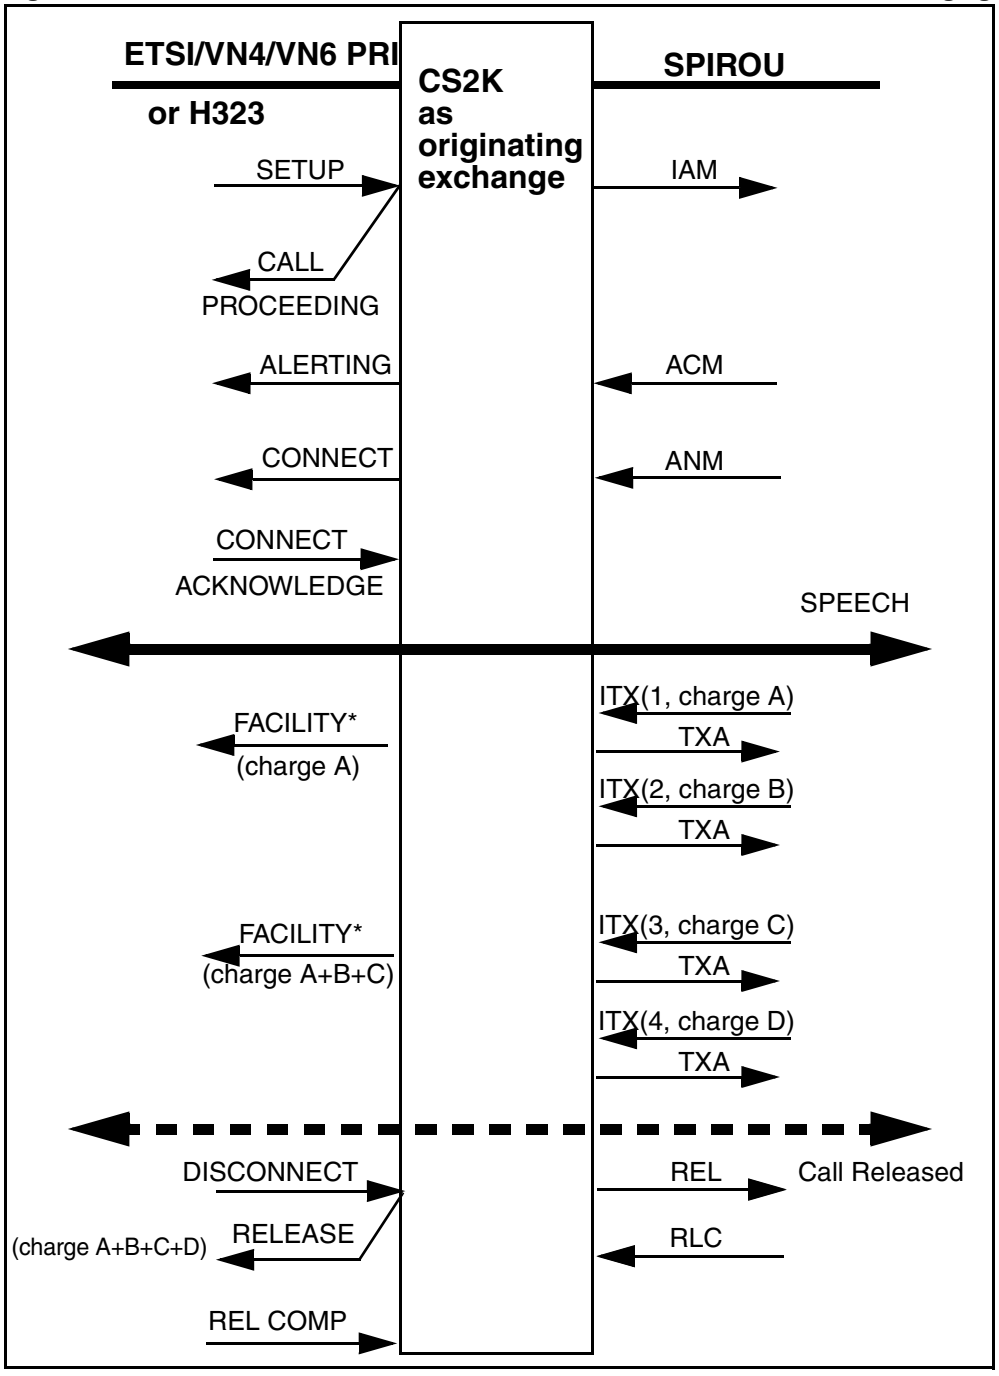
Figure 5, "ETSI/VN4/VN6 PRI or H323 to FTUP(SSUTR2) AOC-D with Backwards Charging" and Figure 6, "ETSI/VN4/VN6 PRI or H323 to SPIROU AOC-D with Backwards Charging" show the messaging for AOC-D where CS2K is an originating exchange.

Figure 5 ETSI/VN4/VN6 PRI or H323 to FTUP(SSUTR2) AOC-D with Backwards Charging



*: For VN4/VN6 PRI originating agents, INFO messages are used instead of FACILITY messages.

Figure 6 ETSI/VN4/VN6 PRI or H323 to SPIROU AOC-D with Backwards Charging



*: For VN4/VN6 PRI originating agents, INFO messages are used instead of FACILITY messages.

Figure 7, "French NAOC Support on the originating exchange" indicates all supported interworkings for each of the relevant originators, in the French market context. French NAOC is only applicable to SSUTR2(FTUP) and SPIROU trunks hence this feature is only applicable to the interworkings marked blue, other supported interworkings where French NAOC is not applicable are marked yellow. The interworkings with SIP-T trunks are tested for verification. “X” indicates the interworkings where French NAOC and interworkings are being supported with this feature.

16.2.3.2 Charge message billing in French NAOC Support

This capability includes presentation of the charging information in AMA billing record if the outgoing SPIROU or FTUP(SSUTR2) trunk is datafilled as supporting the French NAOC Service (option TELETAXE in table TRKOPTS). Please refer to AU3283 for required billing datafill.

The CS2K may optionally store the number of charge units from ITX messages and produce an AMA record with the total number of charge units received. This capability exists both in originating and transit exchange.

16.2.3.3 Charge message tandeming for French NAOC Support

This capability includes transit of ITX messages (FTUP(SSUTR2) to SPIROU, SPIROU to FTUP(SSUTR2), FTUP(SSUTR2) to FTUP(SSUTR2)). Please refer to Figure 8, Figure 9 and Figure 10 for further details.

Note: Transit of ITX messages from SPIROU to SPIROU is supported with activity A00006730-French NAOC on Succession CS2K.

For transit calls, the CS2K normally transits the ITX and TXA messages unchanged. That is, it passes on the ITX message without sending a TXA in reply. The TXA acknowledgement is sent by the originating switch and the CS2K transits the TXA message when received. No checking of the ITX or TXA message contents are performed.

Figure 8 CS2K as interconnect exchange between SPIROU and FTUP(SSUTR2) trunks

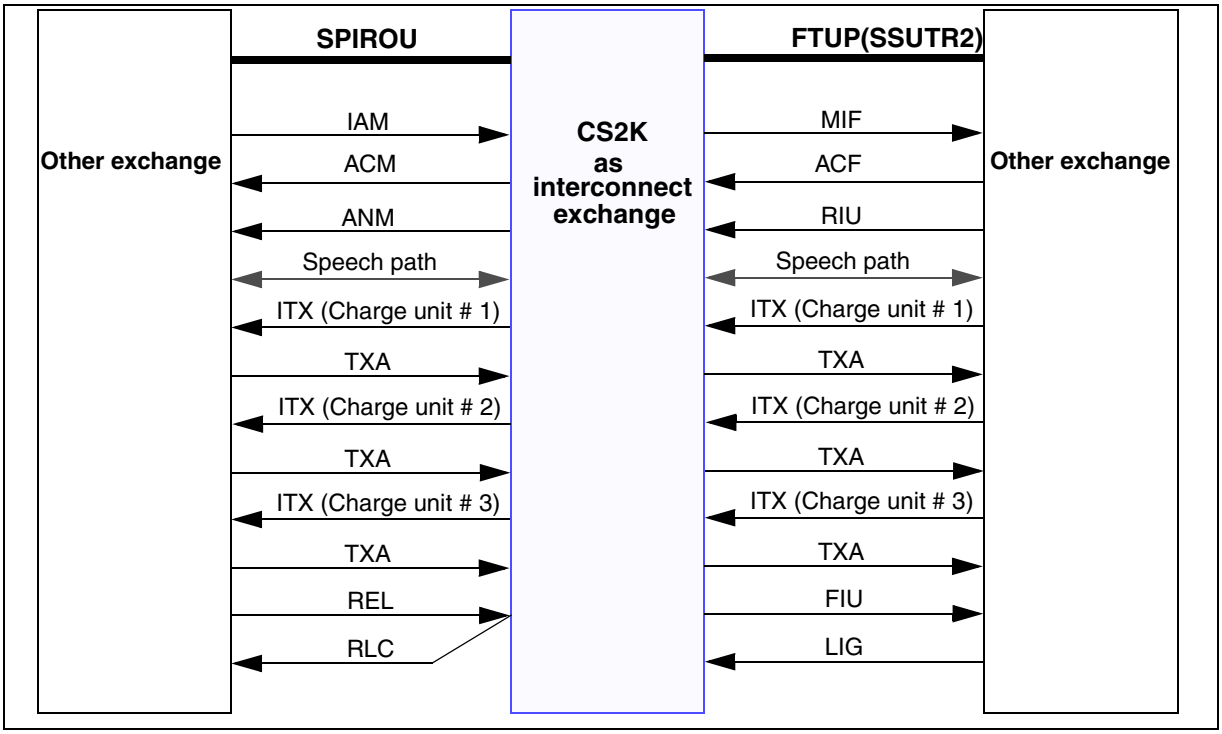

Figure 9 CS2K as interconnect exchange between FTUP(SSUTR2) and SPIROU trunks

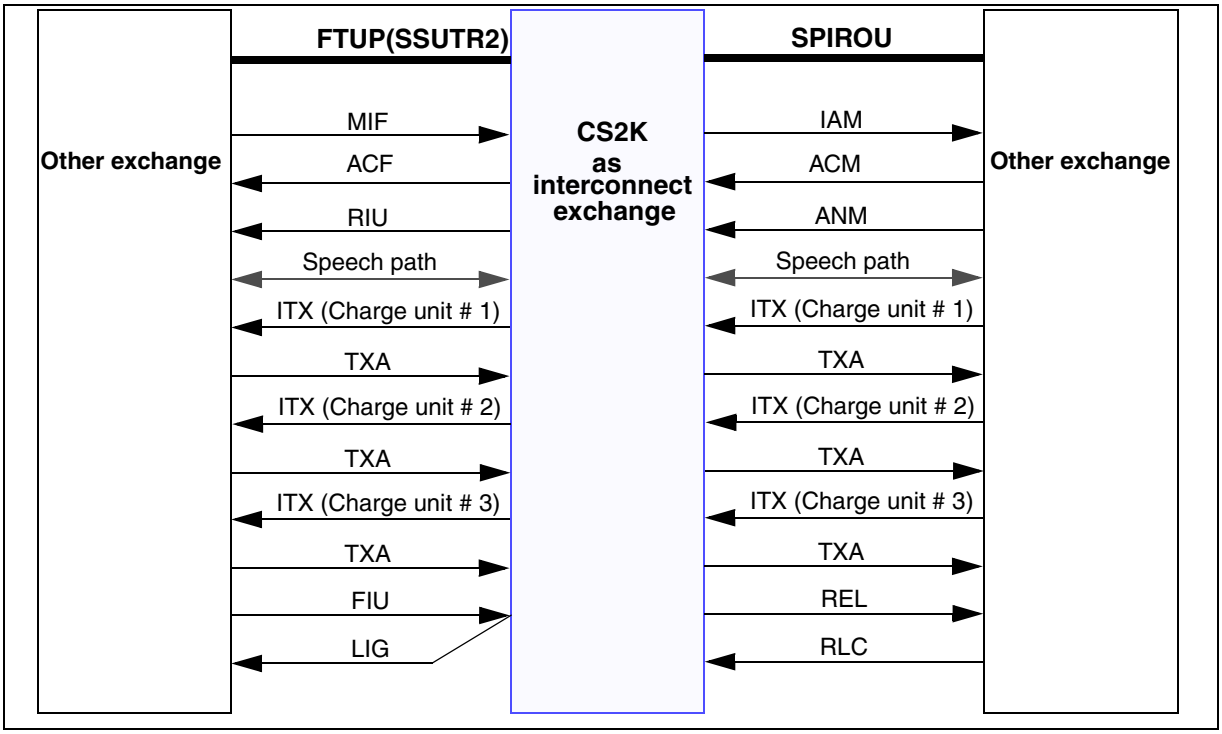

Figure 10 CS2K as interconnect exchange between FTUP(SSUTR2) and FTUP(SSUTR2) trunks

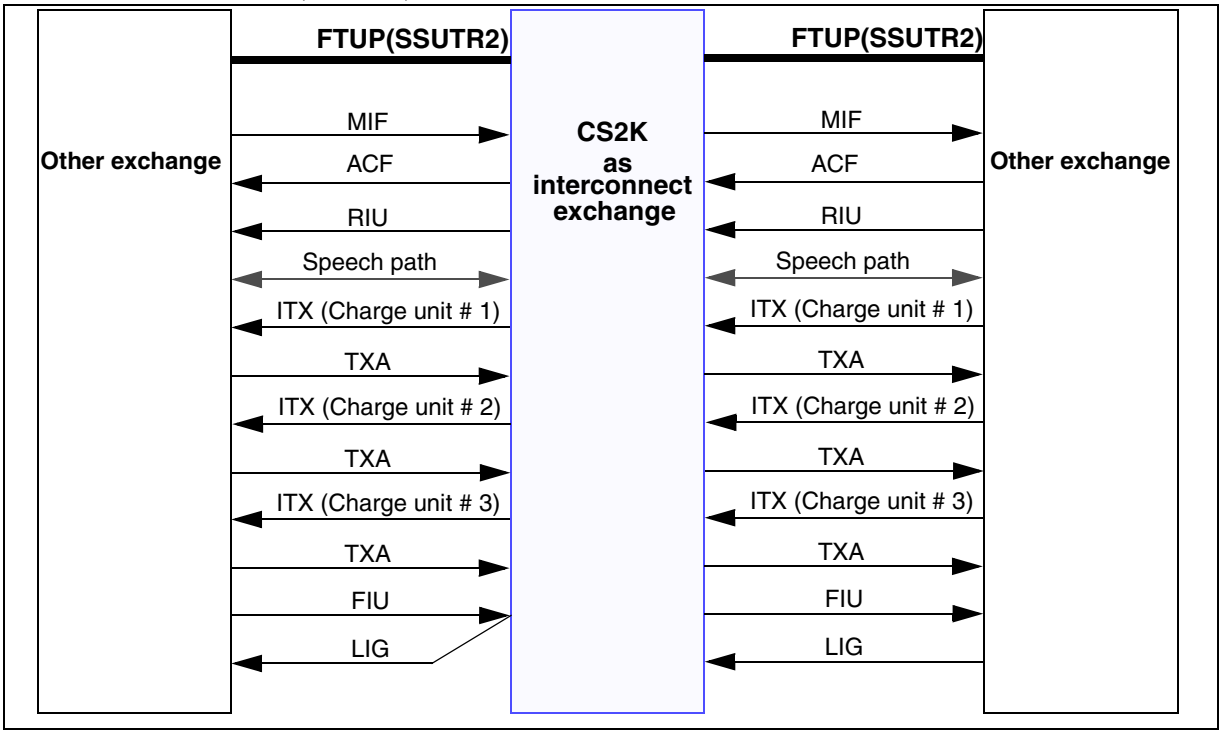

Figure 11, "French NAOC Support on the transit exchange" indicates all supported interworkings for each of the relevant originators, in the French market context. French NAOC is only applicable to SSUTR2(FTUP) and SPIROU trunks hence this feature is only applicable to the interworkings marked blue, other supported interworkings where French NAOC is not applicable are marked yellow. The interworkings with SIP-T trunks are tested for verification. “X” indicates the interworkings where French NAOC and interworkings are being supported with this feature.

16.2.3.4 Functional Protocol

AOC using functional protocol is supported for the following agents on the originating exchange:

— ETSI PRI

— H323

16.2.3.5 Keypad Protocol

AOC using keypad protocol is supported for the following agents on the originating exchange:

— VN4 PRI

— VN6 PRI

16.2.3.6 Verification for French NAOC Support

The following are verified in this activity:

— French NAOC supports acknowledging the reception of ITX messages received over ***FTUP(SSUTR2)*** via TXA messages for ***VN4 PRI, VN6 PRI***, ***ETSI PRI*** and ***H.323*** originating agents.

— French NAOC supports acknowledging the reception of ITX messages received over ***SPIROU*** via TXA messages for ***VN4 PRI*** and ***VN6 PRI*** originating agents.

— French NAOC feature interaction support with the 2CLI feature.

— French NAOC feature interaction support with the Number Portability feature.

— French NAOC supports by adding processing ITX charge messages received over SIP-T (FTUP) or SIP-T (SPIROU) via TXA messages for the following agents:

— VN4/VN6/ETSI PRI

— H323

16.2.3.7 Nodal AOC Support

A brief overview of the supported agent interworkings is given below. The combinations of supported interworkings are listed in Figure 12, "Nodal AOC Support on the Originating Exchange". Only the agents marked blue and with “X” are being supported. Agents marked yellow and with “V” is verified with this activity.

16.3 Hardware Requirements or Dependencies

N/A

16.4 Software Requirements or Dependencies

This activity does not require any additional SOC. The following features are required to be activated by SOC for the originating exchange:

— ***NETK0024*** Network AOC Tariff

— ***NETK0019*** Network AOC

— ***NSUP0020*** NAOC/PCA Supp Svcs

— ***PBXT0011*** ETSI PRI Info

— ***PBXT0018*** QSIG AOC

— ***SULN0011*** AOC on ETSI BRI

16.5 Limitations and restrictions

The current activity does not introduce any new limitations or restrictions except VN4/VN6 restrictions explained in Section 16.5.4.

The restrictions and limitations valid for this activity have been introduced by the previous activities. Please refer to restrictions of these activities AF7344 [35], A59024423 [36], A590038835 [37], A59020791 [33], A00005822 [25], A00006730 [42] about other related restrictions and limitations.

16.5.1 Generic Limitations:

- AOC-S (AOC at call setup) is not supported.
- Provisioning of AOC can only be per trunk group and per GWC. AOC request is always on a per call basis.
- Only connection-oriented charging information is transmitted to the user (charges for supplementary services are not included).
- The calculation of the charging rate time interval can produce a result which is not an exact multiple of 100 ms. The result is therefore rounded up to the next 0.1 sec multiple.
- Interactions with supplementary services other than those specified in the AOC standards will not be handled.
- any ‘aocComplete’ request at Call Transfer will be rejected with a ReturnError APDU with error code ‘supplementaryServiceInteractionNotAllowed’.
- any ‘aocDivChargeReq’ will be ignored but not passed along towards the terminator.

- A conversion factor change does not affect calls in progress; it only affects calls established after the change.
- The design is based on the assumption that AOC will never be delivered by another Call Server located from the Call Server towards the terminating party. Therefore, AOC charge requests can not be passed through the Call Server. Incoming Facility Information Elements (from the terminating side) with operations '***aocInterim***', '***aocFinal***' or '***aocRate***' will be discarded by the GWC and therefore not pass through the CS2000.
- AOC charge requests arriving at the CS2000 after CONNECT are always rejected by the CS2000. This means: no AOC service will be provided for any charge requests received after CONNECT.
- According to the AOC specification it does not make sense to send more than one AOC APDU per message. If an incoming message or Facility IE contains more AOC InvokePDUs, only the first APDU per message is considered. The remaining APDUs are passed through towards the terminating party.
- If an AOC charge request is received in a FACILITY message during the overlap sending phase and before enough digits were received to route, the following situation may lead to failure to provide the service: the reception of the remaining digits necessary to find a route takes longer than 15 seconds. The reason is timer T1 >= 15 seconds running in the originating PINX, waiting for a reply to the request. This timer may time out, because CS2000 can send the reply only when it found the route. As a result, the PINX will report '***notAvailable***' to the user and ignore the AOC information received from CS2000.
- Table ***TRKOPTS***, AOC option, AOCREL = Yes datafill does not have an effect in the following situations (calls are not released):
  - — no AOC service is provisioned, but a request is received. The request is replied with '***notAvailable***' and the call continues. No CS2000 log is generated.
  - — QSIG AOC is provisioned with protocol type KEYPAD or with charging type CHARGING (units). These situations will not even lead to '***notAvailable***' replies, they will lead to GWC Swerrs and CS2000 PM189 logs, and no AOC information being sent out.
- The content of the Interpretation APDU in the AOC requests is not checked by CS2000. But the actions taken (which would depend on it) are always according to the AOC standard.

16.5.2 H323 limitations

- Sending of AOC charge information as currency units is not supported for H.323 trunks yet.

- AOC on H.323 is only supported for bearer calls. AOC on H.323 for non-bearer calls is not supported. Facility IEs with AOC operations for these calls are transparently passed through the CS2K.
- In case no system resources are available in the GWC, a FACILITY message with a Facility IE coded “chargeNotAvailable” is sent towards the originating H.323 gateway.
- Race condition: If a call has AOC-D activated, the originating H.323 gateway might receive a FACILITY message after it sent out a ‘getFinalCharge’ request. This message should not cause an erroneous charge display because it will be received before the RELEASE COMPLETE message with the final charge.
- Basic Service discounts are not supported on H.323 because there is no formal definition of Basic Service for H.323, even though Bearer Capability and High Layer Compatibility are both defined. This means that table AOCBSDSC will not be used by AOC on H.323.
- For calls routed to tones or announcements the charge provided is either ‘freeOfCharge’ or totally missing (which should cause the originating H.323 gateway to report ‘notAvailable’ to the end user).
- A dummy sourceEntityAddress = 0 will be coded in the NFE of outpulsed Facility IEs, because PINX are not supported by QSIG GF.

16.5.3 GWC limitations

- The feature is supported over GWC Warm Swacts. No errors are expected for Swacts with both units InSv. If the inactive unit is RTS’ed and then a Swact happens, there can be errors for the calls that were in talking state at RTS.
- When changes are done in the table ***SERVRINV***, these are not dynamically reported the GWC. After adding the AOC option, the GWC has to be double swacted in order for the changes to take effect
- The SESM interface for table ***SERVRINV*** does not support the AOC option. This option has to be manually added to the table SERVRINV.

16.5.4 VN4/VN6 limitations

- While datafilling table TRKOPTS for VN4/VN6 PRI trunks, only PROTOCOL = KEYPAD datafill is functional. Functional protocol is not supported for these trunk agents.

16.5.5 CM switch activity restrictions

The stable teletaxe service calls remain in the answered state after a CM warm swact or a CM no restart swact (NRS). But a warm/no restart swact will affect the total charge units populated in the billing records.

As the charge units are stored in the history data block (HDB) and since HDB information is not transferred from the active side to the inactive side during the CM swact, the charge units accumulated before the swact will be lost. Hence the billing records generated after the swact will **not** contain the correct charge unit information.

16.5.6 GWC switch activity restrictions

The CS2K is unable to support services over an extended peripheral module (GWC) swact (warm/cold). Given the requirements of the SSUTR2 specification referred to in the ART SPIROU specification (document reference) for backwards Advice of Charge (AOC) handling of error conditions, the following actions occur after GWC swact on an answered call with AOC.

16.5.6.1 Outgoing trunk

The call remains in answered state after an GWC swact has occurred. The inactive unit is not synchronized with the Sequence Number and Last Charge Delta as each ITX message is received. Following an GWC swact, the subsequent received ITX message is **not** verified according to the SSUTR2 specification referred to in the ART SPIROU specification (document reference [40]. Sequence Number and Last Charge Delta are updated **from this ITX message** to provide validation of **further** consecutive ITX messages. Therefore verification of the first ITX message after an GWC swact is ignored. Each following ITX message is verified again.

16.5.6.2 Transit exchange

Transiting of ITX and TXA messages is unaffected by an GWC swact.

Annex A: ITX and TXA Message Formats

SPIROU backward charging messages and parameters are shown in table 1 and 2.

Table 1 ITX message format

Parameter	Type	Value	Length (octets)
Message type	F	#E1	1
Charge unit number	F	Number of charge units	1
Message number	F	Message sequence number	1
End of optional parameters	O	All zeros	1

Table 2 TXA message format

Parameter	Type	Value	Length (octets)
Message type	F	#E2	1
End of optional parameters	O	All zeros	1

FTUP(SSUTR2) backward charging messages and parameters are shown in table 3 and 4.

Table 3 ITX message format

Parameter	Type	Value	Length (octets)
Message header code	F	#40	1
Call charge allocation domain	F	Number of charge units	1
Message number	F	Message sequence number	1

Table 4 TXA message format

Parameter	Type	Value	Length (octets)
Message header code	F	#80	1

ANNEX B: Handling receipt of ITX messages

16.1 CS2K as an originating exchange

This summarizes how ITX messages are handled by the CS2K when it is the originating exchange.

- The first ITX message received for a call must have its message number set to 1.
- The originating CS2K responds with a TXA message to indicate success within 10 seconds after receiving the ITX message.
- The CS2K takes the number of charge units from the Charge unit number parameter and stores it for that call.

- The exchange which has generated the ITX message waits for 15-20 seconds for the TXA acknowledgement. If no TXA is received within that time, it resends the ITX message. If no TXA is received within 60 seconds of the second ITX message, the call is released.
- Subsequent ITX messages must have the message number incremented (up to 255, when it will start from 1 again). If correct, the number of charge units is added to the total for that call and a TXA message is sent in response.
- If the Message number and Charge unit number in an ITX message are identical to those in the previous one, a TXA message is returned and the message is ignored.
- Receipt of ITX messages may continue until the call is released. The arrival rate of ITX messages may vary.
- Once the call is released, an AMA call record will optionally be produced with the total number of charge units received, depending on billing datafill.

16.2 Error handling

When an error occurs during receipt of ITX messages, a billing record is still produced for the call, otherwise this information is lost (and fraud could result). The AMA record will contain an indication that the call was released due to abnormal signalling.

ITX errors are handled as shown in Table 1.

Table 1 Error handling (CS2K as originating exchange)

Error	Action
An ITX is received before both the ACM/ACF and the ANM/RIU.	A reset is implemented on the circuit involved and the call attempt is automatically repeated on another circuit
An ITX is received after the ACM-ACF but before the ANM/RIU.	The ITX is ignored and a PM 189 log is generated.
An ITX is the first ITX received for a call but its Message number is not 1.	The CS2K releases the call and a C7UP 102 log is produced, indicating that the call was released due to abnormal signalling conditions.
An ITX is not the first ITX received for a call, and its Message number is not: • the same as the number of the immediately preceding ITX, or • consecutive to the number of the immediately preceding ITX	

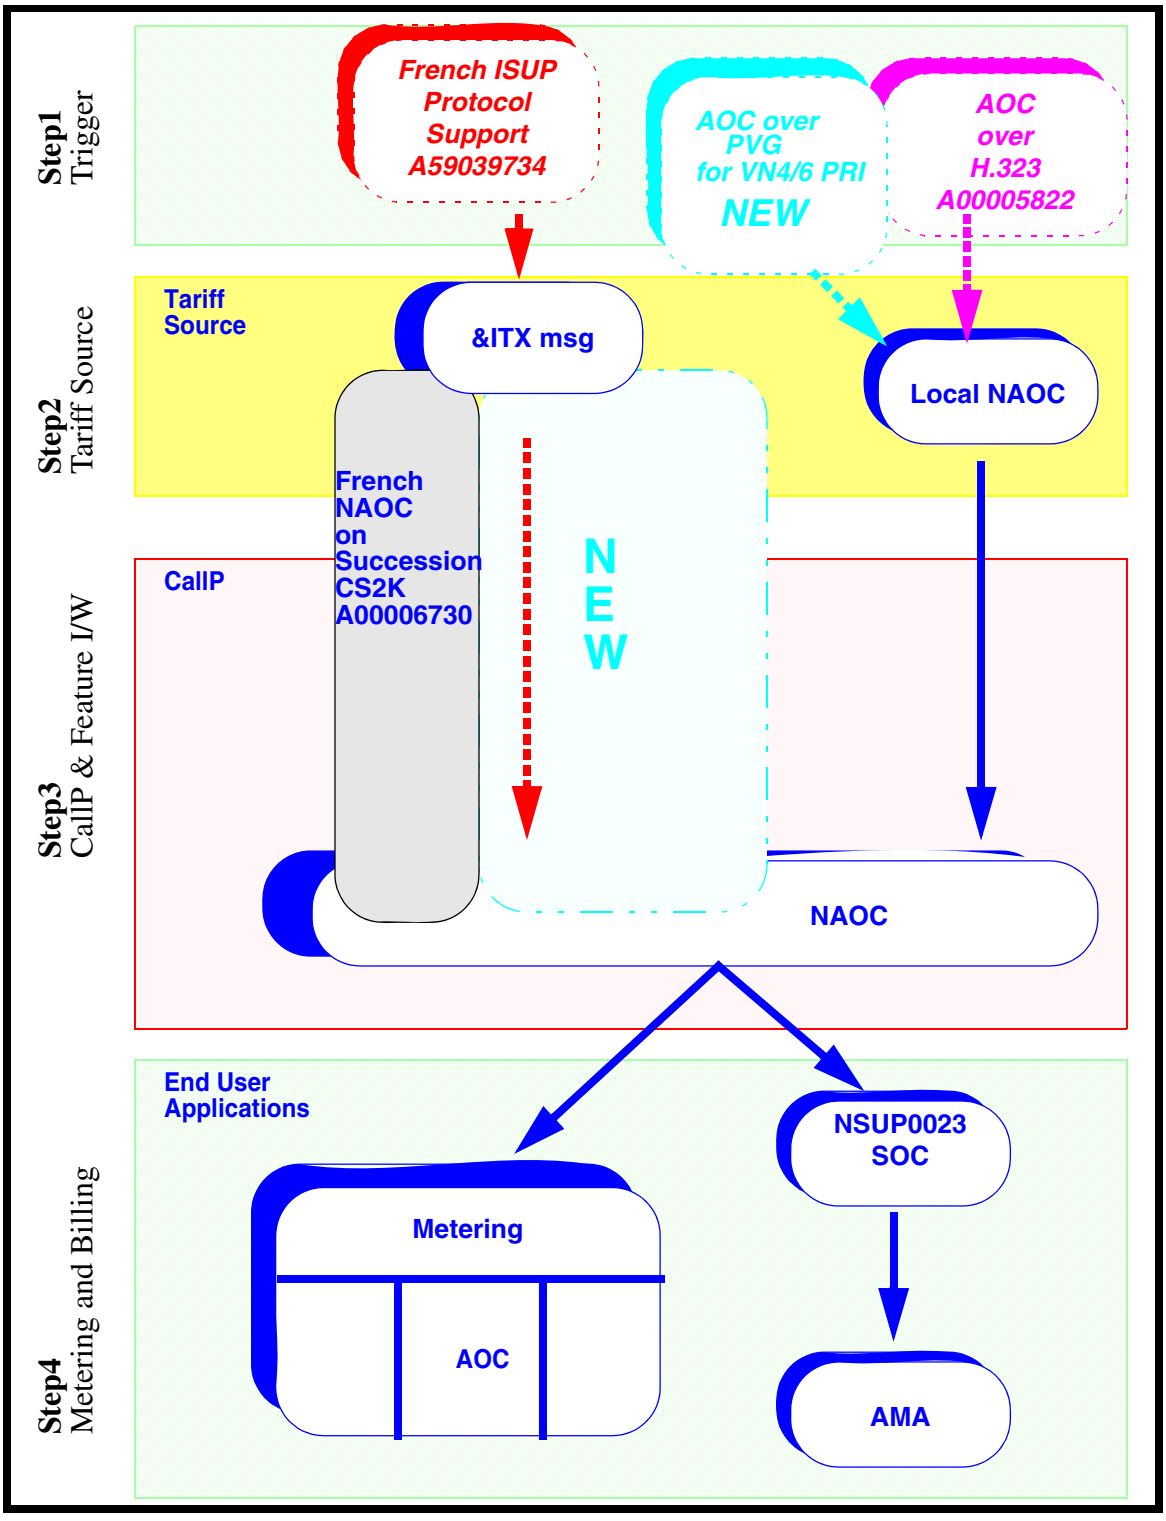
ANNEX C: Current content

The current functionality bridges between the existing features:

- French ISUP support provided on the CS2K by a CSA activity on top of A59013177 and 59034822
- AOC over H.323 (A00005822)
- NAOC metering framework on CS2K (A89007454, 59032878)
- French NAOC on Succession CS2K (A00006730)

See the following Figure 1, "How the new content interacts with existing French NAOC and Nodal AOC feature" for further details.

Figure 1 How the new content interacts with existing French NAOC and Nodal AOC feature



17: Functional Description (FN): A00009145

17.1 Feature name and Feature ID

A00009145: Record Feature Usage

17.2 Description

The purpose of this activity is to provide detailed information about the subscriber action of a service usage at the billing records.

With this activity, developed in ISN09 (MMP22) release, DMS - MMP is capable to give detailed information about the subscriber feature actions as a billing record. By using these billing records, Telco's can charge their customers for their feature usage, if desired.

Feature usage indication is provided for ***Call Lock (ILR), Call Waiting (ICWT), Abbreviated Dialing (SCL), CLIR (SUPPRESS + CNDB), AUL, Do not Disturb (CDND), Directory Number Hunting (DNH)***, and ***Call Wake Up (IWUC)*** upon subscriber actions which are ***activation, deactivation, interrogation,*** and ***customer usage***, where applicable. Crafts person operations via SERVORD are not supported.

This activity is implemented only for IBN lines and provides recording of the feature usage depending on the state of a new AMAOPTS option, which is created by this activity. When this option is ON, a new AMA record is generated and MC611 is appended to this AMA record to indicate the subscriber actions.

When the AMAOPTS option is set to ON and one of the requested features (*) is activated, deactivated, interrogated, or used by the end user, a separate billing record is generated immediately to indicate that user action. This billing record provides the following information within the described fields as below:

- **Feature Subscriber DN:** Stored in the Originating Open Digits 1 field of the Structure Code.
- **Date:** Stored in the Date field of the Structure Code
- **Time:** Stored in the Connect Time field of the Structure Code.
- **Feature Code:** Stored in the Service Identifier field of the module code MC611 context ID 80024
- **Action Type:** Stored in the Service Event field of the module code MC611 context ID 80024.

Note: * stands for the requested set of features which consists of Call Lock (ILR), Call Waiting (ICWT), Abbreviated Dialing (SCL), CLIR (SUPPRESS + CNDB), AUL, Do not Disturb (CDND), Directory Number Hunting (DNH), and Call Wake Up (IWUC).

Feature Subscriber DN represents the IBN line agent which uses the feature actions.

Date is the date at which the feature action is initiated.

Time is the time when the feature action is initiated.

Feature Code is used to represent each feature in the requested set by a feature ID uniquely.

Action Type is used to represent the feature action types which are usage, interrogation, subscriber activation, and subscriber deactivation.

The feature actions; activation, deactivation, interrogation, and usage are not applicable for all of the features in the requested set. A detailed description about which action applies to which feature is given in Table 1 - Feature Requirement List.

Table 1: Feature Requirement List

Feature Name	Feature Option	Act/Deact Billing	Interr. Billing	Feature Usage Billing	For Release

Call Hold Send the Music	IBN CHD	Not requested	Not requested	Y	Further Releases

17.2.1 Background

17.2.1.1 Existing AMA Record and MC611 Components Used in This Feature

In the existing billing framework, an AMA record consists of a base Structure Code and optional Module Codes containing specific information relevant to the call. If any information is necessary in addition to that contained in a base structure, this information is appended to the base structure in the form of module codes. (For detailed information about Structure Codes and Module Codes please refer to the NTP documents 297-1001-830 and 297-9051-800.)

In this implementation, feature actions are recorded in the form of AMA billing records. The Feature Subscriber DN, Date, and Time info related to the feature action are stored in the base structure of the record. Whereas, Feature Code and Action Type are stored in MC611 with CCI_80024 and this module code is appended to the structure code. The fields of MC611 with CCI_80024 and an example structure code can be seen in Table 2 and Table 3.

Table 2: Structure Code 00514

Information	Number of BCD Characters

Table 3: MC611 with CCI_80024

BCD character	Meaning
1 - 12	Service Identifier Up to 6 EBCDIC characters
13 - 14	Service Event 00 = Unidentified 01 = Provisioning of service to line 02 = Removal of service from line 03 = Administration Programming 04 = Subscriber Programming 05 = Interrogation of Service 06 = Usage of service 07 = Subscriber Activation of Service 08 = Administration Activation of Service 09 = Subscriber Deactivation of Service 10 = Administration Deactivation of Service
15	Not used
16	Sign (hex C)

MC611 with context identifier 80024 is the SUSB context and it is already used in MMP to provide Subscriber Usage Sensitive Billing. For instance, when the SOC option RBIL0005 and the SUSP option in Table AMAOPTS are ON, a billing record with MC611 is generated upon end user's activation of the SACB feature. SOC RBIL0005 must be ON to be able to use SUSB billing.

In this activity, a new AMAOPTS option named MC611_FOR_RFU (where RFU stands for **R**ecord **F**eature **U**sage) is created to control the recording of feature actions. Subscribers' feature actions are recorded only if the MC611_FOR_RFU option is set to ON. A brand new billing record is generated after the feature action is initiated. The Feature Subscriber DN, Date, and Time info are put in the Originating Open Digits 1, Date, and Connect Time fields of this record, respectively. After that, module code MC611 with CCI_80024 is generated. Feature Code and Action Type are put in the Service Identifier and Service Event fields of the MC611 and it is appended to the just created Structure Code.

In Figure 1, an example billing record with MC611 can be seen, which is created for the usage of the AUL.

Figure 1 Example view of the record taken with the CALLDUMP FULL command

GENERIC DIGIT STRING ONE:       81A493000000060C
MODULE CODE:                000C     FINAL MODULE
```

In this figure, Generic Digit String One is interpreted as below:

81A493000000060C

- First twelve characters serve as the Service Identifier
  "81" = a, "A4" = u, "93" = l ---> AUL
- The remaining six characters of the first twelve are represented with zeroes, since there are only three letters in the feature acronym.
- The next two characters, "06", represent the service event, which is usage here.

Generic Digit Strings for the features included in the requested set can be seen in Table 4.

Table 4: Generic Digit Strings

Feature	Service Identifier
AUL	81A493000000**XX**C
CDND	838495840000**XX**C
CNDB	839584820000**XX**C
DNH	849588000000**XX**C
ICWT	8983A6A30000**XX**C
ILR	899399000000**XX**C
IWUC	89A6A4830000**XX**C
SCL	A28393000000**XX**C
SUPPRESS	A2A497979985**XX**C

Note: The XX in the Digit String can be 1- 04 for Subscriber Programming, 2- 05 for interrogation, 3- 06 for usage, 4- 07 for Subscriber Activation, 5- 09 for Subscriber Deactivation as shown in Table 3.

17.2.2 Provisioning for Feature Recording

17.2.2.1 Office Wide Parameters:

1. To enable feature recording, the AMAOPTS option MC611_FOR_RFU, created by this activity to make feature recording optional, is set to ON.
2. To disable feature recording, MC611_FOR_RFU is set to OFF.

Figure 2 Provisioning of the new AMAOPTS option MC611_FOR_RFU

```
> Table AMAOPTS

OPTION SCHEDULE
---------------
MC611_FOR_RFU ON
>
```

17.2.2.2 Software Optionality Control

No new Software Optionality Control is created by this activity.

This activity implements a SUSB like recording of feature actions. SUSB can be summarized as DMS's ability to create a billing record per use of a feature action. The features can be billed based on activation, programming, deactivation, or usage. Module code 611 is appended to some of the structure codes during pay per use billing. It uses the context identifier 80024 which has been approved by Bellcore. The existing SOC option RBIL0005 - Subscriber Usage Sensitive Billing must be ON to generate SUSB records.

17.3 Hardware Requirements or Dependencies

No new customer hardware requirements or dependencies are introduced in this feature.

17.4 Software Requirements or Dependencies

This feature uses the existing AMA/Billing framework and the existing components of this framework.

17.5 Limitations and Restrictions

- This activity is implemented for the requested set of features described in Section 2.2 only. Subscriber actions that are not compatible with these features are not supported.
- The functionality provided by this activity applies to IBN lines only.
- Crafts person actions via SERVORD are not recorded. A feature action is recorded only if it is initiated by the subscriber.
- A feature action is recorded only if it is applicable to the related feature. Applicability of actions to features can be seen in Table 1.
- In order to record a feature action in a billing record:
  - — all the datafill described in Section 2.2.2 must be performed

— the feature must be contained in the required set of features

- All limitations which apply to features in the existing implementation (e.g. feature compatibility, precedence, etc.) apply to this activity, as well.
- All features are activated/deactivated/programmed according to CEPT rules (for non CEPT features CEPTONCENTREX is datafilled in Table ISERVOPT).
- Subscriber feature actions are not recorded if the related feature is not assigned to the line or if it is not a default feature (i.e. trying to activate/ deactivate/use a feature even if it does not exist on the line)
- A subscriber feature action is recorded only if it results in success:
  - — If a feature subscriber wants to activate a feature which is not compatible with one or more features already assigned to the line and that is why the activation action is not successfully ended, this action is not recorded.
  - — If a feature subscriber tries to activate an already active feature or deactivate an already inactive feature, this action is not recorded.
- ICWT usage is recorded only if the ICWT subscriber puts in hold or disconnects the active agent and accepts the new calling agent after he gets the ICWT tone.
- The pilot DN is written into the Originating Open Digits1 for DNH usage.
- SUPPRESS usage is recorded only if the SUPPRESS_DN field is ‘Y’ (SUPPRESS_DN is given through SERVORD action during feature assignment and can be checked via QDN command).
  - — If the state of SUPPRESS is toggled using CNDB (i.e. SUPPRESS_DN becomes ‘N’) for a specific call, CNDB usage is recorded as feature action. SUPPRESS usage is not recorded for that case.
  - — If SUPPRESS is not assigned to the line or SUPPRESS_DN field is set to ‘N’ and CNDB is used for a specific call, CNDB usage is recorded as feature action.

17.6 Interactions

- If a user originated feature action is perceived, this action is recorded in a billing record.
- AMA in MMP is based on Bellcore AMA Format. This feature uses the existing AMA/Billing framework components with no change in their existing structures to realize customer’s requirements. So, there is no effect on the existing AMA subsystem in the MMP load.

18: Functional Description (FN): A00009158

18.1 Feature name and Feature ID

A00009158: M3UA over SCTP from Core to USP

18.2 Description

This activity implements M3UA RFC and SCTP RFC on CS2K core, supporting the following M3UA path type to USP.

- M3UA RFC over SCTP RFC client
- M3UA RFC over SCTP RFC server

This activity introduced changes on CS2K core but makes no changes to GWC platform.

This activity is based on the following specification on M3UA and RFC.

- RFC3332 Signaling System 7 (SS7) Message Transfer Part 3 (MTP3) - User Adaptation Layer (M3UA), September 2002
- M3UA Implementor's Guide, V7, February, 2004
- RFC2960 Stream Control Transmission Protocol, October 2000
- Stream Control Transmission Protocol (SCTP) Implementer's Guide, V12, October 15, 2004

Basically, without special mention, RFC2960 in this doc refers to the SCTP RFC2960 and SCTP Implementer’s Guide V12. RFC3332 in this doc refers to the M3UA RFC3332 and M3UA Implementor's Guide V7.

18.3 Support SCTP RFC on CS2K core

Activity A59023997 and A00003649 has implemented SCTP V5 [reference 6] on CS2K core. This activity will enhance the SCTP implementation based on SCTP RFC2960 [reference 3] and SCTP Implementer’s Guide V12 [reference 4].

18.3.1 SCTP chunk common header

In RFC2960, SCTP chunk common header is same as in SCTP V5. No change is introduced in this activity. Please refer to the following table for SCTP chunk common header format.

Table 5 SCTP chunk Common Header Format

Parameter	Type	Length(Octet)
Source Port Number	Mandatory	2
Destination Port Number	Mandatory	2
Verification Tag	Mandatory	4
Checksum	Mandatory	4

18.3.2 SCTP RFC chunks

This activity changes the following existing chunks to comply SCTP RFC version, please refer to section 2.3.3 for more details.

- SACK
- ABORT
- ERROR

This activity also adds a new chunk SHUTDOWN COMPLETE according to specification in RFC2960.

Other chunks are unchanged.

Table 1 shows the SCTP chunks supported by CS2K core. New and changed chunks are marked in BOLD.

Table 6 SCTP RFC chunks Supported by CS2K core

chunk Type	Value	chunk Explanation
DATA	0x0000	Payload Data
INIT	0x0001	Initiation
INIT ACK	0x0002	Initiation Acknowledgement
SACK	**0x0003**	**Selective Acknowledgement**
HEARTBEAT	0x0004	Heartbeat Request

Table 6 SCTP RFC chunks Supported by CS2K core

chunk Type	Value	chunk Explanation
HEARTBEAT ACK	0x0005	Heartbeat Acknowledgement
ABORT	**0x0006**	**Abort**
SHUTDOWN	0x0007	Shutdown Association
SHUTDOWN ACK	0x0008	Shutdown Acknowledgement
ERROR	**0x0009**	**Operation Error**
COOKIE ECHO	0x000A	State Cookie
COOKIE ACK	0x000B	Cookie Acknowledgement
SHUTDOWN COMPLETE	**0x000C**	**Shutdown Complete**

18.3.3 New and changed chunks

18.3.3.1 Selective Acknowledgement (SACK)

The chunk format of SACK is changed as below. Changed field is in BOLD.

Parameter	Type	Length(Octet)
Chunk Type	Mandatory	1
Chunk Flag	Mandatory	1
Chunk Length	Mandatory	2
Cumulative TSN Ack	Mandatory	4
Advertised Receiver Win-dow Credit	Mandatory	4
Number of Gap Ack Blocks	Mandatory	2
Number of Duplicate TSNs	**Mandatory**	**2**
Gap Ack Block #1 - #N	Mandatory	n*4
Duplicate TSN 1-N	**Mandatory**	**n*4**

Two fields are introduced to this activity:

Number of Duplicate TSNs(16 bits): This field contains the number of duplicate TSNs the endpoint has received.

Duplicate TSN(32 bits): Every time a duplicate TSN is received before sending the SACK, it is added to the list of duplicates and appended to the end of the SACK. That is to say, if it is received n times(n>=1) before sending the SACK, it will be appended n-1 times. if it is received n times(n>=1) after sending the SACK for the TSN, it will be appended to SACK for current TSN n timers. The duplicate count is re-initialized to zero after sending each SACK.

18.3.3.2 Abort Association (ABORT)

The format of ABORT chunk is changed as below.

Parameter	Type	Length(Octet)
Chunk Type	Mandatory	1
Chunk Flag	**Mandatory**	**reserved (7 bits)** **T bit (1 bit)**
Chunk Length	Mandatory	2
zero or more Error Causes	Mandatory	4

When an endpoint is to close the association, ABORT chunk is sent with error causes.

The T bit is set to 0 if the sender filled in the Verification Tag expected by the peer. If the Verification Tag is reflected the T bit MUST be set to 1. Reflecting means that the sent Verification Tag is the same as the received one.

Please refer to section 2.3.3.3 for supported error codes on CS2K core.

18.3.3.3 Operation Error (ERROR)

An endpoint sends this chunk to its peer endpoint to notify it of certain error conditions. It contains one or more error causes. An Operation Error is not considered fatal in and of itself, but may be used with an ABORT chunk to report a fatal condition.

The below table shows the Cause Codes used in ERROR chunk, newly introduced Cause Codes are show in BOLD.

Cause Code	Cause	parameter of the Cause-specific Information	Description
1	Invalid Stream Identifier	Stream Identifier(16 bits) reserved (16 bits)	
2	Missing Mandatory Parameter	Number of missing parameters(32 bits) missing parameter type(16 bit)	
3	Stale Cookie Error	Measure of Staleness(32 bits)	
4	Out of Resource	None	
5	**Unresolvable Address**	**Unresolvable Address(32 bits)**	**Contains: complete Type, Length and Value of the address parameter. Indicates: the sender is not able to resolve the specified address parameter(e.g ,invalid transport address)**
6	**Unrecognized Chunk Type**	**Unrecognized Chunk(32 bits)**	**Contains: complete with Chunk Type, Chunk Flags and Chunk Length Indicates: the receiver does not understand the chunk (didn’t defined)and the upper bits of the 'Chunk Type' are set to 01 or 11**
7	**Invalid Mandatory Parameter**	**None**	**Indicates: one of the mandatory parameters is set to a invalid value**
8	**Unrecognized Parameters**	**Unrecognized Parameters(32 bits)**	**Contains: contains unrecognized parameters copied from the INIT ACK chunk complete with TLV Indicates: returned to the originator of the INIT ACK chunk if the receiver does not recognize one or more Optional TLV parameters in the INITACK chunk.**

9	**No User Data**	**TSN value (32 bits)**	**Contains: the TSN of the DATA chunk received with no user data field** **Indicates: returned to the originator of a DATA chunk if a received DATA chunk has no user data**
10	**Cookie Received While Shutting Down**	**None**	**Indicates: A COOKIE ECHO was received while the endpoint was in SHUTDOWN-ACK-SENT state**
11	**Restart of an association with new addresses**	**New Address TLVs**	**Indicates: An INIT was received on an existing association. But the INIT added addresses to the association that were previously NOT part of the association. The New addresses are listed in the erro code.**
12	**User Initiated Abort**	**Upper Layer Abort Reason**	**Indicates: Upper Layer Abort Reason**
13	**Protocol Violation**	**Additional Information**	

18.3.3.4 Shutdown Complete (SHUTDOWN COMPLETE)

SHUTDOWN COMPLETE chunk is required to sent on reception of SHUTDOWN ACK at the completion of the shutdown process in SCTP RFC version. This activity introduced this new chunk type and supports related shutdown procedures.

The chunk format of new chunk SHUTDOWN COMPLETE is as below:

Parameter	Type	Length(Octet)
Chunk Type	**Mandatory**	**2**
Chunk Flag	**Mandatory**	**Reserved(7 bits)** **T bit (1 bit)**
Chunk Length	Mandatory	2

The T bit is set to 0 if the sender filled in the Verification Tag expected by the peer. If the Verification Tag is reflected the T bit MUST be set to 1. Reflecting means that the sent Verification Tag is the same as the received one.

18.3.4 Enhanced SCTP procedures

18.3.4.1 Normal Establishment of an Association

Association establishment procedures are modified to in RFC2960 section 5.1 comparing to SCTP v5. This activity enhances the existing SCTP implementation based on the specification in RFC2960 section 5.1.

18.3.4.2 Handle Duplicate or unexpected INIT, INIT ACK, COOKIE ECHO, and COOKIE ACK

New procedures are introduced to handle duplicate or unexpected INIT, INIT ACK, COOKIE ECHO, and COOKIE ACK in RFC2960 section 5.2. This activity enhances the existing SCTP implementation based on the specification in RFC2960 section 5.2.

The following scenarios are handled in this activity.

- Handle Duplicate INIT in COOKIE-WAIT or COOKIE-ECHOED States
- Unexpected INIT in States Other than CLOSED, COOKIE-ECHOED, COOKIE-WAIT and SHUTDOWN-ACK-SENT
- Unexpected INIT ACK
- Handle a COOKIE ECHO when a TCB exists
- Handle Duplicate COOKIE ACK

18.3.4.3 Path Verification

RFC2960 section 5.4 Path verification procedure is introduced to ensure all the address presented by the peer are in the fact belonging to the peer in SCTP implementor’s guide V12. This activity enhances the existing SCTP implementation based on RFC2960 section 5.4.

18.3.4.4 User Data Transfer

User data transfer procedures are modified to enhance user data transfer reliability in RFC2960 section 6 comparing to SCTP V5. This activity enhances the existing SCTP implementation based on RFC2960 section 6.

18.3.4.5 Congestion Control

Congestion control procedures are modified in RFC2960 section 7 comparing to SCTP v5. This activity enhances the existing SCTP implementation based on RFC2960 section 7.

18.3.4.6 Fault Management

Fault management procedures are modified in RFC2960 section 8 comparing to SCTP v5. This activity enhances the existing SCTP implementation based on RFC2960 section 8.

18.3.4.7 Abort of an Association

Association abort procedures are modified in RFC2960 section 9.1 comparing to SCTp V5. This activity enhances the existing SCTP implementation based on RFC2960 section 9.1.

18.3.4.8 Shutdown of an Association

SCTP RFC version has introduced new procedures to the termination of association (RFC2960 section 9.2). Please refer to figure 1 for the new procedure supported on CS2K core. The changes are marked in BOLD.

18.4 Support M3UA RFC on CS2K core

18.4.1 M3UA paths datafill

A new field PROTOCOL is added to table USPPATHS, to allow user to select the protocol of the path. The new field will have following 3 values:

- M3UA_V2_UDP - M3UA V2 over UDP
- M3UA_RFC_SCTP_CLIENT - M3UA RFC over SCTP CLIENT
- M3UA_RFC_SCTP_SERVER - M3UA RFC over SCTP SERVER

Normally, paths in the same pathset **SHOULD** be the same type. Warning message is displayed if customer try to datafill different path type in the pathset. But in-service cutover from M3UA V2 paths to M3UA RFC paths in one pathset is supported and Opposite cutover from M3UA RFC paths to M3UA V2 paths is not supported.

Please refer to section 2.4.11 and 2.4.12 for cutover and rollback procedures for M3UA V2 pathset to M3UA SCTP pathset.

The total message rate of all M3UA RFC paths over SCTP **SHOULD** be less than the max message rate that SCTP on core can support. Currently the max message rate that SCTP can support is 4500 msg/sec. Please refer to sction 2.4.10 and activity A00003649 “SCTP (Stream Control Transmission Protocol) Enhancements on XA-Core” for more detail.

One pathset on the CS2K core is configured as an ASP. IPSP configuration is not supported.

Please refer to figure 2 for datafill example of paths to USP.

Figure 2 Datafill example of M3UA paths to USP on CS2K core

Datafill for path to USP (M3UA V2 over UDP)
table usppaths
PATHNAME SRCPORT DESTIP DESTPORT PATHSEL **PATHPROT**
---
pathset_to_usp 0 4697 192 168 10 42 2905 0 **M3UA_V2_UDP**

Datafill for path to USP (M3UA RFC over SCTP client)
table usppaths
PATHNAME SRCPORT DESTIP DESTPORT PATHSEL **PATHPROT**
---
pathset_to_usp 0 4697 192 168 10 42 2905 0 **M3UA_RFC_SCTP_CLIENT**

Datafill for path to USP (M3UA RFC over SCTP server)
table pathset
PATHNAME SRCPORT DESTIP DESTPORT PATHSEL **PATHPROT**
---
pathset_to_usp 0 4697 192 168 10 42 2905 0 **M3UA_RFC_SCTP_SERVER**

As M3UA V2 path, the valid port number for M3UA RFC path is from 4697-4700 and 4710- 4721.

18.4.2 RFC M3UA message common header

Table 7: RFC M3UA message common header format

Field	Length (byte)	Description
Version	1 byte	it is set to 0x01, indicating M3UA release 1.0
Reserved	1 byte	it is set to 0x00
Message Group	1 byte	Refer to 2.4.3
Message Type	1 byte	Refer to 2.4.3
Message Length	4 byte	The Message Length defines the length of the message in octets, including the Common Header.

If version is not “0x01”, an ERROR message with error code “0x0001” is sent to USP.

18.4.3 RFC M3UA messages

"Table 4 M3UA RFC messages supported by CS2K" represents the set of messages that are required by M3UA RFC.

Table 8: RFC M3UA messages supported by CS2K

Message	Message Class and message type	Description
ERROR	0x0000	Error
NTFY	0x0001	Notify
DATA	0x0101	Payload data
DUNA	0x0201	Destination Unavailable
DAVA	0x0202	Destination Available
DAUD	0x0203	Destination State Audit
SCON	0x0204	Signalling Congestion
DUPU	0x0205	Destination User Part Unavailable
DRST	0x0206	Destination Restricted
ASPUP	0x0301	ASP Up
ASPDN	0x0302	ASP Down
ASPUP ACK	0x0304	ASP Up Acknowledgement
ASPDN ACK	0x0305	ASP Down Acknowledgement
ASPAC	0x0401	ASP Active
ASPIA	0x0402	ASP Inactive
ASPAC ACK	0x0403	ASP Active Acknowledgement
ASPIA ACK	0x0404	ASP Inactive Acknowledgement

If unsupported message class is received, ERROR message with error code 0x0003 is sent to USP.

If unsupported message type is received, ERROR message with error code 0x0004 is sent to USP.

Note: Since M3UA RFC is transported over SCTP, Heartbeat and Heartbeat ACK messages are not supported. SCTP has its own heartbeat mechanism to

detect loss of transport associations, Thus heartbeat procedure is not required when M3UA is transported over SCTP.

18.4.4 RFC M3UA Parameters

"Table 5 M3UA RFC parameters supported by CS2K" represents the set of parameters that are required by RFC M3UA.

Table 9: RFC M3UA parameters supported by CS2K

Parameter	Parameter Id	Description
Traffic Mode Type	0x000b	Supported in ASP ACTIVE
Error Code	0x000c	Supported in ERROR
Status	0x000d	Supported in SCON
Affected Point Code	0x0012	Supported in DAVA, DUNA, DAUD, DRST, DUPU
Network Appearance	0x0200	Supported in SSNM messages and DATA message.
User/Cause	0x0204	Supported in DUPU
Congestion Indications	0x0205	Supported in SCON
Protocol Data	0x0210	Supported in DATA

When an optional parameter is received and not supported, the message is processed but the optional parameter is discarded silently.

18.4.5 RFC M3UA message format

18.4.5.1 ASPSM messages

No optional parameter is supported in the following messages.

ASP UP

ASP DOWN

ASP UP ACK

ASP DOWN ACK

18.4.5.2 ASPTM messages

The message format of ASP ACTIVE is as below:

Parameter	Type	Length (byte)
Traffic Mode Type	Optional	Tag(2 bytes) Length(2 bytes) Traffic Mode Type (4 bytes) 0x0001 - Override

If unsupported traffic mode type is received, ERROR message is sent to peer.

No optional message is supported in the following message.

ASP INACTIVE

ASP ACTIVE ACK

ASP INACTIVE ACK

18.4.5.3 SSNM messages

Message format for DAVA, DUNV, DRST and DAUD is as below.

Parameter	Type	Fields
Network Appearance	Optional	Tag(2 bytes) Length(2 bytes) Value(4 bytes)
Affected Point Code	Mandatory	Tag(2 bytes) Length(2 bytes) Mask 1 (1 bytes) Affected PC 1 (3 bytes) ..... Mask n (1 bytes) Affected PC n (3 bytes)

Message format for SCON is as below:

Parameter	Type	Fields
Network Appearance	Optional	Tag(2 bytes) Length(2 bytes) Value(4 bytes)

Affected Point Code	Mandatory	Tag(2 bytes) Length(2 bytes) Mask 1 (1 byte) Affected PC 1 (3 bytes) ..... Mask n (1 byte) Affected PC n (3 bytes)
Congestion Indications	Optional	Tag (2 bytes) Length (2 bytes) Reserved (3 bytes) Cong Level (1 byte)

Message format for DUPU is as below.

Parameter	Type	Fields
Network Appearance	Optional	Tag(2 bytes) Length(2 bytes) Value(4 bytes)
Affected Point Code	Mandatory	Tag(2 bytes) Length(2 bytes) Mask 1 (1 byte) Affected PC 1 (3 bytes) ..... Mask n (1 byte) Affected PC n (3 bytes)
User/Cause	Mandatory	Tag (2 bytes) Length (2 bytes) Cause (2 bytes) User (2 bytes)

18.4.5.4 DATA message

Message format for DATA is as below.

Parameter	Type	Fields
Network Appearance	Optional	Tag(2 bytes) Length(2 bytes) Value(4 bytes)

Protocol Data	Mandatory	Tag(2 bytes) Length(2 bytes) Protocol Data (variable length)

18.4.5.5 Error Message

Message format for Error is as below.

Parameter	Type	Fields
Error Code	Mandatory	Tag (2 bytes) Length (2 bytes) Error code (4 bytes)

Error Code supported by CS2K is as below.

Error Code	Description
0x01	Invalid Version
0x03	Unsupported Message Class
0x04	Unsupported Message Type
0x06	Unexpected Message
0x09	Invalid Stream Identifier
0x11	Invalid Parameter Value
0x12	Parameter Field Error
0x13	Unexpected Parameter
0x16	Missing Parameter

18.4.5.6 Notify Message

The Notify message used to provide an autonomous indication of M3UA events in USP to the CS2K.

Message format for Notify message is as below.

Parameter	Type	Fields

Status	Mandatory	Tag (4 bytes) Length (4 bytes) Status Type and Status Information (8 bytes) 0x0101 - Application Server State Change, inactive 0x0102 - Application Server State Change, active 0x0103 - Application Server State Change, pending

Notify message with unsupported status type and status information received is discarded silently.

18.4.6 RFC M3UA procedures

This activity implements the M3UA layer procedures based on the RFC3332 section 4.3, 4.5, 4.6.

18.4.6.1 Activate USP paths

Users can activate USP paths via ACT command in MAPCI CCS7 directory. If the path is the first activated path in the pathset, ASP UP and ASP ACTIVE procedure is started. The path is set to INSV after receive NTFY (AS ACTIVE) from USP. If the path is not the first activated path in the pathset, ASP UP and ASP ACTIVE procedure is not started. The path is set to INSV after SCTP association is established.

Please refer to figure 3, 4 for the message flow of activating USP path in pathset over SCTP.

Figure 3 Activate first path in the pathset when both paths are OFFL

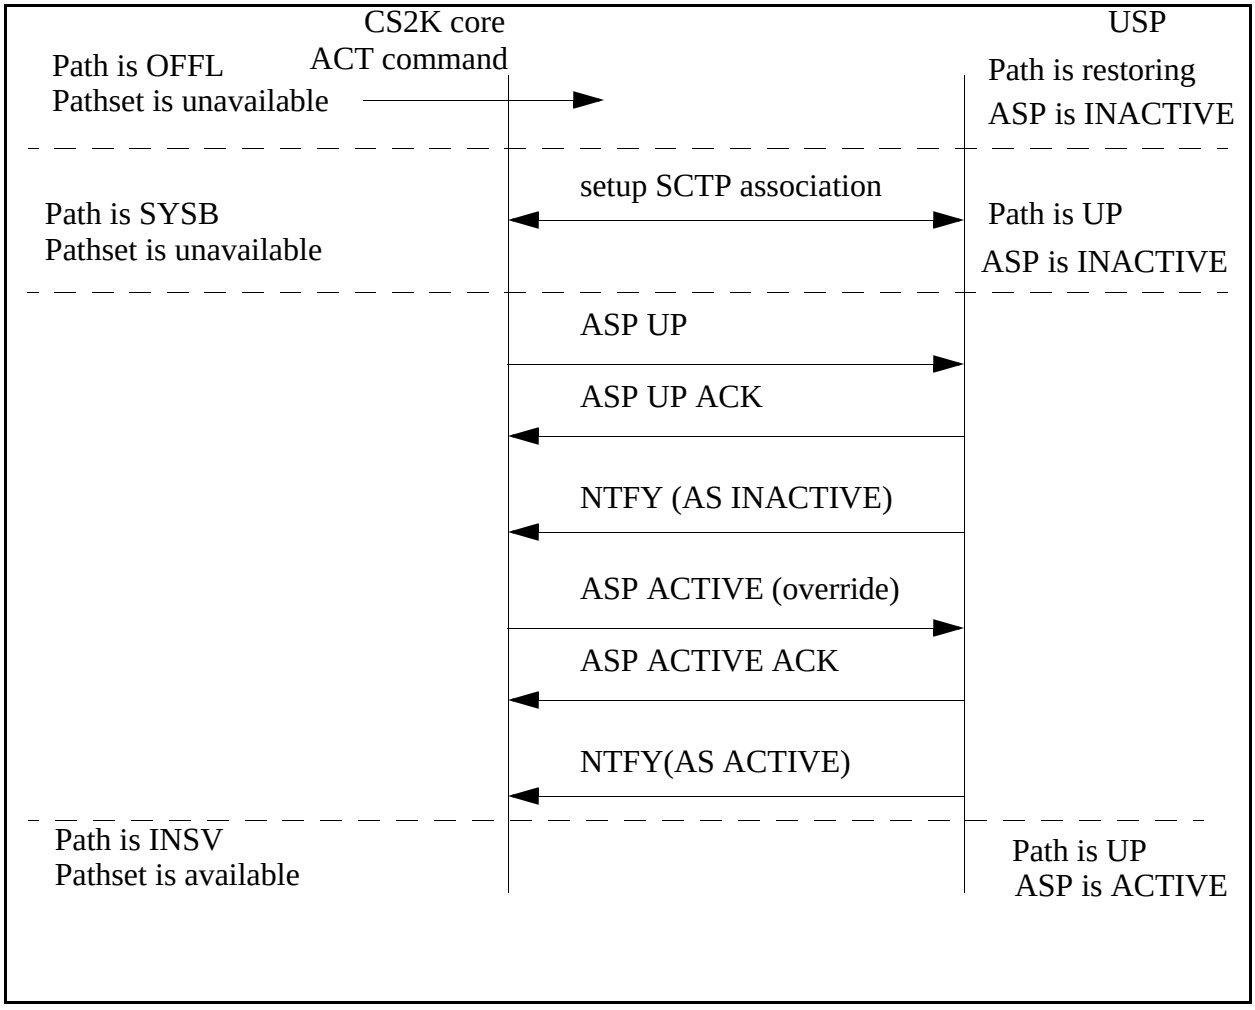

Figure 4 Activate other paths in the pathset when one of the paths is INSV

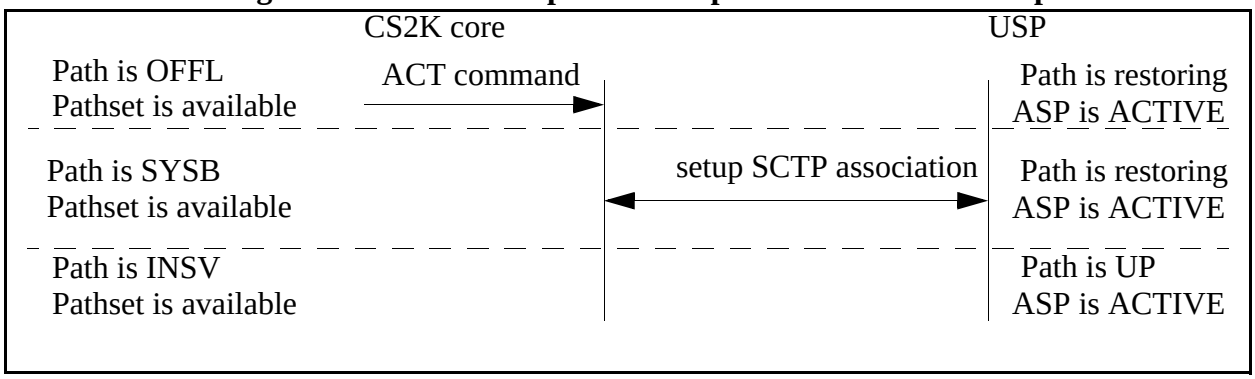

18.4.6.2 Deactivate M3UA path

Users can deactivate USP paths via DEACT command in MAPCI CCS7 directory. The path is set to OFFL when it is deactivated.

- Deactivate the last INSV path in the pathset

If the path is the last INSV path in the pathset, ASP INACTIVE and ASP DOWN procedure is started. and then the SCTP association is taken down.

After the path is deactivated, there is no more INSV path available. No more outgoing and incoming traffic is allowed immediately. ASPIA and ASPDN is sent to peer to update the ASP status.

In this case, the traffic received from peer ULP before ASPIA is received are discarded because no more outgoing and incoming traffic is allowed after the pathset is down.

- Deactivate INSV path (not the last INSV path in the pathset)

If the path is not the last INSV path in the pathset, ASP INACTIVE and ASP DOWN procedure is not started. SCTP association is taken down immediately.

After the path is deactivated, the path can not send outgoing traffic any more. SCTP SHUTDOWN chunk is sent to peer to take down the SCTP association.On reception of the SHUTDOWN chunk in the peer side, the traffic received from peer ULP before SHUTDOWN arrived are still sent out to the Core. To avoid traffic lost, the path will accept these incoming traffic and report to ULP.

- Deactivate SYSB path

If the path is in SYSB, if SCTP association is established, send SHUTDOWN to shutdown the association, otherwise, send ABORT to abort establishing SCTP association.

Please refer to figure 5, 6, 7, 8 for the message flow of deactivating USP path in pathset over SCTP.

Figure 5 Deactivate a path in pathset if it is not last INSV path

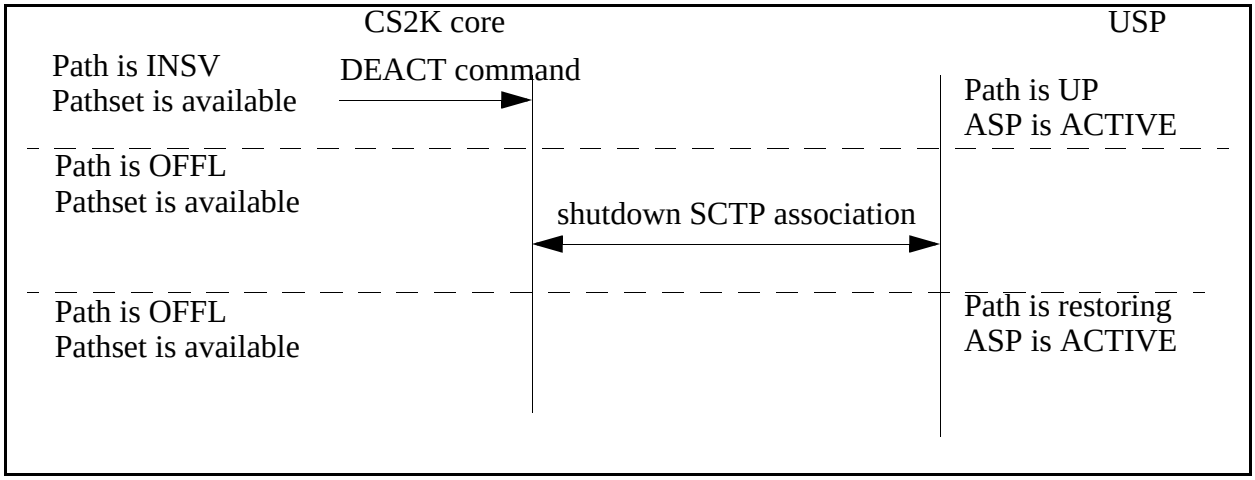

Figure 6 Deactive the last INSV path in the pathset

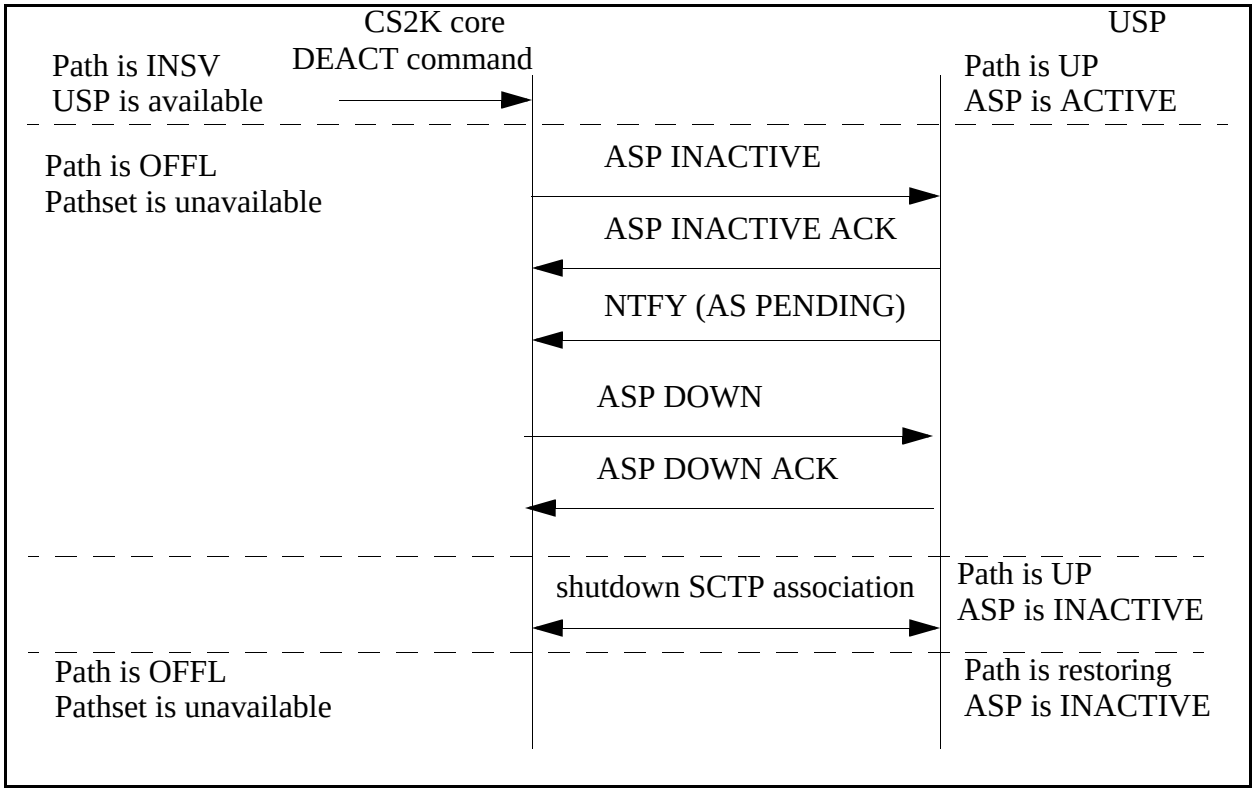

Figure 7 Deactivate a SYSB path if SCTP association is established

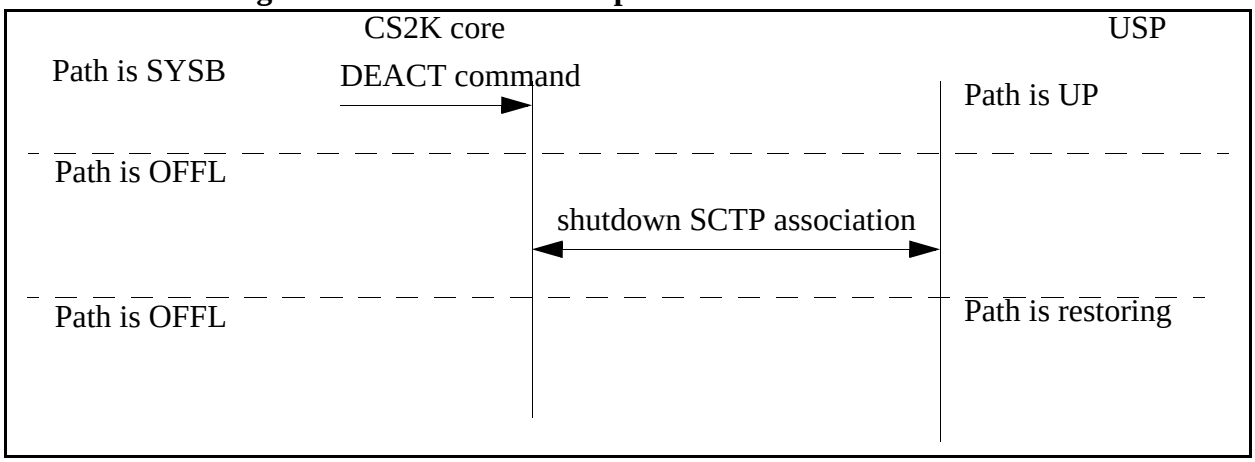

Figure 8 Deactivate a SYSB path if SCTP association is not established

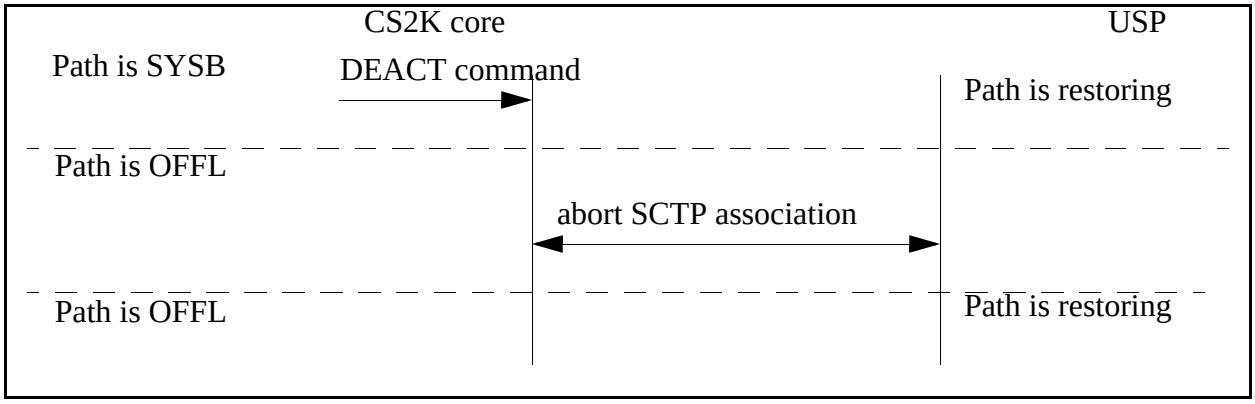


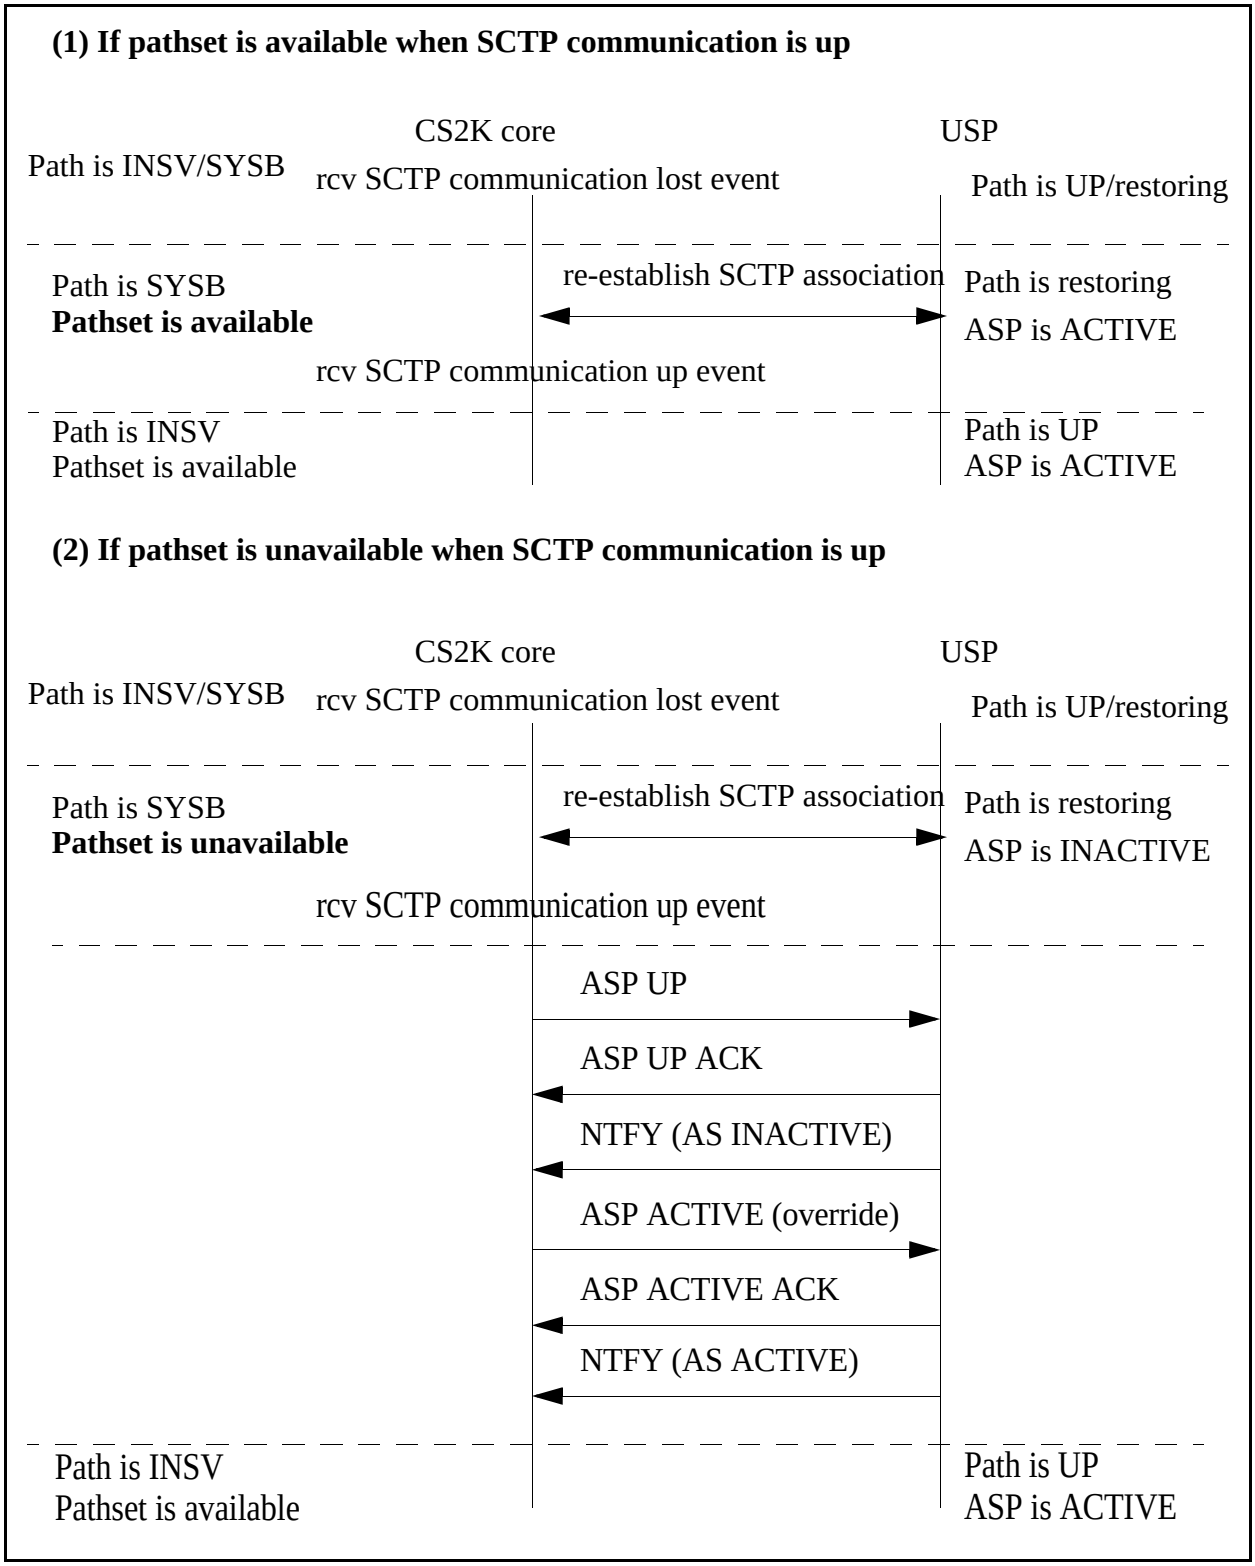
18.4.6.3 SCTP communication lost recovery

On reception of SCTP communication lost notify, M3UA management shall request the SCTP transport layer to re-establish the SCTP association.

If the pathset is unavailable when the SCTP communication is up, ASP UP and ASP ACTIVE procedure is started, otherwise, set the path to INSV.

Please refer to figure 9 for message flow of SCTP communication lost recovery.

Figure 9 Path Recover procedure when SCTP communication lost



18.4.6.4 SCTP congestion handling

Receiving SCTP STATUS CHANGE notification with congestion enter indication from one path in the pathset indicates that other paths in the pathset have the same situation because the paths are load sharing.

On reception of first path congestion indication, the pathset is regarded as congestion, M3UA layer notify the routeset management to update the status of the routeset related with pathset. The routeset status is updated as if received a SCON from USP. When all of the paths are out of congestion, the routeset management is notified. The routeset status related with the pathset is updated as if received a DAVA from USP.

18.4.6.5 SCTP stream mapping

M3UA RFC supports 2 outgoing SCTP streams.

- M3UA DATA message is sent over SCTP stream 1.
- ASPSM, MGMT messages are sent over SCTP stream 0.
- SSNM, ASPTM, BEAT ACK are sent over SCTP stream 0.

If the remote peer can not support 2 incoming streams, M3UA should take down the association.

18.4.6.6 Notify handling procedure

When receiving a Notify message reflecting a change in the AS state from USP, the CS2K core updates the local USP status and restart the ASP UP procedure if necessary. Please refer to the table below for Notify handling on CS2K core.

Table 10: Notify handling

Notify message	Status of paths	Action
AS ACTIVE	At least one path is INSV	No furthur action is taken.
AS ACTIVE	No path is INSV	Set the non OFFL paths to SYSB and start path activation procedure and sent out ASP UP message.
AS INACTIVE	In all cases	Set the non OFFL paths to SYSB and start path activation procedure and sent out ASP UP message.

Table 10: Notify handling

Notify message	Status of paths	Action
AS PENDING	In all cases	Set the non OFFL paths to SYSB and start the path activation procedure and sent out ASP UP message

18.4.6.7 SSNM message handling procedure

DAUD is sent to USP periodly to audit the status of routesets. When the CS2K core receives DAVA, DUNA, SCON, application level is notified.

When the CS2K core receives DRST, application level is notified as if DAVA is received.

Please refer to activity A00009165-Offline Routesets w/o Alarms for more information on SSNM handling when the routeset is not activated on USP and Core.

18.4.7 M3UA RFC message extension

The PROVISIONING messages and MSC_UPDATE messages, which used as M3UA V2 extension on CS2K core to support communication between CS2K core and USP, will be used unchanged as M3UA RFC extension on CS2K core to support communication between core and USP.

18.4.8 Peg OM for M3UA RFC

The existing M3UA OMs are supported for M3UA RFC.

- TXMSG
- RXMSG
- LOSTMSG

M3UA RFC and M3UA V2 use the same OM counters.

18.4.9 M3UA timers for M3UA RFC

- ASPUP timer

When the status of pathset is changed from SYSB to INSV, ASPUP is sent to USP. ASPUP is resent to USP every 2s utill ASPUP ACK is received from USP.

- ASPAC timer

After received ASPUP ACK from USP, ASPAC is sent to USP. ASPAC is resent every 2s utill ASPAC ACK is received from USP.

- ASPIA timer

When the status of pathset is changed from INSV to SYSB or OFFL, ASPIA is sent to USP. ASPIA is sent for only once. If ASPIA ACK is not received from USP, the ASPIA is not sent again. ASPDN is sent out after ASPIA timer timeout.

- ASPDN timer

After received ASPIA ACK from USP or ASPIA timer timeout, ASPDN is sent to USP. ASPDN is sent for only once. If ASPDN ACK is not received from USP, the ASPDN is not sent again. SCTP association is taken down after ASPDN timer timeout.

18.4.10 Max message rate supported

The message rate that one M3UA RFC path can support is up to 1500 msg/sec.

The total message rate of all M3UA RFC paths over SCTP **SHOULD** be less than the max message rate that SCTP on core can support. Currently the max message rate that SCTP can support is 4500 msg/sec. Please refer to activity A00003649 “SCTP (Stream Control Transmission Protocol) Enhancements on XA-Core” for more detail.

18.4.11 Cutover from M3UA V2 pathset to M3UA SCTP pathset

This cutover procedure is used to change the in-service M3UA V2 pathset to M3UA SCTP pathset. This cutover MUST be done with low traffic.

1. Make sure at least **two** paths are provisioned in the M3UA V2 pathset. All of the paths are INSV.

2. Deactivate one of the M3UA_V2_UDP path in the pathset. The status of the path is OFFL now.

3. Change the pathprot from M3UA_V2_UDP to M3UA_RFC_SCTP_*. The pathprot M3UA_RFC_SCTP_* could be M3UA_RFC_SCTP_CLIENT or M3UA_RFC_SCTP_SERVER.

4. Activate the path in MAPCI. Verify the status of the path is INSV now and traffic are sent to the path.

5. Soak for some time. The time depends on customer’s decision.

6. Repeat step 2-5 for other M3UA_V2_UDP paths in the pathset.

Note: it is not recommended provisioning different type paths in one pathset. The cutover status should be regarded as a transient status. During cutover,

there is no traffic change over between paths, which will cause traffic lost when the path is being deactivated.

18.4.12 Rollback from M3UA SCTP pathset to M3UA V2 pathset

This rollback procedure is used to restore the paths to M3UA_V2_UDP paths in case any problem during cutover.

1. Deactivate one of the M3UA_RFC_SCTP_* path in the pathset. The status of the path is OFFL now.

2. Change the pathprot from M3UA_RFC_SCTP_* to M3UA_V2_UDP. The pathprot M3UA_RFC_SCTP_* could be M3UA_RFC_SCTP_CLIENT or M3UA_RFC_SCTP_SERVER.

3. Activate the path in MAPCI. Verify the status of the path is INSV now and traffic are sent to the path.

4. Repeat step 1-3 for other M3UA_RFC_SCTP_* paths in the pathset.

Note: it is not recommended provisioning different type paths in one pathset. The cutover status should be regarded as a transient status. During cutover, there is no traffic change over between paths, which will cause traffic lost when one path is being deactivated.

18.5 Hardware Requirements or Dependencies

NA

18.6 Software Requirements or Dependencies

NA

18.7 Limitations and restrictions

1. This activity implements a basic functionality of M3UA RFC on CS2K core. Only those functionalities mentioned in this document are commited by this activity.

2. This activity doesn’t support dynamic register procedure (RFC3332 section 4.4) on CS2K core.

3. There is no changes introduced in the Core swact mechanism for SCTP and M3UA connections. The existing behavior is expected during SWACT after this activity.

4. There is no changes introduced into the path load sharing mechanism. The existing behavior is expected after this activity.

5. When the path is datafilled as SCTP server, the port used to listen for INIT chunk is not 2905, it can be from 4697-4700 to 4710-4721.

6. It is not recommended provisioning different type paths in one pathset. The cutover status should be regarded as a transient status.

7. There is no traffic change over between paths, which will cause traffic lost when one path is being deactivated.

8. SCTP CRC32 checksum is not supported in Core. Adler checksum should be used to establish SCTP association.

18.8 Interactions

NA

9. A00009165- USP - Offline Routesets w/o Alarms

19: Functional Description (FN): A00009165

19.1 Feature name and Feature ID

A00009165: USP - Offline Routesets without Alarms

19.2 Description

Before this feature, if customer datafills new SS7 routesets in USP which acts as Signal Gateway, but does not wish to, or cannot for some reason, bring them into service immediately, CORE shows alarms for those routesets. The critical alarms caused by it masks other legitimate alarms, resulting in a signaling outage being overlooked.

This type of behavior is very typical for operator craftspersons. In large corporations, the addition of SS7 routesets can be a multi-company activity, where schedules have to be coordinated and resources have to be used as they become available.

The purpose of this feature is to eliminate this kind of alarms found on XA-CORE switch, and provide an OFFLINE state for routeset in CORE.

19.2.1 Set the routeset to offline when it is provisioned from USP

Before this feature, when the routeset is provisioned from USP, its state is set to system busy, then an alarm is generated.

In this feature, the state is set to offline when the routeset is just provisioned from USP.

19.2.2 Enable the operation to offline a routeset in CORE

When CORE receives a DUNA from SG for a routeset, the routeset state is set to SYSB, and an alarm is generated for it. But sometimes, operator wants to offline the routeset and would not expect any alarms on it.

In this feature, when the routeset is seen SYSB (system busy) in CORE , if operator thinks it should be in offline state, the routeset can be offline manually in CORE so that the additional alarm is cleared. This operation can not be done while the routeset is in-service in CORE.

When routeset is in offline state, it can be turn into man-busy state by the command BSY from craftsperson. When DUNA/DAVA/SCON message are received while the corresponding routeset is in offline or man-busy state, these message are discarded.

When RTS command is run for a routeset by craftsperson, routeset state is set to SYSB, and send out a DAUD to USP to get the correct state..

19.2.3 Routeset related with ASM can be deleted at USP only when it is at OFFL state in CORE.

If the routeset is not at OFFL state at CORE, the request to delete it will be rejected by CORE, and the corresponding information will be given.

19.3 Hardware Requirements or Dependencies

N/A.

19.4 Software Requirements or Dependencies

N/A.

19.5 Limitations and restrictions

Need operator to take more action to offline the routeset in CORE, and the additional alarm will exists before the action.

19.6 Interactions

19.7 Glossary

Term	Description
DAVA	Destination Available
DUNA	Destination Unavailable

20: Functional Description (FN): A00009216

20.1 Feature name and Feature ID

A00009216: JI-ISUP to Base ETSI ISUP V2 Mapping Enhancement

20.2 Description

This activity provides an optionality to pass some ISUP parameters unchanged for the JI-ISUP to Base ETSI ISUP V2 interworking. Followings are the parameters to be mapped unchanged:

- Nature of Address (NOA) in Calling Party Number
- ISUP Preference Indicator in Forward Call Indicator
- Calling Party Category value ‘calling subscriber with priority’

This feature is optional with a new controlled SOC option. When the state of this SOC option is ON, feature becomes active, otherwise system behaves as it was before this functionality.

This feature will be available in TDM offices in ISN09 and later releases on DMS100 MMP.

20.3 Current Behavior

20.3.1 NOA of Calling Party Number

In current behavior, Nature of Address of the Calling Party Number is always set to NATL without checking the received value for JI-ISUP to Base ETSI V2 ISUP interworking. Please refer to “Table 1 Current NOA Mapping - JI-ISUP to Base ETSI ISUP V2 i/w” on page 375. for current mapping of the NOA.

Table 1 Current NOA Mapping - JI-ISUP to Base ETSI ISUP V2 i/w

JI-ISUP IAM			dir	Base ETSI ISUP V2 IAM		
Parameter	**Field**	**Field Value**		**Field Value**	**Field**	**Parameter**
Calling Party Number	Nature of Address Indicator	0000000 - spare	⇒	0000011 - All values are mapped to National	Nature of Address Indicator	Calling Party Number
		0000001 - Subscriber number				
		0000010 - Reserved for national use				
		0000011 - National number				
		0000100 - International number				
		0000101 - 1101111 spare				
		1110000 - 1111101 reserved for national use				
		1111110 - peculiar number of network				
		1111111				

Note : The values in shaded cells are the values that are not supported by the JI-ISUP protocol.

20.3.2 ISUP Preference Indicator in Forward Call Indicator

The current behavior of mapping ISUP Preference Indicator for JI-ISUP to Base ETSI V2 ISUP interworking is as follows:

1. If there are any supplementary services in the received IAM (ATP, UUI, CLIP) then set the outgoing ISUP Preference Indicator to 'ISUP Preferred All The Way'.
2. If the condition in item 1 is not met, and the BC received in the TMR/USI combination is set to Speech or 3_1_kHz_Audio, then set the outgoing ISUP Preference Indicator to 'ISUP Not Required All The Way'.
3. If the conditions in item 1 and item 2 are not met, then set the outgoing ISUP Preference Indicator to 'ISUP Preferred All The Way'.

If the received ISUP Preference Indicator value is 'Spare', the Protocol_Error treatment is set and call goes to treatment.

Please refer to "Table 2 Current ISUP PI Mapping - JI-ISUP to Base ETSI ISUP V2 i/w" on page 376. for current mapping of the PI.

Table 2 Current ISUP PI Mapping - JI-ISUP to Base ETSI ISUP V2 i/w

JI-ISUP IAM			dir	Base ETSI ISUP V2 IAM		
Parameter	**Field**	**Field Value**		**Field Value**	**Field**	**Parameter**
Forward Call Indicator	ISDN User Part Preference Indicator	00 - ISDN user part preferred all the way	⇒	Please refer to “Table 3 ISUP Preference Indicator Parameter Coding” on page 376.	ISDN User Part Preference Indicator	Forward Call Indicator
		01 - ISDN user part not required all the way				
		10 - ISDN user part required all the way				
		11 - Spare				

Note : The values in shaded cells are the values that are not supported by the JI-ISUP protocol.

Table 3 ISUP Preference Indicator Parameter Coding

Information Field	**JI-ISUP V.2-->**	**--> ETSI v2**	**JI-ISUP V.2-->**	**--> ETSI v2**
Supplementary Service	**None (No UUI, ATP or CLIP present in the IAM)**		**Any (UUI, ATP and/or CLIP present in the IAM)**	
(Applies to messages: IAM)	**Bits**	**Bits**	**Bits**	**Bits**
ISUP Preferred	HG	HG	HG	HG
For Bearer Service = Speech	00	01	00	00
For Bearer Service = 3.1kHz Aud.	00	01	00	00

For Bearer Service = 64k Unres.	11	00	11	00
For Bearer Service = Other	11	00	11	00

20.3.3 ISUP Calling Party Category

In existing behavior, Calling Party Category value ‘calling subscriber with priority’ is mapped as CPC Unknown for JI-ISUP to Base ETSI ISUP V2 interworking. Please refer to “Table 4 Current CPC Mapping - JI-ISUP to Base ETSI ISUP V2 i/w” on page 377. for current mapping of Calling Party Category.

Table 4 Current CPC Mapping - JI-ISUP to Base ETSI ISUP V2 i/w

JI-ISUP IAM			dir	Base ETSI ISUP V2 IAM		
Parameter	**Field**	**Field Value**		**Field Value**	**Field**	**Parameter**
Calling Party Category		00000000 - calling party’s category unknown 00000001 - spare 00000010 - spare 00000011- spare 00000100 - spare 00000101 - spare 00000110 - By mutual agreement 00000111 - By mutual agreement 00001000 - By mutual agreement	⇒	00000000 - CPC Unknown	Calling Party Category	
		00001001 - national operator desk		00000000 - CPC Unknown		
		00001010 - ordinary calling subscriber		00001010 - ordinary calling subscriber		
		00001011 - calling subscriber with priority		00000000 - CPC Unknown		
		00001100 - data call		00000000 - CPC Unknown		
		00001101 - test call		00001101 - test call		
		00001111 - payphone		00001111 - payphone		
		00010000 - 11110000 spare		00000000 - CPC Unknown		
		11110001 - 11111110 reserved for national use		00000000 - CPC Unknown		
		11111111 - spare		00000000 - CPC Unknown		

Note : The values in shaded cells are the values that are not supported by the JI-ISUP protocol.

20.4 Desired Behavior

20.4.1 Activation of the feature

Activation of the functionality is controlled by the new SOC option NETK00XX-”NETK Jpn I ISUP Parm Enh”.

NETK Jpn I ISUP Parm Enh is a controlled SOC and it has two states, ON and IDLE. Default state of *NETK Jpn I ISUP Parm Enh* is IDLE. When its state is ON, this feature becomes functional.

Table 5 SOC for Activation of Feature

SOC group:	NETK
SOC option name:	NETK Jpn I ISUP Parm Enh
SOC option title:	NETK Jpn I ISUP Parm Enh
SOC option control type:	state
New SOC option?	Yes
SOC option order code	NETK0087
Option defined in DRU:	WT22
Affected products:	ISN09

20.4.2 NOA of Calling Party Number

This activity provides an optionality to pass the value of NOA in calling party number as unchanged to the Base ETSI ISUP V2 for the JI-ISUP to Base ETSI ISUP V2 interworking. In order to achieve this, the implementation will be made optional by new created SOC option.

The NOA values used in JI-ISUP are

- NATL (0000011)
- INTL (0000100)
- Peculiar Number (1111110)

Peculiar Number is a national use value and it is not supported in ETSI ISUP.

After the state of the new SOC option is changed to ON, and if the received NOA value is NATL or INTL, then received value is transparently passed to the Base ETSI ISUP V2. If the received value is Peculiar Number or any other value, then outgoing NOA of Calling Party Number is set to NATL.

If the state of the new SOC option is IDLE, then by default, the current behavior will be kept as described in Please refer to Section “20.3.1 NOA of Calling Party Number” on page 374..

Table 6 Desired NOA Mapping - JI-ISUP to Base ETSI ISUP V2 i/w

JI-ISUP IAM			dir	Base ETSI ISUP V2 IAM		
Parameter	**Field**	**Field Value**		**Field Value**	**Field**	**Parameter**
Calling Party Number	Nature of Address Indicator	0000000 - spare	⇒	0000011 - National number	Nature of Address Indicator	Calling Party Number
		0000001 - Subscriber number		0000011 - National number		
		0000010 - Reserved for national use		0000011 - National number		
		0000011 - National number		0000011 - National number		
		0000100 - International number		0000100 - International number		
		0000101 - 1101111 spare		0000011 - National number		
		1110000 - 1111101 reserved for national use		0000011 - National number		
		1111110 - peculiar number of network		0000011 - National number		
		1111111		0000011 - National number		

Note : The values in shaded cells are the values that are not supported by the JI-ISUP protocol.

20.4.3 ISUP Preference Indicator of Forward Call Indicator

The existing behavior is modified not to send the call to the treatment when the received ISUP preference indicator value is 11-Spare. If received ISUP preference indicator value is ‘11-spare’, it is mapped as in “Table 3 ISUP Preference Indicator Parameter Coding” on page 376 for JI-ISUP to Base ETSI V2 ISUP interworking:

1. If there are any supplementary services in the received IAM (ATP, UUI, CLIP) then set the outgoing ISUP Preference Indicator to 'ISUP Preferred All The Way'.
2. If the condition in item 1 is not met, and the BC received in the TMR/USI combination is set to Speech or 3_1_kHz_Audio, then set the outgoing ISUP Preference Indicator to 'ISUP Not Required All The Way'.
3. If the conditions in item 1 and item 2 are not met, then set the outgoing ISUP Preference Indicator to 'ISUP Preferred All The Way'.

This changing on the current behavior is in effect when the new created SOC option state is IDLE.

Also with this activity, the received ISUP Preference Indicator is tranparently passed to the Base ETSI ISUP V2 for the JI-ISUP to Base ETSI ISUP V2 interworking. This behavior is optional. In order to achieve this, the implementation will be made via new created SOC option.

The ISUP Preference Indicator values used in JI-ISUP are

- ISUP Preferred All The Way (00)
- ISUP Not Required All The Way (01)
- ISUP Required All The Way (10)

If the received ISUP Preference Indicator value is one of the above, and the state of the new SOC option is ON, then received value is passed unchanged for JI-ISUP to Base ETSI ISUP V2 interworking. If the received value is 'spare (11)', then it is mapped as '00-ISUP Preferred All The Way' when the new SOC option state is ON.

Table 7 Desired ISUP PI Mapping - JI-ISUP to Base ETSI ISUP V2 i/w

JI-ISUP IAM			dir	Base ETSI ISUP V2 IAM		
Parameter	**Field**	**Field Value**		**Field Value**	**Field**	**Parameter**
Forward Call Indicator	ISDN User Part Preference Indicator	00 - ISDN user part preferred all the way	⇒	00 - ISDN user part preferred all the way	ISDN User Part Preference Indicator	Forward Call Indicator
		01 - ISDN user part not required all the way		01 - ISDN user part not required all the way		
		10 - ISDN user part required all the way		10 - ISDN user part required all the way		
		11 - Spare		00 - ISDN user part preferred all the way		

Note : The values in shaded cells are the values that are not supported by the JI-ISUP protocol.

If the state of this SOC option is IDLE, then by default, the current behavior will be kept as described in Please refer to Section “20.3.2 ISUP Preference Indicator in Forward Call Indicator” on page 375. except the received ISUP Preference Indicator value is ‘11-spare’.

20.4.4 ISUP Calling Party Category

This activity also provides an optionality to transparently pass the calling party category value ’Calling subscriber with priority’ to the Base ETSI ISUP V2 for the JI-ISUP to Base ETSI ISUP V2 interworking. In order to achieve this, the implementation will be made optional via new created SOC option.

If the state of this SOC option is not ON, then by default the current behavior will be kept as described in Please refer to Section “20.3.3 ISUP Calling Party Category” on page 377..

After the state of the SOC option is changed to ON, CPC value ’Calling subscriber with priority (00001011)’ will be passed as received from the JI-ISUP side for the JI-ISUP to Base ETSI ISUP V2 interworking.

Table 8 Desired CPC Mapping - JI-ISUP to ETSI ISUP V2 i/w

JI-ISUP IAM			dir	ETSI ISUP V2 IAM		
Parameter	**Field**	**Field Value**		**Field Value**	**Field**	**Parameter**
Calling Party Category		00000000 - calling party's category unknown 00000001 - spare 00000010 - spare 00000011- spare 00000100 - spare 00000101 - spare 00000110 - By mutual agreement 00000111 - By mutual agreement 00001000 - By mutual agreement	⇒	00000000 - CPC Unknown	Calling Party Category	
		00001001 - national operator desk		00000000 - CPC Unknown		
		00001010 - ordinary calling subscriber		00001010 - ordinary calling subscriber		
		00001011 - calling subscriber with priority		00001011 - calling subscriber with priority		
		00001100 - data call		00000000 - CPC Unknown		
		00001101 - test call		00001101 - test call		
		00001111 - payphone		00001111 - payphone		
		00010000 - 11110000 spare		00000000 - CPC Unknown		
		11110001 - 11111110 reserved for national use		00000000 - CPC Unknown		
		11111111 - spare		00000000 - CPC Unknown		

Note : The values in shaded cells are the values that are not supported by the JI-ISUP protocol.

20.5 Hardware Requirements or Dependencies

None

20.6 Software Requirements or Dependencies

To make this new feature functional, new controlled SOC option NETK0087 is used. Since the SOC state will be IDLE after ONP completed, it must be changed to ON manually to make the feature functional.

20.7 Limitations and restrictions

None

20.8 Interactions

This feature is affective in the senarious below:

1. call forwarding (when the received call over JI-ISUP is forwarded to another agent over Base ETSI ISUP V2)
2. Carrier Name Notification (CNN) feature

automatically without making any extra implementation.

The NOA value of the outgoing IAM message can be changed with the datafills and features below:

3. EDITCLI option in table TRKSGRP
4. Serving Country Code (SCC) feature

With this activity, those are still be active on the outgoing Base ETSI ISUP V2 trunk without making any new implementation.

20.9 Glossary

Term	Description

21: Functional Description (FN): A00009228

21.1 Feature name and Feature ID

A00009228: LI - International Trunk Interception in Cs2k

21.2 Description

The Intl'LI feature today provides interception of ETSI ISUP V1/V2 trunk on the DMS platform. This capabilty was never migrated to the CS2K.

New markets, Israel and Russia are being entered in which the DMS did not operated in the past. The main requirement is to support the trunk interception in succession market. Base ETSI ISUP V1/V2, national variants (Israel and Russian ISUP) both SIP and TDM based will be supported by this feature in CS2K.

This feature provides the following LI capabilities for the Succession solution:

- Provide interception of incoming trunk calls over ETSI ISUP V1 and V2 with national Calling Party numbers
- Provide interception of outgoing trunk calls over ETSI ISUP V1 and V2 with national and international Called Party numbers.
- Provide incoming and outgoing trunk interception capability for Israeli and Russian ETSI ISUP variants
- Provide interception capability of trunks connected to PVG, M2000, SIP VRDN and NGSS
- Suppor both CDR and IRI call data delivery options using X.25 and TCP/IP delivery for ETSI V1/V2 trunks, Israeli ISUP, Russian ISUP and trunks connected to PVG, M2000, SIP VRDN and NGSS.
- Provide Stereo and Mono Mode delivery of CallContent for the surveillance of ETSI V1/V2 trunks, Israeli ISUP, Russian ISUP and trunks connected to PVG, M2000, SIP VRDN and NGSS.
- Support New CCC Variant R-ISUP as a valid CCC option.

21.2.1 Provisiong of Trunk Interception Monitoring order

Provsioning for **TRK** in DNBDORD for succession market does not need the munch password activiation.

The example for the Help command is given below. The options related to TRK surveillances are highlited in bold.

>help add

```
ADD DNBDORD ENTRIES
Parms: <group_id> STRING
     <cdc_tgtdn> {NO,
                YES}

                        REFNO,
                        NONE}
                <san_req> {NO,
                        YES <san> STRING}}
```

21.2.1.1 International trunk Target and number formats

For provisioning the new INTL TRK agent type check the following information.:

- whether the requested number is an international number, if not, provisioning of the TRK target is rejected.

(note : the above check just checks that the number entered is a international number. It does not validate the provisioned international number. The operator datafills the correct outgoing CDN.)

- whether the requested number is between 4 digits to 18 digits, if not, provisioning of the TRK target is rejected.

To provision and trigger on an international CDN TRK target order
1) check international_access_code (IAC) in OFCENG; let's assume this is '**00**'
2) check national_country_code (NCC) in OFCENG; let's assume this is '49'

If you want to get a successful LI Intl_CDN TRK trigger your mon order DN must look like the following 'template' DN:
00431234567891

The 00 must be identical to the IAC of the specific switch , and the 43 must not be identical to the NCC of the specific switch, else the called number is not being classified a real international number by the LI application. Any other value for the bold digits unequal the NCC=49 will make it as well.

The 1234 is in the above example the SNPA; and the 567891 the local DN.

The following called number **translations results** will provide a trigger:

- 00431234567891, NOA (NatureOfAddress)=unknown, NPI(NumberingPlanIndicator)=don't care
- 431234567891, NOA=international, NPI=don't care

If the routing table is not manipulated for the outpulsed CDN in any Routing table, the LI trigger will happen if, and only if, the result of a TRAVER will show either of the 2 above trigger digit strings.
But note, that if TRAVER shows 431234567891, it must be ensured that the outpulsed NOA is INTERNATIONAL.

Example without CCC's:

```
DNBDORDER:
>add STPO0 YES 1720140405 TRK CDN 4 outgoing_intl 00437545968924 5651999 NO

Add MON ORDER:
ORD STA   GRPID    CDCTDN X25DN       ACC CLLI/LTID/LEN/MAXCCC/DN
    REFNO     CCCREQ IDN              CUGOAE CCCNAME  CCCSYS
    BILLNO  CCCCGSA   SANREQ    SAN

--------------------------------------------------------------------------------
    DEACT STPO0    YES    1720140405  TRK   4 00431234567891
    5651999   NO
```

ACC - Type of the agent to be monitored

MAXCCC - Maximum number of CCC pairs that can be allocated for monitoring. Based on the operators datafill the number of CCC pairs will be set.

DN - This is the DN is the digits that are matched for interception.

Example with CCC's:

```
DNBDORDER3
>add STPO0 YES 1720140405 TRK 4 00431234567891 5651999 YES 0033401234 NO STEPINTL
PX 112233  NONE NO

Add MON ORDER:
ORD STA   GRPID    CDCTDN X25DN       ACC CLLI/LTID/LEN/MAXCCC/DN
    REFNO     CCCREQ IDN              CUGOAE CCCNAME  CCCSYS
    BILLNO  CCCCGSA   SANREQ    SAN

--------------------------------------------------------------------------------
    DEACT STPO0    YES    1720140405  TRK      4 00431234567891
    5651999   YES    0033401234        NO      STEPINTL PX
    112233  NONE      NO
```

21.2.1.1.1 International number formats

The numbers in the following table show an example of a DN identified as an international number. In this example, the displayed IAC of the DN is 41 in table OFCENG.

Table 11: International DN formats

DN	NPI	Type of Number
41888212345	E.164	international
0041888212345	E.164	unknown

21.2.1.2 Interception of International trunk target monitoring

Whenever an outgoing called number over ETSI ISUP has a matching pattern in DNBDORD and if the surveillance is active for this provisioned outgoing CDN, then CDC/IRI records are generated for this monitored call.

The call content of this call is sent by a pair of CC links. The list below give the sequence of the records.

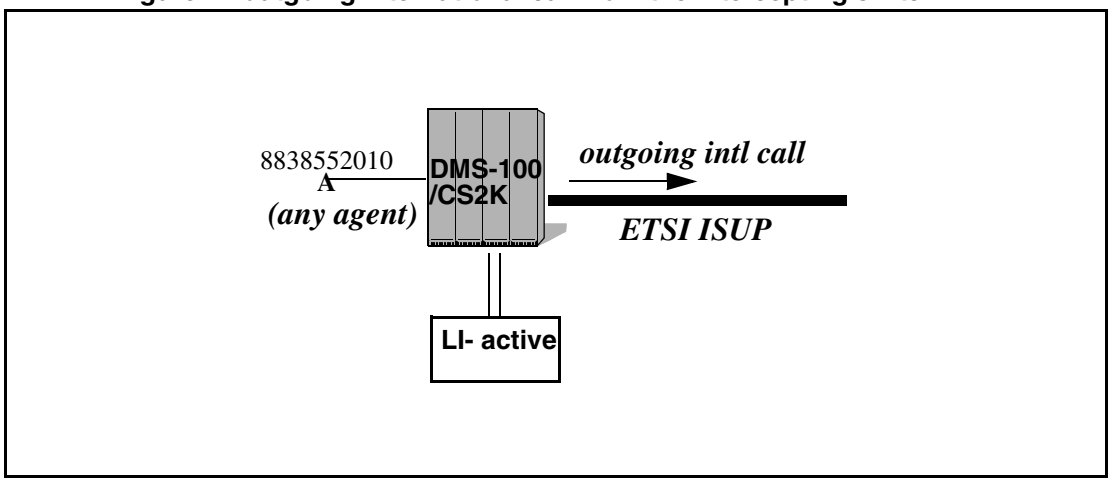
- When the trunk is allocated a BEGIN record is generated and a pair of CC links is setup and connected for this call.
- If the terminator of the call answers then a CONTINUE record is sent.
- When the call is released, an END record is generated and the CC links are also released.

- If the trunk allocation fails then a REPORT record is generated. In this case no CC links are setup.

The address of the target facility is the outgoing CDN which is obtained in the ISUP message. Based on the dialling (enbloc or overlap) the target facility will have the complete number or the part of the number.

The calling number is the address of the correspondent.

Figure 1 outgoing international call from the intercepting switch



In the figure above, A's number is 8838552010. A dials `00431234567891`. The provisioned target `00431234567891`. With respect to this particular scenario the target facility is `00431234567891`and the CDN is `00431234567891`. The other party address is 8838552010.

The target address provisioned can be a complete CDN or a partial address of the complete CDN. for eg,

— complete CDN provisioned : `00431234567891`

— partial CDN provisioned : `00431234`

For the working knowledge refer to "International Lawful Intercept Product and Technology Fundamentals" NN10194-113

21.2.1.3 National trunk Target and number formats

This section describes how LI triggering affects the numbering format for national calls.

21.2.1.3.1 Normalized national number format

The LI triggering for national CLI and CDN monitoring orders is based on a normalized national DN.

The following table shows an example of how a normalized national DN is formatted.

Table 12: Normalized National DN format

DN	NPI	Type Of Number
07545968168	E.164	unknown

Only national CLI and CDN trunk monitoring orders using the above DN format can be datafilled in the DNBDORD level of the LI provisioning interface on the CM. The National access code in table OFCENG (NAC) is the leading 0.

21.2.1.3.2 National number formats

The numbers in the following table shown an example of DNs identified as national numbers that map to their equivalent normalized national DN listed in the previous table. For mapping of the National DN in Table3 to normalized DN format refer to figure 2 and 3.

Table 13: National DN formats

DN	NPI	Type of Nunber
07545968168[1]	E.164	unknown
7545968168	E.164	national
497545968168[2]	E.164	international

1.Leading digit is “0” = NAC (normalized national format)

2.Leading digits are “4” and “9” = international access code (IAC) for Germany. This IAC identifies this number as a national number for the German market i.e National Country code in table OFCENG.

21.2.1.3.3 National CDN/CLI trigger functionality Depending on the selected trigger variant, this trigger is activated when the DNs from the ETSI ISUP V2 IAMs or SAMs match the monitoring order. The DN that is

provisioned in the DNBDORD level can be a complete national number (including the national access code 0) or a partial address of the complete number. (Partial address support applies to the left-most aligned digits only.)

21.2.1.4 Incoming national CLI trigger

The following figure shows how a CPN received in an ETSI ISUP V2 IAM activates CLI monitoring when the equivalent normalized national number matches the target address provisioned in the DNBDORD level, and the monitoring order is active for that address

Example without CCC's:

```
DNBDORDER:
>add STPO0 YES 1720140405 TRK CLI 4 incoming_natl 07545968168 5651999 NO

Add MON ORDER:
ORD STA   GRPID    CDCTDN X25DN       ACC CLLI/LTID/LEN/MAXCCC/DN
    REFNO     CCCREQ IDN              CUGOAE CCCNAME  CCCSYS
    BILLNO  CCCCGSA   SANREQ    SAN

--------------------------------------------------------------------------------
    DEACT STPO0    YES    1720140405  TRK   4   07545968168 5651999 NO
```

..

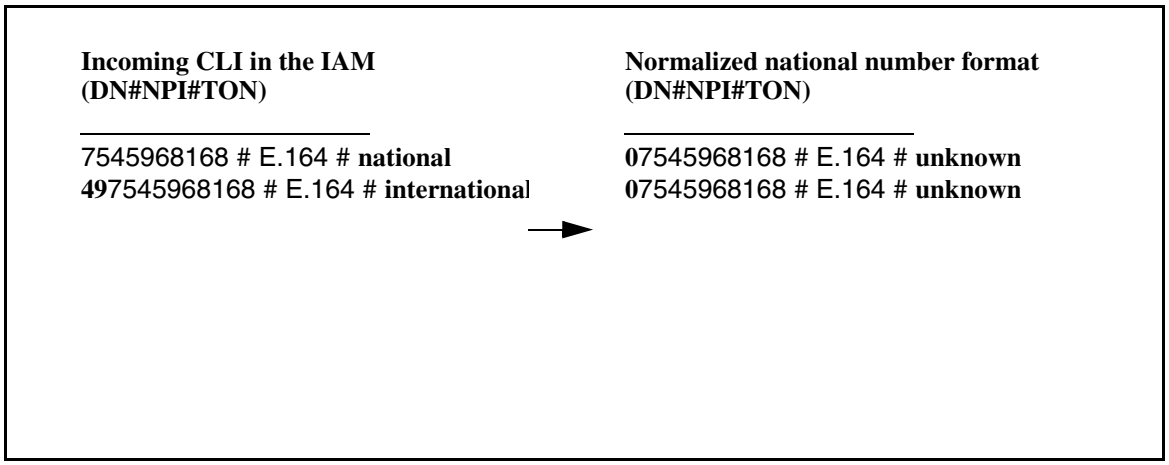


Figure 1 Supported Incoming national DN format

21.2.1.5 Outgoing national CDN trigger

The following figure shows how a CDN sent in an ETSI ISUP V2 IAM or SAM activates CDN monitoring when the equivalent normalized national number matches the target address provisioned in the DNBDORD level, and

the monitoring order is active for that address.

Example without CCC's:

```
DNBDORDER:
>add STPO0 YES 1720140405 TRK CDN 4 outgoing_natl 07545968168 5651999 NO

Add MON ORDER:
ORD STA   GRPID    CDCTDN X25DN       ACC CLLI/LTID/LEN/MAXCCC/DN
    REFNO     CCCREQ IDN              CUGOAE CCCNAME  CCCSYS
    BILLNO  CCCCGSA   SANREQ    SAN

--------------------------------------------------------------------------------
    DEACT STPO0    YES    1720140405  TRK   4    07545968168 5651999 NO
```

Figure 2 Supported outgoing national CDN number format

21.2.2 List of features Supported by Trunk Targets

The following list includes the features that the CDN/CLI trunk trigger service supports for national CLI and CDN trunk triggers:

- ETSI Call Forwardingx (x=all Call Forwarding features)
- ETSI Calling Line Identification Presentation (CLIP)
- ETSI Connected Line Identification Presentation (COLP)
- ETSI Hold
- ETSI Call Waiting (CW)
- ETSI Three-Party (3PTY) Conference Call
- International Telecommunication Union-Telecommunication Standardization Sector (ITU-T) MLPP

21.2.3 DNBD provisioning capacity

For capacity ty information refer to feature A00009229.

21.2.4 Russian ISUP as CCC link

The interface to the LEA, that is, to the transit network, is implemented using the ETSI ISUP baseline protocol. A detailed description of the parameters passed in the IAM, REL, RLC and CON ISUP messages can be found in the FN of feature AN1940. This activity enables configuring of Russian ISUP, which is a variant of ETSI ISUP, as Call Content Interface.

22: Functional Description (FN): A00009245

22.1 Feature name and Feature ID

A00009245: Succession Test Trunks: T904 Support

22.2 Description

This activity provides the capability to conduct the Israeli ISUP T904 line trunk test over Gateway TDM trunks in the Succession Packet Trunking IP product. This project is being designed for the IP Greenfield solution for the Telrad market. However, there should be little difference from this design's perspective if the external fabric is IP or AAL2. The AAL1 solution is not being considered at this time. This activity utilizes the capabilities of the Audio Controller (AC) and the Audiocodes Media Server IP (AMS 2010) for performing the tests. Performing the T904 test using the Audio Server (UAS) is not addressed. This document focuses on expanding the CS2K/CS2Kc (core) and Audio Controller (AC) to support T904 TLT. The proposed changes for the AMS 2010, while mentioned for reference purposes, are not addressed in this document.

> ***Note:*** Hybrid offices will continue to use the legacy test equipment via Interworking Bridges (IW's) to get the T904 line trunk test functionality. This activity specifically addresses the T904 TLT for the IP solution in which the legacy equipment is not available.

Currently, the main test hardware for trunk maintenance requests resides in the Integrated Service Module Equipment or ISME. The ISME is specifically designed to accommodate a variety of test and service hardware which can perform frequency and level measurements on specific trunks.

Test Line Tests or TLTs are used to test trunk connections to other adjacent switching offices, both local and toll. TLTs are run under the control of the originating office, often without human intervention at the terminating office, and can be used to test both the originating and terminating ends of trunk.

There are three T900 series tests for Israeli trunks. Only the T904 test is addressed by this activity.

T901 Communications Test (R2/PIE and ISUP trunks)

In this test the ORIG switch establishes communication with the TERM switch, receives ***answer msg*** *and releases the trunk.*

T902 Transmissions Test (R2 trunks)

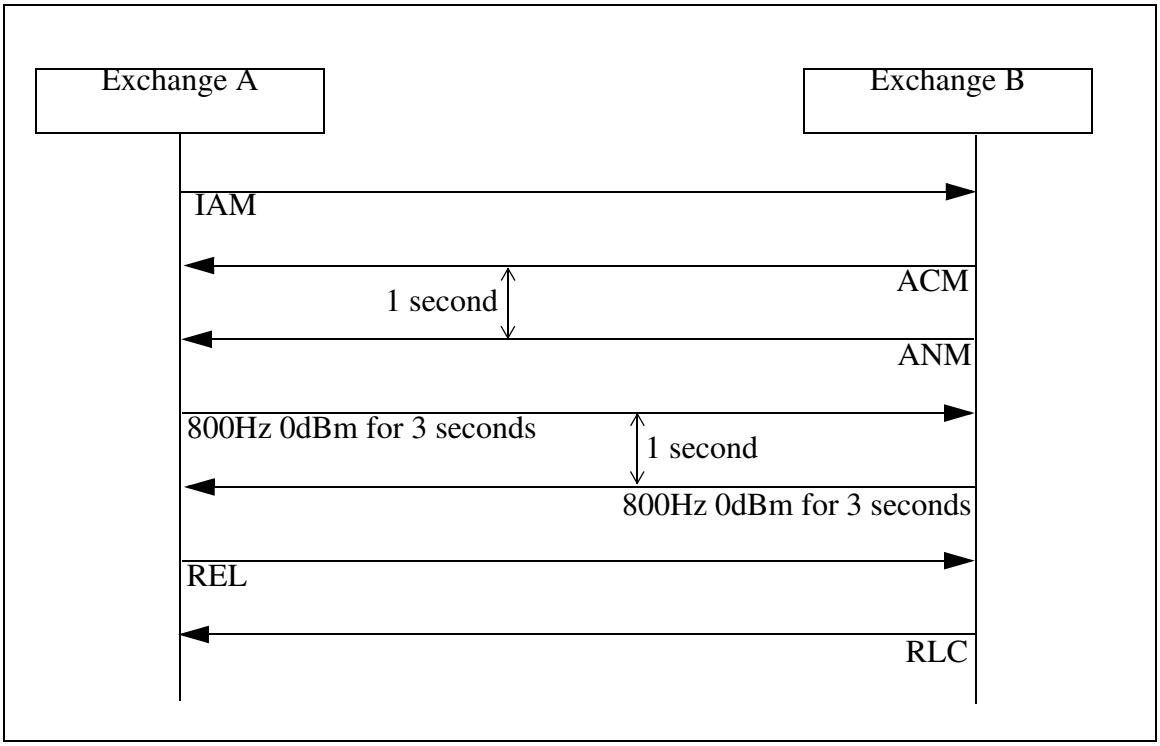
*In this test the ORIG switch establishes communication with the TERM switch, receives **answer msg**, receives **800 Hz tone**, analyses it and releases the circuit.*

T904 Two-way Transmitting Test (R2/PIE and ISUP trunks)

*In this test, the ORIG switch establishes communication with the TERM switch, gets **answer msg**, and sends **800Hz tone** to the TERM switch. The TERM switch analyses the received tone and then sends **800 Hz tone**, which is tested in the ORIG switch. Once the ORIG switch has analyzed the tone, it releases the circuit.*

Note: This test will be supported on Israeli ISUP trunks only, as R2/PIE trunk types are not supported on the existing set of trunk gateways.

Figure 1 T904 Message Sequence



22.2.1 T904 Termination Feature Description

The following steps are performed in the terminating switch after test request is received:

- Seizure of the incoming trunk as a response to receiving the IAM from the originating switch. The IAM should have the following field settings:

— Called Party Address consists of DXF, where “X” is a one-digit number between 0 and 9 that is defined by the administrator.

— Calling Party Category is set to “Test Call”.

— Transmission Medium Requirements is set to “3.1 KHz audio.”

— Nature of Address is set to “Test Line, Test Code.”

— Calling Party Address is not included.

Note: The packet connection between the AMS and the trunk gateway shall use Clear Channel Data.

- Performance of the test protocol. This involves connecting to the AMS to detect the incoming 800Hz at 0 dB tone and to generate the appropriate response tone based on the analysis of the incoming tone:

Table 14: T904 Response Tones

Incoming tone analysis	Response Tone
Tone is within specified range.	800 Hz @ 0dB for 3 seconds.
Tone is determined to be unsteady, out of range or the loss is too high. (-65 DB is max loss.)	Silence @0 dB for 6 seconds.
Tone is determined to have a gain considered too high. (35 DB is max gain.)	Busy tone @0 dB for 11 seconds.

- Release of the trunk (in normal case caused by originator).

22.2.2 T904 Origination Feature Description

The T904 test can be triggered in two ways from the originating switch:

- MAPCI TTP Level Initiation

  The tested trunk is posted on the level mapci;mtc;trks;ttp using command tst. Communication with the far end is done by outpulsing the determined digits. The digits are defined in the table TSTLCONT, subtable TLNOS. The digits are sent automatically and are responsible to activate the test on the far end.

  Sample datafill can be found in Originator Configuration in the CN section.

- MACPCI ATT Level Initiation

  T904 can also be operated from the ATT level as any other test line test.

The following steps are performed on the originating switch:

- Seizure of the outgoing trunk.
- Reserve the AMS test resource.
- Establish connection to the far end.
- Activation of tone to be checked by far end.
- Analysis of the far-end response and appropriate action.
- Release of the trunk.
  - — Execution from TTP MAP level: return trunk to pre-test state
  - — Execution from ATT MAP level:
    - – Success: return trunk to the pre-test state
    - – Failure: take trunk out of service according to the ATT sequence
- Output proper log message
  - — Execution from TTP MAP level: TSTK94X where X is:
    - – 0: Test Success
    - – 1: Communication establishment failure
    - – 2: Tone transmit & receive failure
    - – 3: Tone analysis failure on terminating side
    - – 4: Tone analysis failure on originating side
  - — Execution from the ATT MAP level:
    - – Generate ATT120 log upon test success

Table 15: Test Actions and Test Results according to Trunk States

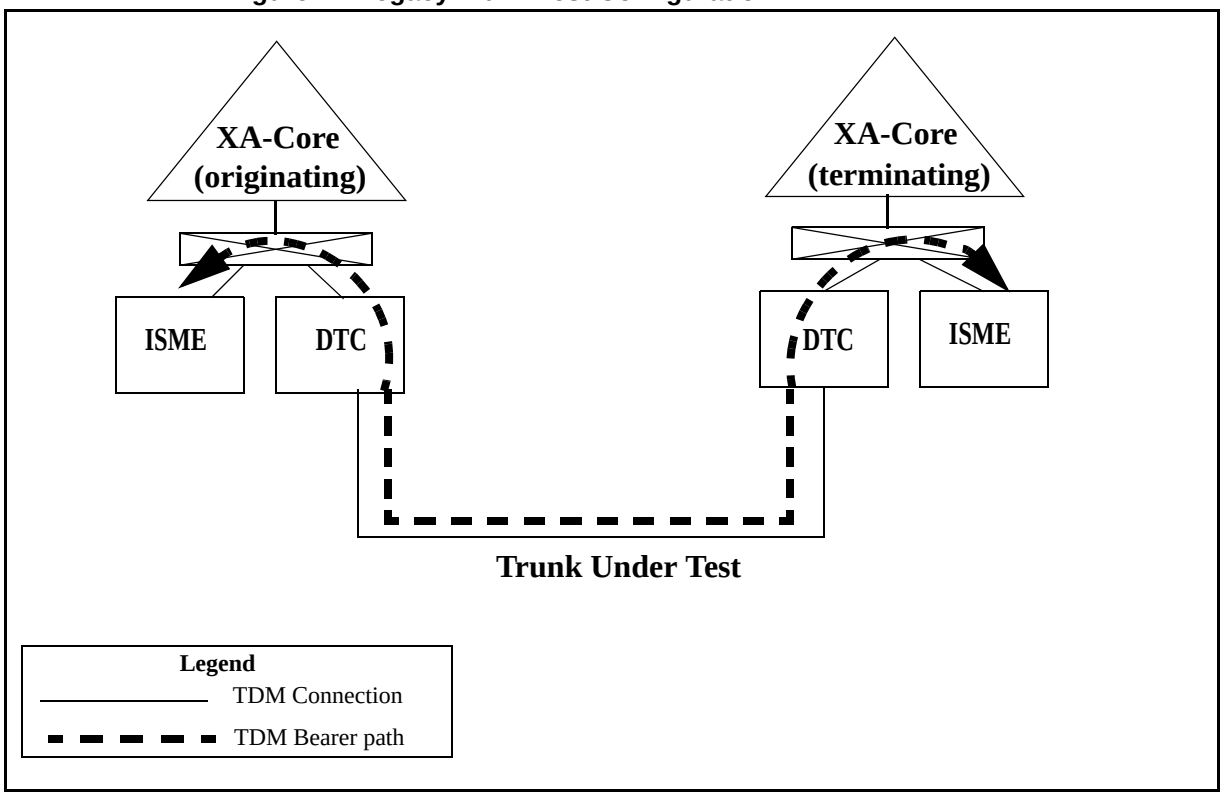
Trunk State	Action	Result
IDL, MB, SZD, INB	Trunk is seized and checked.	PASS or FAIL (According to check result.)
LO, CFL, RMB		FAIL
CPB, CPD, NEQ	Trunk is not seized.	Not checked

22.3 Configuration Overview

22.3.1 Legacy DMS Test Trunk Configuration

In a conventional DMS configuration the Test Line Tests were executed using special hardware connected to the ENET. A request is originated by the user either via a MAP interface or the Automatic Test Trunk system. Connections are created between the Trunk Under Test and the appropriate originating or terminating trunk testing hardware resident on a local ISME. Once completed the test results would be displayed to the user at the MAP or via logs (TSTK940-TSTK944, ATT120).

Figure 2 Legacy Trunk Test Configuration

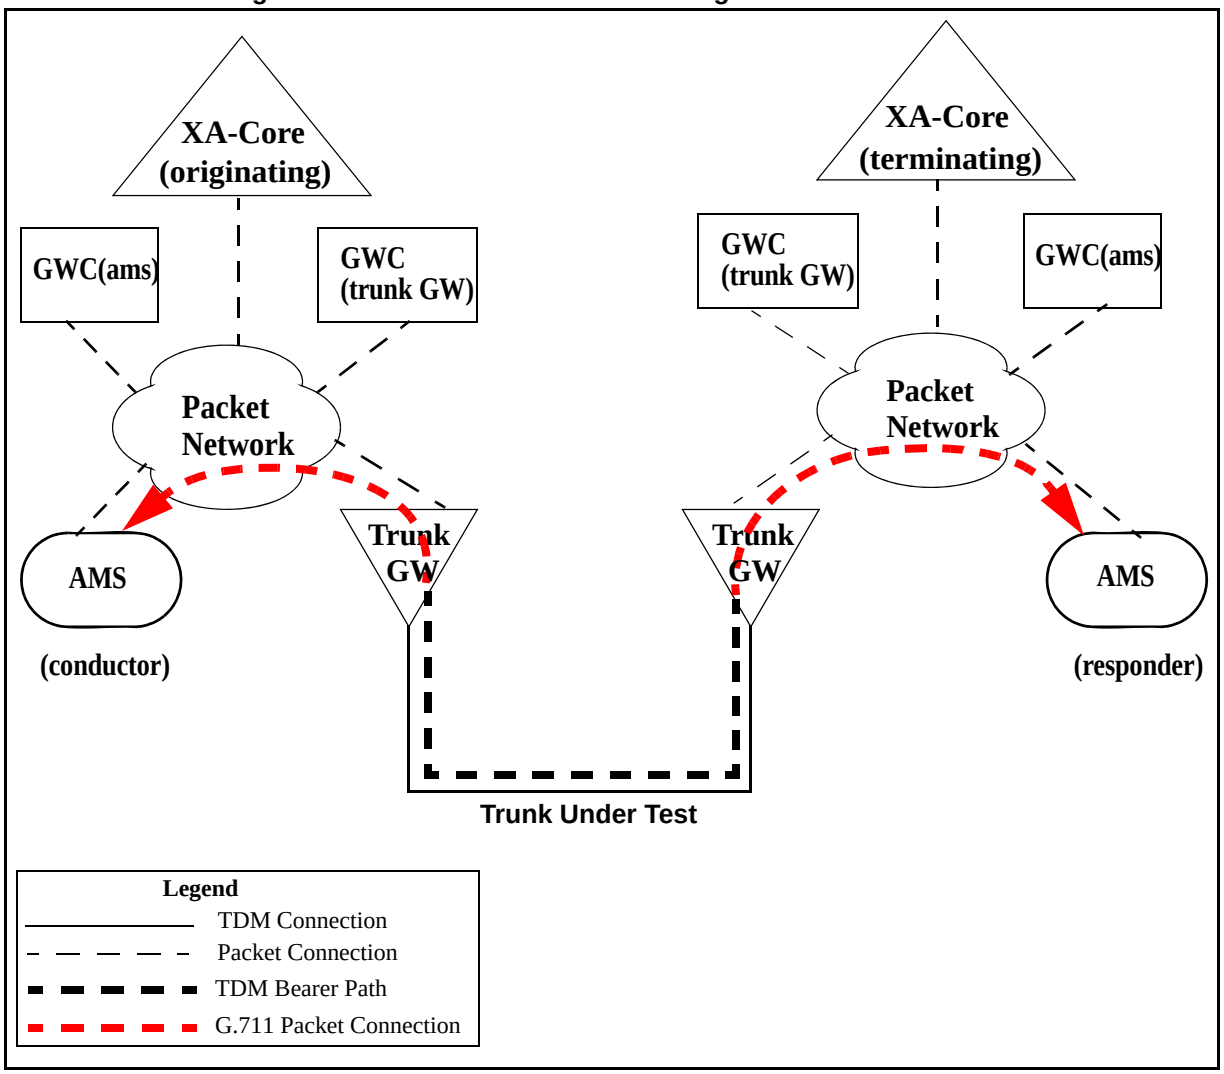


22.3.2 Packet Test Trunk Configuration

The implementation of this feature offers a new method of conducting Test Line Tests via the Audiocodes Media Server IP (AMS 2010). This configuration has the capability of operating without the need for an ENET or ISME. A user can request a test, in the same fashion as a conventional DMS, either via a MAP interface or the Automatic Test Trunk system.

Connections are established between the AMS and the GW TDM Trunk Under Test. Once completed the test results are displayed to the user at the MAP or via logs consistent with the results today on a conventional DMS.

Figure 3 UAS/SAGE Test Trunk Configuration



22.4 Hardware Requirements or Dependencies

For IP: Audiocodes Media Server IP (AMS 2010)

For AAL2: Audiocodes Media Server ATM (AMS 2020)

22.5 Software Requirements or Dependencies

Core: SN09 load or greater

GWC: GC090 load or greater

Provisioning: See “Configuration Walkthrough” in the CN section on page 130.

22.6 Fault Management

Five logs exist for legacy T904 when the test is executed from the TTP MAP level. They are:

- TSTK940: Test Success
- TSTK941: Communication establishment failure
- TSTK942: Tone transmit and receive failure
- TSTK943: Tone analysis failure on the terminating side.
- TSTK944: Tone analysis failure on the originating side.

The TSTK940 log remains unchanged from legacy. The TSTK941, TSTK942, TSTK943 and TSTK944 logs are reused for succession but may contain new fault reasons. See section FM for new error reasons that get displayed for existing TSTK941, TSTK942, TSTK943 and TSTK944 logs.

ATT120 information log referenced in NTP 297-2301-8401 DMS-300 Logs Reference Manual, Volume 1 of 4 is not available.

22.7 Limitations and restrictions

- PIE/R2 trunk types are not currently planned under this activity.
- T900 and T902 TLT tests are not covered under this activity.
- AAL2 testing is not covered under this activity.

22.8 Interactions

Not applicable.

23: Functional Description (FN): A00009282

23.1 Feature name and Feature ID

A00009282: Emergency Stand Alone (ESA) International Support for MG9KEM

23.2 Description

SN08 Introduced Internodal ESA for North American (NA) Markets. This feature provided a Community of Interest (COI) for MG9000 nodes to communicate if unable to communicate with the GWC.

For SN09, this feature is to be expanded to include International markets. COI provisioning will be provided as is used for North America. This feature also removes the restriction that Enhanced ESA be only associated with North America.

International ESA allows the download of information necessary to support International Emergency Stand Alone (ESA) call processing across all native (non ABI) and ABI lines served by a single MG9000 for intra and internodal ESA.

23.3 Hardware Requirements or Dependencies

None

23.4 Software Requirements or Dependencies

This ESA activity on the MG9K is dependent upon two additional activities for successful completion and will be integrated together under an ICAF.

23.5 Limitations and restrictions

- The ESA data from the core will be autonomously downloaded to the MG9000 only once every 24 hours.
- ESA data can be manually downloaded from the core and sent to individual VMGs.
- The MG9000 EM will not allow the modification of any ESA data retrieved from the core.

23.6 Interactions

None

24: Functional Description (FN): A00009297

24.1 Feature name and Feature ID

A00009297: QoSR: Support of AAL2

> ***Note:*** The following Functional Description includes both the original QoS feature 89007819 and the updates related to A00009297, QoSR: Support of AAL2.

24.2 Description

This document covers the QoS Collector Application functionality supported in SN09.1 time frame.

In Voice over IP/VoATM networks, Quality of Service (QoS) can be adversely affected by the components in the network. Unlike TDM networks where the voice quality is consistent for all calls, VoIP/VoATM networks can experience different voice quality on all calls.

The common parameters that make up voice quality are:

- Packets sent
- Packets received
- Packet loss
- Octets sent
- Octets received
- Inter-arrival latency
- Jitter

All gateways beginning SN06 VoIP solutions report these statistics via end-of-call reporting mechanisms specific to the protocol used for MGC - VMG communication.

Beginning SN09.1, QCA will collect QoS Reporting statistics from ATM AAL2 Gateways too. The statistics collected are;

- Packets-sent (aal2/ps - H248 representation)
- Packets-Received (aal2/pr - H248 representation)
- Total Packets lost (aal2/tpl - H248 representation)
- Jitter (aal2/jit - H248 representation)

It is the purpose of this activity to design a method for reporting these QoS parameters on a per call basis for the purposes of;

- Network engineering
- Trend analysis
- Trouble-shooting network problems
- SLA validation

This is accomplished by implementing a reporting mechanism that will allow QoS reports (as IPDR records) to be delivered to a customer provided OSS for processing. In order to achieve SLA validation, QoS reports are correlated to appropriate billing records so that the QoS of billed calls can be determined.

QoS Reporting is applicable for more than just VoIP networks. It can be used in hybrid networks as well. From SN06 time frame to SN09 time frame QoS Reporting was limited to pure IP networks which consist only of GWC driven GWs.

Support for SPM peripherals and hybrid networks will be accomplished in a later release.

Beginning SN09.1 time frame QoS Reporting is extended to ATM AAL2 fabric which consists of GWC driven GWs (which support reporting of End of Call QoS statistics)

The proposed architecture for QoS Reporting beginning SN06 consists of the following components;

1. QoS Correlation ID and billing
2. QoS Reporting Application (on GWC)
3. Provisioning
4. QoS Report collection
5. QoS Report processing

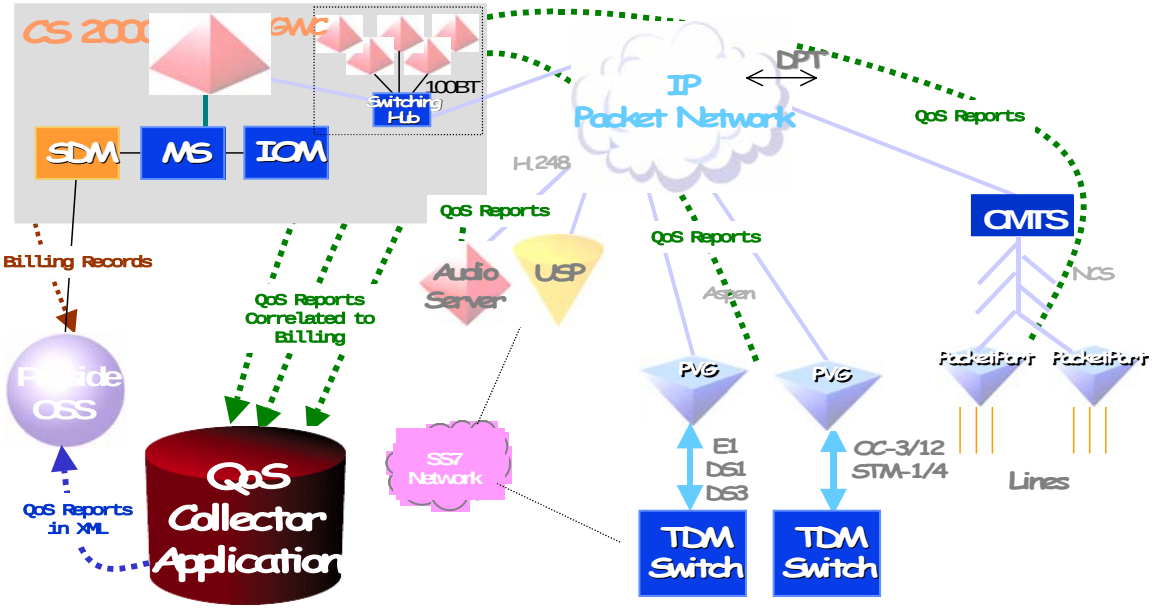
This activity implements component 4. QoS Report collection, the QoS Collector Application (QCA)

24.2.1 System behavior

All QoS (IPDR) records are stored on a QoS Collector Application (QCA) host. The QCA will receive binary QoS records from the GWCs, converts these to QCA IPDR records and stores them in a file. The QCA IPDR records can be obtained by the OSS for processing.

The configuration of this proposal is shown in Figure 1, "QoS Reporting in a VoIP/VoATM Network"

Figure 1 QoS Reporting in a VoIP/VoATM Network



24.2.2 Configuration

The configuration details for the QoS Collector Application are provided by a properties files. The properties file is located at /opt/nortel/qca/properties/qca.properties and can be configured by the user.

The QCA properties are given in Table 1, “QCA properties,” on page 407 and an example QCA properties file is given in Figure 2, "Example of the QCA properties file".

Table 1 QCA properties

Name	Description	Units	Range	default
portNumber[3]	the port number the QCA accepts connections on	N/A	20000 to 20004	20000
MaxFileSize	maximum size of an output file	MBytes	1 to 100	5
MaxFileTime	interval output file is open	minutes	1 to 240	15
RetainFileTime	how long the output files should be retained	days	1 to 30	5
recycleToD	the hour in the day the directories will be recycled	hour	0 to 23	0

Table 1 QCA properties

Name	Description	Units	Range	default
fileExt	the output file extension	N/A	String	xml
nodeName	the node name to be used in the output files	N/A	String	QCA
closedFileCompression[1]	whether the file should be compressed when closed and moved to today	boolean	true or false	true
oldFileCompression[1,2]	whether the files should be compressed at the first directory recycle	boolean	true or false	true

Notes:

1. File compression may be required as there is limited disk space for QCA IPDR record storage.
2. If *closedFileCompression* is true the value of the *oldFileCompression* property is negated as the files will have already been compressed.
3. A range of port numbers is provided for flexibility. The main use is for upgrade purposes, where two QCA instance may be running on a single host. Multiple QCAs, and therefore port numbers, should not be used to segregate QCA traffic.
4. Starting SN09FF the default value of MaxFileSize used in qca.properties file is 5 MB. This change is to improve QCA performance especially on Large Offices where the traffic rate could be as high as 2M BHCA. CR fix for Q01225163 adds this change.

The qca.properties file is read when the QCA is started, therefore the QCA must be stopped and restarted for changes in the qca.properties to be picked up.

When the qca.proprties file is read the contents is validated. If any of the properties are not present or invalid, the default value is automatically used. A warning customer log is generated to indicate that the default value is being used.

An example customer log warning:

```
Oct 11 12:00:02 wmdhs0j8 main:0001 QCA201 WARNING init label:
RetainFileTime property in properties/qca.properties is out of
range. QCA is starting with default retain file time of 5 days
```

Figure 2 Example of the QCA properties file

```
# QCA Properties file
# The QCA will have to be restarted for changes in the properties
# file to be reflected in the application's operation

# The maximum size of a file, in MBytes, before it is closed
# Range is 1 to 100. Default is 1.
  MaxFileSize=1

# The maximum time, in minutes, a file can be open before
# it is closed
# Range is 1 to 240. Default is 15.
  MaxFileTime=15

# Hour of the day that the directory structure is recycled
# Range 0 (12:00 AM) to 23 (11:00 PM). Default is 0 (12:00 AM).
# Do NOT specify minutes.
  recycleToD=0

# port number to start application on.
# Range is 20000 to 20004. Default is 20000.
  portNumber=20000

# How long, in days, the files are kept before deleting
# VERY IMPORTANT: Depending on the call volume and the number of
# days for file retention it could be possible to exhaust all
# available disk space, therefore the value of this property
# should be considered in great depth.If QCA is started with
# the value of this property less than the number of today
# directories for a given port the older directories will be
# deleted.
# Range 1 to 30. Default is 5.
  RetainFileTime=5

# File Extension used in the QCA output file name.
# Default is xml.
  fileExt=xml

# Node name to be used in the QCA output file name.
# Default is QCA.
  nodeName=QCA

# true or false value indicating whether the output file
# should be compressed when closed. Default is true.
  closedFileCompression=true

# true or false value indicating whether the file should be
# compressed at the first directory recycle
# Note: If closedFileCompression is true the value of the
# oldFileCompression property is negated as the files will have
```

24.2.3 Starting QCA

The `qca_server` script is used to start the QCA. The user should log in as root to execute this script.

When the `qca_server` script is run the following warning is displayed:

```
Attempting to register QCA as Qca with PMFADM.
```

If a QCA instance has not already been started with `qca_server` the following message is displayed:

```
Registration as Qca was ok. QCA started.
```

If a QCA instance has already been started with `qca_server` the following message is displayed:

```
pmfadm: Request "Qca" already queued
Could not register QCA as Qca with PMFADM, this suggests a QCA
instance is already running.
```

When the QCA is started the following steps are performed:

- the QCA is registered with PMFADM (processes monitor facility administration).
- This is a Solaris utility that monitors register processes and restarts the process if no longer running.
- configuration details (qca.properties file) are read
- If any of the properties information is not present or is invalid the default value is used and a customer log is generated to indicate this. It is at this point the user can stop the QCA if using default values is not acceptable.
- the QCA attempts to open a server socket on the specified port.
- If the specified port is in use the QCA can not be started.
- a file management process is started
- If the QCA output directory is not available when the QCA is started the directories are created.
- If a file exists in the active output directory, this indicates that QCA did not stop gracefully, the QCA will attempt to complete the file and move it to the today directory.
- the QCA waits for connections from clients (GWCs and SPMs) on the port number specified in the qca.properties.

24.2.4 Stopping QCA

The `stop_qca` script is used to stop the QCA. The user should log in as root to execute this script.

When the `stop_qca` script is run the following warning is displayed:

```
Are you sure you want to stop the QCA? Have you checked the port
number in qca.properties? [ no or yes ]
```

If the port number in qca.properties has been checked and is correctly specified for the QCA to be stopped, this should be validated against the QCA datafill in PTM, then **yes** should be entered, otherwise **no** should be entered and the port number checked.

If a QCA instance was started by `qca_server` the following message will be displayed:

```
Attempting to unregister QCA as Qca from PMFADM.
Attempting to stop local QCA on port : 20001
QCA stopped successfully.
```

If a QCA was not was started by `qca_server` the following message will be displayed:

```
Attempting to unregister QCA as Qca from PMFADM.
pmfadm: "Qca" No such <nametag> registered

QCA not registered with PMFADM as Qca, so stop_qca aborted.
```

If the above message is seen the `query_qca` script should be used to determine if a QCA instance is running on the host.

When the QCA is stopped the following steps are performed, in order:

- the QCA is unregistered with PMFADM
- the QCA stops accepting connections from clients
- the connection to the client(s) is closed
- the IPDR / XML structure in the output file is closed
- the output file is closed and moved to the today directory

Note: to avoid alarms being generated by all the GWCs sending QoS records to the QCA when the QCA is stopped the QCA details must be removed from PTM first. Please refer to activity 89007781 - QoS Reporting: Provisioning for QoS Reporting provisioning details.

24.2.5 Client (GWC) connection to QCA

When the QoS reporting mechanism is started on a client (GWC) it will connect to the QCA as specified in PTM, e.g. IP Address and port.

When a connection is established the QCA waits to received data from the client (GWC).

24.2.6 Client (GWC) Connection heart beat

The TCP/IP connection between the client and QCA will be automatically closed if it is not used for more than 2 hours. To ensure the connection is not closed in this circumstance, the client will send a ‘heart beat’ message after 2 hours of inactivity.

The QCA simply receives the client ‘heart beat’, and does not generate a QCA IPDR record.

24.2.7 QCA File Management

The active output file is in the active directory. When a file is closed it is moved to the today directory.

24.2.7.1 Initialization

When the QCA is started the following file management steps are performed:

- the output directories are created if they do not already exist.
- any files in the active output directory are validated, ensuring that the last IPDR is complete and that the file structure is closed. Once the file is complete it is moved to the today output directory.
- all ‘today’ directories older than the file retention period are deleted. This can occur if the qca.properties is change such that file retention period is reduced.
- a new file is created using the naming convention given below. If the file name already exists the new file will have the number 0 added before the file extension, if this exists, the number 1 will be used, then 2 and so on.

24.2.7.2 Output directory

The directory used for the current QCA output is:

/data/qca/”port number”/output/active

Note: In SN07, QCA registers with the ‘servman’[1] on the SSPFS machine. Depending on your selection of `RetainFileTime` property in qca.properties file and your calculation of Disk consumption depending on Call traffic at your CO, proper disk partition size of /data/qca should be requested during SSPFS installation. For calculation on how much disk space should be allocated, refer to section 2.2.7.5.

Where “port number” is the port number that is specified in qca.properties and that the QCA accepts connections on. This allows the output of two QCAs running on the same host to be distinguished.

24.2.7.3 File names

The QCA will use the following file naming convention:

<Node Type>.<Node Name>.<ReportName>.Year.Mon.Date_HR.MN_<TZ>.<File Ext>

For example:

QCA.Telco_Switch_35.QoS.2002.04.11_02.45_EDT.xml

[1]servman is the application service manager on the SSPFS platform starting SN06.2. servman manages registration and deregistration of all client applications running on the SSPFS machine whether it is simplex or clustered.

Where each of the elements is described as:

<NodeType> - A Nortel defined string identifying the product origination. Always “QCA”.

<Node Name> - This name should MATCH the name of the node that is used in faults, in configuration (FQDN), in accounting and in GUIs. This value is configurable as property nodeName in qca.properties.

<Report Name> - The name of the script/filter/report that is used to create this file. There may be 1 or more report names in operation for a given NE simultaneously. Each report type must be identified in the filename. Always “QoS”

<**Year.Mon.Date_HR.MN_**> - This field when present in the active directory refers to the time when the file was opened or created in the active directory. The same field when present in today directories refers to the time the file was closed i.e the time when the files are closed and recycled to the today directories.

<TZ> - This is the Time Zone of the NE the Performance data is being collected from. This can be an off set from UMT or GMT.

<File Ext> - The file extension specified in qca.properties or the default xml.

24.2.7.4 Output file rotation (closure)

QCA file management provides file rotation (closure) based on file size and time the file has been open, on a ‘which ever comes first’ basis. Theses values are MaxFileSize and MaxFileTime, respectively, in qca.properties.

24.2.7.5 Output file compression

Due to the size of each QCA IPDR record (maximum about 840 bytes) the required disk space to store several days of QCA output files could be very large.

The required disk space storage requirement calculation is a follows:

Assuming:

- BHCA = 550K
- Calls per day = 10 x BHCA = 5.5 M
- QoS records per day = 2 x Calls per day = 11 M
- Record size = 840-bytes
- Compression ratio = 88% (achieved in testing)

Per day disk space required = 11 M x 840 = 8.6 GBytes

When using compression = 8.6 GBytes * 0.12 = 1 GByte

It can be seen that file compression offers a major saving is disk space requirements. And with out compression the disk space in the /data/qca partition would be quickly exhausted.

The file compression is controlled by two properties, closedFileCompression and oldFileCompression.

closedFileCompression controls whether the active file should be compressed when it is closed and moved to the today directory.

oldFileCompression controls whether the retained files should be compressed when the output directories are recycled. When oldFileCompression is enabled, the files in the today-n directories will be checked, and compressed if required, every time directory recycling occurs.

24.2.7.6 Output file retention

The file management of the QCA follows that implemented for the SN05 feature SNMP Performance Measurement Poller (59039902). The output directory structures will contain a *number* of directories, for the current active file, today's closed files and the last *number-1* days closed files.

The clean-up mechanism is described by two parameters:

- 'retain file duration' (RetainFileTime) - how long (in days) should the files be retained on the local disk.
- 'recycle time of day' (recycleToD) - the hour of the day that the today directories are recycled.

Both are parameters specified in the qca.properties file read when the QCA is started.

At a predefined time (recycleToD in qca.properties, default is 12:00 AM), the output directories will be recycled.

The today-n directories are not created when the QCA is started but when the output files are recycled.

When the today directory reaches the maximum file retention period the information is discarded.

E.g.Output file structure if *number* were 30:

/data/qca/"port number"/output/active

/data/qca/"port number"/output/today

/data/qca/"port number"/output/today-1

/data/qca/”port number”/output/today-2

.

/data/qca/”port number”/output/today-28

/data/qca/”port number”/output/today-29

Note: if the QCA is stopped and restarted with a new ‘retain file duration’, that is less than the previous ‘retain file duration’ the QCA operated with, any existing today directories older than the new ‘retain file duration’ will be deleted.

The value for the ‘retain file duration’ should be considered carefully as the operation of the QCA and other applications may be impacted if there is no free disk space because it is used to store QCA output files.

In arriving at a value for the ‘retain file duration’ the following should be considered:

- the BHCA and total number of calls per day.
- total disk space available for file retention
- whether file compression is used.

A similar calculation to that in section 2.2.7.5 ‘Output file compression’ should be used to determine the require ‘per day’ disk space requirements and there fore the ‘retain file duration’, e.g.:

$$\text{‘retain file duration’} = \frac{\text{available disk space in MBytes}}{\text{required MBytes/day}}$$

Suppose the /data/QCA partition size is 8GBytes. Using the assumptions in section 2.2.7.5 ‘Output file compression’ and the above calculation the maximum ‘retain file duration’ value is:

$$\frac{\text{8000 MBytes}}{\text{1000 MBytes}} = \text{8days}$$

However, you may request a higher partition size of /data/qca during SSPFS installation as per the calculation shown in section 2.2.7.5.

24.2.7.7 Retaining modified qca.properties over an Upgrade

Note: Applicable only if values of parameters in qca.properties have been modified (different than default), and the same are required to be maintained over QCA upgrade.

When QCA is installed, qca.properties at /opt/nortel/qca/properties contains default values of various parameters (For example portNumber = 20000, and

retainFileTime = 5). If customers are using other than default values of parameters in qca.properties file, and are planning for upgrade of QCA, following procedure needs to be followed to retain these customized values after upgrade, without having to stop/re-start QCA:

1. Before proceeding with upgrade, change the qca.properties on the inactive side of the cluster as required. (for example, portNumber = 20001, retainFileTime = 5)
2. State of QCA on the inactive side of the cluster: NOT RUNNING
3. Perform the upgrade. (The procedure will involve swacting of the cluster).
4. After the upgrade is complete, the newly active unit of the cluster will have the qca.properties of the previous inactive unit. This way we can expect the modified qca.properties to be maintained over an upgrade, without having to stop/re-start QCA.
5. If the above procedure is not followed, default values of parameters will remain in qca.properties.

For example, consider the present qca.properties have the values for portNumber and retainFileTime to be 20001 and 1 respectively. (It is 20000 and 5 respectively by default). If this qca.properties is to be maintained over an upgrade, the qca.properties of the inactive unit of the cluster has to be updated with these values, before performing the upgrade.

Problem scenario (Before Upgrade):

Active unit	Inactive unit (qca.properties not modified)
(SN08)	(SN09)
portNumber: 20001	portNumber: 20000
RetainFileTime=1	RetainFileTime=5
State: QCA running	QCA Not running

Problem scenario (After Upgrade):

Active unit	Inactive unit
(SN09)	(SN08)

portNumber: 20000 portNumber: 20001

RetainFileTime=5 RetainFileTime=1

State: QCA Running QCA Not running

As seen in above problem scenario, qca.properties will not be maintained over an upgrade if qca.properties not modified in the inactive unit of the cluster.

Solution (Before Upgrade):

Active unit Inactive unit (qca.properties modified)

--- ---

(SN08) (SN09)

portNumber: 20001 portNumber: 20001

RetainFileTime=1 RetainFileTime=1

State: QCA running QCA Not running

Solution (After Upgrade):

Active unit Inactive unit

--- ---

(SN09) (SN08)

portNumber: 20001 portNumber: 20001

RetainFileTime=1 RetainFileTime=1

State: QCA Running QCA Not running

(No records lost)

As seen above, updating qca.properties of inactive unit of the cluster will result in maintaining modified qca.properties over an upgrade.

24.2.7.8 Reporting disk space issues

As the QCA operates, disk space in /data/qca is used for the active file and to retain closed files. If the disk space in /data/qca becomes exhausted this would

effect the operation of the QCA. The QCA uses customer logs to report disk space issues before all the space is used to reduce the possibility of completely filling the partition.

Every time the QCA creates a new file it will attempt check the available disk space, in the unlikely event that available space is not determinable the QCA will write a debug log to a file.

The QCA determines the number of free bytes available in the /data/qca partition and compares this with 3 boundary values; 1 GByte, 500 MBytes and 100 MBytes.

1 GByte boundary

If the available disk space is greater than 1 GByte then no further action is taken. However, if the available disk space is less than 1Gb and more than 500Mb, a minor customer log/alarm is generated.

If some disk space is made available in the /data/qca partition, after a customer alarm was raised, to make the available disk space great than 1GByte, the QCA raises a clear customer log for the minor alarm when the next new file is created.

However, if no action is taken and the available space still lies with between 1 GByte and 500 MBytes when the next file is created, the QCA will generate another minor customer log/alarm.

500 MByte boundary

If the available disk space is less than 500 MBytes and more than 100 MBytes, a major customer log/alarm is generated

If the available disk space goes above 500 MBytes, but below 1 GByte, the QCA raises a clear customer log for the major customer log/alarm when the next new file is created.

If the available disk space goes above 1 GByte the QCA raises clear customer logs for both the major and minor customer logs/alarms when the next new file is created.

However, if no action is taken and the available space still lies with between 500 MBytes and 100 MBytes when the next file is created, the QCA will generate another major customer log/alarm.

100 MByte boundary

If the available disk space is less than 100 MBytes a critical customer log/ alarm is generated

If the available disk space goes above 100 MBytes, but below 500 MBytes, the QCA raises a clear customer log for the critical customer log/alarm when the next new file is created.

If the available disk space goes above 500 MBytes, but below 1 GByte, the QCA raises clear customer logs for both the critical and major customer logs/ alarms when the next new file is created.

If the available disk space goes above 1 GByte, the QCA raises clear customer logs for the critical, major and minor customer logs/alarms when the next new file is created.

However, if no action is taken and the disk space is completely exhausted the QCA will generate a critical customer log/alarm and the QCA will be stopped.

In the scenario where write access is prevented the application will raise a critical customer log/alarm and the QCA will be stopped.

24.2.8 Growing the Size of /data/qca

See Appendix C for the Procedure to grow the size of Partition /data/qca.

24.2.9 QoS record processing

At the end of every call the client reports the QoS statistics to the QCA in a binary QoS record. The QCA validates the record, ensuring the record sequence number, version and length are correct. The QCA then converts the record to an IPDR form. The QCA IPDR record is then written to a file.

Until SN07 the QoS record had only 1 version (size 132 Bytes). In SN08 the QoS Record message version is 2 (size 136 Bytes).

Beginning SN09 the QoS record has version 3 (size 180 = 136 Bytes + 10 Bytes Timestamp - 2 byte filler inVersion 2 + 32 Bytes (GWName is changed to 64 Bytes as compared to 32 Bytes prior to SN09) + 4 byte filler for Version 3.)

Beginning SN09.1 the QCA supports version 4 and version 5 QoS binary Records that come from patched SN07 and SN08 GWCs respectively.

24.2.9.1 Binary QoS record format

The QoS record sent from the client (GWC) is a binary message. A description of the binary QoS record fields is shown in the following table.

Table 2 Binary QoS record fields (version 1 SN07)

Name	Description	Range
MT (MGC Type)	The type of client (MGC) the QoS record was generated by	0 - GWC 1 - SPM

Name	Description	Range
Msg Type	Message type	0 - QoS record 1 - heart beat
Sequence number	Record sequence number	0 to 16777215
RT (Report Type)	Report Type	0 - local 1 - remote
ver (version)	The QoS record version	0 to 15
MGC number	The number of the client (MGC) the QoS record was generated by	0 to 255
Msg length	The length of the message (including header)	0 to 255 (should be 130)
Gateway port number	The port number on the Gateway used in the call	0 to 65535
Gateway IP Address	The IP Address of the Gateway used in the call	4-bytes
Gateway FQDN	Consists of two separate fields; the Gateway name (32 Bytes) and End Point (32 Bytes).	64-bytes
Switch CLLI	The CLLI of the CS2K the client is subtended to	16-bytes
Correlation ID	The correlation id that can be used to correlate the QoS record to an AMA record	10-bytes
Packets Sent	The total number of packets transmitted	0 to 4294967294
Packets Received	The total number of packets received	0 to 4294967294
Octets Sent	The total number of payload octets transmitted	0 to 4294967294
Octets Received	The total number of payload octets received	0 to 4294967294
Packets Lost	The total number of packets lost	0 to 4294967294
Jitter	Estimate of packet interarrival time (milliseconds)	0 to 65534
Latency	Estimate of network latency (milliseconds)	0 to 65534

Table 3 Binary QoS record fields (version 2 SN08)

Name	Description	Range
MT (MGC Type)	The type of client (MGC) the QoS record was generated by	0 - GWC 1 - SPM
Msg Type	Message type	0 - QoS record 1 - heart beat
Sequence number	Record sequence number	0 to 16777215
RT (Report Type)	Report Type	0 - local 1 - remote
ver (version)	The QoS record version	0 to 15
MGC number	The number of the client (MGC) the QoS record was generated by	0 to 255
Msg length	The length of the message (including header)	0 to 255 (should be 130)
Gateway port number	The port number on the Gateway used in the call	0 to 65535
Gateway IP Address	The IP Address of the Gateway used in the call	4-bytes
Gateway FQDN	Consists of two separate fields; (the Gateway name and end point)	64-bytes
Switch CLLI	The CLLI of the CS2K the client is subtended to	16-bytes
Correlation ID	The correlation id that can be used to correlate the QoS record to an AMA record	10-bytes
Packets Sent	The total number of packets transmitted	0 to 4294967294
Packets Received	The total number of packets received	0 to 4294967294
Octets Sent	The total number of payload octets transmitted	0 to 4294967294
Octets Received	The total number of payload octets received	0 to 4294967294
Packets Lost	The total number of packets lost	0 to 4294967294
Jitter	Estimate of packet interarrival time (milliseconds)	**0 to** 4294967294
Latency	Estimate of network latency (milliseconds)	**0 to** 4294967294

Table 4 Binary QoS record fields (version 3 SN09)

Name	Description	Range
MT (MGC Type)	The type of client (MGC) the QoS record was generated by	0 - GWC 1 - SPM
Msg Type	Message type	0 - QoS record 1 - heart beat
Sequence number	Record sequence number	0 to 16777215
RT (Report Type)	Report Type	0 - local 1 - remote
ver (version)	The QoS record version	0 to 15
MGC number	The number of the client (MGC) the QoS record was generated by	0 to 255
Msg length	The length of the message (including header)	0 to 255 (should be 130)
Gateway port number	The port number on the Gateway used in the call	0 to 65535
Gateway IP Address	The IP Address of the Gateway used in the call	4-bytes
Gateway FQDN - GW Name	**Consists of two separate fields; (the Gateway name**	**64-bytes**
Gateway FQDN Endpoint	**End point**	**32-bytes**
Switch CLLI	The CLLI of the CS2K the client is subtended to	16-bytes
Correlation ID	The correlation id that can be used to correlate the QoS record to an AMA record	10-bytes
Packets Sent	The total number of packets transmitted	0 to 4294967294
Packets Received	The total number of packets received	0 to 4294967294
Octets Sent	The total number of payload octets transmitted	0 to 4294967294
Octets Received	The total number of payload octets received	0 to 4294967294

Name	Description	Range
Packets Lost	The total number of packets lost	0 to 4294967294
Jitter	Estimate of packet interarrival time (milliseconds)	0 to 4294967294
Latency	Estimate of network latency (milliseconds)	0 to 4294967294
StartTimeStamp*	Call Start Timestamp	5 -bytes.
EndTimeStamp*	End Time Timestamp	5 -bytes.

*Start and End timestamp addressed in the following section.

24.3 Timestamp (Call Start Time and Call End Time)

24.3.1 DISCLAIMER:

- QoS records contain performance measurement data only and they are never intended to be used as a source for billing information.
- Call durations for billing/revenue generation purposes have to be based on the time data in the billing records, such as AMA and CDR records, and not QoS records.

24.3.2 Timestamp Support

Timestamp support (Call Start Time and Call End Time) for QoS IPDR records are supported beginning SN09. This activity is tracked under A0009297 and provides support to display correct call start time and call end time in the QoS IPDR XML records.

All QoS (IPDR) records are stored on a QoS Collector Application (QCA) host. The QCA receives binary QoS records from the MGCs, converts these to QCA IPDR records and stores them in a file. The QCA IPDR records can be obtained by the OSS for processing

Prior to SN09, the timestamp parameter (Call Start time and Call End time) was hardcoded to a default value 1970-01-01T00:00:00.000Z and thus the QoS record output in the XML file show this default value for all calls irrespective of the actual call start time and call end time for the particular call and does not depict the correct value.

GWC sends end of call statistics to active QCA servers. Timestamps (Call Start and Call End Timestamp) are IPDR parameters that would be displayed on a QoS Report along with other IPDR parameters such as timezone, call completion code, hostname, subscriberID, unique Call ID, IP Address, port

number, sequence number and End of Call QoS Statistics such as average packet latency, inbound byte count, outbound byte count, inbound packet count, outbound packet count, packet lost and packet delay.

24.3.2.1 Timestamp Format

Timestamp (Call Start Time and Call End TIme) are in ISO 8601 format. The format is shown below:

YYYY:MM:DD:HH:MM:SS:MS Where,

YYYY - Year

MM - Month

DD -Day

HH - Hour

MM - Minute

SS - Second

MS - Millisecond

This timestamp is included in the QoS Binary message and this in turn is parsed by the QCA to extract the Call Start Time and Call End Time. QCA IPDr records show these extracted timestamp.

The timestamp used for the QoS Binary records and QoS IPDR XML records (Call Start Time and Call End Time) will be in Universal coordinated time (UTC) previously known as Greenwich Mean Time (GMT). Time represented as UTC will be universal and will not have to worry about Daylight saving time.

GMT is World Time and the basis of every world time zone which sets the time of day and is at the centre of the time zone map. Call Start Time and Call End Time use UTC time format and these timestamp will be represented in QCA XML reports.

> ***Note:*** Since Timestamps are in UTC time format they do not support Day Light Saving time. Hence the Time value in the start and End time might be off by 1 hour compared to the time in billing records during the period between 1st April to 31st October every year.

24.3.2.2 Call Start Time and Call End Time

Call Start TimeStamp (STS) and End TimeStamp (ETS) will be depicted in the QCA Xml records. An example of the timestamp is given below:

<StartTime>2005-01-01T14:52:57.000Z</StartTime>

<EndTime>2005-01-01T14:59:01.000Z</EndTime>

24.3.3 QCA IPDR record format

The output of the QCA is a single stream (file) of IPDR Version 3.1-A.0.2 compliant records.

24.3.3.1 QCA IPDR elements

The IPDR elements used in the QoS output format are shown in the following table.

Table 5 QCA IPDR tags

QoS Field Tag	Type	Range
StartTime	dateTime	ISO 8601 format.
EndTime	dateTime	ISO 8601 format.
timeZoneOffset	integer	Time offset, in minutes, of local time zone referenced to GMT.
callCompletionCode	String	Final call completion code for billing use.
originalDestinationId	String	Called-party (designation) number
hostName	String	0 to 22 characters
subscriberId	**String**	**0 to 65 characters (version 1 and 2)**
		0 to 97 characters (version 3)
uniqueCallId	String	20 hexadecimal digits
ipAddress	String	7 to 15 numerical characters
portNumber	String	0 to 2147483647
seqNum	integer	0 to 16777215
averagePacketLatency	integer	0 to 65536 (version 1)
		0 to 2147483647 (version 2 and 3)
inboundByteCount	integer	0 to 2147483647
outboundByteCount	integer	0 to 2147483647
inboundPacketCount	integer	0 to 2147483647
outboundPacketCount	integer	0 to 2147483647
inboundLostPacketCount	integer	0 to 2147483647
packetDelayVariation	integer	0 to 65536 (version 1)
		0 to 2147483647 (version 2 and 3)

An example QCA IPDR record (for IP/AAL2 fabric):

```
<IPDR>
<StartTime>2005-10-05T15:30:09Z</StartTime>*
<EndTime>2005-10-05T15:32:12Z</EndTime>
<timeZoneOffset>0</timeZoneOffset>
<callCompletionCode>CC</callCompletionCode>
<originalDestinationId></originalDestinationId>
<hostName>GWC3@COMITIP</hostName>
<subscriberId>aaln/1@ttp018.mgsite-2.b4sky.ott</subscriberId>
<uniqueCallId>43c01738000f13e30d05</uniqueCallId>
<ipAddress>10.0.15.1</ipAddress>
<portNumber>2427</portNumber>
<seqNum>18</seqNum>
<averagePacketLatency>0</averagePacketLatency>
<inboundByteCount>41538</inboundByteCount>
<outboundByteCount>0</outboundByteCount>
<inboundPacketCount>301</inboundPacketCount>
<outboundPacketCount>0</outboundPacketCount>
<inboundLostPacketCount>0</inboundLostPacketCount>
<packetDelayVariation>0</packetDelayVariation>
</IPDR>

* Note: Starting SN09, the value of the timestamp in the IPDR
records will show the actual value and not the defaulted value
of 1970-01-01T00:00:00.000Z. This is tracked under the activity
A00009297 and is addressed in section <2.3>
```

An example QCA IPDR record (for AAL2 fabric):

```
<IPDR>
<StartTime>2005-10-05T15:30:09Z</StartTime>*
<EndTime>2005-10-05T15:32:12Z</EndTime>
<timeZoneOffset>0</timeZoneOffset>
<callCompletionCode>CC</callCompletionCode>
<originalDestinationId></originalDestinationId>
<hostName>GWC3@COMITIP</hostName>
<subscriberId>aaln/1@ttp018.mgsite-2.b4sky.ott</subscriberId>
<uniqueCallId>43c01738000f13e30d05</uniqueCallId>
<ipAddress>10.0.15.1</ipAddress>
<portNumber>2427</portNumber>
<seqNum>18</seqNum>
<averagePacketLatency>0</averagePacketLatency>
<inboundByteCount>41538</inboundByteCount>
<outboundByteCount>0</outboundByteCount>
<inboundPacketCount>301</inboundPacketCount>
<outboundPacketCount>0</outboundPacketCount>
<inboundLostPacketCount>0</inboundLostPacketCount>
<packetDelayVariation>0</packetDelayVariation>
</IPDR>

* Note: Starting SN09, the value of the timestamp in the IPDR
records will show the actual value and not the defaulted value
of 1970-01-01T00:00:00.000Z. This is tracked under the activity
A00009297 and is addressed in the Timestamp section.
```

The maximum size of a QCA IPDR record is around 840 characters, this equates to 840-bytes (using UTF-8 encoding).

Not all of the QoS statistics are provided by all media gateways, e.g. the UAS does not support the Jitter and Latency statistics, therefore if the received binary QoS record does not contain a valid value for any of the QoS statistics the element will not be included in the output QCA IPDR record.

24.3.3.2 QCA IPDR element values

Refer to the following table.

Table 6 Mapping of input binary QoS Record fields to output QCA IPDR record elements

Output QCA IPDR elements	Input Binary QoS field	Comment
StartTime	Call Start Time	A00009297 feature: Starting SN09, QoS IPDR records will show correct timestamp (Call start Time) and not the Hardcoded value used: 1970-01-01T00:00:00.000Z earlier.
EndTime	Call End Time	A00009297 feature: Starting SN09, QoS IPDR records will show correct timestamp (Call End Time) and not the Hardcoded value used: 1970-01-01T00:00:00.000Z earlier.
timeZoneOffset	N/AN/A	Not applicable. Hardcoded value used: 0
callCompletionCode	N/A	Not applicable. Hardcoded value used: CC (call completed normally)
originalDestinationId	N/A	Not applicable. Empty String
subscriberId	Concatenation of Endpoint and Gateway Name (from Gateway FQDN)	<EndPoint>@<GW Name>
hostName	Concatenation of MT (MGC Type), MGC Number and Switch CLLI	<MGC Type><MGC Number>@<Switch CLLI>
uniqueCallId	Correlation Id	
ipAddr	Gateway IP Address	standard 4-part format
portNumber	Gateway Port Number	
seqNum	Sequence number	
averagePacketLatency	Latency	Element not present in IPDR if the received binary QoS record value is
inboundByteCount	Octets Received	
outboundByteCount	Octets Sent	

Table 6 Mapping of input binary QoS Record fields to output QCA IPDR record elements

Output QCA IPDR elements	Input Binary QoS field	Comment
inboundPacketCount	Packets Received	less than 0, indicating that the GW did not support the statistic.
outboundPacketCount	Packets Sent	
inboundLostPacketCount	Packet Loss	
packetDelayVariation	Jitter	

Starting SN09.1 - aal2/ps, aal2/pr, aal2/pl, aal2/jit AAL2 parameters (A00009297 feature) are also reflected in QoS Records using inboundPacketCount, outboundPacketCount, inboundLostPacketCount, packetDelayVariation respectively.

The following elements are ‘required’ IPDR elements so have been included in the QCA output for IPDR compliancy.

- StartTime
- EndTime
- timeZoneOffset
- CallCompletionCode
- originalDestinationId

24.3.3.3 QCA IPDR file format

The output of the QCA is a file with format conforming to the IPDR structure. The first line in the file is the header, providing details about the XML version and encoding. The next line is the ‘open’ IPDR tag which gives information about the version of QCA and indicates the start of records. The last line in the file is the ‘close’ IPDR tag which indicates the end of the file.

Refer to the following figure for an example QoS XML file format.

Figure 3 QCA IPDR file format

Line no.	Line	Description
1	`<?xml version="1.0" encoding="UTF-8" ?>`	File header

Figure 3 QCA IPDR file format

2	<IPDRDoc xmlns="http://www.ipdr.org/namespaces/ipdr" xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" IPDRRecorderInfo ="qca.nortelnetworks.com" xsi:schemaLocation="http://www.ipdr.org/namespaces/ ipdr VoIP3.1-A.0.2.xsd" version="3.1-A.0.2">	IPDRDoc is the file open tag
3	<IPDR>	Start of record
	.	
	.	
	.	
	.	
	.	
n-1	</IPDR>	End of record
n	</IPDRDoc>	/IPDRDoc is the file close tag

The IPDRDoc tag gives information about the IPDR format used and the device that generated the IPDR file, e.g.

IPDRRecorderInfo = “qca.nortelnetworks.com”

24.4 Detecting Events and Errors

In the situation that the QCA detects an event (e.g. client closes the connection) or an error (e.g. out of sequence record), a customer log is generated and an error IPDR record is written to the output file.

The error IPDR record is generated so that the OSS does not require two interfaces to the QCA host, one to retrieve IPDR records and one to monitor events and errors. All the relevant information to the QCA output processing is provided in the single output stream.

The error IPDR record is compliant to the IPDR specification, i.e. contains all of the required IPDR elements, some of which will contain default or empty values.

Multiple errors

This is only applicable to unsupported QoS record version and unsupported QoS record length errors.

The QCA allows up to 9 consecutive unsupported QoS record version and up to 9 consecutive unsupported QoS record length errors. When the 10th consecutive error is detected a customer log is generated to indicate this and the connection is being closed.

If a client sends a QoS record with valid length or version before sending 10 unsupported QoS record version or 10 unsupported QoS record length records, a customer log is generated to indicate that the alarm condition has been cleared.

Table 7 QCA Error and Event actions

Error/Event	QCA Action
out of sequence record	customer log generated error IPDR record generated binary QoS record processed
unsupported QoS record version (less than 10 consecutive records)	customer log generated error IPDR record generated binary QoS record discarded
unsupported QoS record version (10th consecutive records)	customer log generated error IPDR record generated binary QoS record discarded connection closed
unsupported QoS record length (less than 10 consecutive records)	customer log generated error IPDR record generated binary QoS record discarded
unsupported QoS record length (10th consecutive records)	customer log generated error IPDR record generated binary QoS record discarded connection closed
unknown message type	customer log generated error IPDR record generated binary QoS record discarded connection closed
unable to read binary QoS record header	customer log generated error IPDR record generated binary QoS record discarded connection closed

Table 7 QCA Error and Event actions

Error/Event	QCA Action
unable to process binary QoS record body	customer log generated
	error IPDR record generated
	binary QoS record discarded
connection closed (not by QCA)[a]	customer log generated
	error IPDR record generated
	connection closed (from QCA end)
QCA stopped	customer log generated
	error IPDR record generated
QCA started	error IPDR record generated
New GWC Connection	customer log generated
	error IPDR record generated

a. Note: This includes the ‘GWC Swact’ scenario.

Note: please refer to Appendix A for more details of the customer logs generated by the QCA.

24.4.1 QCA Error IPDR record

Depending on the type of error, different information can be used in the error IPDR record.

For example, if a message with an ‘unknown message type’ is received the whole message is unreliable so only the connection information can be used. Whereas, if an ‘out of sequence’ record is received the message format is valid so information from the connection and record header can be used.

Default values are used in the QCA error IPDR record for the following required IPDR elements:

- callCompletionCode - CC
- originalDestinationId - empty string
- subscriberId - empty string
- uniqueCallId - empty string

Depending on the type of error or event the following QCA error IPDR record elements may contain information:

- hostName - MGC Id, if the MGC Id is not available it is an empty string and the Node name (the value of the nodeName property in the qca.properties file). Below are some examples.

  - GWC3@CS2K_LAB (if MGC Id is available)
  - CS2K_LAB (if MGC Id is an empty string)
- seqNum - the sequence number of the QoS record with the error, the sequence number is not available it is 0

The following QCA error IPDR record elements are always used to convey information:

- ipAddress
- portNumber
- proprietaryErrorCode

The values for each element in the error IPDR record, other than the default elements, are given in the following table.

Table 8 Error IPDR record elements

Error/Event	Element	Value
Unexpected Record Sequence Number	hostname	MGC Id, Node name
	seqNum	record sequence number
	ipAddress	IP Address of connection
	portNumber	Port number of connection
	proprietaryErrorCode	0 (plus previous valid record sequence number, e.g. previous sequence number = 1638, proprietaryErrorCode = 01638)
Record Lost: Unsupported Version	hostname	MGC Id, Node name
	seqNum	record sequence number
	ipAddress	IP Address of connection
	portNumber	Port number of connection
	proprietaryErrorCode	1
Record Lost: Unsupported Record Length	hostname	MGC Id, Node name
	seqNum	record sequence number
	ipAddress	IP Address of connection
	portNumber	Port number of connection
	proprietaryErrorCode	2

Table 8 Error IPDR record elements

Error/Event	Element	Value
Connection closed: Unrecognized Message Type	hostname	Node name
	seqNum	0
	ipAddress	IP Address of connection
	portNumber	Port number of connection
	proprietaryErrorCode	3
Connection closed: Error while processing QoS record header	hostname	Node name
	seqNum	0
	ipAddress	IP Address of connection
	portNumber	Port number of connection
	proprietaryErrorCode	4
Record Lost: Error while processing binary QoS data	hostname	MGC Id, Node name
	seqNum	0
	ipAddress	IP Address of connection
	portNumber	Port number of connection
	proprietaryErrorCode	5
Connection closed	hostname	Node name
	seqNum	0
	ipAddress	IP Address of connection
	portNumber	Port number of connection
	proprietaryErrorCode	6
QCA Stopped	hostname	Node name
	seqNum	0
	ipAddress	IP Address of connection
	portNumber	Port number of connection
	proprietaryErrorCode	7
QCA Started	hostname	Node name
	seqNum	0
	ipAddress	IP Address of connection

Table 8 Error IPDR record elements

Error/Event	Element	Value
	portNumber	Port number of connection
	proprietaryErrorCode	8
New GWC Connection[a]	hostname	MGC Id, Node name
	seqNum	record sequence number
	ipAddress	IP Address of connection
	portNumber	Port number of connection
	proprietaryErrorCode	9

a. These records will be produced for every new connection from the GWCs.

24.4.1.1 Error IPDR record format

Examples for each of the QCA IPDR error records:

Unexpected Record Sequence Number

```
<IPDR>
   <StartTime>1970-01-01T00:00:00.000Z</StartTime>*
   <EndTime>1970-01-01T00:00:00.000Z</EndTime>*
   <timeZoneOffset>0</timeZoneOffset>
   <callCompletionCode>CC</callCompletionCode>

   <ipAddress>47.96.0.243</ipAddress>
   <portNumber>37559</portNumber>
   <seqNum>567</seqNum>
   <proprietaryErrorCode>9</proprietaryErrorCode>
</IPDR>
* Note: Starting SN09, the value of the timestamp in the IPDR
records will show the actual value and not the defaulted value of
1970-01-01T00:00:00.000Z. This is tracked under the activity
A00009297 and is addressed in section <4.0.0.1>
```

24.4.2 Streaming to OSS

Real-Time streaming of the QCA IPDR record stream to the OSS is provided via the streamQoS utility. It should be used as follows:

1. Connect to the machine on which QCA is running, e.g. via telnet
2. Change directory to the QCA home directory, e.g. /opt/nortel/qca/
3. Start the logging to file of the window.
4. Type streamQoS to start the stream
5. The streaming utility is stopped by closing the connection

24.4.3 Display tool

A tool to display QCA IPDR records in an output QCA file is provided. There are three outputs from the tool:

- display all the QCA IPDR Records in the file
- display all the QCA IPDR Records for a particular Subscriber Id in the file
- display all the QCA IPDR Records for a particular MGC in the file

The command must have at least one argument, the file name.The command is able to handle the compressed and also uncompressed QCA output files.

To display only the records for a particular Subscriber Id, the Subscriber Id must be provided to the utility.

To display only the records for a particular MGC, the following information is necessary:

- MGC type (GWC or SPM), *mgcType* or *mt* field in QCA IPDR record
- MGC number (0 to 255), *mgcNumber* or *num* in QCA IPDR record

Displaying all QCA IPDR records in a file:

```
displayQoS <file name>
```

Displaying all QCA IPDR record from a particular client in a file:

```
displayQoS <file name> <Subscriber Id>
```

Displaying all QCA IPDR record from a particular client in a file:

```
displayQoS <file name> <MGC type> <MGC number>
```

If the file can not be found an error is displayed.

The first argument is always the file name. If only two arguments are provided the second argument is taken as the Subscriber Id. If more than two arguments are provided they are taken as the MGC type and MGC number.

Example displayQoS output:

```
Displaying QoS Records for GWC 80 from file:
GWC.Telco_Switch_35.QoS.2002.04.11_02.45_EDT.xml

Record:
Start Time*    = 1970-01-01T00:00:00.000Z
End Time*      = 1970-01-01T00:00:00.000Z
TimeZone Offset  = 0
Call Comp Code   = CC
Orig Dest Id     =
Host name        = GWC171@3911296719576333
Subscriber id    = 709615575170887 78@4995546324
Correlation Id   = 14714216668188184186
IP Address       = 96.143.185.15
Port Number      = 35187
Sequence Number  = 9
Latency          = 19685
Octets Received  = 1894381033
Octets Sent      = 1785294279
Packets Received = 648495757
Packets Sent     = 286520160
Packets Lost     = 922391632
Jitter           = 14826

Record:
Start Time*    = 1970-01-01T00:00:00.000Z
End Time*      = 1970-01-01T00:00:00.000Z
TimeZone Offset  = 0
Call Comp Code   = CC
Orig Dest Id     =
Host name        = GWC99@CS2K_LAB
Subscriber id    =
Correlation Id   =
IP Address       = 47.96.0.243
Port Number      = 37559
Sequence Number  = 4
Previous seq num = 2
Error Code       = 0 (Unexpected Record Sequence Number)

End of XML QoS File.
```

Example displayQoS output (for call over AAL2 fabric):

```
Displaying QoS Records for GWC 80 from file
GWC.Telco_Switch_35.QoS.2002.04.11_02.45_EDT.xml

Record:
Start Time*    = 1970-01-01T00:00:00.000Z
End Time*      = 1970-01-01T00:00:00.000Z
TimeZone Offset  = 0
Call Comp Code   = CC
Orig Dest Id     =
Host name        = GWC171@3911296719576333
Subscriber id    = 7096155751708778@4995546324
Correlation Id   = 14714216668188184186
IP Address . . . = 96.143.185.15
Port Number      = 35187
Sequence Number  = 9
Latency          = 19685
Octets Received  = 1894381033
Octets Sent      = 1785294279

Packets Received = 648495757
Packets Sent     = 286520160
Packets Lost     = 922391632
Jitter           = 14826

Record:
Start Time*    = 1970-01-01T00:00:00.000Z
End Time*      = 1970-01-01T00:00:00.000Z
TimeZone Offset  = 0
Call Comp Code   = CC
Orig Dest Id     =
Host name        = GWC99@CS2K_LAB
Subscriber id    =
Correlation Id   =
IP Address       = 47.96.0.243
Port Number      = 37559
Sequence Number  = 4
Previous seq num = 2
Error Code       = 0 (Unexpected Record Sequence Number)

End of XML QoS File.

* Note: Starting SN09, the value of the timestamp in the IPDR
records will show the actual value and not the defaulted value of
1970-01-01T00:00:00.000Z. This is tracked under the activity
A00009297 and is addressed in section <2.3>
```

Note: when displaying error IPDR records, the displayQoS utility adds a textual description to the error code value.

Note: when displaying Unexpected Record Sequence Number error IPDR records, the displayQoS utility extracts the previous sequence number value from the proprietryErrorCode and displays it as a separate field, Previous seq num.

24.4.4 Installation

The QCA application (NTQCA.pkg) is available in the CS2M[1] software package. Below are the steps to install the QCA

- Insert the CD with the CS2M load and log onto the SESM server as root. Then change the directory to the bin directory on the CD.

```
cd /cdrom/cdrom0/bin
```

- To start the install process, enter the following command.

```
./appl_mgr.ksh
```

Note: Select option 1 to install all the application along with QCA.

Below are the steps when QCA needs to be installed on a SSPFS machine which does not run the CS2M load.

- FTP the NTQCA.pkg onto the SSPFS machine. Log in as root.
- Install the new QCA software using: pkgadd -d NTQCA.pkg

Below are the steps to follow to uninstall the QCA package.

- Connect to the host where the QCA is running.
- Log in as root.
- Stop the QCA server: stop_qca.
- Uninstall the original QCA package: pkgrm NTQCA.

24.4.5 Upgrades

As of SN06.2, the QCA is a patchable component. The patchability mechanism conflicts with the in-service upgrade mechanism. So the support for in-service upgrade of QCA on a single SSPFS machine is removed. Please see section 2.2.15 for more details.

The QCA software upgrades are performed using the install scripts provided with QCA as part of the new software release. Software upgrades of QCA must be coordinated with the OSS to avoid loss of data. The OSS would be redirected to an alternative QCA instance while the primary QCA is being updated. Once the primary instance is updated, the OSS can be redirected back to the primary instance and the other instances can be updated.

24.4.6 QCA customer logs

In addition to QCA Error IPDR Records the QCA raises alarms and events via the customer logging stream.

[1]CS2M (CS 2000 Management Components) refers to a NCL software package used on the CS 2000 management tools server. This package includes SESM, NPM, SAM21EM, QCA.

The QCA uses the logging API introduced by activity 89008996 “Log Reporting and Storage Mechanism for Managed Elements”.

Figure 4 Sample customer log message generated by QCA

```
Oct 11 12:00:02 wmdhs0j8 main:0001 QCA201 WARNING init wmdhs0j8
RetainFileTime property in properties/qca.properties is out of
range. QCA is starting with default retain file time of 5 days
```

The QCA customer logs contain the following fields

- Report name
- Report Number
- Priority
- Event Type
- Device ID
- Message

All the QCA customer logs contain the following information:

- Report name = “QCA”
- Device ID = QCA host name

See Appendix A - QCA Customer Logs for a summary of QCA customer logs and the contents of the other fields in the logs.

The QCA also generates debug logs to report software errors.

24.4.7 Patchability

In SN06.2, the activity A00003229 provides the functionality of making the QCA a patchable OAM device. The Network Patch Manager is responsible for administering individual fixes to QCA. Patches for the QCA will be in the same format and have the same naming convention of OAM patches such as NPM, SAM21EM, etc

When a QCA patch (containing modified Java-based classes) is delivered to a customer site, the patch is applied and then the QCA application is required to be stopped and then restarted by the NPM for the patch to be ‘enabled’. The restart enables a new Java Virtual Machine to be started that picks up the patched/modified Java classes. This procedure also applies to removal of QCA patches. For a QCA patch to be truly removed, the patch is removed and then a restart must be performed via the NPM on the application.

The QCA application must be inservice to perform any maintenance operations such as application, removal, or restart. In addition, the QCA application must be inservice for an audit to succeed. Because QCA is monitored or polled by an external system (OSS) for performance data or SLA agreements, it is important that any changes to QCA be coordinated to avoid loss of data or duplication of data. The OSS should be moved from monitoring the primary instance of QCA to an alternative QCA instance while the primary QCA is being updated via the restart request initiated by NPM. Once the primary instance is updated, the OSS should be redirected back to the primary instance and the other instances can be updated.

Since QCA is an OAM software application, it will be registered in the NPM database upon system start-up and initialization, and it will appear as a device with the device name QCA_<node_name>, where node_name is the name of the SSPFS machine where the QCA is running. Reports and queries at the NPM Graphical User Interface (GUI) and NPM Command Line User Interface (CLUI) will show the QCA as a device.

In SN06.2, the support for in-service QCA upgrade (on a single SSPFS machine) is removed to enable QCA patchability. Hence, the scripts to start and stop the second instance of QCA (qca_server2 and stop_qca2) will be obsoleted in this release.

The following sections briefly give information about applying/removing patches to/from QCA.

24.4.7.1 Applying patch to QCA

The following steps are a recommended procedure in applying QCA patches to a QCA application.

- QCA patch files are delivered to a customer site to the SSPFS machine containing the NPM server via RPS/PFRS or by manual action.
- QCA patches are introduced to the NPM database via the NPM CLUI with the ‘getpatch’ command.
- QCA patches are applied to the QCA application via the NPM apply command at the NPM GUI or NPM CLUI.

After all the QCA patches are applied, a restart command from the NPM GUI or NPM CLUI is invoked on the QCA application to enable or activate the patches.

> ***Note:*** A restart consists of stopping the QCA application and then starting the application. It is important that any maintenance activities associated with the QCA should be completed or stopped before the restart from the NPM GUI or CLUI is invoked. Also, the OSS should be directed from the primary instance of QCA to an alternative instance prior to the restart. The NPM restart will result in current active file being moved into the *today*

directory and a new active file will be opened. The whole of this operation will take around **60 seconds**, during this period any QoS records sent from GWC to QCA will be lost.

Also, a NPM restart will result in following logs.

1. NPM 620: Initiated restart on device,<qca_devicename>.
2. GWC 312: QCA connection failure, indicating that GWC is having communication problems with QCA.
3. NPM 620: A restart initiated by the NPM on device <qca_devicename> has completed.
4. QCA 322: New GWC Connection, indicating that QCA has come up after the restart, and is accepting connections.
5. GWC 399: Clear event for GWC312, indicating that previous 'Raise' event is cleared.

Note: It is important to note the NPM database could show patches to be applied to an OAM device, but the patch is not actually enabled or performing its task to address the original problem. It is only after a restart is performed from the NPM GUI or CLUI on the OAM device that the patch is enabled.

- After the restart is performed on the QCA an NPM audit needs to be executed to update OAM patch enabled statuses in the NPM database. The audit can be performed manually from the NPM GUI or CLUI or it will be done automatically on the device approximately 20-25 minutes after the restart has been completed.

24.4.7.2 Removing Patch from QCA

The following steps are a recommended procedure in removing QCA patches from QCA.

- QCA patches are removed via the NPM remove command at the NPM GUI or NPM CLUI.
- After all QCA patches are removed, a restart command from the NPM GUI or NPM CLUI is invoked on the QCA to disable the patches.

Note: A restart consists of stopping the QCA application and then starting the QCA application. It is important that any maintenance activities associated with QCA should be completed or stopped before the restart from the NPM GUI or CLUI is invoked. Also, the OSS should be directed from the primary instance of QCA to an alternative instance prior to the restart. The NPM restart will result in current active file being moved into the *today* directory and a new active file will be opened. The whole of this operation will take around **60 seconds**, during this period any QoS records sent from GWC to QCA will be lost.

Also, a NPM restart will result in following logs.

1. NPM 620: Initiated restart on device,<qca_devicename>
2. GWC 312: QCA connection failure, indicating that GWC is having communication problems with QCA.
3. NPM 620: A restart initiated by the NPM on device <qca_devicename> has completed.
4. QCA 322: New GWC Connection, indicating that QCA has come up after the restart, and is accepting connections.
5. GWC 399: Clear event for GWC312, indicating that previous 'Raise' event is cleared.

Note: It is important to note the NPM database could show patches to be removed from an OAM device, but the patch is still enabled or performing its task to address the original problem. It is only after a restart is performed from the NPM GUI or CLUI on the OAM device that the patch is disabled.

- After the restart is performed on the QCA, an NPM audit needs to be executed to update QCA patch enabled statuses in the NPM database. The audit can be performed manually from the NPM GUI or CLUI or it will be done automatically on the device approximately 20-25 minutes after the restart has been completed.

24.4.7.3 AutoApply

QCA patches can be automatically applied if the end user has the automated process scheduled to run. Refer to the NPM online help for more information on this automated process.

24.4.7.4 Restart and AutoRestart Restrictions

Due to the implications to the OSS, restrictions are placed on the NPM restart command for QCA devices. The following restrictions are enforced by the NPM:

- QCA devices are not included in the set of OAM devices that can be auto-restarted, nor can a QCA restart be included in any plans scheduled at a designated time. Only a manual restart of a QCA device is supported.
- Only one QCA at a time can be restarted. The multitasking ability of NPM is not utilized for QCA.

A warning will be displayed to the user by the NPM CLUI or GUI explaining the implications of restarting QCA. The user will be forced to choose whether to continue with the restart command or to cancel.

24.4.8 QCA Software Management

The QCA application is designed to allow multiple copies to run in the network to provide increased levels of reliability. Additional copies of the QCA

application should be installed on different servers and assigned in the GWC EM. Two instances of QCA can not be installed on the two halves of the same high availability cluster; they must be on separate servers. Because QCA is monitored or polled by an external system (OSS) for performance data or SLA agreements, it is important that any changes to QCA be coordinated with the OSS to avoid loss of data or duplication of data. These changes include starting or stopping the application, applying corrective content, or applying upgrades. The OSS must be able to move from monitoring one instance of QCA to another during patching or upgrades or any activity that interrupts the QCA application. The OSS can either be manually redirected to another instance of QCA or programmed to automatically redirect on command.

24.5 Hardware Requirements or Dependencies

The QCA application has the following requirements:

- SUN Netra T1400

440Mhz UltraSPARCC IIi with QFE card, 4MB Cache, 512MB RAM, 2x18.2GB Disk Running SUN Solaris 8 Oracle DB 8.1.6 Enterprise and Java Virtual Machine.

Note: The QCA can run on the same SUN Netra T1400 that SESM and other network management tools are running on.

24.6 Software Requirements or Dependencies

- SSPFS 3d party software suite Version 06.

24.7 Limitations and restrictions

24.7.1 Upgrades

To ensure that the QCA support the version of QoS record used in the network, the QCA must be upgraded before the QoS reporting clients are upgraded.

Note: For a major release upgrade, where the SSPFS software is upgraded before the QCA, a QCA running on a separate host is required to ensure no loss of QoS records.

Note: For a QCA maintenance release upgrade or when applying patches, a QCA running on a separate host is required to ensure no loss of QoS records.

Note: Corrective content is applied and managed by the Network Patch Manager (NPM) in SN06.2. Because of the need to coordinate QCA changes like patching with the external OSS, QCA patches are manually applied and activated. This allows the OSS to be redirected to an alternative QCA instance while the primary QCA is being updated. Once

the primary instance is updated, the OSS can be redirected back to the primary instance and the other instances can be updated.

24.8 Interactions

Appendix A - QCA Customer logs

Table 1 Service summary (initialization) warning logs

Event / Error	Report Number	Priority	Event Type	Description	QCA Action	Customer Action
Qca.properties not available at QCA start-up.	201	Warning	INIT	Properties file (properties/ qca.properties) not available. QCA is starting with default settings.	Default used	None
portNumber property not in properties/ qca.properties at QCA start-up.	201	Warning	INIT	portNumber property not in properties/qca.properties. QCA is starting with default port number of 20000	Default used	None
portNumber property in properties/qca.properties not in range at QCA start-up.	201	Warning	INIT	portNumber property in properties/qca.properties not in range. QCA is starting with default port number of 20000	Default used	None
portNumber property in properties/qca.properties not a number at QCA start-up.	201	Warning	INIT	portNumber property in properties/qca.properties could not be used. QCA is starting with default port number of 20000	Default used	None
MaxFileSize property not in properties/ qca.properties.	201	Warning	INIT	MaxFileSize property not in properties/qca.properties. QCA is starting with default maximum file size of 1 MByte	Default used	None

Table 1 Service summary (initialization) warning logs

Event / Error	Report Number	Priority	Event Type	Description	QCA Action	Customer Action
MaxFileSize property in properties/qca.properties not in range.	201	Warning	INIT	MaxFileSize property in properties/qca.properties not in range. QCA is starting with default maximum file size of 1 MByte	Default used	None
MaxFileSize property in properties/qca.properties not a number.	201	Warning	INIT	MaxFileSize property in properties/qca.properties could not be used. QCA is starting with default maximum file size of 1 MByte	Default used	None
MaxFileTime property not in properties/ qca.properties.	201	Warning	INIT	MaxFileTime property not in properties/qca.properties. QCA is starting with default maximum file time of 15 minutes	Default used	None
MaxFileTime property in properties/qca.properties not in range.	201	Warning	INIT	MaxFileTime property in properties/qca.properties not in range. QCA is starting with default maximum file time of 15 minutes	Default used	None
MaxFileTime property in properties/qca.properties not a number.	201	Warning	INIT	MaxFileTime property in properties/qca.properties could not be used. QCA is starting with default maximum file time of 15 minutes	Default used	None
RetainFileTime property not in properties/ qca.properties.	201	Warning	INIT	RetainFileTime property not in properties/qca.properties. QCA is starting with default retain file time of 5 days	Default used	None
RetainFileTime property in properties/ qca.properties not in range.	201	Warning	INIT	RetainFileTime property in properties/qca.properties not in range. QCA is starting with default retain file time of 5 days	Default used	None
RetainFileTime property in properties/ qca.properties not a number.	201	Warning	INIT	RetainFileTime property in properties/qca.properties could not be used. QCA is starting with default retain file time of 5 days	Default used	None
recycleToD property not in properties/ qca.properties.	201	Warning	INIT	recycleToD property not in properties/qca.properties. QCA is starting with default recycle hour of day of 0	Default used	None
recycleToD property in properties/qca.properties not in range.	201	Warning	INIT	recycleToD property in properties/qca.properties not in range. QCA is starting with default recycle hour of day of 0	Default used	None

Table 1 Service summary (initialization) warning logs

Event / Error	Report Number	Priority	Event Type	Description	QCA Action	Customer Action
recycleToD property in properties/qca.properties not a number.	201	Warning	INIT	recycleToD property in properties/qca.properties could not be used. QCA is starting with default recycle hour of day of 0	Default used	None
fileExt property not in properties/qca.properties.	201	Warning	INIT	fileExt property not in properties/qca.properties. QCA is starting with default file extension of xml	Default used	None
oldFileCompression property not in properties/ qca.properties.	201	Warning	INIT	oldFileCompression property not in properties/qca.properties. QCA is starting with default value of true	Default used	None
oldFileCompression property in properties/ qca.properties not true or false.	201	Warning	INIT	oldFileCompression property in properties/qca.properties could not be used. QCA is starting with default value of true	Default used	None
closedFileCompression property not in properties/ qca.properties.	201	Warning	INIT	closedFileCompression property not in properties/ qca.properties. QCA is starting with default value of true	Default used	None
closedFileCompression property in properties/ qca.properties not true or false.	201	Warning	INIT	closedFileCompression property in properties/ qca.properties could not be used. QCA is starting with default value of true	Default used	None
nodeName property not in properties/ qca.properties.	201	Warning	INIT	nodeName property not in properties/qca.properties. QCA is starting with default value of QCA	Default used	None
old file retention directory (today-x) is being removed.	202	None	INIT	File Recovery: removing closed file retention directory: *directory* as it is older than *x* days.	Directory removed	None
File found in active directory when QCA started.	202	None	INIT	File Recovery: file *file name* found in active directory. This could indicate that the QCA failed. Please check debug logs.	File completed (if necessary) and moved to today directory.	Check debug logs.

To comply with X.733, the structure of the logs will also contain following attributes. The logs are differentiated from each other by Specific Problem and Description attributes.

- Location : QCA Host Name
- Category : Appropriate category from X.733 list of available categories.
- Cause : Appropriate category from X.733 list of available cause-values.
- Time : Time at which log was generated.
- ComponentID : File /Directory path, GWC name (components causing generation of log)
- SpecificProblem : Text giving details of the specific-problem
- Description : Text describing the problem and/or giving more information.

Table 2 Trouble logs

Event / Error	Report Number	Priority	Event Type	Message	QCA Action	Customer Action
File handler or server socket could not be started.	300	None	FAIL	QCA not started: Could not open server socket: +*reason* or QCA not started: Could not create File Handler: +*reason*	QCA not started	Rectify problem and re-start QCA.
Out of sequence QoS record received.	302	None	FLT	Out of Sequence QoS Record received. '*MGC Type MGC number*': sequence number = '*record sequence number*' previous sequence number = '*last record sequence number*'	XML Error record generated.	None
Problem processing binary QoS record.	302	None	FLT	Problem processing binary QoS record: Sequence number = '*record sequence number*' Relevant MGC is mentioned in *Component ID* attribute of the log.	XML Error record generated. XML QoS Record not written to file.	None

Event / Error	Report Number	Priority	Event Type	Message	QCA Action	Customer Action
QoS Record received with Unsupported Length. (Notification Id: 9)	301	Minor	FLT	Location: <hostName> Notification ID: 9 State: Raise Category:Processing Error Cause: Corrupt Data. Time:<time> Component Id: 'MGCType MGCNum' Specific Problem: The QCA has received records with < numberOfLengthErrors> length errors from the source. Description: If 10 (or more) records with unsupported length are received consecutively, Major fault log is generated and the connection is closed.	XML Error record generated. XML QoS Record not written to file.	Investigate why client is sent QoS Record with Unsupported Length
10 sequential QoS Records received with Unsupported Length.	301	Major	FLT	Location: <hostName> Notification ID: 9 State: Raise Category:Processing Error Cause: Version mismatch. Time:<time> Component Id: 'MGCType MGCNum' Specific Problem: 10 unsupported length records received. The connection to the client will be closed	Connection to client closed	Investigate why client is repeatedly sending Unsupported Length QoS records
QoS Record received with Unsupported Version. (Notification Id: 57)	301	Minor	FLT	Location: <hostName> Notification ID:57 State: Raise Category:Processing Error Cause: Version mismatch. Time:<time> Component Id: 'MGCType MGCNum' Specific Problem: The QCA has received records with <NumberOfVersionErrors> version errors from the source. Description: If 10 (or more) records with unsupported version are received consecutively, Major fault log is generated and the connection is closed.	XML Error record generated. XML QoS Record not written to file.	Investigate why client is sent QoS Record with Unsupported Version
10 sequential QoS Records received with Unsupported Version.	301	Major	FLT	Location: <hostName> Notification ID: 57 State: Raise Category:Processing Error Cause: Version mismatch. Time:<time>Component Id: 'MGCType MGCNum' Specific Problem: 10 unsupported version records received. The connection to the client will be closed.	Connection to client closed	Investigate why client is repeatedly sending Unsupported Length QoS records

Event / Error	Report Number	Priority	Event Type	Message	QCA Action	Customer Action
The binary QoS Record header could not be processed.	305	None	FLT	Connection closed: Error while processing QoS record header: Client at, IP Address '*client IP Address*'. Local Port '*local port number*' closed connection.	Connection to client closed	Investigate why client is sent QoS Record with faulty header
Disk space shortage, local disk requires more free space. Disk Space is below 100Mb.	310	Critical	TBL	Location: <hostName> Notification ID: 49 State: Raise Category:Processing Error Cause: StorageCapacityproblem. Time:<time>Component Id: / data/qca Specific Problem: checkDiskSpace() has shown that there is less than 104857600 bytes available on the local disk. More Space is required immediately.	None	More space must be created.
Disk Space is starting to run seriously low. This means that the available space is below 500Mb.	310	Major	TBL	Location: <hostName> Notification ID: 49 State: Raise Category:Processing Error Cause: StorageCapacityProblem. Time:<time>Component Id: / data/qca. Specific Problem:Less than 524288000 bytes available on the local disk.Critical alarm will be raised if disk space continues to drop.	None	More space must be created.
Disk space is below the minimum threshold. Initially set at 1Gb.	310	Minor	TBL	Location: <hostName> Notification ID: 49 State: Raise Category:Processing Error Cause: StorageCapacityProblem. Time:<time>Component Id: / data/qca. Specific Problem: Less than 1073741824 bytes available on the local disk. Major alarm will be raised if the disk space continues to drop.	None	More space must be created.
A request to get a new file name has failed, there are either 10000 files with the same name or the new file can not be created.	315	Warning	FLT	Unable to get an unused file name for <fileName> Please check the output directory.	file null.xml used	Output directories need to be checked.

Event / Error	Report Number	Priority	Event Type	Message	QCA Action	Customer Action
The QCA has failed to write the footer information to the active file whilst attempting to close. The active file might have been compressed without the footer information.	315	Warning	FLT	Cannot write the FOOTER to the active file. This file is corrupted FileName = <fileName>.	None	Check the file and confirm that all XML tags have been closed.
The active file did not exist when trying to write to it. Attempt to get new file then failed. Further failures will result in the QCA being shutdown.	315	None	FLT	Active file <fileName> has been removed. Data may have been lost. Creating new file, and attempting to write record again. Failure to do so will result in shutdown of the QCA	Attempts to create a new output file	File IO problems, if problem is resolved the Major alarm will be withdrawn.
Attempting to write data to file, the active file does not exist. Try to get new file. This has failed. Sleep The thread and try and get new file again.This also failed. No file to write to, QCA will shutdown.	315	None	FAIL	Could not get new file to write records. File <fileName> is corrupted or removed. QCA shutting down.	QCA is stopped.	check: disk space and write permissions. If all is well try starting QCA again.
The XML writer and the file all seem well, unfortunately the file cannot be accessed at in either the first or second attempt, serious problem with file IO. QCA will shutdown.	315	None	FAIL	Could not write to the activefile. Active file exists but cannot write records to it. Reason unknown. QCA shutting down	QCA is stopped.	check: disk space and write permissions. If all is well try starting QCA again.

Event / Error	Report Number	Priority	Event Type	Message	QCA Action	Customer Action
The QCA has encountered inconsistent errors when building the directory structure for old files, old files may have been deleted and directory locked. The error should never appear, as it is the last resort.	315	None	FAIL	Cannot create directories under *output* directory. Cannot write records. QCA shutting down	QCA is stopped.	Check: directory structure, active and old files.
Attempt to rename the active file from the active directory to the today directory has failed. Serious error, but no loss of data immediately. Files can be moved by hand if required.	315	None	FLT	Could not rename active file <fileName> to file <newFileName>. Please check write permissions for the output directory	Closed file remains in active directory.	Check the directories exist and all the write permissions.
Could not create new active file. Data is being lost.QCA must shut down.	315	None	FAIL	Could not get new file for writing. Critical Error: <reason>. QCA shutting down.	QCA is stopped.	Check the active directory for old files and permissions.
Attempt to compress an old active file has failed.	315	None	FLT	Could not compress file: <fileName>. File compression failed.	None	Check the active directory for old files and permissions.
Failed to rename directories on the Recycle_day proc. This is where all files are moved along a level and the last gets deleted.	315	None	FLT	Could not rename director from <dirName> to <newDirName>. Check disk space and permissions.	None	Check disk space and permissions.
New GWC connection received.	322	None	INFO	New GWC COnnection: '*MGC Type MGC number*': sequence number = '*record sequence number*'	XML Error record generated	

Table 3 Information and alarm clear logs

Event / Error	Report Number	Priority	Event Type	Message	QCA Action	Customer Action
Connection closed.	305	None	INFO	Connection closed. Client at, IP Address '*client IP Address*'. Local Port '*local port number*' closed connection.	Connection to client closed	None
Client has stopped sending records with unsupported length (clear for QCA 301 Notification Id: 9)	399	None	INFO	Location: <Hostname> Notification Id: 9 State: Alarm Cleared Time: <time>	None	None

*** NOTE: (There are no changes in Alarms as a result of feature A00008338)

1> There are 3 different Types of Alarms uniquely identified by the Notification ID

a> Notification ID: 9

Event: Client is sending Records with unsupported Length.

Raise Severity (Major or Minor)

Raise Customer Log Report Number: QCA 301

Clear Severity: (None)

Clear Customer Log Report Number: QCA 399.

b> Notification ID: 57

Event: Client is sending Records with unsupported Version.

Raise Severity (Major or Minor)

Raise Customer Log Report Number: QCA 301

Clear Severity: (None)

Clear Customer Log Report Number: QCA 399.

c> Notification ID: 49

Event: Critical/Major/Minor Disk Space issue.

Raise Severity (Critical, Major or Minor)

Raise Customer Log Report Number: QCA 310.

Clear Severity: (None)

Clear Customer Log Report Number: QCA 399.

Example of Raise/Clear Alarms:

Appendix C- Increasing the size of a file system on a Sun server Application

Use one of the following procedures to increase the size of a file system on a Succession Server Platform Foundation Software (SSPFS)-based server:

- Simplex configuration (one server)

- High-availability configuration (two servers)

It is recommended you perform this procedure during off-peak hours.

The Succession Server Platform Foundation Software (SSPFS) creates file systems to best fit the needs of applications. However, it may be necessary to increase the size of a file system.

Not all file systems can be increased. The table below lists the file systems that cannot be increased, and lists examples of those that can be increased.

SSPFS file systems

Cannot be increased	Can be increased (examples)
/ (root)	/data
/var	/opt/nortel
/opt	/data/oradata
/tmp	/audio_files
/PROV_data	
/user_audio_files	
/data/qca	
/data/mg9kem/logs	

During the time file systems are being increased, writes to the file system are blocked, and the system activity increases. The more size that is added to the file system, the greater the impact on performance.

Prerequisites

Before you perform this procedure, verify that the file system is full or nearly full and that its content is valid application data. Remove any unneeded files or files generated in error that could be taking up disk space.

Action

Perform the following steps to complete this procedure.

Simplex configuration (one server)

At your workstation

1> Telnet to the Sun server by typing

> telnet <server>

and pressing the Enter key.

where

server
is the IP address or host name of the Sun server that has the file system you want to increase

2> When prompted, enter your user ID and password.

3> Change to the root user by typing

$ su - root

and pressing the Enter key.

4> When prompted, enter the root password.

5> Access the command line interface by typing

cli

and pressing the Enter key.

Example response

Command Line Interface 1 - View

2 - Configuration

3 - Other
X - exitselect -

6> Determine which file system to increase by checking the current disk capacity utilization as follows:

a> Enter the number that corresponds to the “View” option in the menu.

Example response

View 1 - sspfs_soft (Display Software Installation Level Of SSPFS) 2 - chk_sspfs (Check SSPFS Processes) 3 - sw_conf (The software configuration of the znc0s0jx) 4 - cpu_util (Overall CPU utilization) 5 - cpu_util_proc (CPU utilization by process) 6 - port_util (I/O port utilization) 7 - disk_util (Filesystem utilization) X - exitselect -

b> Enter the number that corresponds to the “disk_util” option in the menu.

Example response

7> Determine the appropriate size for the file systems based on your specific needs.

8> Exit each menu level of the command line interface to eventually exit the command line interface, by typing

select - x

and pressing the Enter key.

9>

ATTENTION
Once you increase the size of a file system, you cannot decrease it.

Increase the size of the file system by typing

filesys grow -m <mount_point> -s <size>{m,g}

Where

mount_point
is the name associated with the file system

- /data
- /opt/nortel
- /data/oradata
- /PROV_data
- /audio_files
- /user_audio_files
- **/data/qca**
- /data/mg9kem/logs

size
is the size in megabytes (m) or gigabytes (g) you obtained in step 7

Example# filesys grow -m /data/qca -s 512m

Note: The example above increases the “/data” file system by 512 megabytes (MB).

10> You have completed this procedure.

High-availability configuration (two servers)

ATTENTION
During this procedure, the cluster will be running without a standby node. The duration is estimated at approximately one hour.

At your workstation

1> Telnet to the inactive node of the server cluster by typing

> telnet <server>

and pressing the Enter key.

where

server
is the physical IP address of the inactive node in the server cluster

2> When prompted, enter your user ID and password.

3> Change to the root user by typing

$ su - root

and pressing the Enter key.

4> When prompted, enter the root password.

5> Ensure the cluster is in a good state as follows:

a> Run the udstat command by typing

udstat

and pressing the Enter key.

If the system response contains “nodaemon”, “offline”, “down, “not mounted”, contact your next level of support. Otherwise, proceed to the next step.

b> Run the ubmstat command by typing

ubmstat

and pressing the Enter key.

If the system response is other than “ClusterIndicatorSTBY”. contact your next level of support. Otherwise, proceed to the next step.

c> Run the CheckConfiguration command by typing

CheckConfiguration

and pressing the Enter key.

If the system response is other than “Checking local cluster configuration against <other node>, contact your next level of support. Otherwise, proceed to the next step.

At the Inactive node

6>

ATTENTION
Once you increase the size of a file system, you cannot decrease it.

Increase the size of the desired file system by typing

GrowClusteredFileSystem.ksh <mount_point> <size>{m,g}

Where

mount_point
is the name associated with the file system, for example

- /data
- /opt/nortel
- /data/oradata
- /PROV_data
- /audio_files
- /user_audio_files

•/data/qca

•/data/mg9kem/logs

size
is the size in megabytes (m) or gigabytes (g)

Example# GrowClusteredFileSystem.ksh **/data/qca** 10m

Note: The example above increases the “/data/qca” file system by 10 megabytes (MB).

7> Reboot the Inactive node by typing

init 6

and pressing the Enter key.

8> Wait for the Inactive node to reboot, then log in again using its physical IP address.

9> Telnet to the active node of the Sun server cluster by typing

> telnet <server>

and pressing the Enter key.

where

server
is the physical IP address of the active node in the Sun server cluster

10> When prompted, enter your user ID and password.

11> Change to the root user by typing

$ su - root

and pressing the Enter key.

12> When prompted, enter the root password.

At the Active node

13> Stop the cluster by typing

StopCluster

and press the Enter key.

This action causes a cluster failover and makes the active node inactive, and the inactive node active.

At the newly Active node

14> Clone the other node using procedure Cloning the image of one node in a cluster to the other node on page 9 in this document.

15> You have completed this procedure.

Document Reference:

For increasing the size of a file system on an SSPFS-based server refer NN10402-600.

Appendix D: List of GWs that Report End of Call QoS Statistics.

12.1 GWs Supported

Table 1 : SN06

GW	SN06 Validation Level	SN06 Comments	Future Plans (Beyond SN06)
UAS (H.248)	Full	Does not currently report all stats. The stats that are reported depend on the mode: SendOnly: PS, OS SendRecv: PS, OS, PR, OR, PL RecvOnly: PR,OR,PL	
Motorola CG4500 (NCS)	Full	5.x stream. all stats reported. Latency calculation is not PacketCable compliant.	
PVG (Aspen/ VSP2)	Full	All stats reported.	
PVG (Aspen/ VSP3)	None	All stats reported.	
PVG (H.248)	None	All stats reported.	
Mediatrix (MGCP)	Partial		
Arris PacketPort (MGCP)	Full		
Arris TTM/ TTP (NCS)	Partial		

Table 1 : SN06

GW	SN06 Validation Level	SN06 Comments	Future Plans (Beyond SN06)
Askey	Partial	Validated basic functionality during End to End IT. Will do further testing during PV.	
CICM	None	CICM does not currently report end of call stats to the GWC.	Requirement submitted to CICM team, negotiating inclusion into SN07.

Table 2

GW	SN06.2 Validation Level	SN06.2 Comments	Future Plans (Beyond SN06.2)
UAS		Does not currently report all stats. Does not report Jitter and Inter-arrival Latency.	
MS2010 (Megaco/ H.248)		Does not currently report all stats. Does not report Jitter and Inter-arrival Latency.	
PVG (H.248)		All stats reported.	
H.248M2K		All Stats reported.	
Ambit MG1K		All Stats reported.	
Ambit 32		All Stats supported.	
PVG PP15K (VSP3 and VSP3oCard)		All Stats supported.	
PVG PP15K and PP7k (VSP2)		All parameters reported other than Jitter and inter-arrival latency which not measured.	

GW	SN06.2 Validation Level	SN06.2 Comments	Future Plans (Beyond SN06.2)
UAS		Does not currently report all stats. Does not report Jitter and Inter-arrival Latency.	

GW	SN06.2 Validation Level	SN06.2 Comments	Future Plans (Beyond SN06.2)
MS2010 (Megaco/ H.248)		Does not currently report all stats. Does not report Jitter and Inter-arrival Latency.	
PVG (H.248)		All stats reported.	
H.248M2K		All Stats reported.	
Ambit MG1K		All Stats reported.	
Ambit 32		All Stats supported.	
PVG PP15K (VSP3 and VSP3oCard)		All Stats supported.	
PVG PP15K and PP7k (VSP2)		All parameters reported other than Jitter and inter-arrival latency which not measured.	

GW	SN07.0 Validation Level	SN07.0 Comments	Future Plans (Beyond SN07.0)
UAS		Does not currently report all stats. Does not report Jitter and Inter-arrival Latency.	
MS2010 (Megaco/ H.248)		Does not currently report all stats. Does not report Jitter and Inter-arrival Latency.	
PVG (H.248)		All stats reported.	
H.248M2K		All Stats reported.	
Ambit MG1K		All Stats reported.	
Ambit 32		All Stats supported	
PVG PP15K (VSP3 and VSP3oCard)		All Stats supported	
PVG PP15K and PP7k (VSP2)		All parameters reported other than Jitter and inter-arrival latency which not measured.	

GW	SN08.0 Validation Level	SN08.0 Comments	Future Plans (Beyond SN08.0)
Motorola MTA2	Y	All Stats Reported	
TTM/TTP Profile	Y	All Stats Reported	
ASKEY (4/12/ 30 Port Profile)	Y	All Stats Reported.	
Mediatrix 1104/1124 Profile	Y	All Stats Reported.	
UAS	Y	Does not currently report all stats. Does not report Jitter and Inter-arrival Latency.	
MS2010 (Megaco/ H.248)	Y	Does not currently report all stats. Does not report Jitter and Inter-arrival Latency.	
PVG (H.248)	Y	All stats reported.	
H.248M2K		All Stats reported.	
Ambit MG1K		All Stats reported.	
Ambit 32	Y	All Stats supported	
PVG PP15K (VSP3 and VSP3oCard)		All Stats supported	
PVG PP15K and PP7k (VSP2)	Y	All parameters reported other than Jitter and inter-arrival latency which not measured.	

Appendix E - QCA Versions available and the Binary content for each version

The following are the QoS Binary versions generated by loads in various releases. Version 1, 2, and 3 are for SN07, SN08 and SN09 Releases. Version 4, 5 are for patched SN07 and patched SN08 loads.

For Version 1:

132 byte - QoS binary message. Bytes are counted from 0 to N-1.

Header – 8 bytes (byte 0 to 7)
Codec – 2 bytes (byte 8 and 9)
Port Number – 2 bytes (byte 10 and 11)
IP Address – 4 bytes (byte 12 to 15)
GW Name – 32 bytes (byte 16 to 47) (first 32 bytes of FQDN)
End Point – 32 bytes (byte 48 to 79)
CLLI – 16 bytes (byte 80 to 95)
CorrID – 10 bytes (byte 96 to 105)
Two Byte Filler – 2 bytes (byte 106 and 107)
PacketSent – 4 bytes (byte 108 to 111)
PacketReceived – 4 bytes (byte 112 to 115)
OctetSent – 4 bytes (byte 116 to 119)
OctetReceived – 4 bytes (byte 120 to 123)
packetLost – 4 bytes (byte 124 to 127)
Jitter – 2 bytes (byte 128 and 129)
Latency – 2 bytes (byte 130 and 131)

For Version 4: (Jitter and latency mapping)

132 byte - QoS binary message. Bytes are counted from 0 to N-1.

Header – 8 bytes (byte 0 to 7)
Codec – 2 bytes (byte 8 and 9) (**Byte 8 and 9** holds information about the MSBytes of Jitter)
Port Number – 2 bytes (byte 10 and 11)
IP Address – 4 bytes (byte 12 to 15)
GW Name – 32 bytes (byte 16 to 47) (first 32 bytes of FQDN)
End Point – 32 bytes (byte 48 to 79)
CLLI – 16 bytes (byte 80 to 95)
CorrID – 10 bytes (byte 96 to 105)
Two Byte Filler – 2 bytes (byte 106 and 107) (**Byte106 and 107** holds the MSBytes of Latency component)

PacketSent – 4 bytes (byte 108 to 111)
PacketReceived – 4 bytes (byte 112 to 115)
OctetSent – 4 bytes (byte 116 to 119)
OctetReceived – 4 bytes (byte 120 to 123)
packetLost – 4 bytes (byte 124 to 127)
Jitter – 2 bytes (byte 128 and 129)
Latency – 2 bytes (byte 130 and 131)

Jitter and latency in Version 4 is of 4 bytes each, MSBytes of Jitter and Latency are obtained from Codec field and Filler byte fields of Version 1 respectively.

For Version 2:

136 byte - QoS binary message. Bytes are counted from 0 to N-1.

Header – 8 bytes (byte 0 to 7)
Codec – 2 bytes (byte 8 and 9)
Port Number – 2 bytes (byte 10 and 11)
IP Address – 4 bytes (byte 12 to 15)
GW Name – 32 bytes (byte 16 to 47) (first 32 bytes of FQDN)
End Point – 32 bytes (byte 48 to 79)
CLLI – 16 bytes (byte 80 to 95)
CorrID – 10 bytes (byte 96 to 105)
Two Byte Filler – 2 bytes (byte 106 and 107)
PacketSent – 4 bytes (byte 108 to 111)
PacketReceived – 4 bytes (byte 112 to 115)
OctetSent – 4 bytes (byte 116 to 119)
OctetReceived – 4 bytes (byte 120 to 123)
packetLost – 4 bytes (byte 124 to 127)
Jitter – 4 bytes (byte 128 and 131)
Latency – 4 bytes (byte 132 and 135)

For Version 5: (Timestamp Patched load)

144 byte - QoS binary message. Bytes are counted from 0 to N-1.

Header – 8 bytes (byte 0 to 7)
Codec – 2 bytes (byte 8 and 9)
Port Number – 2 bytes (byte 10 and 11)
IP Address – 4 bytes (byte 12 to 15)
GW Name – 32 bytes (byte 16 to 47) (first 32 bytes of FQDN)
End Point – 32 bytes (byte 48 to 79)
CLLI – 16 bytes (byte 80 to 95)
CorrID – 10 bytes (byte 96 to 105)
Two Byte Filler – 2 bytes **(removed)**
STime – 5 bytes (byte 106 to 110)
ETime – 5 bytes (byte 111 to 115)
PacketSent – 4 bytes (byte 116 to 119)
PacketReceived – 4 bytes (byte 120 to 123)
OctetSent – 4 bytes (byte 124 to 127)
OctetReceived – 4 bytes (byte 128 to 131)
packetLost – 4 bytes (byte 132 to 135)
Jitter – 4 bytes (byte 136 and 139)
Latency – 4 bytes (byte 140 and 143)

For Version 3:

180 byte - QoS binary message. Bytes are counted from 0 to N-1.

Header – 8 bytes (byte 0 to 7)
Codec – 2 bytes (byte 8 and 9)
Port Number – 2 bytes (byte 10 and 11)
IP Address – 4 bytes (byte 12 to 15)
GW Name – 64 bytes (byte 16 to 79) (first 64 bytes of FQDN)
End Point – 32 bytes (byte 80 to 111)
CLLI – 16 bytes (byte 112 to 127)
CorrID – 10 bytes (byte 128 to 137)
STime – 5 bytes (byte 138 to 142)

ETime – 5 bytes (byte 143 to 147)
PacketSent – 4 bytes (byte 148 to 151)
PacketReceived – 4 bytes (byte 152 to 155)
OctetSent – 4 bytes (byte 156 to 159)
OctetReceived – 4 bytes (byte 160 to 163)
packetLost – 4 bytes (byte 164 to 167)
Jitter – 4 bytes (byte 168 and 171)
Latency – 4 bytes (byte 172 and 175)
32 Bit Filler – 4 bytes (byte 176 and 179)

Header Field details:

```
// ------------------ Report Header variables ----------------------------
private int mgcType = -1;        // bits 0 to 3 of byte 0
private int messageType = -1;    // bits 4 to 7 of byte 0
private int sequenceNumber = -1; // bytes 1 to 3
private int reportType = -1;     // bits 0 to 3 of byte 4
private int version = -1;        // bits 4 to 7 of byte 4
private int mgcNumber = -1;      // byte 5
private int msgLength = -1;      // byte 6
private int ipVersion = -1;      // byte 7 (IP version 2-bits plus 6-bit filler)
// ------------------ End of Report Header variables ----------------------
```

25: Functional Description (FN): A0009321

25.1 Feature name and Feature ID

A00009321 - NMC Code Blocking

25.2 Description

25.2.1 Introduction

This feature is to enhance the Mass Call function on the CS2Kc system.

GAP is a existing hidden CBK option which is the time interval between completed calls. In Code Blocking feature, another CBK option PCT is provided. Within the implementation of this activity, following will be covered:

- *Percentage*(PCT) is a CBK option which allows calls to be blocked from proceeding based upon the destination code(digits). Calls can be blocked by a specified percentage ranges from 1 to 100. Blocked calls can have one of three possible treatments applied: NCA, EA1, or EA2.

Whether a CBK control should be applied only depends on the destination digits. it does not care the call agent is line or any kind of trunk.

25.2.2 Block calls with the percentage

The Code Blocking control provides a means to block calls from progressing further into the Network. Because the route taken by a call is determined by the destination code, the control provides a means to limit traffic over particular routes.

A certain percentage(between 1 and 100 percent) can be defined in PCT option and the specified percentage of calls should be blocked based on the preset destination code.

Calls which are blocked from proceeding further into the Network can be sent to one of three possible treatments:

- No Circuit Announcement (NCA);

- Emergency Announcement 1 (EA1); or
- Emergency Announcement 2 (EA2).

25.2.3 PCT option is available in MASSCALL command

MASSCALL command is implemented to List/Apply/Remove mass call control. PCT is available in MASSCALL command as a CBK option.

Following are some examples:

Example 1

```
MASSCALL APPLY CBK PCT PX CSXLA '8308001' '8308004'
60 NCA
```

In this example, only 40 percent of calls which enters:

1. UXLA with an XLASYS of PX
2. XLANAME of CSXLA with called party digits starting in range from ’8308001’ to ’8308004’

will be allowed to complete, all other calls will be sent to NCA treatment.

Example 2

```
MASSCALL APPLY CBK GAP PX CSXLA '8308001' '8308004'
'60.0' NCA
```

In this example, only one call per 60 seconds which enters:

1. UXLA with an XLASYS of PX
2. XLANAME of CSXLA with digits starting in range from ’8308001’ to ’8308004’

will be allowed to complete, all other calls will be sent to NCA treatment.

Example 3

```
MASSCALL LIST CBK PCT PX CSXLA ALL
```

In this example, all the percentage code blocking controls that applied which enters UXLA with an XLASYS of PX and an XLANAME of CSXLA will be listed.

Example 4

```
MASSCALL LIST CBK GAP PX CSXLA ALL
```

In this example, all the gap code blocking controls that applied which enters UXLA with an XLASYS of PX and an XLANAME of CSXLA will be listed.

Example 5

```
MASSCALL REMOVE CBK PCT PX CSXLA '8308001' '8308004'
```

In this example, the percentage code blocking control which enters

1. UXLA with an XLASYS of PX

2. XLANAME of CSXLA with digits starting in range from ’8308001’ to ’8308004’

will be removed.

Example 6

```
MASSCALL REMOVE CBK GAP PX CSXLA '8308001' '8308004'
```

In this example, the gap code blocking control which enters

1. UXLA with an XLASYS of PX

2. XLANAME of CSXLA with digits starting in range from ’8308001’ to ’8308004’

will be removed.

25.2.4 PCT option is available in MAPCI commands

PCT is available in MAPCI commands as a CBK option. Direct access to the CodeCtrl menu level is from the Command Interpreter (CI) level by entering the commands “`MAPCI;NWM;CODECTRL`”. This level can also be entered indirectly by selecting the appropriate menu item until the desired level is reached.

CodeCtrl commands are to List, Apply and Remove code controls. PCT option is available in these code control commands.

Followings are some examples:

Example 1

```
APPLY CBK PCT PX CSXLA '8308001' '8308004' 60 NCA
```

In this example, only 40 percent of calls which enters:

1. UXLA with an XLASYS of PX

2. XLANAME of CSXLA with called party digits starting in range from ’8308001’ to ’8308004’

will be allowed to complete, all other calls will be sent to NCA treatment.

Example 2

```
APPLY CBK GAP PX CSXLA '8308001' '8308004' '60.0' NCA
```

In this example, only one call per 60 seconds which enters:

1. UXLA with an XLASYS of PX

2. XLANAME of CSXLA with digits starting in range from ’8308001’ to ’8308004’

will be allowed to complete, all other calls will be sent to NCA treatment.

Example 3

```
LIST CBK PCT PX CSXLA ALL
```

In this example, all the percentage code blocking controls that applied which enters UXLA with an XLASYS of PX and an XLANAME of CSXLA will be listed.

Example 4

```
LIST CBK GAP PX CSXLA ALL
```

In this example, all the gap code blocking controls that applied which enters UXLA with an XLASYS of PX and an XLANAME of CSXLA will be listed.

Example 5

```
REMOVE CBK PCT PX CSXLA '8308001' '8308004'
```

In this example, the percentage code blocking control which enters

1. UXLA with an XLASYS of PX
2. XLANAME of CSXLA with digits starting in range from ’8308001’ to ’8308004’

will be removed.

Example 6

```
REMOVE CBK GAP PX CSXLA '8308001' '8308004'
```

In this example, the gap code blocking control which enters

1. UXLA with an XLASYS of PX
2. XLANAME of CSXLA with digits starting in range from ’8308001’ to ’8308004’

will be removed.

25.2.5 TRAVER routines

A new message is created to be displayed if PCT option is activated while doing TRAVER which is as following:

- ‘A Mass Call Code Block Control with percentage may affect this call.’

The message which displayed if GAP option is activated while doing TRAVER is also modified to indicate that this condition is encountered. Followoing is the message:

- ‘A Mass Call Code Block Control with gapping may affect this call.’

A TRAVER example of a call encountering a PCT Code Blocking Control is shown in Figure 1.

Figure 1 TRAVER example displaying Mass Call warning message

25.3 Hardware Requirements or Dependencies

No hardware dependency.

25.4 Software Requirements or Dependencies

None.

25.5 Limitations and restrictions

Please refer to the activity AU3395-Mass Call Control FN document for limitations and restrictions as there are no new restrictions are added by this feature to the functionality.

The ‘MM’ option in translation allows the possibility of creating an "unreachable" Mass Call Control tuple. (i.e. A Mass Call tuple with more digits than the Min value of the associated call's translations.) This attempt at setting a Mass Call Control is unreachable and could never be exercised. To avoid this issue, the minimum value in ‘MM’ should be datafilled not less than the digits in the masscall control code.

The Pass and Block counters are reset to 0 when they reach the maximum value 65536.

25.6 Interactions

This feature is a enhancement of Mass Call Control feature. A new CBK option PCT is implemented to provide the function to block calls with percentage based upon destination digits. This feature does not extend the capacity of the Code block control. The sum of CBK, PRP and HTRF entries still can not exceed 256.

25.7 Glossary

Term	Description
CBK	Code Blocking
PCT	Code Blocking with percentage
GAP	Code Blocking with gapping
TRAVER	Translation verification

26: Functional Description (FN): A0009322

26.1 Feature name and Feature ID

A00009322 - Call Lock and Do Not Disturb Enhancements

26.2 Description

26.2.1 Call Lock

26.2.1.1 Introduction

CEPT ILR feature gives the administrator the capability to restrict outgoing calls for the subscriber according to the predefined restriction classes. The administrator can assign, de_assign, activate or deactivate this feature on a line via Service Order or assign and de_assign the feature by using the default option functionality. Subscribers are able to activate, deactivate or interrogate ILR feature by dialing access codes.

The following enhancements are provided by this activity over existing Call Lock Feature:

- To support dial tone during the deactivation procedure.The user can originate a new call directly after the successful deactivation without going on hook.
- To allow class of restriction to be overwritten by new entry without doing a feature deactivation.
- To allow the user to change the password according to the required dialing sequence LH DT*SC*PWO*PWN#CT. The password is 4 digits.
- To generate report and disallow any feature modification (activation, deactivation, change) until the following day upon 3 times of wrong password entry in succession, or until the administration by operator. The following day is the time after the next 00:00 midnight. The 3 times is the value of field MAX_PIN_RETRY which is datafilled in CEPTPW tuple of table ISERVOPT. The password is 4 digits.

26.2.1.2 General Considerations

These enhancements are provided for IBN lines. There are some prerequisites to implement these enhancements which are:

- For the first two enhancements the subscriber should assigned ILR option.
- For the last two enhancements the subscriber should assigned CEPTPW option.

For the assignment of ILR and CEPTPW option, please refer to References 1,2,3.

26.2.1.3 To support dial tone during the deactivation procedure

The subscriber will hear dial tone instead of confirm tone when deactivating the ILR successfully, and the subscriber can originate a new call directly after the successful deactivation without going on hook.

Dial tone is optional and determined according to the field ALLOW_ORIG_AFTER_DEACT of ILRCLS tuple in table ISERVOPT.

- ALLOW_ORIG_AFTER_DEACT {BOOLEAN}: indicates that the dial tone will be generated or confirm tone will be generated. If it is set as ‘Y’, dial tone is generated and the user can originate a new call directly after the successful deactivation without going on hook. Otherwise, confirm tone is generated. The default value for the field is ‘N’.

...
```

26.2.1.4 To allow class of restriction to be overwritten by new entry without doing a feature deactivation

The subscriber can overwrite the class of restriction when activating the ILR option without doing a ILR deactivation first by using the following dialing sequence:

LH DT*SC*PW*CR#CT

This enhancement is optional and determined according to the field OVERRIDE_ILR_CLASS of ILRCLS tuple in table ISERVOPT.

- OVERRIDE_ILR_CLASS{BOOLEAN}: indicates whether the user can overwrite the class of restriction when activating the ILR option without doing a ILR deactivation first or not. If it is set as ‘Y’, the user can overwrite the class of restriction, otherwise can’t. The default value for the field is ‘N’.

```

Please refer to References 1,2.

26.2.1.5 To allow the user to change the password according to the required dialing sequence LH DT*SC*PWO*PWN#CT

The user can change the password according to the required dialing sequence LH DT*SC*PWO*PWN#CT when CEPTPW line option is assigned to the subscriber.

This enhancement is optional and determined according to the field NEW_PWD_ONCE of tuple CEPTPW in table ISERVOPT.

- NEW_PWD_ONCE{BOOLEAN}: indicates whether the user can change the password by the dialing sequence LH DT*SC*PWO*PWN#CT or not. If it is set as ‘Y’, the user can change the password by this dialing sequence. Otherwise the subscriber can change the password by the dialing sequence LH DT*SC*PWO*PWN*PWN#CT. The default value for the field is ‘N’.

26.2.1.6 Password Unlock

When CEPTPW and ILR line option is assigned to the subscriber, upon 3 times of wrong password entry in succession the subscriber will be disallowed any feature modification (activation, deactivation, change) until the following day , or until the administration by operator.The following day is the time after the next 00:00 midnight. The 3 times is the value of field MAX_PIN_RETRY which is datafilled in CEPTPW tuple of table ISERVOPT. The password is 4 digits.

CEPT102 log is generate when subscriber is locked. This log has four fields which are:

- Date and time

- feature
- action of the third wrong password
- calling DN

This enhancement is optional and determined according to the field AUTO_UNLOCK of tuple CEPTPW in table ISERVOPT.

- AUTO_UNLOCK{BOOLEAN}: indicates whether the information of locked user will be recorded and the locked user will be unlocked in the following day automatically. If it is set as 'Y', the locked user will be unlocked automatically in the following day. The default value for the field is 'N'.

26.2.2 Do Not Disturb

26.2.2.1 Introduction

When a called subscriber has CEPT Do Not Disturb feature active then the calling subscriber receives a busy tone or an announcement.

The following enhancements are provided by this activity over existing CDND Feature:

- To support Special Dial Tone if the feature is activated.
- To disable the ring splash.
- To support dial tone upon feature deactivation dialing sequence, the user is able to originate new call without hanging up.

26.2.2.2 General Considerations

These enhancements are developed for IBN lines.

26.2.2.3 To support special dial tone if the feature is activated

This function has been implemented by feature AT.59019083 and updated by feature AT.59022097. In table ISERVOPT, if the SPECIAL_DIAL_TONE field of CEPT_CFX tuple set to Y and CFD_CFB_INDICATION field of CEPT_CFX set to Y and CDND is active, the special dial tone will be given. A verify will be done in PV stage.

26.2.2.4 Disable the ring splash

CEPT CDND has no ring splash.

26.2.2.5 To support dial tone instead of confirmation tone during the deactivation procedure

The subscriber will hear dial tone instead of confirm tone when deactivating the CDND successfully, and the subscriber can originate a new call directly without hanging up.

Dial tone is optional and determined according to a datafill at table ISERVOPT. There is a new tuple CDND defined in table ISERVOPT, and a new field ALLOW_ORIG_AFTER_DEACT is added in this tuple.

- ALLOW_ORIG_AFTER_DEACT {BOOLEAN}: indicates that the dial tone will be generated or confirm tone will be generated. If it is set as ‘Y’, dial tone is generated. Otherwise, confirm tone is generated. The default value for the field is ‘N’.

Figure 5 :Example of ISERVOPT table datafill

MACHINES NOT IN SYNC - DMOS NOT ALLOWED
JOURNAL FILE UNAVAILABLE - DMOS NOT ALLOWED
ENTER Y TO CONTINUE PROCESSING OR N TO QUIT
>y
SOPTSKEY:
>CDND
OPTION:
>CDND
ALLOW_ORIG_AFTER_DEACT:
>y
TUPLE TO BE ADDED:
CDND CDND Y

ENTER Y TO CONFIRM, N TO REJECT OR E TO EDIT.
...
```

26.3 Hardware Requirements or Dependencies

Please refer to the hardware requirements or dependencies part of References 1,2,3,4,5.

26.4 Software Requirements or Dependencies

This feature does not affect the provision method of CEPT ILR, CEPTPW and CDND. It takes effect when the subscriber is using CEPT ILR, CEPTPW and CDND and it is controlled by following datafill:

- in table ISERVOPT, tuple ILRCLS, the ‘Allow_orig_after_deact’ field

- in table ISERVOPT, tuple ILRCLS, the ‘Override_ilr_class’ field

- in table ISERVOPT, tuple CEPTPW, the ‘New_pwd_once’ field

- in table ISERVOPT, tuple CDND, the ‘Allow_orig_after_deact’ field

Please refer to the software requirements or dependencies part of References 1,2,3,4,5 for more details.

26.5 Limitations and restrictions

- The user will not be locked when user input wrong password three times in succession in the period of ONP Swact.
- The max locked users who can be unlocked automatically simultaneously in the following day is limited to 10000. When the number of locked users exceed 10000, the new locked user cann't be unlocked automatically in the following day, but CEPT 102 log will still be generated.

For the other details of limitations and restrictions, please refer to References 1,2,3,4,5.

26.6 Interactions

Please refer to the interaction part of References 1,2,3,4,5.

27: Functional Description (FN): A00009373

27.1 Feature name and Feature ID

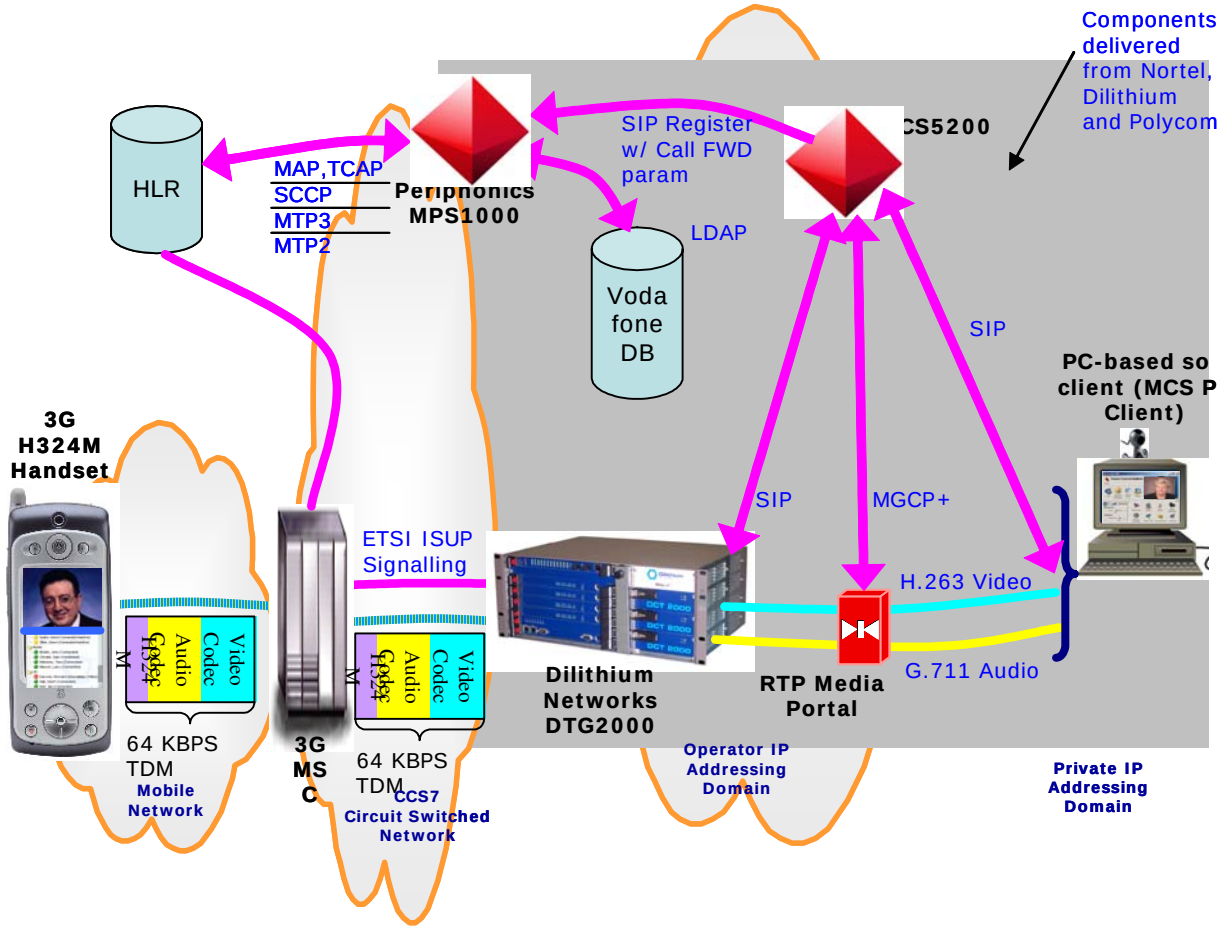
A00009373 - Vodafone Portugal 3G Video Features (Interworking)

27.2 Description

Vodafone Portugal 3G Video Features is an infrastructure that allows MTS R99 H.324M terminal users to have conversational video sessions with users based in a fixed packet network, and it also allows those UMTS R99 H.324M terminal users to access fixed network based application servers. The infrastructure will support sessions that are mobile to MCS client, MCS client to mobile and MCS client to MCS client.

This feature redirects calls destined to a mobile subscriber's wireless number to that subscriber's MCS client, if the subscriber is logged on to their MCS client and is requesting the forwarding of calls. Mobile subscribers will just have the basic 2 way voice and video call in this phase.

Figure 1 Functional Behavior Diagram

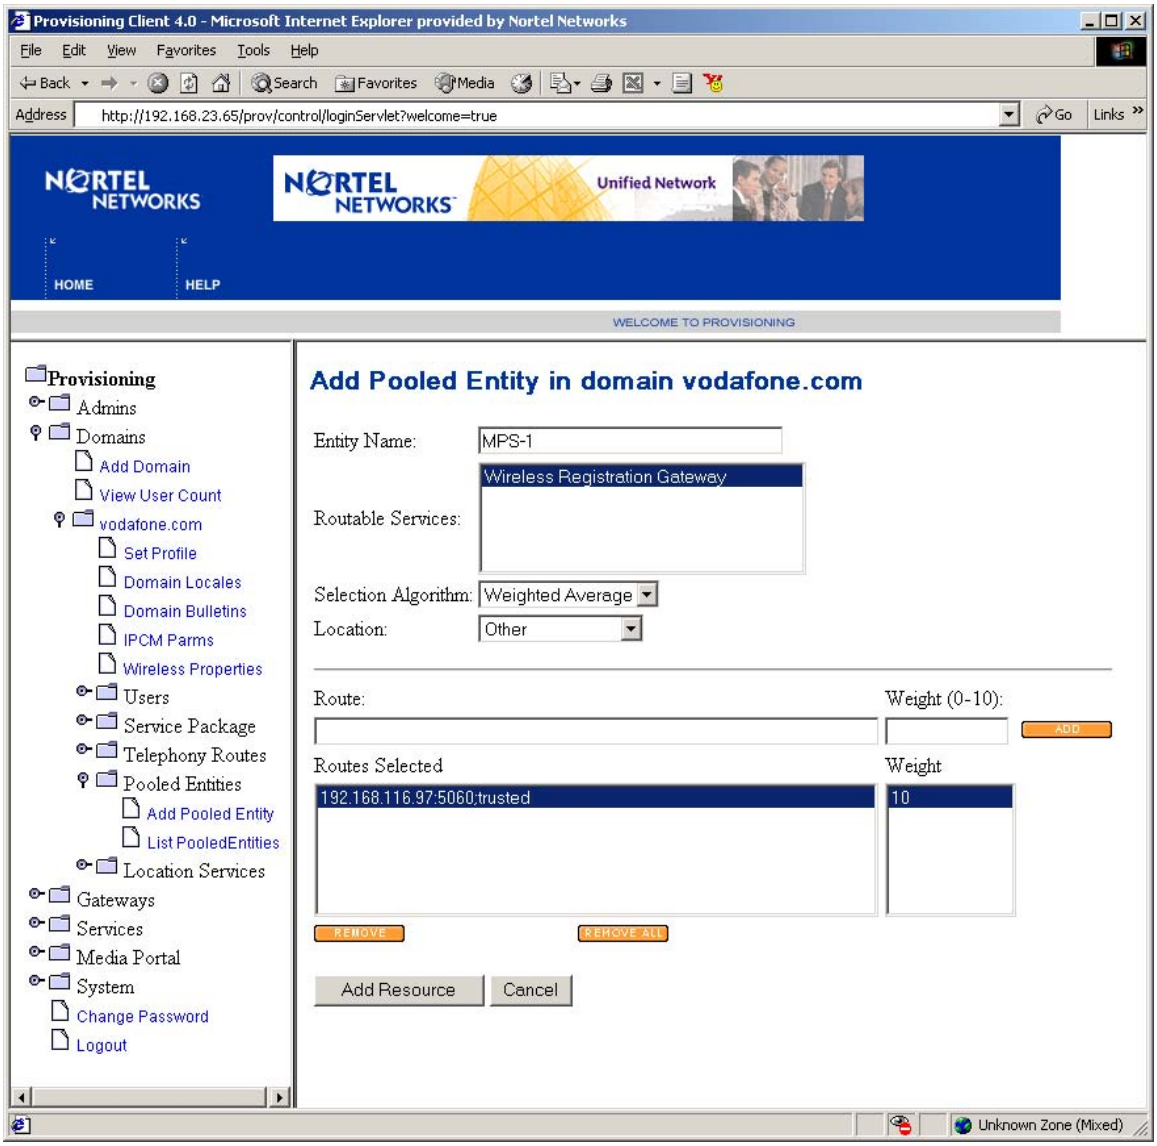


27.3 Network Configuration

27.3.1 MPS1000 Provisioning

The MCS supports multiple MPS1000 servers, and routes outbound calling traffic across them in a load balanced fashion. MPS1000 servers will be provisioned as a pooled resource by the MSC. This will allow multiple MPS IP addresses and associated weights to be provisioned for the support of load balancing and load sharing. See the figure 2 for an example of provisioning MPS servers with the MCS Provisioning Client.

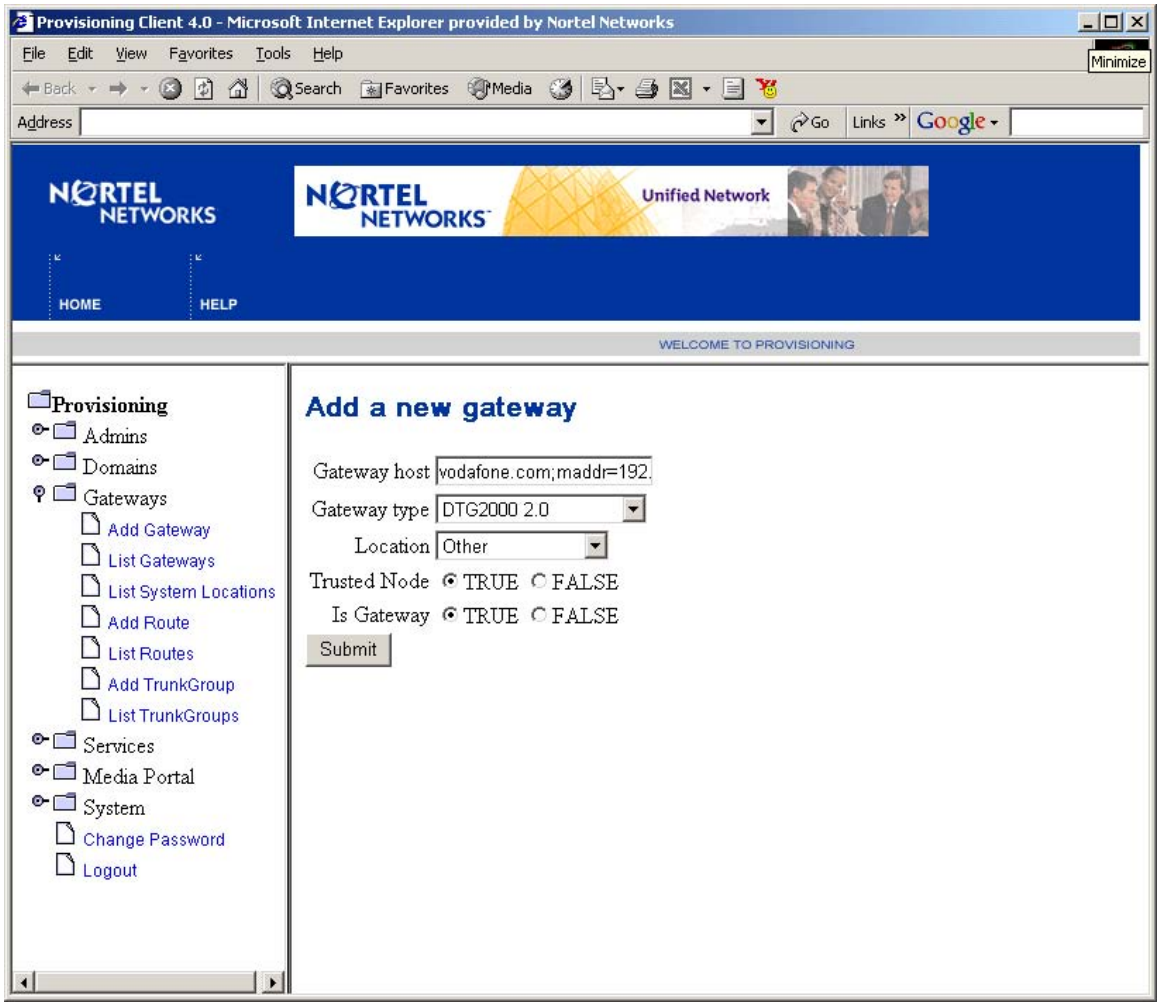
Figure 2 Provisioning MPS1000 as a Pooled Entity



27.3.2 DTG Provisioning

The MCS will support multiple Dilithium gateways. The DTG2000 will be provisioned as trusted gateways by the MCS. Telephony Translation will be used to determine which specific DTG to route outgoing calls through. See figure 3 for an example the DTG2000 gateway provisioning.

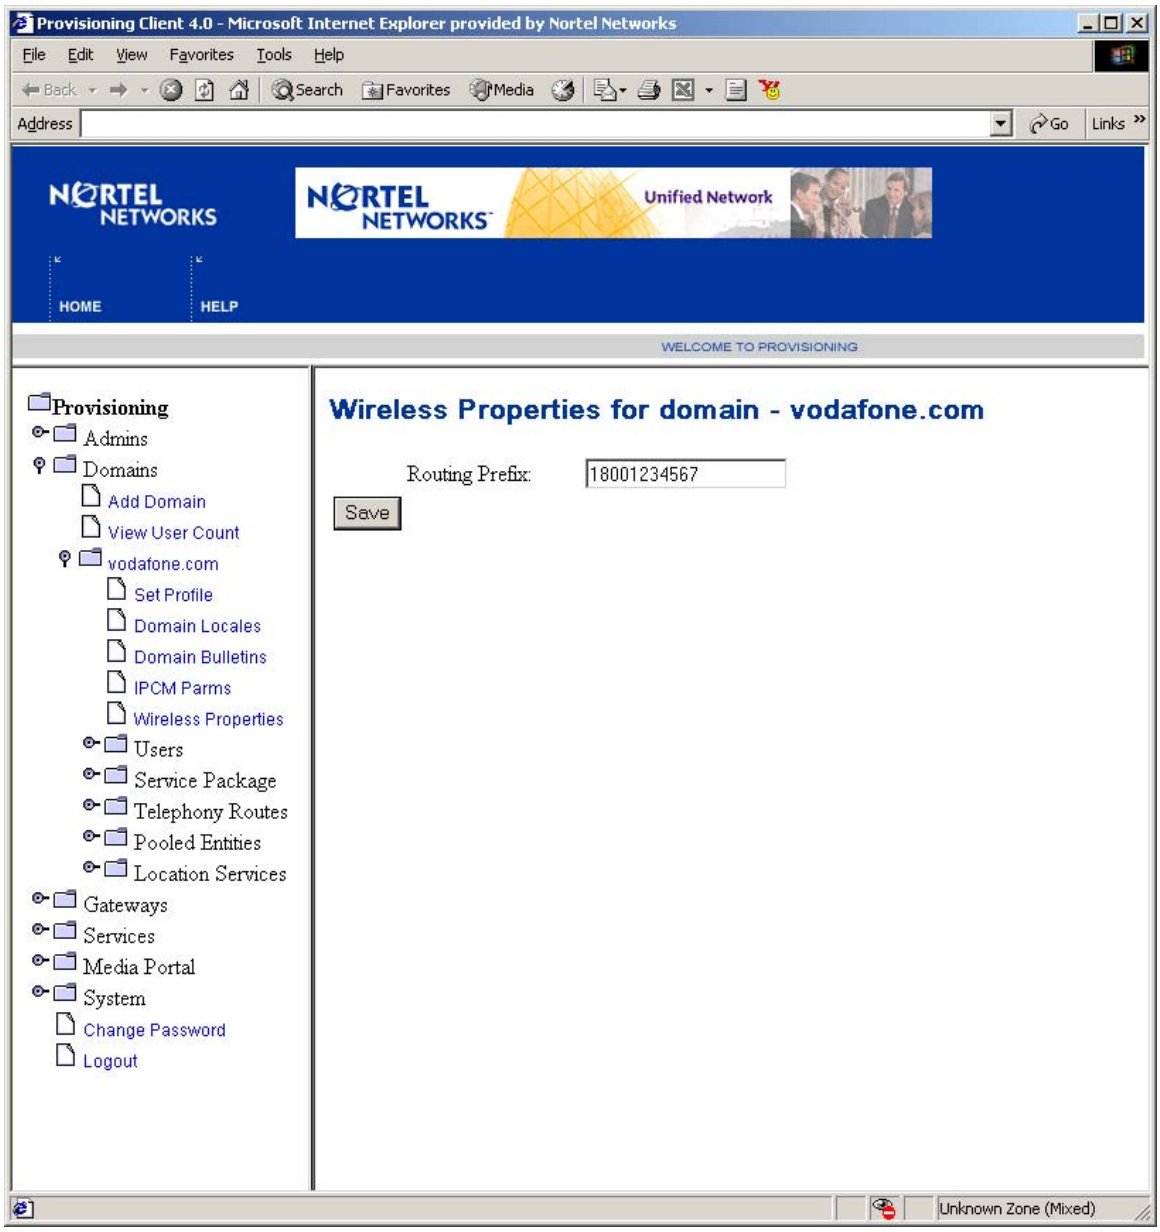
Figure 3 Provisioning DTG2000 as a trusted gateway



27.3.3 Wireless Properties

Wireless properties allow the operator to provision a single routing number that will be used across the MCS for all subscribers. This number will be used to route incoming wireless calls to the appropriate MCS system via the DTG2000. This routing prefix is sent to the MPS during registration. See Figure 4 for an example provisioning screen.

Figure 4 Provisioning the Routing Prefix



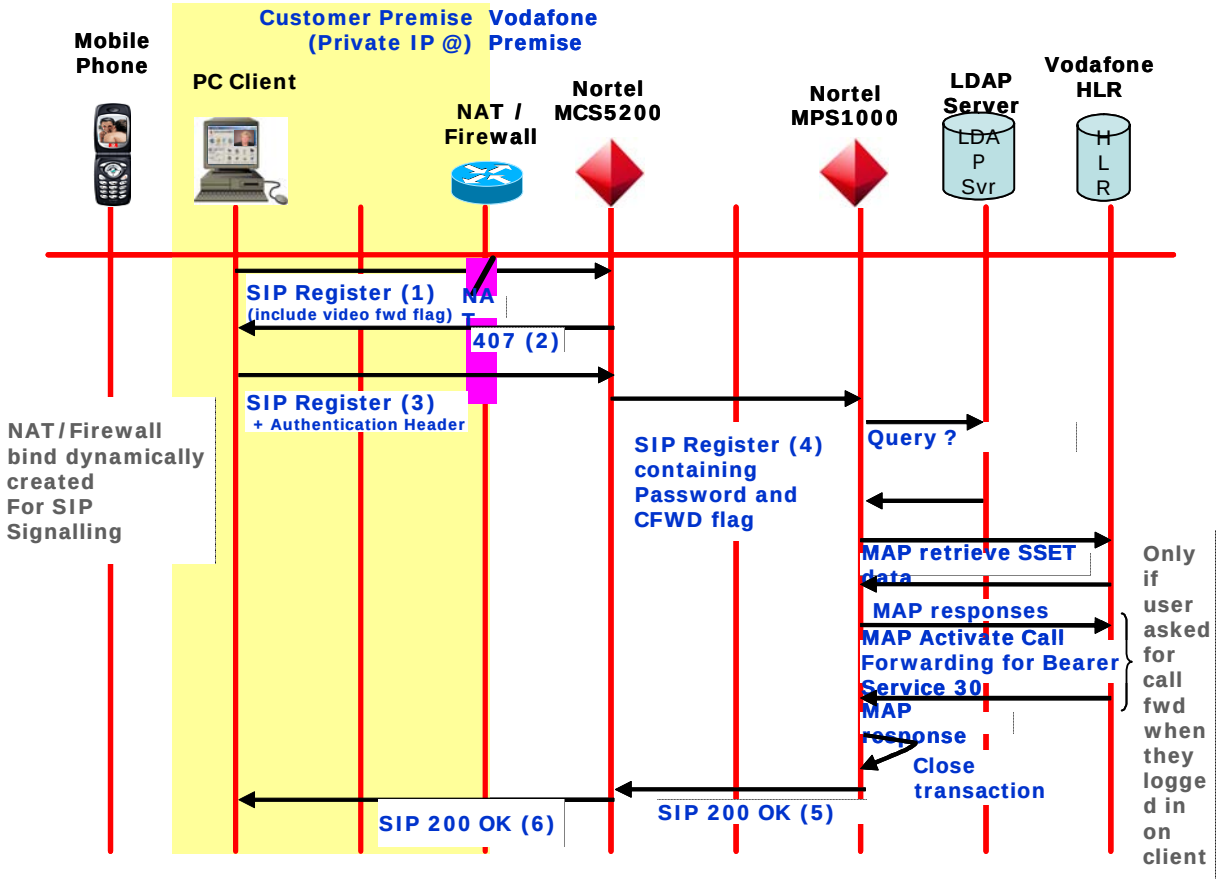
27.3.4 Subscriber Registration Requirements

User registration occurs when a subscriber logs into a client which triggers the client to send a registration message to the MCS. Since these subscribers are dynamic, and not initially provisioned on MCS, the MCS will challenge the subscriber and require proper credentials. After the subscriber supplies credentials, the MCS sends a SIP REGISTER message to the MPS1000 with the subscriber's credentials, routing prefix, and the state of the CFWD checkbox from the MCS PC Client. After doing a successful query, the MCS creates a user account for this subscriber using the user-id supplied by the user.

The MCS also populates the subscriber's record with data received in the 200OK from the MPS1000. This data includes the call barring state, pre-paid or post-paid, called prefix, and call forwarding information for the subscriber. A default service package and locale will be set for all subscribers. The subscriber will be able to only change the locale, but not the service package. See figure 5 for a call flow that describes this requirement.

If the MCS cannot create a dynamic account for any reason, the registration response returned to the subscriber must indication failure to register due to lack of system resources.

Figure 5 Figure 5 Registration Message flow



26.3.5 Registration SIP Messages

The following are examples of registration SIP messages.

```

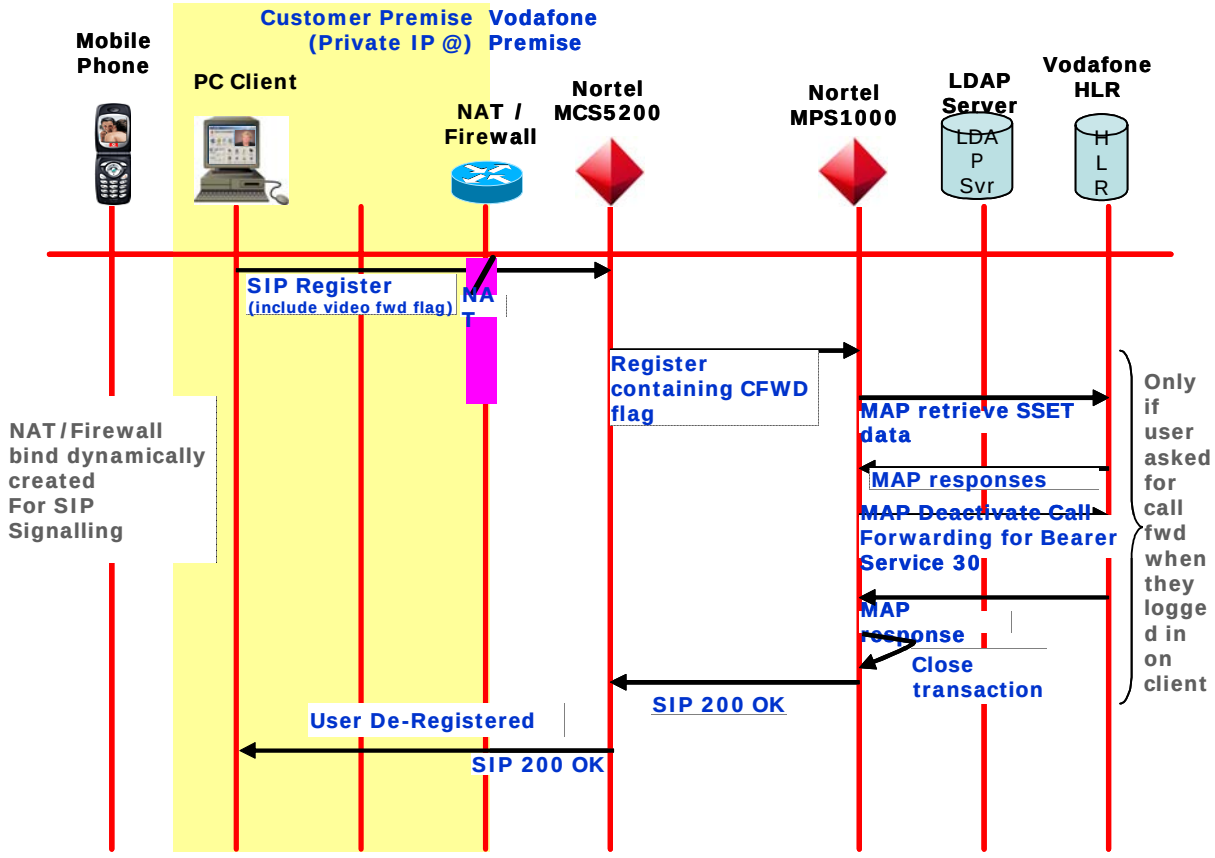
27.3.6 Subscriber De-registration Requirements

When a user logs out of the client or is unreachable, the MCS will de-register the dynamic user by restoring the original CFWD information, if needed, in the HLR and deleting the local subscriber info. Restoring the CFWD information is done by sending a SIP REGISTER with ‘expires=0’ and the original CFWD information to the MPS1000 which will restore the HLR via MAP. This is done only if the subscriber checked the CFWD check box on the MCS PC Client during registration. Once the MPS1000 responds to the MCS will delete the dynamic subscriber and all information related to the user. If the CFWD checkbox was not checked, the MCS will delete the local subscriber info without any interaction with the MPS1000.

An unreachable subscriber is a subscriber that cannot be contacted when an incoming call, SIP INVITE, arrives for the subscriber. There can be several scenarios of when this would occur and these are just a few:

- MCS PC Client crash
- Computer crash
- Loss of network connectivity

Figure 6 De-Registration Call Flow



27.3.7 De-Registration (from MCS to MPS)

The following is an example of a de-registration SIP message.

DE-REGISTRATION (from MCS to MPS)

```

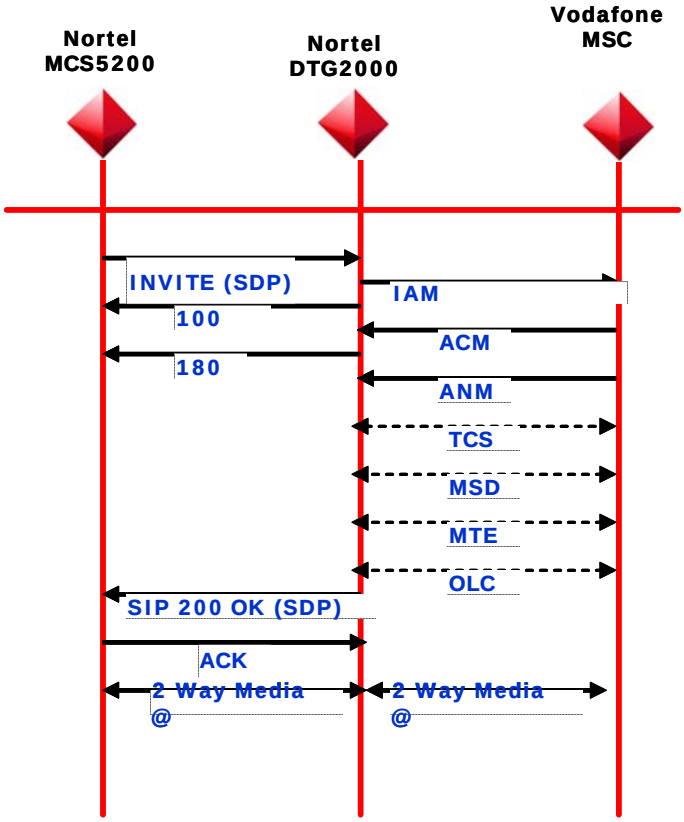
27.3.8 Call Processing Requirements

The MCS routes all calls originating at an MCS PC Client outward to the TDM network, via the Dilithium DTG2000 gateway, towards a mobile operator MSC. As a result, MCS client to MCS client calls “trombone” through an MSC.

The MCS checks the subscriber record of all subscribers placing outbound calls. If their subscriber record indicates that they are in a call barred state, MCS will disallow the call. See figure 8 for an example call flow.

Figure 7 Outbound INVITE Call Flow



When a subscribers make an outgoing call from the MCS PC Client the called number in the request URI should be changed to Called Prefix + called number. The Called Prefix is obtained from the MPS1000 during registration and will be stored with the subscriber data. See the following example of INVITE with the required Called-Prefix.

27.3.9 Outbound SIP INVITE message

REGISTRATION (from MCS to DTG)

The routeing prefix is appended to the subscriber digits in the request URI.

```

27.3.10 MCS PC Client

The MCS PC Client presents a logon screen checkbox option (in the same area as the current “remember my password” and “auto login” options) to allow the subscriber to select video call forwarding for all calls made to the subscriber’s mobile DN, from that DN to their MCS PC Client. Not selecting the checkbox allows subscribers to use both their mobile phone and their MCS PC client at the same time. Logging into the MCS PC Client doesn’t preclude receipt of calls destine for the mobile subscriber.

27.4 Hardware Requirements or Dependencies

This feature introduces two new hardware dependencies that must be deployed along with the MCS5200 Sip Server:

- Perphonics MPS1000
- Dilithium Networks DTG2000
- RTP Media Portal

The MPS1000 provides the MAP and LDAP interface into the 3G Network for registration services.

The DTG2000 is a Transcoding Media Gateway Controller intended for 3G carrier operators. The DTG 2000 supports a variety of voice and video protocols, and performs signaling interworking and transcoding to end-points such as mobile phones, PDAs, ISDN phones, and IP terminals.

The primary function of the RTP Media Portal is to extend the reach of multimedia services so that they are accessible to obscured endpoints, devices residing behind a firewall, or a Network Address Translation (NAT) and/or Network Address Port Translation (NAPT) device.

See the network diagram in figure 1 to see the interfaces for these hardware dependencies.

27.5 Software Requirements or Dependencies

This feature is part of the MCP 9.0 release, the RTP Media portal software loads will be bundled with this release.

This feature requires a MCS PC Client release that aligns with the MCP 9.0 release.

This feature requires the DTG2000 2.0 release.

This feature requires the MPS 2.1, SIP software release CCSS 6.3, and SS7 software release CCSS 6.3 for the MPS1000 component.

27.6 Limitations and restrictions

One default service package is allowed per domain which will only include wireless gateway (for accessing the DTG gateway), video with h.263 enabled and multiple login restrictions.

Multiple normal domains or wireless domains are allowed but a mix of domain types is not supported.

Only supports voice plus video calls.

The DTG2000 only supports a maximum of 5 calls per gateway.

The subscriber will not receive wireless calls if the subscriber forgets to logout of the MCS PC Client.

The following list of services are not supported:

- Multiple MCS PC Client logins not supported.
- Mid-call codec changes are not supported.

- Call Waiting Not supported
- Any collaborative service like File Transfer, White Board etc.
- Any MAS services like Treatment, branding, no unified communication service including voicemail
- MCS hosted Voicemail service
- Instant Messaging
- Presence
- Network Call Logs
- Call Park
- Call Transfer
- Call Forward to another user
- No Personal Agent access and no services from the personal agent like call routing, privacy.
- No CPL access
- No Privacy control

In short just to reiterate, only basic voice and video calls from the Vf PCC are supported.

27.7 Interactions

This feature does not interact with other call services on the MSC5200. Most of the call services will be disabled at the MCS and will be inaccessible from the PC Client.

28: Functional Description (FN): A00009446

28.1 Feature name and Feature ID

A00009446: M2UA/SCTP Protocol for PVG SS7 backhaul support

28.2 Description

This feature implements the M2UA protocol thus providing the USP with the ability to backhaul MTP3 message, allowing the termination of MTP2 or SAAL on a remote node.

The USP always acts as the client with respect to SCTP associations and use SCTP port 2904. The USP implements the ASP portion of the M2UA while the PVG supports the SG portion.

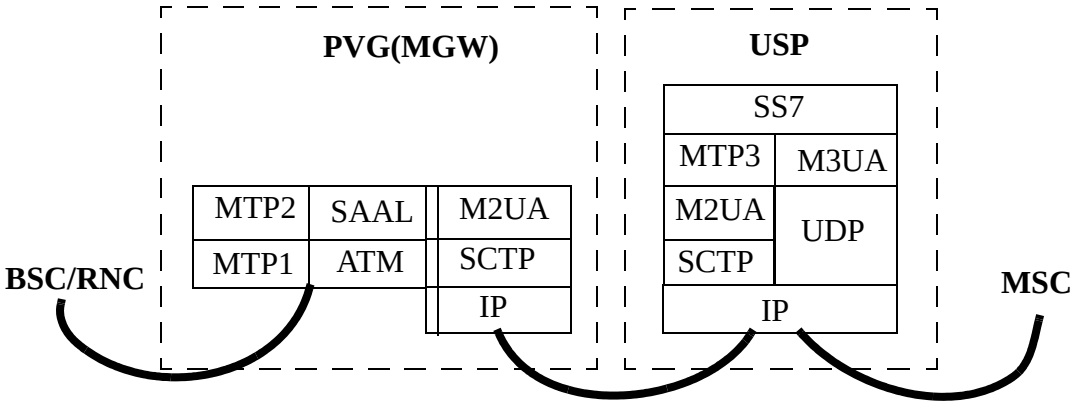
For the requirement, please refer to [2].

28.3 Support M2UA in USP

28.3.1 Functional overview

Broadband SS7 (MTP3b/SAAL/ATM) is the signaling transport used on the UMTS Iu interface, Iu-RANAP from the UTRAN is backhauled to the MSC over IP. The MGW provides the interworking function between bbSS7 and SIGTRAN over IP. The SG/USP accepts the SIGTRAN interface from the MGW and converts it to the proprietary interface required by the MSC.

In addition to the requirement for bbSS7 backhaul, narrowband SS7 (MTP3/ MTP2/MTP1) backhaul over IP is also applicable. Narrowband SS7 is used for control signaling on the GSM A interface and ISUP signaling on the PSTN interfaces. Narrowband SS7 is carried over IP in much the same way as bbSS7. MTP2 is terminated on the MGW and transported over M2UA/SCTP/IP to MSC. The enables the MTP2 physical interface to be geographically separated from the MTP3 layer running on the USP.



28.3.2 Function provided by the M2UA Adaptation Layer

28.3.2.1 Mapping

Interface Identifier (IID) is used to tie the SCTP association/stream with the SS7 physical link in the SGP (PVG/MGW). When an ASP (USP) sends an ASP Active message for a particular IID, the SGP will try to provide the Signalling Link Terminal service to an SS7 link tied by the IID.

28.3.2.2 Support for the management of SCTP associations

The M2UA layer may be instructed by local management (LM) to establish an SCTP association to a peer M2UA node. This can be achieved using the MSCTP_ESTABLISH primitive to request, indicate and confirm the etablishment of an SCTP association with a peer M2UA node.

The M2UA layer MAY also need to inform local management of the status of the underlying SCTP associations using the M-SCTP_STATUS request and the indication primitive.

28.3.2.3 SCTP Stream Management

M2UA requires a stream for each ss7 link provisioned. The M2UA layer residing on a card can handle maximum 32 ss7 links. Each association (determined by far-endpoint ip address, local and remote port) can have up to

8 traffic streams and one more stream for management - stream '0' is reserved for ASP Management (ASPM) messages.

The SS7IPLink running M2UA can handle approx 1792 messages/sec at 80% capacity or 2300 messages/sec in overload regardless of message size. The bandwidth of 1792 messages/sec per card is shared among the M2UA links provisioned on that card.

28.3.3 M2UA Message Structure

28.3.3.1 Common Message Header

Table 1 Common Message Header for M2UA

0	1	2	3
0 1 2 3 4 5 6 7	0 1 2 3 4 5 6 7	0 1 2 3 4 5 6 7	0 1 2 3 4 5 6 7
Version	Spare	Message Class	Message Type
Message Length			

Table 2: Message Class List

Value	Description
0	Management (MGMT) Message
3	ASP State Maintenance (ASPSM) Messages
4	ASP Traffic Maintenance (ASPTM) Messages
6	MTP2 User Adaptation (MAUP) Messages

Table 3: Message Type List

Message Class	Value	Description	Notes
0	0	Error (ERR)	
	1	Notify (NTFY)	

Message Class	Value	Description	Notes
3	1	ASP Up (UP)	
	2	ASP Down (DOWN)

28.3.3.2 M2UA Message Header

For MAUP messages, there is a M2UA specific message header immediately follow the common message header. The format like the below.

Table 4 MAUP Specific Message Header

0	1	2	3
0 1 2 3 4 5 6 7	0 1 2 3 4 5 6 7	0 1 2 3 4 5 6 7	0 1 2 3 4 5 6 7
Tag (0x01)		Length (=8)	
Interface Identifier			

28.3.3.3 Parameters

M2UA messages consist of a Common Header followed by zero or more variable-length parameters, as defined by the message type. The variable-length parameters contained in a message are defined in a Tag-Length-Value format.

The common parameter tags (can be used by all User Adaptation layers) is supported as below.

Table 5: Common Parameters Tags

Value	Description	Notes
1	Interface Identifier (Integer)	
3	Interface Identifier (Text)	Not supported
4	Info String	Not supported
7	Diagnostic Information	Not supported
8	Interface Identifier (Integer Range)	Not supported
9	Heartbeat Data	
11	Traffic Mode Type	
12	Error Code	
13	Status Type/Information	
17	ASP Identifier	

Value	Description	Notes
19	Correlation Id	Not supported

Besides the common parameters, there are M2UA specific parameters.

Table 6: M2UA Specific Parameters Tags

Value	Description	Notes
768	Protocol Data 1	
769	Protocol Data 2 (TTC)	Not supported
770	State Request	
771	State Event	
772	Congestion Status	
773	Discard Status	Not supported

28.3.5 Messages Contents

28.3.5.1 MAUP - Data (PDU of MTP3)

0	1	2	3
0 1 2 3 4 5 6 7	0 1 2 3 4 5 6 7	0 1 2 3 4 5 6 7	0 1 2 3 4 5 6 7
Tag (0x300)		Length (=8)	
Protocol Data			
Tag (0x13)		Length (=8)	
Correlation ID (optional)			

The purpose of Correlation ID is to permit the newly active ASP to synchronize its processing of the traffic in each ordered stream with other ASPs in the broadcast group. It’s optional and not supported by the feature.

TTC protocol data is not supported.

28.3.5.2 MAUP - Establish (Request, Confirm)

No specific parameters except for the Common Message Header.

28.3.5.3 MAUP - Release (Request, Confirm, Indication)

No specific parameters except for the Common Message Header.

28.3.5.4 MAUP - State (Request, Confirm)

0	1	2	3
0 1 2 3 4 5 6 7	0 1 2 3 4 5 6 7	0 1 2 3 4 5 6 7	0 1 2 3 4 5 6 7
Tag (0x302)		Length (=8)	
State			

State is Mandatory IE, the valid values for it are shown below.

Value	Define	Note
0x0	STATUS_LPO_SET	
0x1	STATUS_LPO_CLEAR	
0x2	STATUS_EMER_SET	
0x3	STATUS_EMER_CLEAR	
0x4	STATUS_FLUSH_BUFFERS	

0x5	STATUS_CONTINUE	
0x6	STATUS_CLEAR_RTB	
0x7	STATUS_AUDIT	
0x8	STATUS_CONG_CLEAR	
0x9	STATUS_CONG_ACCEPT	
0xa	STATUS_CONG_DISCARD	

28.3.5.5 MAUP - State Indication

0	1	2	3
0 1 2 3 4 5 6 7	0 1 2 3 4 5 6 7	0 1 2 3 4 5 6 7	0 1 2 3 4 5 6 7
Tag (0x302)		Length (=8)	
Event			

Event is Mandatory IE, the valid values for it are shown below.

Value	Define	Note
0x1	EVENT_RPO_ENTER	
0x2	EVENT_RPO_EXIT	
0x3	EVENT_LPO_ENTER	
0x4	EVENT_LPO_EXIT	

28.3.5.6 MAUP - Retrieval Request

0	1	2	3
0 1 2 3 4 5 6 7	0 1 2 3 4 5 6 7	0 1 2 3 4 5 6 7	0 1 2 3 4 5 6 7
Tag (0x306)		Length (=8)	
Action (Mandatory)			
Tag (0x307)		Length (=8)	
Sequence Number (Optional)			

The valid values for Action are shown below.

Value	Define	Note
0x1	ACTION_RTRV_BSN	
0x2	ACTION_RTRV_MSGS	

28.3.5.7 MAUP - Retrieval Confirm

0	1	2	3
0 1 2 3 4 5 6 7	0 1 2 3 4 5 6 7	0 1 2 3 4 5 6 7	0 1 2 3 4 5 6 7
Tag (0x306)		Length (=8)	
Action (Mandatory)			
Tag (0x308)		Length (=8)	
Result (Mandatory)			
Tag (0x307)		Length (=8)	
Sequence Number (Optional)			

The valid values for Result are shown below.

Value	Define	Note
0x1	RESULT_SUCCESS	
0x2	RESULT_FAILURE	

28.3.5.8 MAUP - Retrieve Indication

0	1	2	3
0 1 2 3 4 5 6 7	0 1 2 3 4 5 6 7	0 1 2 3 4 5 6 7	0 1 2 3 4 5 6 7
Tag (0x300)		Length (=8)	
Protocol Data			

The Retrieval Indication message is sent by the Signalling Gateway with a PDU from the transmit or retransmit queue. The Retrieval Indication message does not contain the Action or Sequence Number fields, just a MTP3 Protocol Data Unit (PDU) from the transmit or retransmit queue.

28.3.5.9 MAUP - Retrieve Complete Indication

The MTP2 Retrieval Complete Indication message is exactly the same as the MTP2 Retrieval Indication message except that it also indicates that retrieval is complete. In addition, it MAY contain a PDU (which MUST be the last PDU) from the transmit or retransmit queue.

28.3.5.10 MAUP - Congestion Indication

The Congestion Indication message can be sent from a Signalling Gateway Process to an ASP to indicate the congestion status and discard status of a SS7 link.

0	1	2	3
0 1 2 3 4 5 6 7	0 1 2 3 4 5 6 7	0 1 2 3 4 5 6 7	0 1 2 3 4 5 6 7
Tag (0x304)		Length (=8)	
Congestion Status (Mandatory)			
Tag (0x308)		Length (=8)	
Discard Status (Optional)			

For the Congestion Status, there are the following values can be selected.

Value	Define	Note
0x0	LEVEL_NONE	
0x1	LEVEL_1	Not supported
0x2	LEVEL_2	Not supported
0x3	LEVEL_3	

28.3.5.11 ASPM - ASP UP

0	1	2	3
0 1 2 3 4 5 6 7	0 1 2 3 4 5 6 7	0 1 2 3 4 5 6 7	0 1 2 3 4 5 6 7
Tag (0x11)		Length (=8)	
ASP Idenfifier (optional)			
Tag (0x4)		Length (=8)	
Info String (optional)			

The optional ASP Identifier parameter would contain a unique value that is locally significant among the ASPs that support an AS. The SGP should save the ASP Identifier to be used, if necessary, with the Notify message.

28.3.5.12 ASPM - ASP UP Ack

0	1	2	3
0 1 2 3 4 5 6 7	0 1 2 3 4 5 6 7	0 1 2 3 4 5 6 7	0 1 2 3 4 5 6 7
Tag (0x4)		Length (=8)	
Info String (optional)			

28.3.5.13 ASPM - ASP Down

0	1	2	3
0 1 2 3 4 5 6 7	0 1 2 3 4 5 6 7	0 1 2 3 4 5 6 7	0 1 2 3 4 5 6 7
Tag (0x4)		Length (=8)	
Info String (optional)			

28.3.5.14 ASPM - ASP Down Ack

0	1	2	3
0 1 2 3 4 5 6 7	0 1 2 3 4 5 6 7	0 1 2 3 4 5 6 7	0 1 2 3 4 5 6 7
Tag (0x4)		Length (=8)	
Info String (optional)			

28.3.5.15 ASPM - ASP Active (Ack)

0	1	2	3
0 1 2 3 4 5 6 7	0 1 2 3 4 5 6 7	0 1 2 3 4 5 6 7	0 1 2 3 4 5 6 7
Tag (0xb)		Length (=8)	
Traffic Mode Type (Optional)			
Tag (0x1, 0x8)		Length (=8)	
Interface Identifier(s) (Optional)			
Interface Identifier Start1			
Interface Identifier End1			
.....			
Interface Identifier StartN			
Interface Identifier EndN			
Tag (0x4)		Length (=8)	
Info String (Optional)			

28.3.5.16 ASPM - ASP Inactive (Ack)

The same format as ASP Active.

28.3.5.17 MGMT - ERR

0	1	2	3
0 1 2 3 4 5 6 7	0 1 2 3 4 5 6 7	0 1 2 3 4 5 6 7	0 1 2 3 4 5 6 7
Tag (0xc)		Length (=8)	
Error Code (Mandatory)			
Tag (0x1,0x8)		Length (=8)	
Interface Identifier(s) (optional)			
Tag (0x7)		Length (=8)	
Diagnostic Information (optional)			

The Error (ERR) message is used to notify a peer of an error event associated with an incoming message. An Error message MUST not be generated in response to other Error messages.

The valid values for Error Code are shown below.

Value	Define	Note
0x1	Invalid Version	
0x2	Invalid Interface Identifier	
0x3	Unsupported Message Class	
0x4	Unsupported Message Type	
0x5	Unsupported Traffic Handling Mode	
0x6	Unexpected Message

28.6 Provisioning

28.6.1 Provisioning - CLI interface

CMD: mtp link add <linkset-name> <slc> ss7iplink <shelf> <slot> <periodic-slt-option> <dest-ipaddr> <local-port> <remote-port> { m2ua client <sctp-

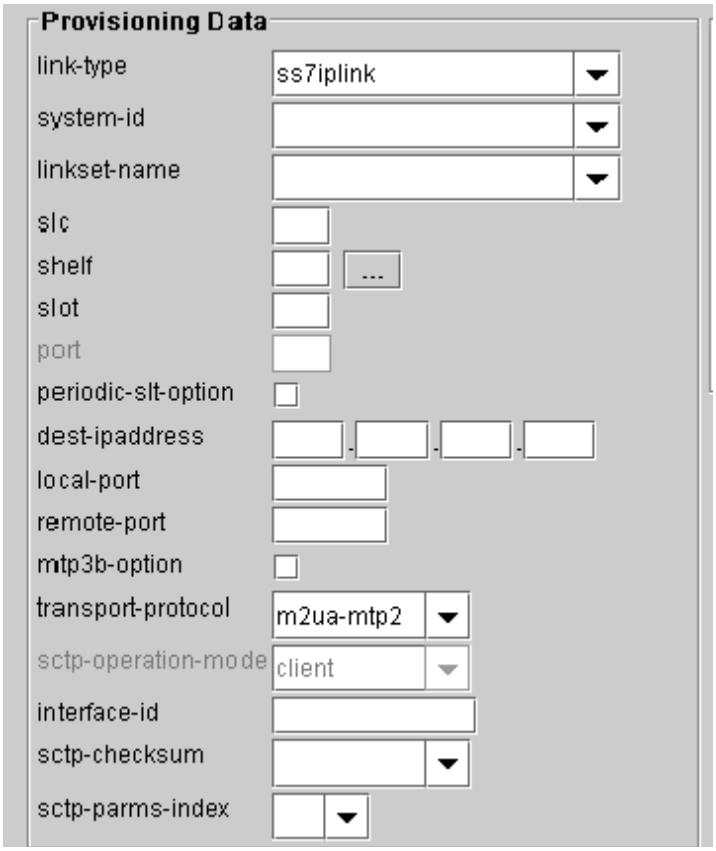
checksum> <sctp-parm-index> | m2ua <interface-id> <sctp-checksum> <sctp-parm-index> }

CMD: mtp link mod <linkset-name> <slc> ss7iplink interface-id <interface-id>

CMD: mtp link mod <linkset-name> <slc> ss7iplink transport-protocol { m2ua client <sctp-checksum> | m2ua <interface-id> <sctp-checksum> }

CMD: mtp link show <linkset-name> <slc>

28.6.2 GUI



Some fileds are needed to be noticed when protocol M2UA is selected.

Field Name	Value	Description
transport-protocol	m2ua-mtp2/ m2ua-saal	select different value depending on the far-end l2 type in the PVG/MGC
local-port	2904	2904 is dedicated for M2UA

remote-port	2904	2904 is dedicated for M2UA

28.7 Hardware Requirements or Dependencies

N/A

28.8 Software Requirements or Dependencies

N/A

28.9 Limitations and restrictions

1. USP can only be configured as SCTP Client

2. The M2UA layer supports a n+k redundancy model(active-standby, load sharing, broadcast) where n is the minimum number of redundant ASPs required to handle traffic and k ASPs are available to take over for a failed or unavailable ASP. A simplex 1+0 model is also supported as a subset, with no ASP redundancy is supported by the feature. (ASP identifier <-> number of ASP, link(set) <-> ASP), (send it PVG team)

3. Registration procedure is not supported by the feature.

28.10 Interactions

N/A

28.11 Glossary

29: Functional Description (FN): A00009489

29.1 Feature name and Feature ID

A00009489 - CHT: Call Waiting Enhancement

29.2 Description

This ISN09 activity enhances the CEPT Call Waiting for CS2Kc IP platform. Only IBN lines and TW ISUP, TW PRI are supported.

The feature is to enhance the existing CEPT Call Waiting in the aspects as below:

- To support generating the second Call Waiting Tone B for both parties during Call Waiting scenario.
- To support answer the call and toggle between held parties by hook-flash only, no need to enter any digit right after hook-flash.

29.2.1 Call Waiting Scenario

The feature supports the following scenario.

Assume that subscriber A with ICWT option is talking with subscriber B, when a new call to subscriber A comes from subscriber C. The call waiting operation with the implementation of the feature shall be as follows:

a) Subscriber C shall receive a ring back tone.

b) Subscriber A shall receive Call Waiting Tone A.

After 2 seconds (which can be datafilled in CWT_TONE_CYCLE_TIME tuple of table OFCVAR), Call Waiting Tone B shall then be sent periodically to both talking subscribers A and B until A answers the new call.

c) Subscriber A may answer the new call by flashing the cradle hook of his telephone set; the previous talking path connection is still held.

d) Subscriber B shall receive a SILENCE Tone if he continues to hold his telephone off hook.

e) Flashing action by turns shall cause the change over of talking path to subscriber B or subscriber C as desired.

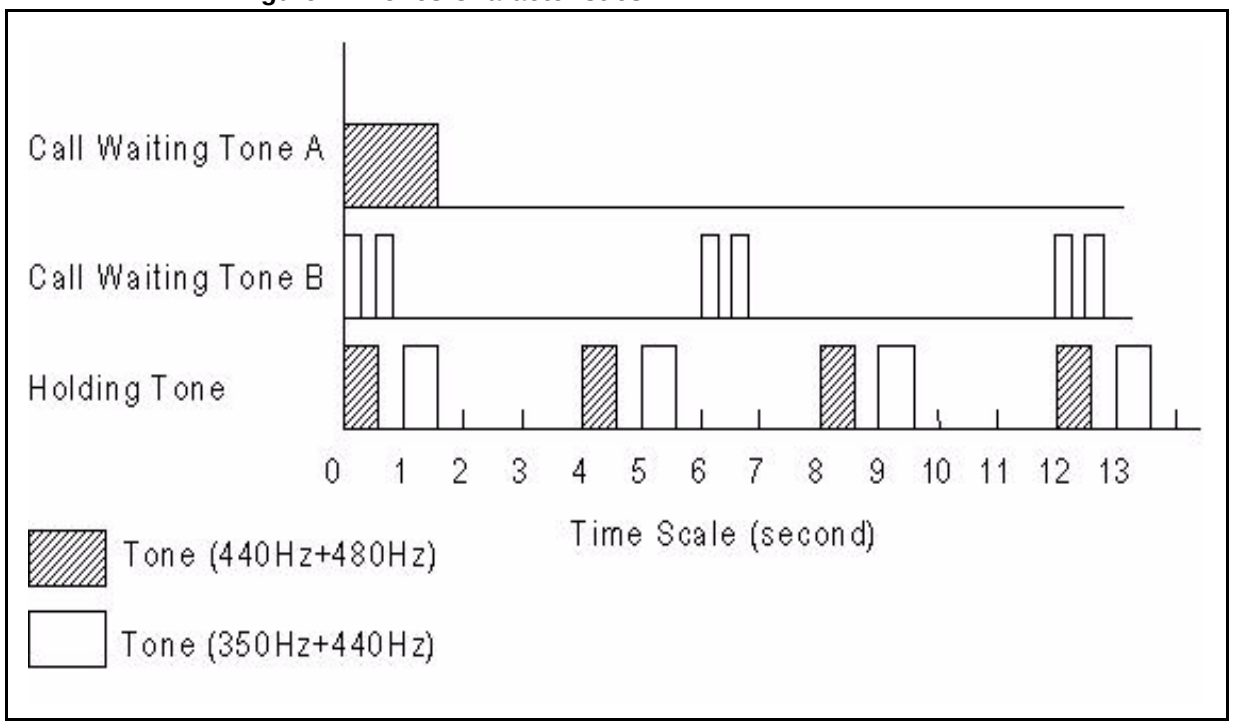
f) When subscriber B or C hangs up, another terminating call shall be able to reach subscriber A, and the call waiting action proceeds as before.

29.2.2 TONES CHARACTERISTICS

Table 17: Tones Characteristics

Tones	Frequency	Level(dBm0)	Cadence ON-1	Cadence OFF-1	Cadence ON-2	Cadence OFF-2	Duration
Call Waiting Tone A	440+480	-13	One pulse ON				1.5 sec
Call Waiting Tone B	350+440	-13	0.25 sec	0.25 sec	0.25 sec	5.25 sec	INFI-NITE

Figure 1 Tones Characteristics



29.2.3 Example of ISERVOPT table datafill

When ICWT_2PTY_TONE_B is changed from ‘N’ to ‘Y’, a warning message will be displayed: ‘* WARNNING * - If icwt_2pty_tone_b is datafilled YES, field icwt_ignore_waiting_tmo will be disabled.’.

When ICWT_DFLT_RCODE is changed from ‘N’ to ‘Y’, a warning message will be displayed: ‘ If icwt_dflt_rcode is datafilled YES, only TOGGLE ACTION is supported, and Rcode tuple with toggle action in table ISERVOPT should be datafilled.’.

Figure 2 The view of ICWT Tuple in ISERVOPT Table

```
TABLE: ISERVOPT

* WARNNING * -
If icwt_2pty_tone_b is datafilled YES,
field icwt_ignore_waiting_tmo will be disabled.
* WARNNING * -
If icwt_dflt_rcode is datafilled YES,
only TOGGLE ACTION is supported, and Rcode tuple with
toggle action in table ISERVOPT should be datafilled.
TUPLE TO BE ADDED:
                ICWT
                                        ICWT 11 Y Y BUSY Y Y
ENTER Y TO CONFIRM, N TO REJECT OR E TO EDIT.
...
```

29.3 Hardware Requirements or Dependencies

Table 18: Signals should be supported in Media Gateways

	Call Waiting Tone A	Call Waiting Tone B
MGCP	L/wt1	L/wt2

	Call Waiting Tone A	Call Waiting Tone B
Megaco/H.248	alert/cw{pattern=1}	alert/cw{pattern=2}

VG201, MG1K and PVG should support Taiwan Tonesets including the signal above. While Call Waiting Tone B is OFF, speech path should NOT be killed by VG201, MG1K and PVG.

29.4 Software Requirements or Dependencies

This feature does not affect the provision method of CEPT ICWT. It takes effect when the subscriber is using CEPT ICWT and it is controlled by following datafill:

- In table OFCVAR, tuple CWT_TONE_CYCLE_TIME should be set to 2, which is the inteval between the begining of CWT tone A and CWT tone B.

- In table ISERVOPT, tuple ICWT, the ICWT_2PTY_TONE_B field. If datafilled ‘Y’, Call Waiting Tone B will be applied to both talking side infinitely after applying Call Waiting Tone A to the controller and field icwt_ignore_waiting_tmo will be disabled.

- In table ISERVOPT, tuple ICWT, the ICWT_DFLT_RCODE field. If datafilled ‘Y’, R-code is not needed while toggling between held parties. The RCODE tuple in table ISERVOPT must exist and the ACTION “TOGGLE” must be datafilled. If not , a nack tone will be given when flash and after the tone is over, the call will revert to the former state before flash.

Please refer to the software requirements or dependencies part of References b,c for more details.

29.5 Limitations and restrictions

Please refer to References b,c.

29.6 Interactions

Please refer to References b,c.

c. A59019281 - CEPT I3WC and ICT

29.9 Appendix: Q01097743 FN (I3WC Default Rcode)

CR.Q01097743: ISN09, ICWT&I3WC Enhancement, I3WC default RCODE.

The CR is to enhance the existing CEPT International Three Way Calling in the aspects as below:

- To support using hook-flash only without dialing RCODE in I3WC scenario.

29.9.1 I3WC Scenario

This feature supports following scenario:

Assume that line A has the I3WC feature. A is talking with B, and then A flashes to calls C to make a three way call. The scenario with the implementation of this feature will be described as follows:

a) If C is busy, A will hear a busy tone. Then A can flash and resume the two parties connect with B.

b) If C is not busy and answers the call from A, the active parties are A and C and B is the holding party. If A flashes, **without dialing RCODE**, a three way conference is established. A is the controller.

c) In 3-way conference state, if A flashes, **without dialing RCODE**, party C is disconnected, A and B are still in talking mode.

d) In 3-way conference state, if B or C goes on hook, then A will be connected to the remaining 3wc party. That means if B disconnect, A will be connected to C and A can make another conference call by hook-flash.

e) In 3-way conference state, if the controller A goes on hook, then the conference call is over. i.e. all calls drop.

To implement the above requirement needs supporting I3WC without dialing RCODE.

29.9.2 Support I3WC Without Dialing RCODE

A new tuple I3WC with field I3WC_DFLT_RCODE(Y/N) will be defined in table ISERVOPT. When the I3WC_DFLT_RCODE is ‘N’, the existing behavior will be used. When the I3WC_DFLT_RCODE is set to ‘Y’, the scenario described above will be used. The default value for the field is ‘N’.

When I3WC_DFLT_RCODE is changed from ‘N’ to ‘Y’, two warning messages will be displayed: ‘RCODE tuple in table ISERVOPT must exist and the ACTION CON_3WC and DISC_ACT must be datafilled.’ and ‘Default RCODE only supports CON_3WC and DISC_ACT actions.’

Figure 3 :Example of ISERVOPT table datafill

```
TABLE: ISERVOPT
>add
MACHINES NOT IN SYNC - DMOS NOT ALLOWED
JOURNAL FILE UNAVAILABLE - DMOS NOT ALLOWED
ENTER Y TO CONTINUE PROCESSING OR N TO QUIT
>y
SOPTSKEY:
>I3WC
OPTION:
>I3WC
I3WC_DFLT_RCODE:
>y
TUPLE TO BE ADDED:
I3WC I3WC Y

ENTER Y TO CONFIRM, N TO REJECT OR E TO EDIT.
>y
* WARNNING * - RCODE tuple in table ISERVOPT must exist and the
ACTION CON_3WC and DISC_ACT must be datafilled.
* WARNNING * - Default RCODE only supports CON_3WC and
DISC_ACT actions.
TUPLE ADDED
```

Notes: the interaction between I3WC, ICWT, I6WC and ICT features will change accordingly.

- Assume that subscriber A with ICWT option is talking with subscriber B, when a new call to subscriber A comes from subscriber C. In this case, the ICWT feature has the highest priority. That means when A flashes, the default flash action is toggle if icwt_dflt_rcode datafill Y even the I3WC or I6WC or ICT feature exist on the line A.
- If not in the ICWT case described above , the I6WC feature has the highest priority. Suppose ICWT, I6WC, I3WC and ICT exist on the line at the same time but not in ICWT scenario, due to we don't disable the Rcode for I6WC, after flashing, we need dialing rcode to select the action we want. Everything seems like before, but if we select establish 3-way call, and after we enter the 3-way call scenario, whether we need rcode in 3-way call is decided by i3wc_dflt_rcode datafill.
- If not in the ICWT case and line A has not I6WC feature, the I3WC feature will take the highest priority. Suppose ICWT, I3WC and ICT exist on the line at the same time but not in ICWT scenario, after flashing, if i3wc_dflt_rcode datafilled Y, we don't need Rcode to setup the 3-way call and don't need Rcode to disconnect party C as well.

- If not in the ICWT case and line A has not I6WC and I3WC feature, the ICT feature will take effect. In this case, Rcode is needed.

29.9.3 Software Requirements or Dependencies

This feature does not affect the provision method of CEPT I3WC. It takes effect when the subscriber is using CEPT I3WC and it is controlled by following datafill:

- In table ISERVOPT, tuple I3WC, the I3WC_DFLT_RCODE field. If datafilled ‘Y’, R-code is not needed in I3WC scenario. The RCODE tuple in table ISERVOPT must exist and the ACTION “CON_3WC” and “DISC_ACT” must be datafilled. If not , a nack tone will be given when flash and after the tone is over, the call will revert to the former state before flash.

30: Functional Description (FN): A00010168

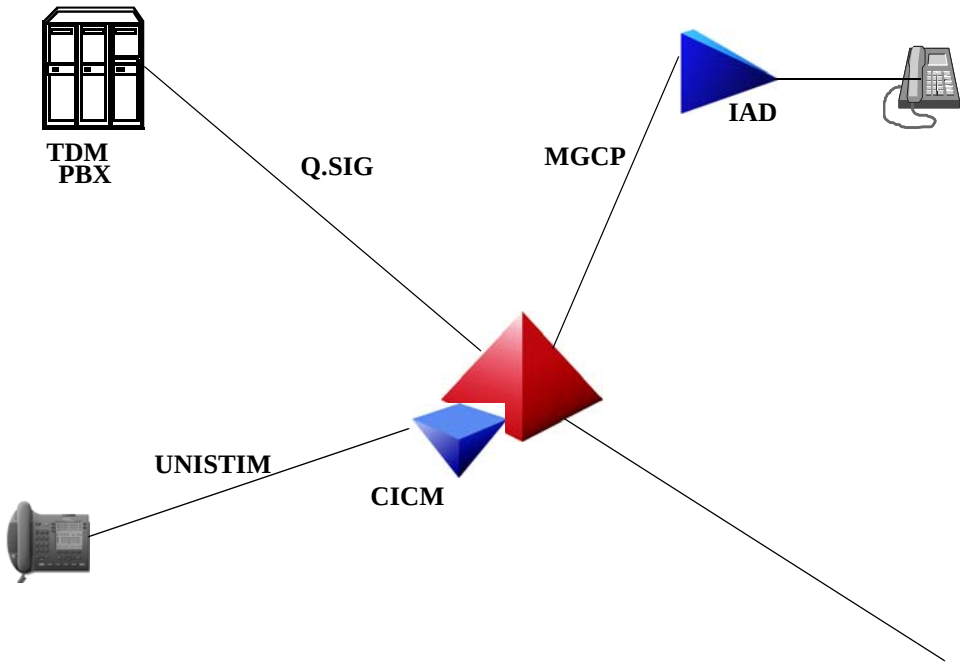
30.1 Feature name and Feature ID

A00010168: H.323 support for COnnected Line Presentation/COnnected Line Restriction (COLP/COLR)

30.2 Description

This feature is to support COLP/COLR on International H.323 Gateways.
In the context of H.323, QSIG (Q-reference point SIGnalling) is a private (i.e. corporate) network signaling protocol for communication between ISDN Private BranchExchanges (PBX). In respect to H.323 GWs Q.SIG will be used between H.323 and the core. COLP/COLR are existing QSIG functionalities. No new COLP/COLR capabilities are introduced by this feature.
Please refer to ìFigure 1 COLP/COLR Supplementary Servicesî on page 30.

Figure 1: Agent Interworkings over which COLP/COLR Mapping will be supported



2.2.1 COnnected Line Identification Presentation

COnnected Line Identification Presentation (COLP) supplementary service (SS) provides the calling party with the possibility to receive the connected users number.

COLP has the following functionalities:

Provides the calling user with the connected number (CNN).

The CNN IE is provided in the CONNECT message.

The service is provided on a per trunk-group basis, datafilled in table LTDATA.

When the COLP SS is activated, the Connected Party Subaddress Information Element (CNS IE), if provided by the connected user is included in the CONNECT message if COLR is not activated.

For a Private call provisioning is not required for the presentation of the CNN or the CNS IEsí. Whenever a CNN IE and CNS IE are received they are transparently passed on.

Supposing no information is provided by the connected user, the network provides the Default Number associated with the connected user. The DFLTCNN option in table LTDATA stores the Default Connected Number for the terminating side. If this is not datafilled then no digits are sent across to the originating side.

If the Presentation number is datafilled, then COLP enables the originator to receive the connected presentation number.
If NOSCRN option is datafilled, then the COLP enables the originator to receive the unscreened connected number.

For a call originated by a QSIG trunk which does not have COLP datafilled in table LTDATA, the COLP SS is not supported. To invoke the COLP SS, the originating QSIG trunk must be defined with the COLP option in table LTDATA. Please refer to ìTable 1 Sample Datafill for COLP in Table LTDATAon page 31.

Table 1 Sample Datafill for COLP in Table LTDATA

LTDKEY LTDRSLT
ISDN 4 SERV SERV N N ALWAYS ALWAYS **COLP**

Default Connected Number :
In case, the COLP SS is activated for the originator QSIG trunk and no information (CNN IE) is provided by the connected user or the information provided is invalid, the network provides the DeFauLT CoNnected Number (DFLTCNN) associated with the connected userís QSIG access in the destination local network. The default connected number is obtained from the DFLTCNN option in table LTDATA associated with the terminating QSIG trunk. The maximum number of connected number digits is 15.

Please refer to Table 2 Sample Datafill for Default Connected Number in Table LTDATA on page 32.

Table 2 Sample Datafill for Default Connected Number in Table LTDATA

LTDKEY LTDRSLT
ISDN 4 SERV SERV N N ALWAYS ALWAYS **DFLTCNN 6966970**

2.2.3 COnnected Line Identification Restriction

COnnected Line Identification Restriction (COLR) supplementary service (SS) enables the connected party to prevent presentation of its number to the calling party.

COLR has the following functionalities:

ï The COLR SS is offered at the terminating end.

ï It prevents the presentation of the connected number (CNN).

ï The service is provided on a per trunk-group basis. For COLR temporary, the default value (allowed/restricted) can be overwritten on a per call basis.

ï It prevents the presentation of the Connected Party Subaddress (CNS).

ï The COLR SS is offered by a permanent mode (PERM), or by a temporary mode (TEMP):

PERM mode: The COLR SS is invoked automatically by the network on all calls. If the calling party has subscribed to COLP SS, and the COLR SS datafilled as PERM RESTRICT is invoked and the valid CNN IE is sent from the terminating side, then the calling party receives the Connected Number IE with the indication of ìpresentation restrictedî and the digits not included.

TEMP mode: The COLR SS is invoked on a per call basis. This means that one of the following scenarios occurs, according to the default value set in the network:

a. If the Presentation Indicator (PI) value is supplied into the Connected Number Information Element (CNN IE), then the PI remains as received from the connected user.

b. If the PI value is not supplied into the Connected Number IE, the presentation indicator is set according to the COLR TEMP sub option that could be Allow or Restrict.

Please refer to Table 6 Sample Datafill for COLR: Table LTDATA on page 39.

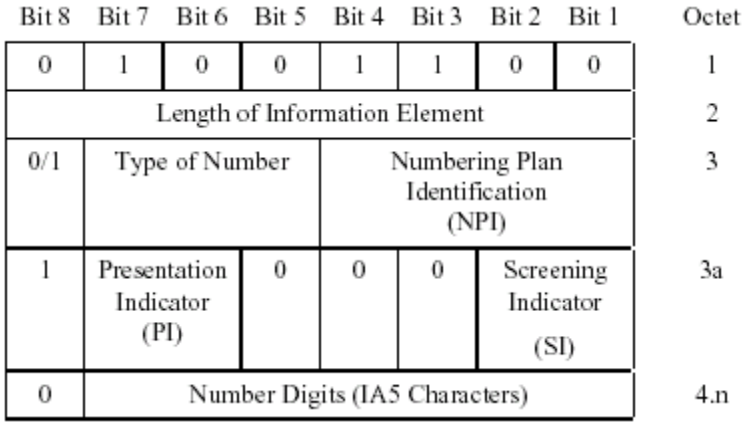
Table 6 Sample Datafill for COLR: Table LTDATA

LTDKEY LTDRSLT
ISDN 3 SERV SERV N N ALWAYS ALWAYS **COLR TEMP ALLOW**
ISDN 3 SERV SERV N N ALWAYS ALWAYS **COLR PERM RESTRICT**
ISDN 3 SERV SERV N N ALWAYS ALWAYS **COLR TEMP RESTRICT**

2.2.4 Values supported for SI, PI, TON, NPI in CNN IE

The connected number information is contained in the optional connected number information element (CNN IE) of the Q.931 connect message. The CNN IE is coded as shown in fig. 6. Please observe that octet 3 can have 0 or 1 value depending upon the usage. The maximum length of this information element is 24 octets. Please refer to ìFigure 5 Connected Number Information Element (CNN IE)î on page 41.

Figure 5 Connected Number Information Element (CNN IE)



The different option values of Screening Indicator (SI), Presentation Indicator (PI), Type Of Number (TON), Numbering Plan Indicator (NPI) as supported on the DMS100, are explained below.

Please refer to Figure 6 Option Values on page 34.

Figure 6 Option Values

Screening Indicator (SI)

2	1	
0	0	user-provided, Not Screened
0	1	user-provided, Verified, and Passed
1	0	user-provided, Verified and Failed
1	1	Network Provided

Presentation Indicator (PI)

7	6	
0	0	Allow
0	1	Restrict
1	0	Not available

Type Of Number (TON)

7	6	5	
0	0	0	Unknown
0	0	1	International Number
0	1	0	National Number
1	0	0	Subscriber number

Numbering Plan Identification (NPI)

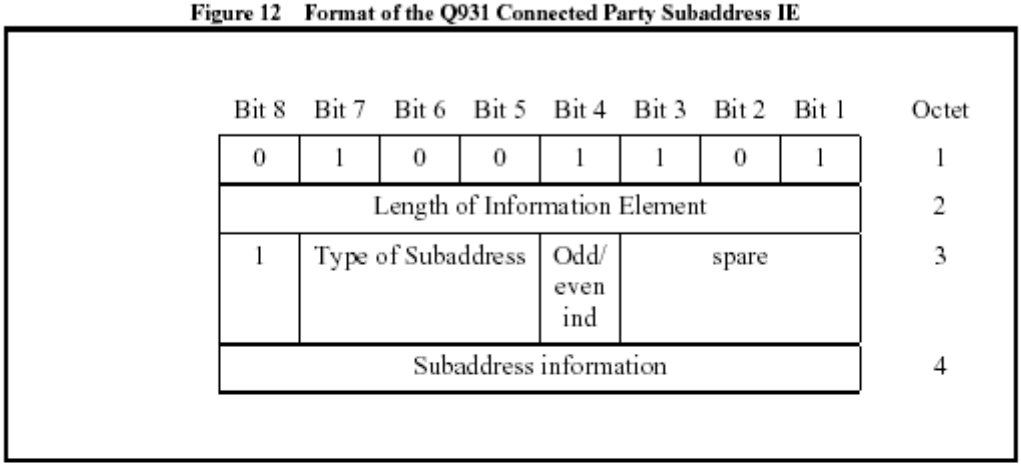
4	3	2	1	
0	0	0	0	Unknown
0	0	0	1	ISDN Telephony Numbering Plan (E164)
1	0	0	1	Private Numbering Plan

An incoming CNN IE at the terminating side is considered as valid only if the NPI field has "Unknown" or "ISDN Telephony Numbering Plan (E164)" values. Otherwise the information is discarded. The CNN fields from CONNECT message are updated at the CM level to reflect the CNN information that is delivered to the originating interface.

2.2.6 Connected Party Subaddress (CNS)

The purpose of the Connected party subaddress information element is to identify a subaddress associated with the terminator of a call. Please refer to "Figure 12 Format of the Q931 Connected Party Subaddress IE" on page 54.

Figure 12 Format of the Q931 Connected Party Subaddress IE



Bit 8	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Octet
0	1	0	0	1	1	0	1	1
Length of Information Element								2
1	Type of Subaddress			Odd/ even ind	spare			3
Subaddress information								4

For the Connected Party Subaddress the following is done,

- The CNS is mapped to the APP-PSS1 parameter. (For QFT only)
- The CNS is mapped to the ATP parameter in case of ISUP.
- If COLP SS is activated, add the Connected Party Subaddress Information Element to the CONNECT message.
- If COLR SS is activated, the Connected Party Subaddress Information Element is not added to the CONNECT message.
- If the calling user has not subscribed to COLP, then the CNN IE and the CNS info are not sent in the CONNECT message.
- On interworking of QSIG to QSIG, the CNS IE shall be mapped independently of the COLP SS.

The Presentation of the CNS IE depends on the following:

Public call:

- When COLP SS is not subscribed, the CNN IE and CNS IE are not sent to the calling user.

- When COLP SS is subscribed and PI = allowed, the CNN IE and CNS E (if available) are sent to the calling user.

- When COLP SS is subscribed and PI = restrictd, an 'empty/restricted' CNN IE is sent to the calling user. The CNS IE is not sent in this case.

Private Call:

- The CNN IE and CNS IE are mapped transparently.

- Exception for Originating and END PINX:

- When COLP SS is subscribed and PI = restricted, and empty/restricted' CNN IE is sent to the calling user. The CNS IE is not sent in th

2.2.8 Interworkings

Networked services support for interworking QSIG for H.323-based originating/ terminating at a 3rd party based PBX (e.g., Siemens HiPath) should include the following:

. i.COnnected Line Identification Presentation (COLP) supplementary service (SS).
ii.COnnected Line Identification Restriction (COLR) supplementary service (SS).

Networked services support for interworking QSIG for H.323-based originating/ terminating at a Nortel PBX (e.g., BCM50, BCM 200/400) should include the following:

i.COnnected Line Identification Presentation (COLP) supplementary service (SS).
ii.COnnected Line Identification Restriction (COLR) supplementary service (SS)

30.3 Limitations and restrictions

There is no attempt within this feature to map MCDN versions of COLP/ COLR to H.323 or to Q.SIG. This feature merely maps Q.SIG versions of COLP/COLR to H.323 versions of COLP/COLR (and vice versa). The following provide specific examples of messaging in MCDN environments

This feature is implemented exclusively for the support of International H.323 COLP/COLR. Refer to A59027747 QSIG Support for COLP/COLR for additonal restrictions on COLP/COLR.

31: Functional Description (FN): A00011363

31.1 Feature name and Feature ID

A00011363: International H.323 2CLI (Calling Line Identity) Support

31.2 Description

The activity provides support for 2 CLI delivery to a H.323 terminating Gateway/terminal[1] in the International CS2000 ISN load, for public calls.

This feature provides support for 2 CLI delivery for the following originating agent scenarios in a French market configuration, with functional equivalency to a terminating PRI trunk:

- ETSI ISUP v2 Base Variant -> International H.323 in Section 5.2.2.1.
- SPIROU -> International H.323 in Section 5.2.2.2.
- ETSI PRI -> International H.323 in Section 5.2.2.3.
- International H.323 -> International H.323 in Section 5.2.2.3.
- International H.323 -> ETSI PRI in Section 2.2.2.3
- International H.323 -> ETSI ISUP V2 Base Variant in Section 2.2.2.4
- International H.323 -> SPIROU in Section 2.2.2.5

Other originators and market configurations may also work but are not formally verified by this feature.

Support for 2 CLI delivery on outgoing ISUP/PRI trunks for a call originating from H323 is already supported and not changed by this feature.

The 2 CLI functionality is associated with ISDN supplementary service provisioning option Calling Line Identification Presentation (CLIP) and Calling Line Identifiation Restriction (CLIR). With 2 CLI the calling line has two identities namely the Network Number (NN) and Presentation Number (PN).

The standard 2 CLI handling mode described as “special arrangement” in H.246 and Q.699 is supported by this feature. In this mode of operation a User Provided CLI is passed on without verification and a 2nd Network Provided CLI is added to the call signalling by the 1st public network exchange.

[1]A H.323 terminating Gateway/terminal is referred to as the “International H.323 terminator” through out this document.

- A Network Number is a CLI provided by the public network,which identifies the actual network termination point from which a call originates.
- A Presentation Number (PN) is a dialable number that the calling user wishes to display to the called user. It is normally User provided and not verified by the network (Q699/H.246 “special arrangement” case).

The NN and PN may or may not be the same. The PN can be used to return a call to the originator or an associated number. For example, a calling salesperson may want to display a free phone number , in order to provide the incentive of a free call, when a purchase is made.

For the International H.323 terminator, if 2 CLIs are available they are delivered in the SETUP message by sending the Presentation Number in the CGN IE (Calling Party Number Information Element) field and the Network number in the additionalSourceAddresses field. If only 1 CLI is available then it is delivered in the CGN IE whether it is a Network Number or Presentation Number.

This complies with ITU-T H.246.0 Annex C(07/2003)[1] as ammended by the ITU-T H.323 System Implementors’ Guide(30th Januay 2004), for the case of interworking to a Gateway/terminal in “special arrangement” mode.

For this feature to work functionally a Gateway that also supports this capability per these versions of the specifications is required eg.OneAccess.

This feature extends the existing functionality implemented by French market 2 CLI feature A59027509 to provide equivalent behaviour for International H323 terminators. A59027509 is a refinement and extension of MMP14 feature A59016672 that developed 2CLI delivery for an ETSI PRI terminator. A59016672 in turn works only in conjunction with feature AJ5284 “Presentation CLI Support” and enhanced it to support Special Arrangement on selected agents. The “Special Arrangement” feature introduced by AJ5284 was developed to give selected customers the possibility to deliver Calling Party Numbers to the terminator which are not screened.

If Special Arrangement applies to a customer, the CGN digits delivered by him are not screened , however the NPI (Number Plan Indicator) and TON (Type of Number) information elements are screened to check public E.164 numbers are provided.

[1]Older versions of the H.323 and H246 specifications had different unrobust schemas.

31.2.1 Datafill control

This feature A00007329 will reuse the same datafill options that control 2 CLI delivery and behaviour for PRI trunks. Reference A59016672 & A59027509.

31.2.1.1 2 CLI delivery control options on the Terminating H323

31.2.1.1.1 2CLI Delivery Control option for International H.323 Terminator

Delivery of 2 CLIs vs only 1 CLI for an International H.323 terminator is enabled on a trunk group basis by datafilling the 2CLI option on the H.323 QSIG trunk. When the "2CLI" option is not data filled the QSIG interface will not generate 2CLI's in the outgoing SETUP message. A sample datafill in table LTDATA is as follows:

Table 1 Table LTDATA - Datafill 2CLI Option(New Datafill)

LTDKEY	LTDRSLT	LTCLI_OPTION	LTCLI_OPTION
H323TST CLI	CLI	2CLI	$

The 2CLI option is an existing option in table LTDATA previously only functional for PRI trunks.

31.2.1.1.2 CLIP option Table LTDATA

The CLIP option is applicable to ETSI PRI and International H.323 terminator. Sample datafill for International H.323 terminator is as follows :

Table 2 Table LTDATA CLIP option

LTDKEY	LTDRSLT	AUDTRMT	CGNREQD	CGNDELV	CDNDELV
H323TST 1 SERV	SERV	N	Y	SCREENED	ALWAYS

31.2.1.2 Related CLI options on the Originating H323

The availability of 2 CLIs for delivery is dependent on several factors. For PRI/ H323 to H323 the following options on the originating trunk are relevant (all are existing options and unchanged by this feature):

- CLIR option provisioned for the originator
- Screening for originator (Table LTDATA)
- CUSTGROUP public call (relation between originator and terminator)
- PN_SUPPORTED = Y

31.2.1.2.1 CLIR option Table LTDATA

The CLIR option is applicable for ETSI PRI and International H.323 originators. Sample datafill allowing presentation of the CLI unless overridden by per call CLIR activation code .

Table 3 Table LTDATA CLIR option

LTDKEY	LTDRSLT	LTCLI_OPTION	PI	MODE
H323TST 1 CLI	CLI	DFLTPI	ALLOW	TEMP

31.2.1.2.2 Screening in Table LTDATA

For “special arrangement” behaviour as required in France no screening is performed on the received CLI from the user . This is configured by using the NOSCRN option in a LTDATA CLI tuple.

Table 4 Table LTDATA

LTDKEY	DATATYPE	OPTION
H323TST 1 CLI	CLI	**NOSCRN**

In this NOSCRN case the Network Number is taken from the DFLTCGN option in LTDATA

Table 5 Table LTDATA

LTDKEY	DATATYPE	DFTLTCGN
H323TST 1 DN	DN	017 230 3680 $

Note)

For other markets other CLI options are used to configure different screening behaviour. eg: SCRNPN (screen the received CLI but use it as a PN) or SCRNLTID and SCRNDFLT (“no special arrangement scenarios to screen the

received CLI and use after editting as a single User provided Verified and Passed CLI)

31.2.1.2.3 CUSTGROUP Table CUSTNTWK

This option is applicable for ETSI ISUP V2, SPIROU, ETSI PRI and International H.323. It is a prerequisite for the 2CLI feature that the call must be a public call.

31.2.1.2.4 PN_SUPPORTED Table OFCENG

This option is applicable for ETSI ISUP V2, SPIROU, ETSI PRI and International H.323. The office parameter has two fields. They are ACTIVE and BTUP_SIM_HANDLING. For this feature, the field ACTIVE must be set to Y to enable 2 CLI behaviour for PRI/H323 to H323. It should not affect the ISUP interworkings. Datafill for PN_SUPPORTED option is illustrated below:

Table 6 Table OFCENG

PARMNAME	PARMVAL
PN_SUPPORTED	**Y** N

31.2.2 2CLI Mapping for Interworking Scenarios Supported:

31.2.2.1 ETSI ISUP v2 Base Variant to International H.323

There are three possible cases:

31.2.2.1.1 "Calling party Number" parameter in IAM complete

If a CGPN is present and complete in the IAM then one or two "calling party number" IE may be created according to the presentation indicator and the category of the served subscriber,i.e.

— If the presentation indicator of the CGPN is set to 0 (Presentation allowed), one or two "calling party number" IE may be created.

— If the presentation indicator of the CGPN is set to 1 (Presentation restricted) and called subscriber has the CLIR override category one or two "calling party number" IE may be created.

If the above condition is met and if the served subscriber is subscribed to the CLIP[1] supplementary service, then:

GNP presentation - If a "Generic Number" qualified to "additional calling party number" is present, it shall be sent in a first "calling party number" IE. This IE contains the address signal received in the IAM and is coded as follows:

Table 7 Generic Number mapped to CGN IE in International H.323SETUP

Bits	Value
Octet 3 bits 765	Type of Number is mapped transparently according to bits BA of identity of the calling line.

[1]Data filled in table LTDATA for the International H.323 terminator
Sample Datafill :
LTDKEY LTDRSTL CGNDELV CDNDELV

QSIG 1 CLI SERV SCREENED ALWAYS

Bits	Value
Octet 3 bits 4321	Numbering Plan Identification is mapped transparently.
Octet 3a bits 76	Presentation Indicator is mapped transparently
Octet 3a bits 21	Screening Indicator is mapped transparently
Octet 4 and above	Address signals

A second CLI (the Network Number) is sent to the terminating International H.323 agent in the additionalSourceAddresses parameter. The Calling party number parameter from the IAM is used to encode the additionalSourceAddresses Information element as follows:

Table 8 Coding of the additionalSourceAddresses Information Element According to the Calling party number parameter

IAM Calling Party Number parameter	SETUP additionalSourceAddresses
Nature of Address National number International number	Type of number National number International number
Numbering Plan Indicator	"Numbering plan identification"
ISDN/Telephony Numbering Plan	ISDN/Telephony Numbering Plan
Address Presentation Restricted Indicator Presentation allowed Presentation Restricted	Presentation Indicator Presentation Allowed Presentation restricted
Screening Indicator User provided, verified and passed Network Provided	Screening Indicator User provided, verified and passed Network Provided
Address signals	Number digits

31.2.2.1.2 Calling Party Number absent or incomplete

If the “calling party number” parameter received in the IAM is absent or incomplete then only one “calling party number” IE shall be created. The IE contains no address signal and is coded as follows:

Table 9 Calling Party Number in the SETUP (International H.323)

Bits	Value
Octet 3 bits 765	The "type of number" is set to unknown (000).
Octet 3 bits 4321	"Numbering plan identification" is set to unknown (0000)
Octet 3a bits 76	"presentation indicator" is set to number not available due to interworking (10).
Octet 3a bits 21	"Screening indicator" is set to network provided (11)

31.2.2.1.3 Identity complete, presentation restricted (without CLIR override)

If the "calling party number" received in the IAM is complete and available, and the presentation indicator is set to restricted, and the served subscriber does not have the CLIR override category, then only one "calling party number" IE shall be created. The IE contains no address signal. It shall be coded as follows:

Table 10 "Calling Party Number" in SETUP

Octet 3 bits 765	The "type of number" is set to unknown (000).
Octet 3 bits 4321	"Numbering plan identification" is set to unknown (0000).
Octet 3a bits 76	"presentation indicator" is set restricted (01).
Octet 3a bits 21	"Screening indicator" is set to network provided (11)

31.2.2.2 SPIROU to International H.323

The CLI handling is the same as Figure 5.2.2.1, "ETSI ISUP v2 Base Variant to International H.323".

31.2.2.3 International H.323/ ETSI PRI to International H.323/ ETSI PRI

The mapping of parameters for International H.323/ETSI PRI to International H.323 according to ETSI/ITU Q.699for the following configurations is supported:

Configuration	Calling user provisioned to:	Called user provisioned to:
I as described 5.2.2.3.1	CLIR option provisioned; PI = **allowed**	**CLIP** option provisioned 2CLI option provisioned;
II as described in 5.2.2.3.2	CLIR option provisioned; PI = **restricted**	**CLIP** option provisioned 2CLI option provisioned;
III as described in 5.2.2.3.3	CLIP option provisioned; PI = restricted	CLIP override option provisioned 2CLI option provisioned.

31.2.2.3.1 Configuration I:

- Calling User: Special arrangement applies
- Called User: CLIP
- Terminator : Two number delivery supported

Originator: ETSI-PRI/International H.323	optional: ETSI-ISUP V2	Terminator: International H.323/ ETSI PRI
Calling party number IE: TON = international national subscriber ***1** NPI = unknown or ISDN PI = Presentation allowed SI = not relevant digit = any digits	**Generic number parameter:** NOA = international national subscriber ***1** NPI = ISDN/Telephony PI = Presentation allowed SI = User provided, not verified digit = digits as received	**1. Calling party number IE:** TON = international national subscriber ***1** NPI = ISDN/Telephony PI = Presentation allowed SI = User provided, not screened digit = digits as received
	Calling party number parameter: NOA = national NPI = ISDN/Telephony PI = Presentation allowed SI = Network provided digit = Default DN	**2. Calling party number IE:** TON = national NPI = ISDN/Telephony PI = Presentation allowed SI = Network provided digit = Default DN

Originator: ETSI-PRI/International H.323	optional: ETSI-ISUP V2	Terminator: International H.323/ ETSI PRI
Calling party number IE: TON = 'unknown' or 'private network' or NPI != unknown or ISDN or digits = not available	**Generic number parameter:** not mapped **Calling party number parameter:** NOA = national NPI = ISDN/Telephony PI = Presentation allowed SI = Network provided digit = Default DN	**Calling party number IE:** TON = national NPI = ISDN/Telephony PI = Presentation allowed SI = Network provided digit = Default DN

Notes: 1 - only for certain markets, eg Germany. N/A to France. Controlled by Market of Office or other market datafill.

31.2.2.3.2 Configuration II:

- Calling User: Special arrangement applies
- Calling User: Temporary CLIR, Presentation restricted
- Called User: CLIP
- Terminating ETSI-PRI: Two number delivery supported

Originator: ETSI-PRI/International H.323	optional: ETSI-ISUP V2	Terminator: International H.323/ETSI PRI
Calling party number IE: TON = international national subscriber ***1** NPI = unknown or ISDN PI = Presentation restricted SI = not relevant digit = any digits	**Generic number parameter:** NOA = international national subscriber ***1** NPI = ISDN/Telephony PI = Presentation restricted SI = User provided, not verified digit = digits as received **Calling party number parameter:** NOA = national NPI = ISDN/Telephony PI = Presentation restricted SI = Network provided digit = Default DN	**Calling party number IE:** TON = unknown NPI = unknown PI = Presentation restricted SI = Network provided digit = not included/empty
Calling party number IE: TON = 'unknown' or 'private network' or NPI != unknown or ISDN or digits = not available	**Generic number parameter:** not mapped **Calling party number parameter:** NOA = national NPI = ISDN/Telephony PI = Presentation restricted SI = Network provided digit = Default DN	**Calling party number IE:** TON = unknown NPI = unknown PI = Presentation restricted SI = Network provided digit = not included/empty

Notes: 1 - only for certain markets, eg Germany. N/A to France. Controlled by Market of Office or other market datafill.

31.2.2.3.3 Configuration III :

- Calling User: Special arrangement applies
- Calling User: Temporary CLIR, Presentation restricted
- Called User: CLIP **override category**
- Terminating ETSI-PRI: Two number delivery supported

Originator: ETSI-PRI / International H.323	optional: ETSI-ISUP V2	Terminator: International H.323/ ETSI-PRI
Calling party number IE: TON = international national subscriber ***1** NPI = unknown or ISDN PI = Presentation restricted SI = not relevant digit = any digits	**Generic number parameter:** NOA = international national subscriber ***1** NPI = ISDN/Telephony PI = Presentation restricted SI = User provided, not verified digit = digits as received	**1. Calling party number IE:** TON = international national subscriber ***1** NPI = ISDN/Telephony PI = Presentation allowed SI = User provided, not screened digit = digits as received
	Calling party number parameter: NOA = national NPI = ISDN/Telephony PI = Presentation restricted SI = Network provided digit = Default DN	**2. Calling party number IE:** TON = national NPI = ISDN/Telephony PI = Presentation allowed SI = Network provided digit = Default DN
Calling party number IE: TON != international/national(or subscriber ***1**) or NPI != unknown or ISDN or digits = not available	**Generic number parameter:** not mapped	**Calling party number IE:** TON = national NPI = ISDN/Telephony PI = Presentation allowed SI = Network provided digit = Default DN
	Calling party number parameter: NOA = national NPI = ISDN/Telephony PI = Presentation restricted SI = Network provided digit = Default DN	

Notes: 1 - only for certain markets, eg Germany. N/A to France. Controlled by Market of Office or other market datafill.

31.2.2.4 International H.323 to ETSI ISUP V2 Base Variant

This functionality already exists and is not changed by this feature, but is not explicitly documented for H323 yet, hence this section is included for information only.

In the French market configuration the mapping is identical to that for PRI to ETSI ISUP V2 Base Variant as documented in feature A59027509. Any additionalSourceAddresses field or 2nd CGN IE received from H323 will be ignored by the CS2000.

This is in alignment with the mapping as specified in Q.699 with Special Arrangement and ITU-T H.246 Annex C Gateway/Terminal interworking case with Special Arrangement. A59027509 has some clarifications to the handling of some field coding cases not explicitly defined in Q699/H.246 and not normally expected.

31.2.2.5 International H.323 to SPIROU

This functionality already exists and is not changed by this feature, but is not explicitly documented for H323 yet, hence this section is included for information only.

In the French market configuration the mapping of Calling Party Number and Generic Number Parameter in the IAM from the SETUP message are as described in the TWOCLI FN document.

31.2.3 Network Number editing

When the Network Number is delivered on H323 in the additionalSourceAddresses field the digits contained may be editted by the CLGDMI option against the outgoing H323 trunk.

The Presentation Number sent in the CGN IE will also be editted by CLGDMI as in the current 1 CLI delivery case.

31.3 Hardware Requirements or Dependencies

This feature requires a Gateway supporting ITU-T H.246.0 Annex C(07/2003)[1] as ammended by the ITU-T H.323 System Implementors' Guide(30th Januay 2004). The terminating International H.323 Gateway/terminal must be capable of receiving 2CLIs in the H.225.0 SETUP message. The first CLI is coded in the Calling Party Number Information Element and the second CLI in the additionalSourceAddresses field .

31.4 Software Requirements or Dependencies

None

31.5 Limitations and restrictions

- This feature requires a Gateway supporting ITU-T H.246.0 Annex C(07/2003)[2] as ammended by the ITU-T H.323 System Implementors' Guide(30th Januay 2004). This feature will not work with gateways implementing older versions of the ITU-T H.246 Specification.
- Only Public E164 type (User Provided) Presentation Number CLIs are supported and will always be sent in the Calling Party Number IE field.

[1]Older versions of the H.323 and H246 specifications had different unrobust schemas.
[2]Older versions of the H.323 and H246 specifications had different unrobust schemas.

- as per Section 5.8.1 Interworking for Conveying Two Calling Party Number, Section C.7.2.3 Calling Line Identification Presentation (CLIP) /Calling Party Name Presentation (H.450.8), Table C.56/ H.246 “CLIP information sent to the called user” of the ITU-T H.323 System Implementors’ Guide shall not use the SourceAddress of the SETUP message and shall use the Calling Party Number IE field because the number being sent is a public number.
- As per Section 7.8.2.1 Calling party address information of the ITU-T H.323 (07/2003) the SourceAddress field of the SETUP message is used to encode numbers belonging to the Private numbering plan.
- The mapping of parameters from the H.225.0 SETUP to ISUP IAM as per Table C.20.1/H.246 Calling Party Number and Table C.20.2/ H.246 Calling Party Number of the ITU-T H.323 System Implementors’ Guide which referes to cases where SourceAddress fields are received is not supported.

- The Gatekeeper to Gatekeeper scenarios described in H.246 are not supported,
  - — any received additionalSourceAddresses field will be ignored by the CS2000. Only the 1st CGN IE is used.
  - — The mapping of parameters from the H.225.0 SETUP to ISUP IAM for SETUP messages received from the Gatekeeper when Special Arrangement applies is not supported.
  - — The mapping of 2CLIs received from the Gatekeeper as per Section 5.8.1 Interworking for Conveying Two Calling Party Numbers, Section C.6.2.1.1 Special Arrangement Applies - “Setup Received from the Gatekeeper” of the ITU-T H.323 System Implementors’ Guide is not supported.
- ‘Special Arrangement does not apply’ scenarios are not applicable - these are 1 CLI scenarios:
  - This feature does not support carrying of the GNP in the IAM message for International H.323 to ETSI ISUP v2 Base Variant for “without special arrangement” case.
  - The mapping of parameters from the H.225.0 SETUP to ISUP IAM as per Table C.21/H.246 “CLIP - Special Arrangement does not apply” of ITU-T H.246.0 Annex C is out of the scope of this feature and should be provided by the base H.323 feature.
  - The mapping of parameters from the H.225.0 SETUP to the ISUP IAM as outlined in Section 5.8.1 Interworking for Conveying Two Calling Party Number, Section C.6.2.1.2 Special Arrangement does not apply “Setup Received from the Gatekeeper” of the ITU-

T H.323 System Implementors' Guide is not a supported configuration for this feature.

32: Functional Description (FN): A00012291

32.1 Feature name and Feature ID

A00012291: MG15K Call-waiting Tone Support & Additional International Tones

32.2 Description

This feature extends the existing PVG Toneset support to include several new international variants. This feature also modifies several currently supported tonesets per business requirements. Finally, this feature provides support for multiple call-waiting tones within a given country toneset.

Specifically, this feature provides:

- New Support for Pakistan Toneset
- New Support for Brazil (Custom 1) Toneset
- New Support for Mexico (Custom 1) Toneset
- Modifications to Venezuela Toneset
- Modifications to Turkey Toneset
- Modifications to Taiwan Toneset
- General Support for Multiple (Up to 15) Call Waiting Tone Patterns per Country Toneset
  - —Support for 2 (specific) Call Waiting Tones for Mexico Toneset
  - —Support for 2 (specific) Call Waiting Tones for Taiwan Toneset
- Improved Support for Spare Toneset Patching (Patchability for up to 5 spare tonesets per release)

The primary driver for this feature is to allow for PVG market penetration into new countries and/or new telecommunication companies in the newly supported countries.

32.3 Overview

This feature does not require any changes to the basic external operation of the existing PVG toneset.

As per the requirements, this feature does provide the following customer/ subscriber visible changes:

- New Support for Pakistan Toneset
- New Support for Brazil (Custom 1) Toneset

- New Support for Mexico (Custom 1) Toneset
- Modifications to Venezuela Toneset
- Modifications to Turkey Toneset
- Modifications to Taiwan Toneset
- General Support for Multiple (Up to 15) Call Waiting Tone Patterns per Country Toneset
    - Support for 2 (specific) Call Waiting Tones for Mexico Toneset
    - Support for 2 (specific) Call Waiting Tones for Taiwan Toneset
- Improved Support for Spare Toneset Patching (Patchability for up to 5 spare tonesets per release)

Primary internal areas impacted:

- SPM - Connection Manager
- SPM - Tones Database
- PDC - Provisioning options for new country tonesets
- PDC - Improved Support for Spare Toneset Patching

32.4 Provisioning procedures

There are no significant changes to the provisioning procedures for PVG tones. However, as the feature provides for some previously unsupported country tonesets, (Pakistan, Brazil Custom 1, Mexico Custom 1) provisioning options for these tonesets are now available.

Below is a summary of the provisioning areas changed. As each of these areas provide for the provisioning of a toneset attribute, and since the list of supported tonesets is expanded with this feature (per above), these areas now provide the new choices.

- Nsta/n Vgs - *defaultToneset*
- Nsta/n Vgs Brag/n - *toneset*
- Nsta/n Vgs BragS/n - *toneset*
- Nsta/n Vgs TProf/n - *toneset*

The above now include options for provisioning “*pakistan*”, “*mexicoCustom1”*, and “*brazilCustom1*”.

33: Functional Description (FN): A00012349

33.1 Feature name and Feature ID

A00012349: U3WC Support For SIP Lines

33.2 Description

This feature expands the existing Three Way Call (3WC) and Usage Sensitive Three Way Call (U3WC) services to IBN and RES type SIP Lines.

The 3WC/U3WC service provides the activation/deactivation of the Three Way Calling on the line. In SIP Lines case, actual conferencing service is provided by edge device like Optical Network Terminator (ONT) or by the CS2K Session Server, on an ad-hoc basis, as in the case of a PC Client. To the CS2K Core, the calls appear as separate ones.

This feature supports both possible methods to invoke U3WC from a UA (User Agent), that is, via the access code or via flash access (same as normal 3WC, no access code).

When a UA, in a stable call state, invokes this feature, it triggers the core to first check for the 3WC or U3WC option provisioning, for that SIP line. If any of these options are provisioned correctly, the second (consultation) leg origination attempt is allowed to proceed. Otherwise, the origination attempt is denied and the caller is sent to treatment for the add-on leg. If the second leg call is successful, the UA can flash again to conference the three parties involved. This activity will not pre-empt the other features from allowing the second leg call origination.

33.2.1 Billing

Each time DPL U3WC is invoked, a billing record based on Structure Code 00001 with Call Type of 048 and Service Feature of 018 is created. For DPL, the conferencing is done at the client or on ad-hoc basis at the CS2K SS and hence no conference resources are used in the core. Also, the conference notification from User Agent is not being implemented as part of this activity. Because of this, the DPL U3WC billing record will be made always consistent with the TOTAL_DURATION setting of the U3WC_ELAPSED_TIME, irrespective of this parm being set to any other values. Also the billing record will be generated for every successful U3WC consult call termination, regardless of whether a conference is ever established.

The module code 260 will be appended to the DPL U3WC billing records to indicate that they pertain to SIP lines, when the RECORD_MC260 tuple is set

to ON in table AMAOPTS. An example DPL U3WC billing record is shown below.

Figure 1 Example call code 048 for U3WC billing

```
*HEX ID:AA  STRUCTURE CODE:40001C  CALL CODE:048C  SENSOR TYPE:036C

 MODULE CODE:260C  COMPONENT ROLE:201C  IP SERVICE PROTOCOL:001C
 MODULE CODE:000C
```

33.2.2 Operational Measurements (OMs)

Currently in the CS2K core, for non-DPL case, the U3WC OM registers are being pegged for the User Three Way Call service. This OM has the U3WCATT (U3WC Attempts), U3WCCONS (U3WC consultations) and the U3WCCONF (U3WC conferencing) registers that are pegged.

For DPL case, the conferencing service is provided by the UA or the CS2K SS and the conference notification from User Agent or CS2K SS is not available to the core. Hence for DPL, it is not possible to peg the U3WCCONF register. If the other two registers are pegged, it could lead to an imbalance over time. For this reason, none of the U3WC OM registers will be pegged for the DPL case.

33.3 Hardware Requirements or Dependencies

Not Applicable

33.4 Software Requirements or Dependencies

Not Applicable

33.5 Limitations and restrictions

The following are the restrictions and limitations of this service:

- The conferencing capability shall be enabled in the clients (for UAs like ONTs) or ad-hoc conferencing shall be provided by the CS2K SS (for UAs like PC clients).
- For DPL case, none of the U3WC OM registers will be pegged. Please refer to the "Operational Measurements (OMs)" section above.
- This activity supports consult leg originations with or without the VSCs. However, for originations with only the U3WC VSCs, then followed by

CDN digits after second dial tone, the PMA/AMS setup needs to be configured, so that digit collection can take place.

- Client based refer or redirect requests will not be screened or blocked by 3WC/U3WC options.
- The 3WC option must be explicitly datafilled for SIP lines, for IBN type and when U3WC is not applicable, for the RES type also, in order to establish additional sessions, once the first session has been answered.
- Conference Notification from User Agent (ONT or PC Client or a SIP Phone) is not planned to be implemented as part of this activity. Hence the DPL U3WC billing record will be always consistent with the TOTAL_DURATION setting of the U3WC_ELAPSED_TIME, irrespective of this parm being set to any other values. Also the billing record will be generated for every successful U3WC consult call termination, regardless of whether a conference is ever established. Module code 260 will be appended to the DPL U3WC billing records to indicate that they pertain to SIP lines, when the RECORD_MC260 tuple is set to ON in table AMAOPTS.

33.6 Interactions

- U3WC option is not compatible with the CXR (Call Transfer) option (refer to the U3WC related FN sections of actids AQ1302). U3WC if active on a RES line, will disappear (become inactive), once the CXR option is assigned to that line.
- For 3WC option, if the client needs to transfer the call, will have to invoke REFER before exiting. While 3WC is active, call transfer screening will occur when the controller gets out of the conference. At that point, the CXR option provisioning will determine if the call between the remaining 2 parties will survive or not.
- 911 calls on consult leg are treated the same way as any other calls and don’t have any preferential processing.

U3WC	Usage Sensitive Three Way Call
UA	User Agent

34: Functional Description (FN): A00012477

34.1 Feature name and Feature ID

A00012477: Session Initiation Protocol (SIP) Services - Call Completion to Busy Subscriber (CCBS)

34.2 Description

This activity provides support for Call Completion to Busy Subscriber collectively called CCBS, for Dynamic Packet Lines (DPL).

CCBS supplementary service enables user A, encountering a busy destination B to have the call completed without having to make a new call attempt. Originator A activates CCBS after getting busy tone from terminator B and goes onhook. When the terminator B is idle, originator A is notified by recall ringing. If A answers the call, normal call setup with B is carried and the call proceeds. If B becomes busy after A gets recall ringing, the CCBS request is queued again. For call scenarios and detailed information please refer to document A59011976, CCBS to Analog Lines.

CCBS is similar in functionality to the North American RAG (Ring AGain) service but is based on ETSI specification and therefore different in implementation.

Network CCBS is an integral part of CCBS, it is invoked when and if the called party is in another office, there is an ISUP V2 link and TCAP messages are carried between switches.

This activity **only** supports for single digit activation of CCBS and CEPT CCBS functionalities on SIP lines.

34.3 User Agent Requirements

In order to be integrated with the CS2000 CCBS service, the User Agent (UA) must be able to support the interface specified by this feature. A User Agent must be able to handle SIP Refer and Hold methods. To be able to provide the CS2000 CCBS service fully, they must also support callerid, distinctive ringing.

34.4 Hardware Requirements or Dependencies

Not applicable

34.5 Software Requirements or Dependencies

This activity is implemented in ISN09 drop 2 release. This activity requires the activity A00012317 SIP - Automatic Call Back (ACB) and Automatic Recall (AR) which is being also implemented for ISN09 drop2.

34.6 Limitations and restrictions

In this functionality CCBS will work as

- Line should have CCBS option,
- SINGLE_DIGIT_ACTIVATION for CCBS feature should be set to Y as in ISERVOPT table (CCBS tuple)
- The single_digit_activation digit should be datafilled in this tuple
- CCBS owner (ragor) calls busy agent, and receives CCBS announcement,
- Ragor dials activation digit and receives confirmation or negative acknowledgement

The following limitations and restrictions are needed for this activity.

- Activating of CCBS feature via sending INFO messages is not supported in this activity
- Activating of CCBS feature via opening a new session and dialing service code is not supported. Since SIP phone is not able to open a new session if the it is not received 200 OK message.
- The announcement resources should be provided in the office

34.7 Interactions

34.7.1 Network Based Interactions

34.7.1.1 Destination Line - Network Determined Idle

If the CS2000 is monitoring a destination line for an CCBS request, and that line is a DPL line, the line will be determined to be idle when there are no network based sessions for that line. User Agent based sessions and User Agent based services (e.g. Do Not Disturb) will not be taken into account by the CS2000.

34.7.1.2 CCBS Subscriber - Network Determined Idle

If the CS2000 is about to recall notify a DPL CCBS subscriber, that subscriber will be determined to be idle for recall when there are no network based sessions for that line. User Agent based sessions and User Agent based services (e.g. Do Not Disturb) will not be taken into account by the CS2000.

34.7.2 User Agent Interactions

34.7.2.1 Normal Call Termination Failure

If the CS2000 is attempting to terminate to a DPL line that the CS2000 has determined to be “network idle”, but the termination fails for any of the following reasons:

- User Agent not registered
- User Agent registered, but not responding

the CS2000 will not accept an CCBS activation on that call (either via flash and dial access code).

34.7.2.2 CCBS Recall Notification Failure

If the CS2000 attempts to recall notify a DPL CCBS subscriber, and that recall attempt fails due to any of the following:

- User Agent not registered
- User Agent registered, but not responding
- User Agent registered, User Agent responds with any response other than a “100 Trying” or “180 Ringing”, (e.g.busy indication due to Do Not Disturb, or currently in dialing state),

the CS2000 will check ccbs_recall_time expires, if so request is removed.

34.7.2.3 CCBS Call Setup Failure

If the DPL CCBS subscriber has answered the recall notification, and the CS2000 is attempting to setup the call to the destination line (using the REFER method), but the Call Setup request fails due to any of the following:

- User Agent not registered
- User Agent registered, but not responding
- User Agent registered, User Agent responds with anything other than a “202 Accepted” or “NOTIFY:Terminated” (e.g a busy/reject indication)

the CS2000 will check if ccbs_term_recall_time timer expires. if so request is removed.

34.7.2.4 CCBS Call Termination Failure

If the CS2000 is attempting to terminate to a DPL line because of an CCBS request, and the CS2000 has determined that DPL line to be “network idle”, but the termination fails for any of the following reasons:

- User Agent not registered
- User Agent registered, but not responding

the CS2000 will not accept an CCBS activation on that call (either via flash and dial access code).

34.8 Glossary

Term	Description

35: Functional Description (FN): A00012509

35.1 Feature name and Feature ID

A00012509: SIP Services Wake up Call Reminder

35.2 Description

This activity provides support for WUCR (Wake Up Call Reminder) and CEPT IWUC for SIP Lines.

WUCR is assigned as a line option and is activated and deactivated by the end user through the use of access codes.

Upon activation of WUCR, a wake-up call request is programmed by the end user to ring the end user's line at a particular time within the next 24 hours. The end user can deactivate the feature and cancel the wake-up call request at any time after it is programmed.

This activity will also provide the Wake Up Call features for SIP Lines CEPT variant (IWUC).

The differences between two variants are:

- IWUC feature requires * (star) after the activation code of IWUC. Examples of digit sequences are shown below;

  Centrex variant activation digit sequence: *SC<RDT>HHMM#
  *CEPT variant activation digit sequence: *SC*<RDT>HHMM#*
  Centrex variant deactivation digit sequence: #SC#
  CEPT variant deactivation digit succulence: #SC#
  Centrex variant interrogation digit sequence: not applicable
  *CEPT variant interrogation digit sequence: *#SC*HHMM#*

- For the interrogation issue which is only applicable for CEPT variants; if the request is valid, then the subscriber will receive a confirmation tone, if the request is invalid, or a wakeup request is not active on the line; then the subscriber will receive a NACK treatment.

35.3 Hardware Requirements or Dependencies

Not applicable

35.4 Software Requirements or Dependencies

This activity is implemented in ISN09 drop 2 release.

35.5 Limitations and restrictions

The limitations stated in the previous document Wake Up Call for International with ID AE0240FN.AB01 are also valid except the limitations for the line capacity of both LCM and the switch since these limitations are not valid for DPL lines.

35.6 Interactions

35.6.1 Network Based Interactions

35.6.1.1 WUCR Subscriber - Network Determined Idle

If the CS2000 is about to ring a DPL subscriber, that subscriber will be determined to be idle when there are no network based sessions for that line.

35.6.2 User Agent Interactions

35.6.2.1 Normal Call Termination Failure

If the CS2000 is attempting to terminate to a DPL line that the CS2000 has determined to be “network idle”, but the termination fails for any of the following reasons:

- User Agent not registered
- User Agent registered, but not responding
- User Agent registered, User Agent responds with busy indication (e.g. Do Not Disturb, or currently in dialing state),

35.6.2.2 Treatment tones

When the client answers during to the wakeup ringing, the WUCR treatment to be applied (defined as extended_treatment_type) is set in the call. Then this can be mapped to the initial tone (in table tones) via TMTCNTL table.

So when WUCR treatment is applied, TMTCNTL and TONES table should be datafilled accordingly. We can datafill initial tone patterns, cadence, time value, tone ids etc. in table TONES.

Consequently there is an opportunity to datafill supported tone ids in table TONES for WUCR treatment, there is no hard coded tone id for WUCR.

35.6.2.3 User Agent Based Sessions

User Agent based sessions and User Agent based services (such as user based Do Not Disturb) will not be taken into account by the CS2000 and will not factor into determining if the line is available.

35.6.2.4 Client Dependencies

Different SIP clients show different behaviors during applications and this causes different flows.

Until now we had the chance to test PC SoftClient and that's why the documentation is depending on the results retrieved with PC SoftClient.

35.6.3 Service Interactions

35.6.3.1 Core Based Services

- **911 Network Hold:** No interaction.
- **ACB/AR:** Not available in Drop 2 content. Out of scope.
- **AIN:** No interaction.
- **Anonymous Call Rejection:** No interaction
- **Auth/Account Codes:** No interaction
- **Busy Line Verification:** Not available in Drop 2 content. Out of scope.
- **Call Forward**: There is no interaction if activation or deactivation of WUCR is attempted on a line that is call forwarded. If a wake-up call attempts to call an end user who has Call Forwarding active, the wake-up call is treated as if it were not answered, and WUCR follows the rules for unanswered first attempts.
- **Call Park - Directed Call Park:** No interaction.
- **Call Pickup / Directed CPU:** Not available. Out of scope.
- **Call Transfer Screening:** No interaction.
- **Calling Name Delivery:** No interaction, user line rings with an anonymous call.
- **Calling Number Delivery:** No interaction, user line rings with an anonymous call.
- **Calling Name/Number Blocking:** No interaction.
- **Customer Originated Trace:** No interaction.

- **Directed CPU w/Barge In:** Incompatible.
- **Hunting:** Incompatible.
- **Lawful Intercept:** No interaction.
- **LNP:** No interaction.
- **`MADN:** Not available in Drop 2 content. Out of scope.
- **MADN/SCA:** Not available in Drop 2 content. Out of scope.
- **Malicious Call Trace:** No interaction.
- **No Double Connect:** No interaction.
- **SIMRING:** No interaction.
- **Speed Calling:** No interaction.
- **Subscriber Activated Call Blocking:** No interaction.
- **Call Completion Busy Subscriber (CCBS):** No interaction.
- **CLF & B-Party Control:** No interaction.
- **Payment Ceiling Advice (PCA):** No interaction.

35.6.3.2 Session Server Based Services

- **SIMRING:** No interaction, if the pilot activates a wakeup call, the members will not be affected by wakeup call.
- **Ad-hoc conferencing (3 and 6 way):** No interaction
- **Personal Agent Screening / Routing:** No interaction, the wakeup call will not be routed.

35.6.3.3 Client Based Services

- **Blind Transfer:** No interaction

• **Call Forwarding / Redirect:** No interaction, the wakeup call will not be forwarded.

• **Call Hold:** No interaction

• **Call Waiting:** No interaction.

• **Cancel Call Waiting:** No interaction

• **Consultative Transfer:** No interaction

36: Functional Description (FN): A00012510

36.1 Feature name and Feature ID

A00012510: SIP Services: Malicious Call Trace

36.2 Description

This feature introduces the following two services for SIP Line users. These two services will be presented in this FN in two separate sections.

- CLF for SIP Lines in International Markets
- B-Party Control on ETSI ISUP for SIP Lines in International Markets

36.3 CLF for SIP Lines in International Markets

36.3.1 Description

CLF is a service that enables the subscribers to catch the DN of a malicious caller and report this as a log in their local exchange.

MCT (Malicious Call Trace) is the common name used for features CLF and MCH:

- CLF stands for Calling Line Identification with Flash and is used in IBN lines
- MCH stands for Malicious Call Hold and used in KSETs.

This activity deals only with CLF feature, since SIP Lines use the features of IBN and RES lines.

The markets shown below are chosen as the markets with high priority and CLF for these markets will be implemented initially.

Australia[1] (ATUP[2], AISUP[3], ACIF-ISUP[4] and CA30-ISUP[5])

Israel[6] (Israel ISUP)

UK[7] (BTUP and UKISUP)

36.3.2 Feature Activation

In TDM IBN lines “flash + activation code” is used to activate CLF service. However, SIP lines cannot use flash since there is no equivalent way of sending a flash message in SIP and the clients currently don’t support it. The way to activate features using SIP lines is sending the access code to CS2000 in a new session with an invite message.

When the user wants to activate CLF feature, he/she will initiate a new session (the 2nd session) and dial * + the access code. Note that, this activity assumes that there will be only one existing session in addition to the one that is used for dialling the access code.

The second session will be initiated by an Invite message including the * followed by the access code datafilled in table IBNXLA.

Datafill Example:

In the office of the victim (term), give option CLF to the terminating line in servord and datafill the table IBNXLA with MCH option.

SO:
>ado $ 5551201 clf $

>qdn 5551201

DN: 5551201
TYPE: SINGLE PARTY LINE
SNPA: 216 SIG: DT LNATTIDX: N/A
LINE EQUIPMENT NUMBER: PHNX 00 0 00 01
LINE CLASS CODE: IBN
IBN TYPE: STATION
CUSTGRP: CUST783 SUBGRP: 0 NCOS: 0
CARDCODE: GWLPOT GND: N PADGRP: PKNIL BNV: NL MNO: N
PM NODE NUMBER : 85
PM TERMINAL NUMBER : 2
OPTIONS:
CLF DGT DPL Y 10

Then datafill the table IBNXLA with MCH option.

CI:
>table ibnxla
JOURNAL FILE UNAVAILABLE - DMOS NOT ALLOWED
TABLE: IBNXLA
>add
JOURNAL FILE UNAVAILABLE - DMOS NOT ALLOWED
ENTER Y TO CONTINUE PROCESSING OR N TO QUIT
>y
KEY:
>STARCEPT 89
TRSEL:
>FEAT

```
ACR:
>N
SMDR:
>N
FEATURE:
>MCH
TUPLE TO BE ADDED:
STARCEPT              89 FEAT N N      MCH
ENTER Y TO CONFIRM, N TO REJECT OR E TO EDIT.
>y
TUPLE ADDED
JOURNAL FILE INACTIVE
>lis
KEY RESULT
----------
STARCEPT 89 FEAT N N MCH
>
```

To activate CLF in this example, the victim makes a new call with the digits *89 on the second session upon receiving a malicious call on the first session.

(Note for the Israel market:
In Israeli market, the TDM IBN lines activate the CLF by a hook-flash only. In order to implement this in SIP Lines, there will be an arrangement with MTA vendors so that when using IBN sets as SIP Lines through MTA, the MTA should be capable of converting the flash message into a SIP INVITE message bearing the activation code as dialled digits.)

36.3.3 AFTER ACTIVATION:

If the activation is successful, the second session (i.e. the session where we activated CLF) will receive confirmation tone. If the activation is not successful, like in the case of having less than or more than two active sessions (one for activation and one for the malicious call), a nack tone will be received.

The activation of CLF will result in production of a Malicious Call log in logging device - logutil in the switch of the victim (the term office). The calling line information (i.e. the malicious caller) will be visible in this log.

36.3.4 B-PARTY CONTROL:

The B-party control will give the control of the call to the called party (i.e. the victim). So, the call will not be released until the called party goes on-hook or the timer expires, depending on the individual market specifications. This means the malicious caller can not make any other calls as long as the call is held. If the malicious caller tries to make a new call after hanging up on the victim, he/she will be connected back to the existing held connection to the

victim's line. This will enable tracing the malicious caller in cases of the Calling Line Identity (CLI) can not be received. In case of timer expiry, this will allow a regret time to the victim to activate the CLF after the malicious caller hangs up.

The B-Party Control behavior in SIP Lines for CLF will be transparent to the B-Party Control behavior in TDM IBN Lines for CLF. The only difference is that we can not hold the subscriber's agent as in TDM world but instead we connect it back to the held connection when it tries to make a new connection.

36.3.5 Hardware Requirements or Dependencies

Not Applicable.

36.3.6 Software Requirements or Dependencies

This feature has dependency on feature "A00012402 - SIP Lines: 911 Hold/ Ringback" for the Session Server load.

36.3.7 Limitations and restrictions

The CLF can be activated by sending a new invite message with the access code. There can only be one active session in addition to the session in which the access code is sent. If this is not the case, then the session will receive a nack tone.

In TDM IBN lines, the CLF feature can also be activated by CLF_ACCESS_CODE that is datafillable in table OFCVAR. CLF feature for SIP Lines does not support this method of activation.

Please see the note at the end of Section 9.3.2 for the arrangement in Israeli market.

36.3.8 Interactions

There are no new interactions introduced by this feature.

36.4 B-Party Control on ETSI ISUP for SIP Lines in International Markets

36.4.1 Description

This feature provides the functionality to give the control of the call to the called party where the called party is an emergency service line.

B-Party Control on ETSI ISUP for TDM IBN Lines was handled by activity AJ5441. This activity brings the same functionality to SIP Lines.

When a call is made from a SIP Line to an emergency service (CLASS=EMRG), and the caller goes on-hook, the network resources from the emergency's line to the Session Server of the calling SIP Line will be held. When the caller tries to make a new connection, it will be connected back to the existing held connection.

The resources will be held until either the terminating line goes on-hook or the timer expires.

36.4.2 Hardware Requirements or Dependencies

Not Applicable.

36.4.3 Software Requirements or Dependencies

This feature has dependency on feature "A00012402 - SIP Lines: 911 Hold/ Ringback" for the Session Server load.

36.4.4 Limitations and restrictions

In TDM activity "AJ5441 - B-Party Control on ETSI ISUP", it is also required that CALLCTRL should be set to CALLED in table OFCHEAD to give the call control to the called party. This is because in TDM IBN lines, the Call Control can have 3 separate values: CALLING, CALLED and MUTUAL. However in SIP Lines, the Call Control is always MUTUAL. It is unnecessary to check if the CALLCTRL is CALLED here. Therefore, this requirement has been taken off the requirements list here with the agreement of PLM.

36.4.5 Interactions

There are no new interactions introduced by this feature.

37: Functional Description (FN): A00012511

37.1 Feature name and Feature ID

A00012511: SIP Services: Payment Ceiling Advice (PCA)

37.2 Description

The following two sections summarize Payment Ceiling Advice (PCA).

37.2.1 NAOC (Tariff Database Part)

Network Advice Of Charge (NAOC) implements the tariffing of calls over the network boundaries. Two network configurations are supported:

1. It operates in a single/multiple carrier environment, where the originating exchange is able to determine the tariff. This improves the performance and reduces the messaging over the network (see Figure , ""). This is generic functionality which supports all versions of ETSI ISUP interconnection trunks.
2. It operates in a multiple carrier environment, where the originating exchange (named Charged Generation Point, CGP) does not know the tariff that will be applied to the call for every call, so it has to retrieve the information over the network from the selected carrier's exchange (called Charge Determination Point, CDP, see Figure 2, "NAOC messages are exchanged between different networks (Germany only)").

Figure 1 CGP tracking for a Combined CGP and CDP is supported (generic)

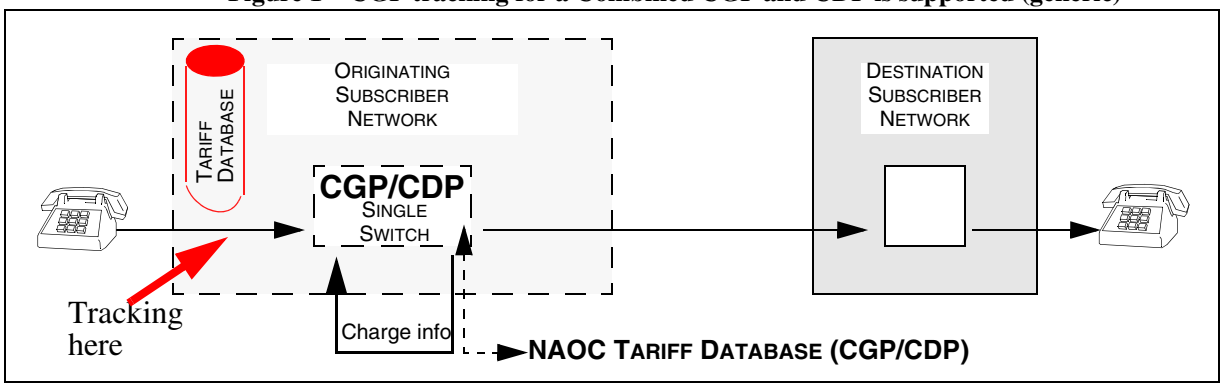

Figure 2 NAOC messages are exchanged between different networks (Germany only)

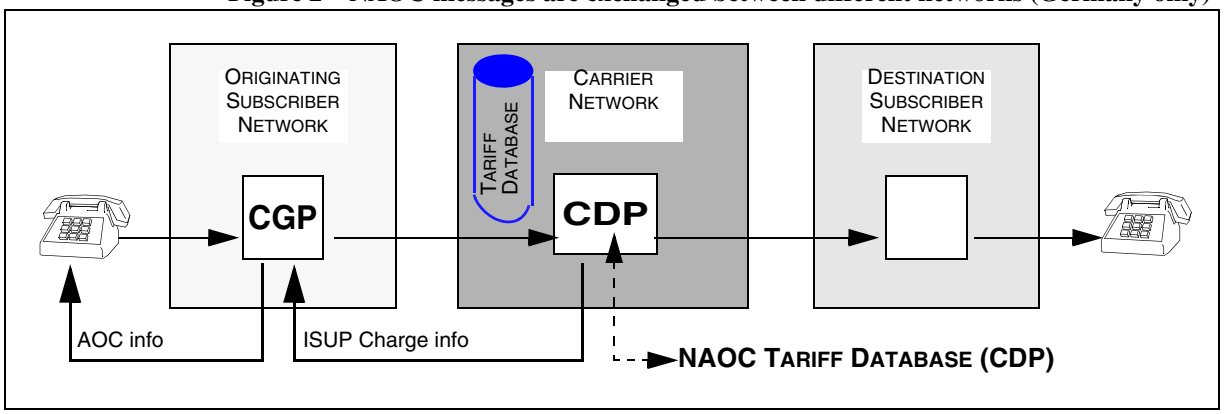


37.2.2 PCA (Hot Billing Part)

A SIP line may request that the PCA option be added to his or her directory number (DN). When ordering this service, the subscriber must specify a particular payment ceiling amount. This amount applies to each of the subscriber's billing cycle (generally every 29 - 32 days, but it can be any period of the year in terms of PCA). If no billing cycle is provided, the subscriber's account will never get reset.

PCA comes with the following abilities:

- When performing a call, the subscriber's charges are counted during the call and written into the PCA database (PCADB) at the end of the call. This operation is done in real time, so that PCA can provide hot-billing abilities.
- The PCA database can be queried at any point of time to retrieve the information regarding a specific subscriber's account.
- The PCA database information can be displayed in either currency units or virtual pulses (which correspond to 1/1000 of one currency units)
- Complex tariff structure described by the NAOC tariffs is fully supported.
- Several complex call scenarios are supported.
- PCA database can be automatically reset based on the provisioned information.
- PCA Essential functionality prevents a subscriber from originating line-to-ETSI ISUP calls that do not provide PCA charging information.
- PCA tracking per access provides a possibility to use one base DN for multiple lines with separate DNs. That is, call charges for all lines of that access are tracked via one dedicated DN (referred to as base DN).
- Announcements are provided for approaching or exceeding the PCA limit:
    - Prepaid or tracking phone bill

  - When a subscriber approaches the PCA limit by exceeding the 80% PCA limit, he hears a (provisionable) announcement he is approaching his limit (80% announcement).
  - When he exceeds his PCA limit, he hears the announcement, that he exceeds his limit. Depending on the datafilled information, he might not be able to do any additional phone calls (prepaid) or only some specific call classes (100% or mid-call announcement).
- Bonus notification
  - When a subscriber exceeded the 80% limit, he hears an announcement that encourages him to perform additional calls to get the discount.
  - When he exceeded his PCA limit, he hears the announcement that he qualified to get a bonus.

- PCA supports prepaid functionality and selective force release:
  - Prepaid
    - When exceeding his PCA limit, the subscriber cannot perform any calls except emergency calls and charge free calls.
    - When the prepaid account expires, the account is reset, so that the subscriber cannot perform any calls except emergency calls and charge free calls.
  - Selective force release
    - Depending on the datafilled information, only specific call classes are allowed after the subscriber reached his PCA limit during a call or during the last call.

For more details please refer to the following activities:

a. A59034497 - Payment Ceiling for Succession International Integrated Access-Cable

b. A59039121 - NAOC and PCA Feature Interworkings with 3WC, CFx, HOLD and CWT

c. A89007461 - Payment Ceiling Regulatory Enhancements

37.3 Hardware Requirements or Dependencies

None.

37.4 Software Requirements or Dependencies

None.

37.5 Limitations and restrictions

The limitations and restrictions introduced by the above activities (A59034497, A59039121, A89007461) are all inherited by this activity. In addition to these:

- Metering for more than 2 sessions are not supported.

37.6 Interactions

37.7 Glossary

Term	Description
NAOC	Network Advice Of Charge
PCA	Payment Ceiling Advice
SIP	Session Initiation Protocol

38: Functional Description (FN): A00012847

38.1 Feature name and Feature ID

A00012847: CS2K DPNSS Message Waiting Indicator for UMS

38.2 Description

The UMS (Unified Messaging Server) optionally connects via SIP or SMDI to the CS2K and will send MWI activation or deactivation requests as appropriate to the CS2K where they will enter the CS2K core software component ‘EMWI’. The EMWI framework has two concepts:-

Controlling User - *The user that activates and deactivates the message waiting indication - i.e., the Voice Mail System.*

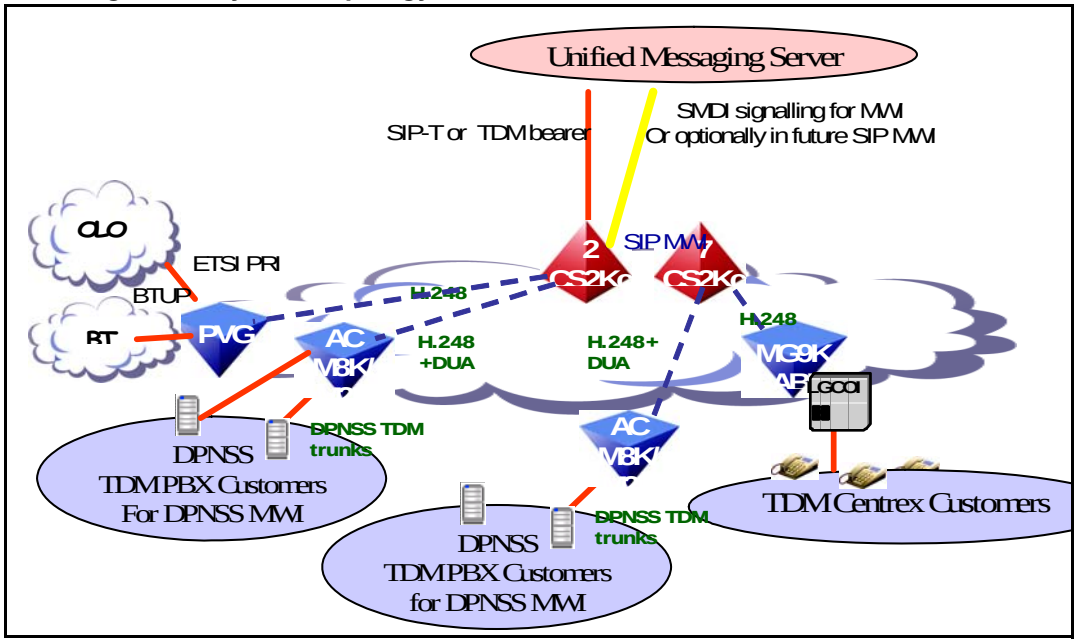
Receiving User - *(served user) The user that receives the message waiting indication - i.e., the PBX Line connected to CS2K via DPNSS.*

This feature provides the new functionality inside the EMWI component for these requests to be mapped by the CS2K software and transmitted using native DPNSS signalling[1] to the PBX where the end user’s line would have the message waiting lamp light up, or be extinguished. Therefore, this feature provides DPNSS Receiving User functionality.

The feature is controlled by SOC code PBXA0022

[1]Through a suitable DUA gateway such as the Nortel MG3200, or DTCOi for MMP.

Figure 1 System Topology



38.2.1 Configurable NSI Strings per DPNSS trunk group

The DPNSS specification does not standardize the contents of the NSI (Non-Specified Information) string that is sent to the PBX in the Layer 3 DPNSS ISRM message to indicate MWI activation or deactivation.

This has led to PBX systems using different NSI strings, and so is born the requirement for the activation and deactivation NSI strings to be defined in the CM such that they can be selected per DPNSS trunk group.

In order to increase compatibility between Nortel products (Nortel CS2K & Nortel M1 PBX) and to minimize the amount of 'datafill work' by the customer, the CS2K will create a 'default' tuple, set to the activation and deactivation strings used by the M1 PBX. All DPNSS trunks will use this NSI string unless overridden.

If the NSI string is required to be overridden for a particular trunk group, then a new tuple would be added in new table DPNSSNSI to map the MWI NSI strings to a particular NSINAME, and then an entry in TRKOPTS to map the NSINAME to a particular trunk CLLI.

For example, the datafill for a customer that has a Nortel M1 and a Plessey/ GPT ISDX (connected over CLLI DPNSSISDX1) would be as follows:-

TABLE DPNSSNSI

```
NSINAME OPTION
--------------
DEFAULT   (MWI ( ACT B N N 1) (DEACT B N N 0)$)$
ISDX      (MWI ( ACT B A N 1) (DEACT B A N 0)$)$
```

TABLE TRKOPTS

```
OPTKEY      OPTINFO
-------------------
DPNSSISDX1  DPNSS DPNSS (NSINAME ISDX) $
```

The craftsperson can alter the information in the DEFAULT tuple, but will receive the warning:-

```
** WARNING ** : Changes to DEFAULT tuple detected.
These changes will affect all DPNSS trunk groups that
have not had their CLLI overridden with the DPNSS
NSINAME option in table TRKOPTS. You have been
warned.
```

Table 1 DPNSSNSI Table Specification

Field Name & Hierarchy			Description & Format		Mandatory
NSINAME			Table Key	= 16 Chars	Yes
OPTION			Options list, currently 1 option of MWI		
	MWI		Message Waiting Indicator		Yes
		ACT	Activation NSI String		Yes
			Vector of 4 parameters		
			SIS_ID_SUFFIX	= 1 Char	
			MFR_ID	= 1 Char	
			MFR_SERVICE	= 1 Char	
			OTHER_PARM	= 3 Chars	
		DEACT	Deactivation NSI String		Yes
			Vector of 4 parameters		
			SIS_ID_SUFFIX	= 1 Char	
			MFR_ID	= 1 Char	
			MFR_SERVICE	= 1 Char	
			OTHER_PARM	= 3 Chars	

Table Restrictions & Notes

- Table can support up to a maximum of 255 tuples.
- The default tuple cannot be deleted.
- It is recommended that the NSINAME reflect the type of PBX.
- The format of the NSI Activation & Deactivation string is as follows:-
  `*58<SIS_ID_SUFFIX>*<MFR_ID><MFR_SERVICE>*<OTHER_PARM>#`

  *e.g., the DEFAULT entry of 'B N N 1' would be sent as *58B*NN*1#*

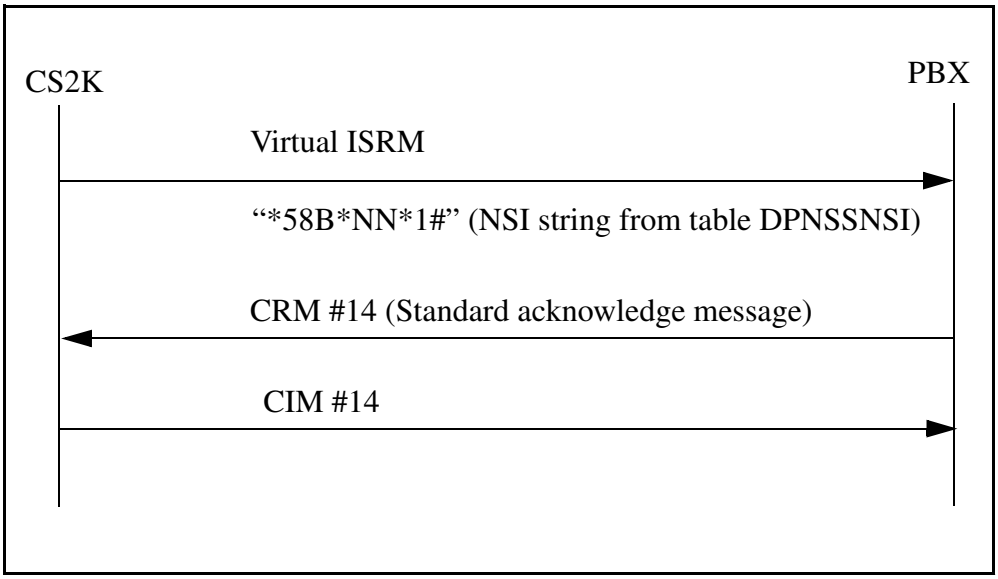
Table 2 Manufacturer Identities

MFR_ID	Manufacturer
A	GEC-Plessey
B	BT/E
C	Mitel
D	GEC-Plessey
E	STC
F	Ferranti
G	Philips

MFR_ID	Manufacturer
H	AT&T
I	IBM
J	Ericsson
K	GEC-Plessey
L	BT
M	Siemens
N	Nortel

11.2.1 DPNSS Signalling to convey the MWI command

The Layer 3 DPNSS signalling that is generated to convey the NSI string to the PBX will use a Virtual DPNSS trunk with the NSI string in the ISRM message. E.g.:-



When the PBX receives the ISRM message, it will then translate the destination digits in the message to find the line, and then parse the NSI string to decide if the line should have it’s message waiting lamp light up, or be extinguished.

Here is an example of the DPNSS Layer 3 bytes for activating MWI on the PBX line 4506070 using the DEFAULT NSI:-

```
Msgcode: #00 ISRMC(INITIAL SERVICE REQUEST
(COMPLETE))
          10 2A 31 23 2A 35 38 42 2A 4E
<.*1#*58B*N>
          4E 2A 31 23 34 35 30 36 30 37
<N*1#450607>
          30                              <0          >
```

11.3 Hardware Requirements or Dependencies

No new hardware requirements or dependencies are introduced by this feature.

11.4 Software Requirements or Dependencies

No new software requirements or dependencies are introduced by this feature.

11.5 Limitations and restrictions

Because this feature reside in the native DPNSS stack on the CM, it is compatible with MMP/hybrid solutions (e.g., DTCOi) or with CS2K solutions using DUA gateways (MG3200).

The feature is not compatible with the Westell DPNSS gateway as this is not true DPNSS in the CM.

11.6 Interactions

No interactions between this feature and others are introduced.

39: Functional Description (FN): A00013275

39.1 Feature name and Feature ID

A00013275: SESM Flex Large Line GWC Profile Support - Phase 1

39.2 Description

This feature provides generic support for large line gateways supporting up to a maximum of 2047 endpoints within a single virtual media gateway. This is initially aimed at supporting the Audiocodes TP6310 card as used within the Mediant 8000 chassis on behalf of C&W.

Additionally support is provided for the Audiocodes TP6310 card when configured as a trunk carrier gateway in order to support DPNSS.

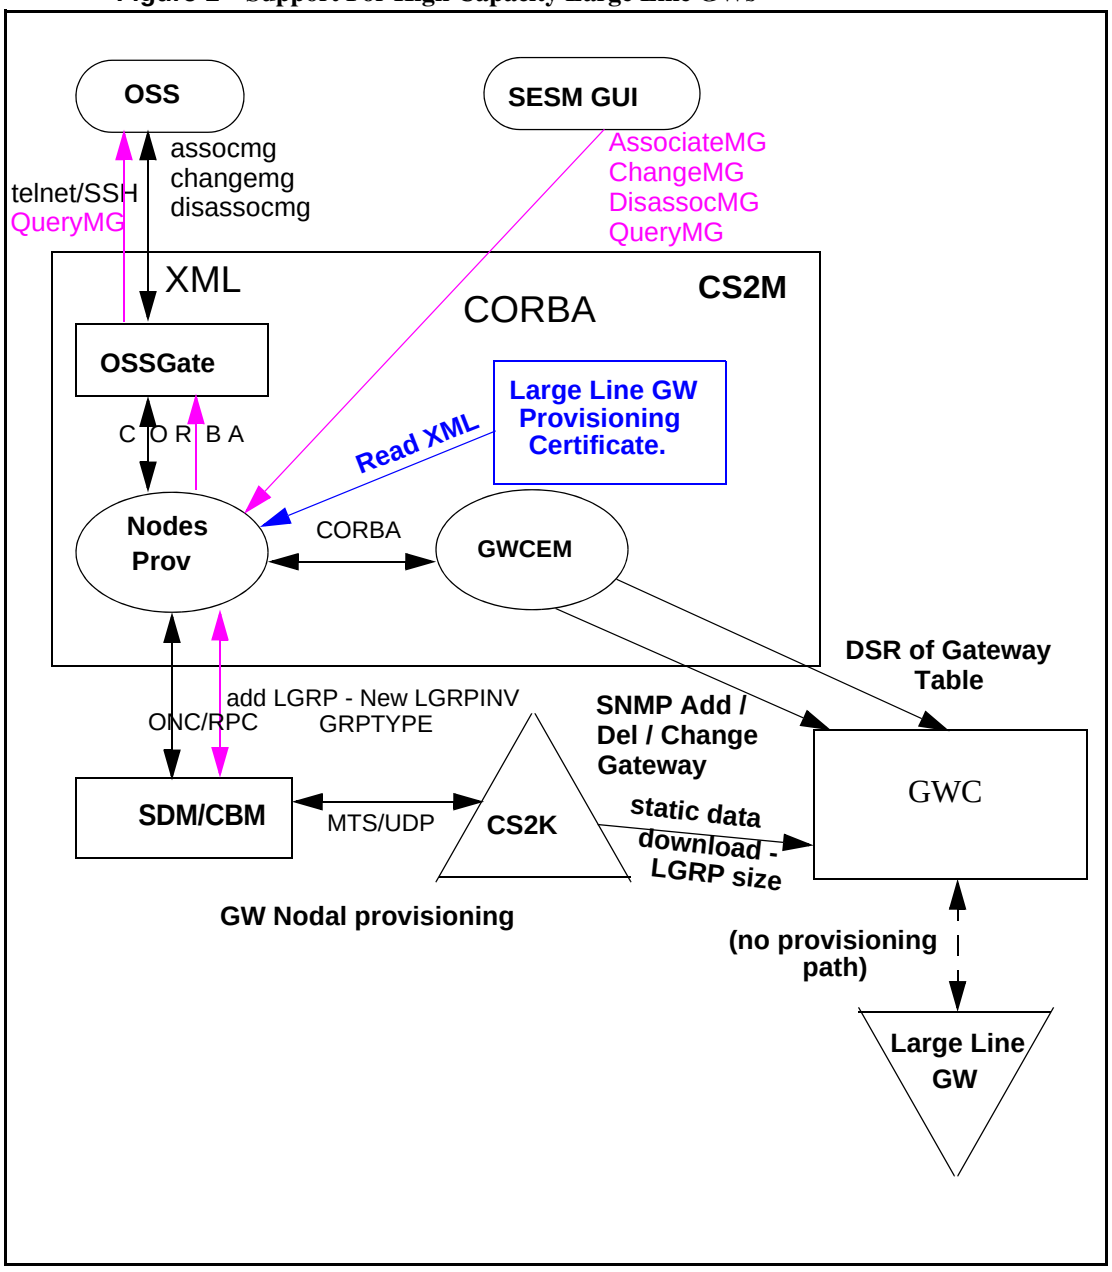
The support for the Audiocodes TP6310 configured as a trunk gateway is restricted to this feature only, the corresponding associated GWC and CM features only cover the TP6310 when provisioned as a high capacity large line GW.

Prior to this feature large line gateways were limited to a maximum of 1024 endpoints, and in situations where additional endpoints were required this has been modelled by treating the gateway as multiple gateways from the perspective of the CM - examples being the CICM and SIP voice gateways.

This feature adds the following functionality to the CS2M:

- Support for the Audiocodes TP6310 card provisioned as a large line GW for use in the Mediant 8000 Gateway chassis.
- Support for the Audiocodes TP6310 card provisioned as a trunk GW for use in the Mediant 8000 Gateway chassis.
- Support for large line GWs of capacity <= 2047 endpoints.
- Support for both International and North American market fit.
- Support for both 750 and 905 GWC types.

Figure 1 Support For High Capacity Large Line GWs



39.2.1 Pre-Requisites

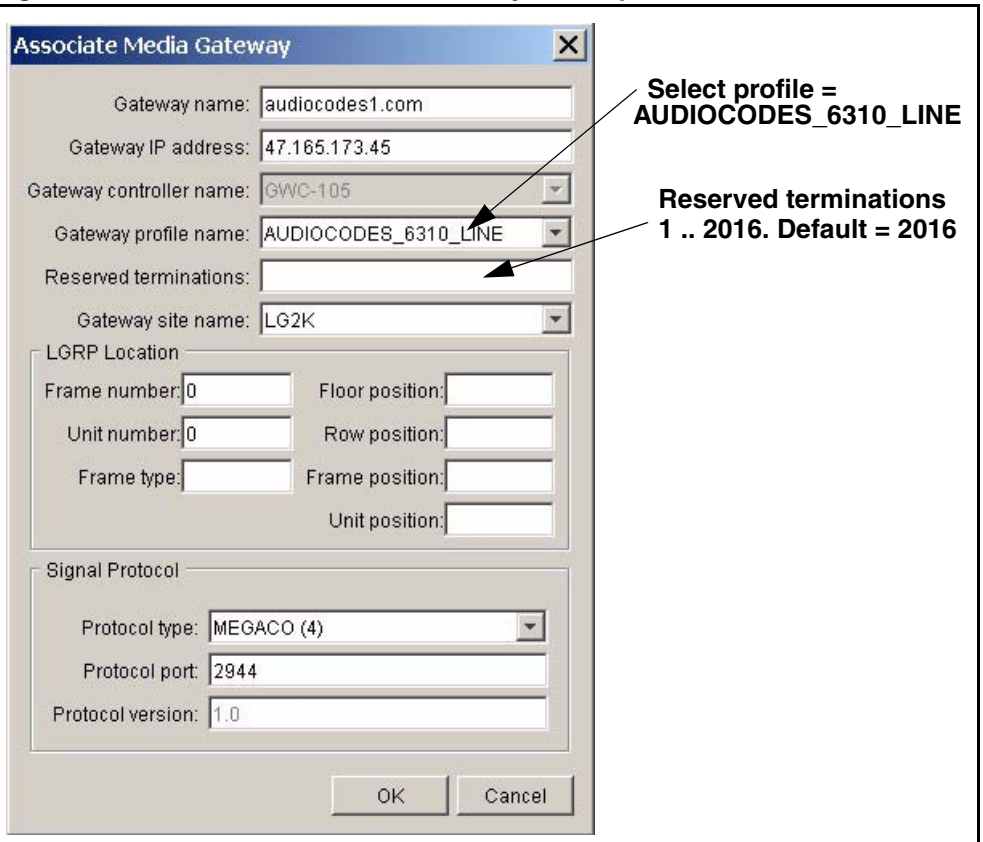
The following pre-requisites must be met before attempting to provision an Audiocodes M8K GW:

- The CS must be running an SN09.1 or later load.
- The CS2M should be running the SESM SN09.1 or later load.
- The GWC which will host the Audiocodes M8K GW must be provisioned with a profile supporting Large Line GWs and must be running the SN09.1 or later load.

39.2.2 Provisioning Of Audiocodes TP6310 Large Line GW - GUI Interface

Provisioning of the Audiocodes TP6310 Large Line GW is similar to existing 3rd party line GWs. The provisioning of 3rd party line type GWs is as per SN08 features A00007071 and A00007072. On selecting the "AUDIOCODES_6310_LINE" profile the Associate Media Gateway dialog will be populated as follows:

Figure 2 CS2M Associate Media Gateway GUI Population For TP6310 Line GW



The Audiocodes TP6310 is a 3rd party GW. This means that the provisioning crafts person must define the LGRPINV tuple to be provisioned at the CM.
The LGRPINV tuple consists of Site + Frame + Unit. In this example we are specifying and LGRPINV tuple of "LG2K 0 0".

Table 1 Associate Media Gateway Field Population

Field	Contents
Gateway name	Provisioned GW Name. Max 32 characters. Follows DNS naming convention.
Gateway IP address	IP address for Audiocodes GW
Gateway controller name	GWC-nnn Name of a valid GWC provisioned with a large lines supporting profile.
Gateway profile name	AUDIOCODES_6310_LINE for TP6310 card as large line GW
Reserved terminations	In range 1 .. 2016. Defines number of terminations to reserve for use with this GW. If the field is left empty the default behaviour is to reserve 2016 terminations.
Gateway site name	From CM table SITE. Chosen site must be capable of supporting manually provisioned LGRPs of size 2048 (maximum 2047 endpoints)
Frame number	Logical frame number in range 0 .. 511 Combines with Site and unit number to form LGRP. The combination of all 3 must be unique.
Unit number	Logical unit number in range 0 .. 9 Combines with Site and Frame number to form LGRP. The combination of all 3 must be unique
Protocol type	MEGACO - H.248
Protocol port	defaults to 2944 but may be edited if desired
Protocol version	Fixed to version 1.0

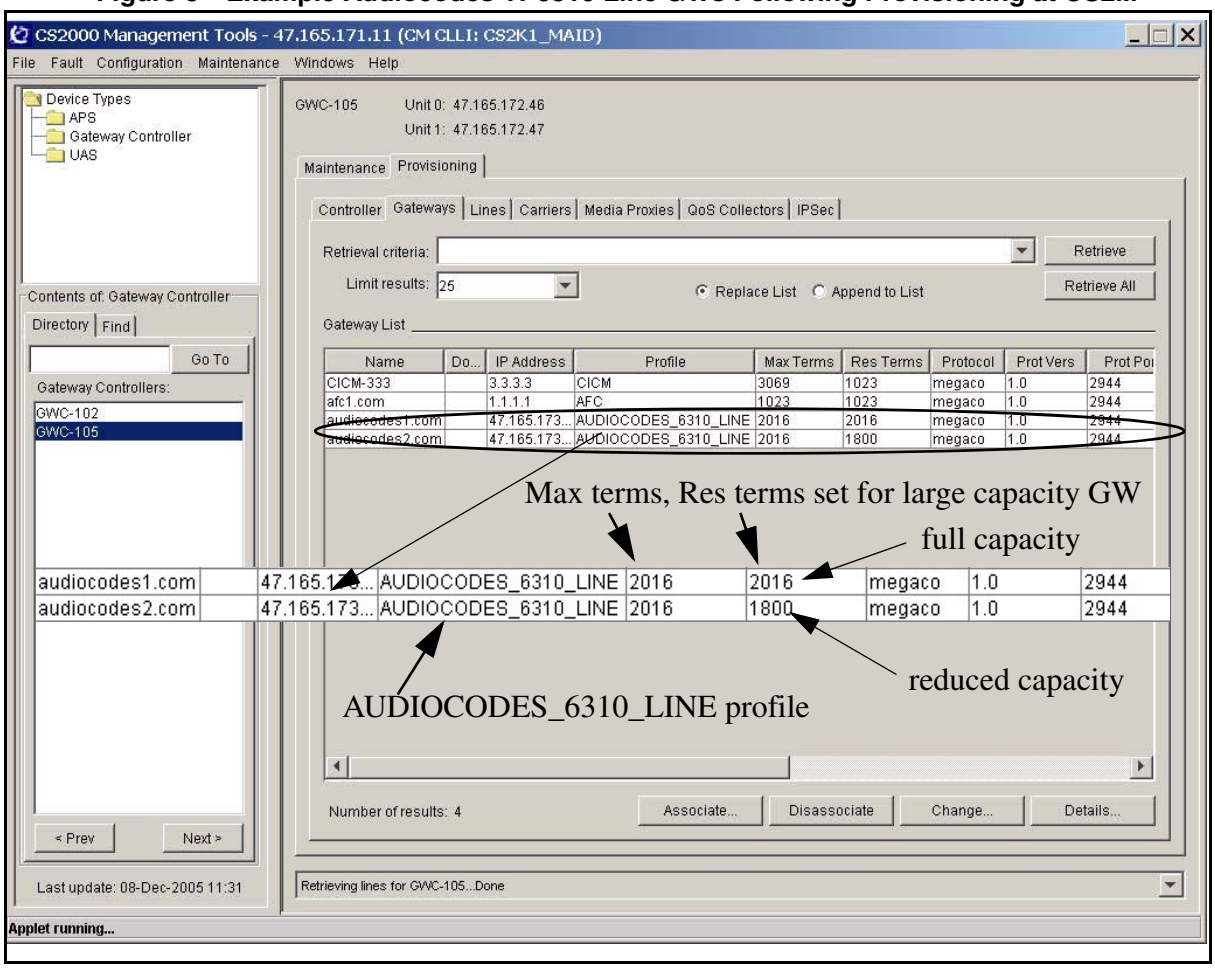
Following successful provisioning of the Audiocodes TP6310 Line GW, the following will have occurred:

- GW will have been created at GWC.
- LGRP entry will have been created at CM.
- GW will exist within CS2M database.
- GW will be displayed at CS2M GUI (upon gateway list refresh).

Initially there will be no endpoints and associated LENs provisioned at the GWC or CM, however the capacity to provision the required number of terminations will have been reserved.

The following figure shows an example of 2 provisioned Audiocodes GW as displayed by the CS2M Gateway List GUI.

Figure 3 Example Audiocodes TP6310 Line GWs Following Provisioning at CS2M



The Audiocodes TP6310 large line GWs when provisioned have LGRPs of size 2048. This will have a direct impact on the number of gateways addressable by a GWC. The rules governing the number of provisionable GWs with relation to LGRP size are as follows:

- 1024 size LGRPs - Max 27 large line GWs.
- 2048 size LGRPs - Max 13 large line GWs.
- GWs comprising multiple LGRPs are considered to be multiple GWs from the perspective of this discussion.
- Number of supported GWs independent of reserved terminations.
- Total number provisionable large line GWs between 13 and 27 dependant on mix of 1024 and 2048 size LGRPs.

As the Audiocodes TP6310 large line GW requires the provisioning of a 2048 size LGRP, this will reduce the capability of a given GWC to support new GWs by 2.

39.2.3 Deprovisioning Of Audiocodes TP6310 Large Line GW

Deprovisioning of the Audiocodes TP 6310 Large Line GW uses the standard "Disassociate Media Gateway" GUI interface or the disassocmg XML interface from OSSGate.

As this type of gateway is treated as 3rd party for endpoint creation and deletion the user must ensure that all endpoints for the target GW are removed from the system prior to attempting the deletion operation.

39.2.4 Modifying An Audiocodes TP6310 Large Line GW

The only change interface supported in this release is the "change gateway capacity" interface to modify the number of reserved terminations.

Specifying Root / Adjacent ITRANS zones is currently unsupported for the Audiocodes TP6310 Large Line GW.

39.2.5 Provisioning Of Audiocodes TP6310 Large Line GW - OSSGate XML Interface

Provisioning of the Audiocodes TP6310 Large Line GW using the OSSGate XML interface is unchanged by this feature. Please refer to the OSSGate documentation for details of this interface.

39.2.6 Querying Of Provisioned GWs via the OSSGate XML Interface

The response from the queryMG interface is unchanged by this feature. Please refer to the OSSGate documentation for details of this interface.

39.2.7 Provisioning Endpoints For The Audiocodes TP6310 Large Line GW

Before an Audiocodes TP6310 Large Line GW endpoint may be used it must first be pre-provisioned. The pre-provisioning is a manual activity using the OSSGate or bulk provisioning tool functionality introduced by feature A00007072 to support 3rd party GW endpoint provisioning.

The reader of this document should be fully conversant with the information specified in the FN of feature A00007072 and the OSSGate user guide as we will only cover that information of direct relevance to the Audiocodes TP6310 Large Line GW here.

Examples for the addition and deletion of an endpoint associated with an Audiocodes TP6310 Large Line GW are shown in Figure 4 and Figure 5.

Figure 4 Example addLineEndpoint Request For Audiocodes TP6310 Large Line GW

```
<?xml version=”1.0” encoding=”UTF-8”?>
<CommandList>
        <Command>
                <Interface>cs2kCfgMgrIf</Interface>
                <Methods>
                <addLineEndpoint usn=”1” version=”1.0”>
                <Parameters>
                <mgUIName>audiocodes1.com</mgUIName>
                <endpointName>tp/2016</endpointName>
                <circuitNumber>2015</circuitNumber>
                <cardCode>GWLPOT</cardCode>
                <padGroup>PKNIL</padGroup>
                <ground>N</ground>
                </Parameters>
                </addLineEndpoint>
                </Methods>
        </Command>
</CommandList>
```

Multiple addLineEndpoint operations may be submitted as part of a single XML document

Figure 5 Example delLineEndpoint Request For Audiocodes TP6310 Large Line GW

```
<?xml version=”1.0” encoding=”UTF-8”?>
<CommandList>
        <Command>
                <Interface>cs2kCfgMgrIf</Interface>
                <Methods>
                <delLineEndpoint usn=”1” version=”1.0”>
                <Parameters>

                <endpointName>tp/2016</endpointName>
                </Parameters>
                </delLineEndpoint>
                </Methods>
        </Command>
</CommandList>
```

Multiple delLineEndpoint operations may be submitted as part of a single XML document

39.2.7.1 Audiocodes M8K Shelf Brief Overview

The Audiocodes M8K GW shelf is comprised of one or more STM-1 / OC-3 TP6310 or lower capacity TP1610 cards.

The TP1610 can be used to support Trunk carriers and makes use of the existing AUDIOCODES profile (2 x AUDIOCODES profile trunk GWs per TP1610 card). This will not be discussed further as it is existing functionality.

The TP6310 can be configured for use as either a Trunk or a high capacity Large Line GW. The configuration of the TP6310 as a Trunk GW is considered later in this document - see section 12.2.14 on page 608. The remainder of this section refers only to the use of the TP6310 as a Large Line GW.

When operating in line mode each TP6310 card can terminate 2016 POTS type lines via additional external demuxing.

Each TP6310 card in the Audiocodes M8K shelf operates as a separate independent gateway with its own unique IP address / protocol port, and will therefore be treated as a separate gateway by the CS2M and subtended GWC modules. Therefore the Audiocodes TP6310 Large Line GW as described by this document refers to a single TP6310 card configured within an M8K shelf to terminate lines.

The CS2M may have multiple Audiocodes TP6310 GWs provisioned which are in fact all line cards within a single Audiocodes M8K shelf. This is analogous to multiple independent CICM GWs occupying a SAM21 shelf.

The Audiocodes TP6310 Large Line Gateway must be configured via the Audiocodes element manager to expect the endpoint naming convention and range as present in this document so as to match what the CS2M is expecting to provision.

39.2.7.2 Endpoint Naming Convention

Endpoints as provisioned on the Audiocodes TP6310 Large Line GW will be of the following format:

tp/nnnn where:

- nnnn = endpoint number on card with nnnn in the range 1 - 2016.
- nnnn is not padded (no leading zeros for padding to 4 digits).

As an example the endpoints for a TP6310 Large Line GW will be as follows:

tp/1, tp/2, tp/3.... tp/2014, tp/2015, tp/2016.

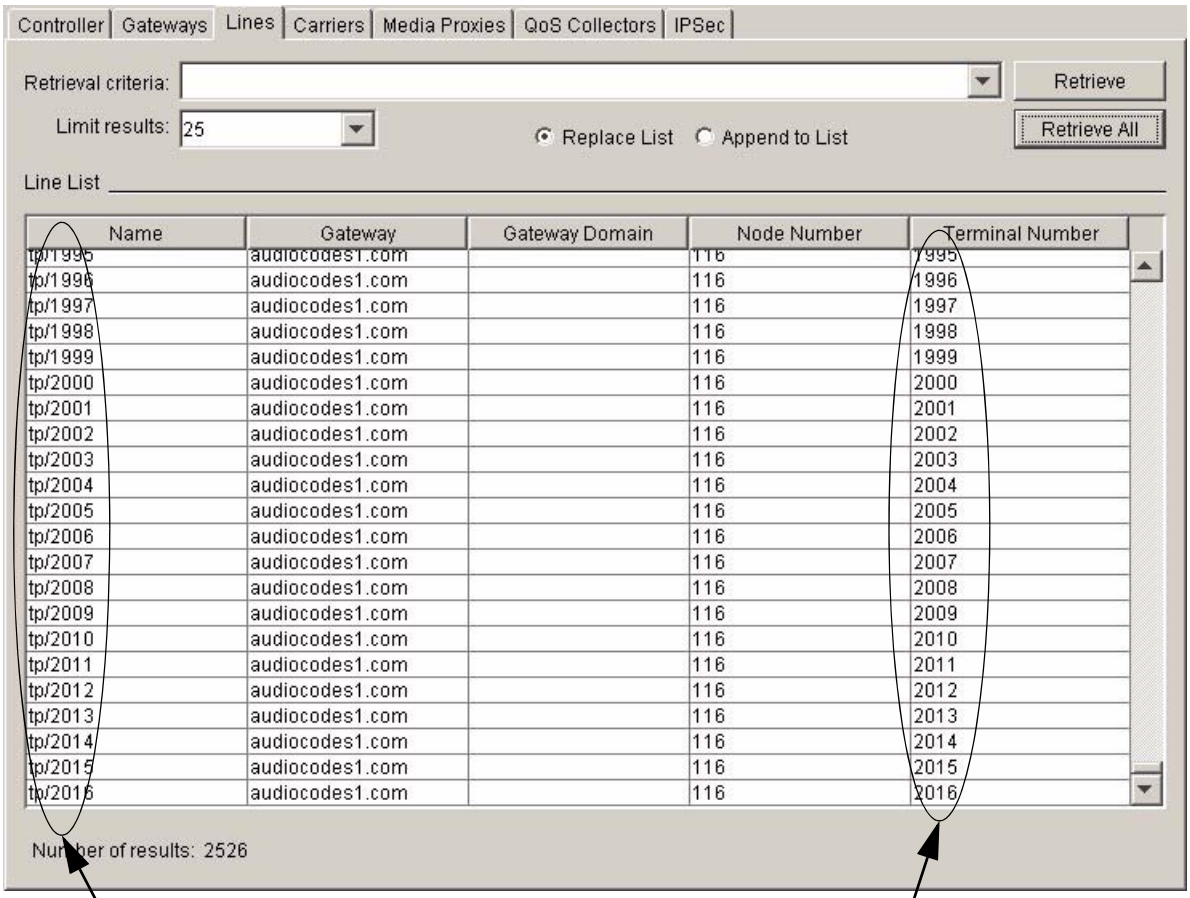
39.2.7.3 Circuit Number Allocation

The 3rd party GW provisioning interface allows flexible allocation of the LEN circuit number (and hence endpoint terminal number) independently of the endpoint name. The circuit number allocated for an endpoint must be unique and in the range 0 - 2046. This identifies directly the LEN to be created.

It is recommended that the circuit number be equal to the endpoint “nnnn” component -1. This will allow for easy correlation of endpoint to LEN and assist with maintenance. For example tp/1 associated with LEN <LGRP> 00 00.

39.2.8 Lines Panel Indication Extended Endpoint Range

Figure 6 Extended Endpoint Range Display At Line List Tab



Due to the larger LGRP size supported for the Audiocodes M8K, additional endpoints are directly addressable. This results in the endpoint range being increased for this GW as opposed to a normal pre SN09.1 GWs such as AFC.

Figure 6 shows the display of additional endpoints for the Audiocodes TP6310 Large Line GW provisioned using a 2048 size LGRP. Supported endpoints will be in the range tp/1 to tp/2016.

> ***Note:*** Total number of possible endpoints is 2047 for the 2048 member LGRP as one TID will be reserved for signaling purposes.

39.2.8.1 Mapping Endpoint to LEN:

The mapping of endpoint to LEN is performed based on the terminal number which in turn is considered GW type independent. For the Audiocodes TP6310 Large Line GW there is no guaranteed logical mapping between the endpoint name and its associated terminal number. This is due to the terminal number being generated from the supplied circuit number at provisioning time.

It is recommended that the circuit number be set equal to the endpoint number - 1 at provisioning time to produce a 1:1 mapping but this is not enforced.

For LENs with LGRPType = LL_3RDPTY_2K the endpoint format is as follows:

LENs will be of the format <Node Name> <TT> <tt> where:

- Node Name - LGRPINV entry as auto generated on GW addition. Formed from <Site> <Frame> <Unit> where <Site> is used specified on GW addition, frame and unit are auto allocated.
- TT is in range 00 .. 20
- tt is in the range 00 .. 99 where TT < 20 and 00 .. 46 where TT = 20

For example with LGRP = “LG2K 01 5” the possible range of LENs for the LGRP as a whole will be:

LG2K 01 5 00 00 - LG2K 01 5 20 46 dependant on circuit number allocation.

It is recommended that the circuit number be tied to the endpoint name which would mean the range of recommended LENs for an Audiocodes TP6310 Large Line GW is:

LG2K 01 5 00 00 - LG2K 01 5 20 15.

The corresponding Terminal numbers will be as follows:

terminal number = (TT x 100) + tt + 1

And the reverse mapping will be:

TT = terminal number - 1 - tt

tt = (terminal number - 1) MODULUS 100

Assuming the recommendation on allocating circuit numbers at endpoint provisioning is followed, the endpoint name would be directly generated from the terminal number as:

tp/<terminal number>.

39.2.9 Line Provisioning Using the SERVORD+ Interface

Line provisioning using the servord interface is unchanged by this feature. Lines may be provisioned using either LENs or endpoints as specified in the OSSGate documentation.

The OSS must however take into account the extended endpoint / LEN range introduced for the Audiocodes TP6310 Large Line GW.

39.2.10 Audits - CS2K and Line Audit

The CS2K Data integrity audit and Line Data integrity Audit are unchanged by this feature.

Please be aware that the Line Data Integrity Audit will report a greater range of lines where an Audiocodes TP6310 Large Line line GW is provisioned due to the greater capacity supported by this GW type.

39.2.11 Line Maintenance Manager

There will be no functional changes to the Line Maintenance Manager introduced by this feature. Currently Large Line H.248 gateways are unsupported by the Line Maintenance Manager. This restriction will apply equally to the Audiocodes TP6310 Large Line gateway.

39.2.12 Bulk Provisioning Tool

The bulk provisioning tool used for provisioning line data fill will not be impacted by this feature. Line provisioning for the Audiocodes TP6310 Large Line GW is supported as is, however the range of valid LENs / endpoints is increased in accordance with the additional endpoint / LEN range.

39.2.13 Third Party Gateway Profile Certificate Changes

Third party gateway certificate profiles produced to support new large line type gateways generated in accordance with the guidelines for feature A00007071 and A00007072 are now required to indicate the size of CM LGRP to be generated to support the new GW. In addition the LGRP generated may be 1 of 2 sizes:

1024 - identical to all releases prior to SN09.1

2048 - double sized for higher capacity large line GWs.

A new tag value pair <LgrpSize>value</LgrpSize> is introduced to the certificate XSD to carry size information. This should be set to 1024 or 2048. The higher capacity size of 2048 should only be used where absolutely necessary as this will reduce the provisionable number of GWs that can be associated with a given GWC.

The value of the <LgrpType> tag value pair must be set to indicate the type of LGRP to be generated at the CM. For 3rd party large line GWs this will be

either LL_3RDPTY or LL_3RDPTY_2K dependant on whether a size of 1024 or 2048 is required.

The certificate files for all new 3rd party large line GWs should therefore contain either of the following entries:

Figure 7 LGRP of Size 2048: Between 1 and 2047 Endpoints Supported

```
<EndpointType>thirdPartyLens</EndpointType>
 <LgrpType>LL_3RDPTY_2K</LgrpType>
 <LgrpSize>2048</LgrpSize>
```

Figure 8 LGRP of Size 1024: Between 1 and 1023 Endpoints Supported

```
<EndpointType>thirdPartyLens</EndpointType>
 <LgrpType>LL_3RDPTY</LgrpType>
 <LgrpSize>1024</LgrpSize>
```

Note 1: LgrpSize tag should directly follow LgrpType

Note 2: If the LgrpSize tag is not present in a certificate the default size of 1024 is assumed to ensure backwards compatibility with existing certificates.

Note 3: Specifying LgrpSize for a non large line GW will result in a corrupt profile alarm being raised and the certificate will not be loaded.

39.2.14 Provisioning Of Audiocodes TP6310 Trunk GW - GUI Interface

The Audiocodes TP6310 card when provisioned as a Trunk GW can be considered as a higher capacity version of the existing Audiocodes Trunk GW as supported in both this and prior releases.

All functionality provided by the existing Audiocodes GW profile is adopted, with the range of possible carriers being increased due to the larger capacity offered by the OC-3 / STM-1 interface supported by this card.

A new gateway profile "AUDIOCODES_6310_TRUNK" is introduced by this feature to support the provisioning of the TP6310 as a Trunk GW. On selecting the "AUDIOCODES_6310_TRUNK" profile the Associate Media Gateway dialog will be populated as follows:

Figure 9 CS2M Assoc. Media Gateway GUI Population For TP6310 Trunk GW

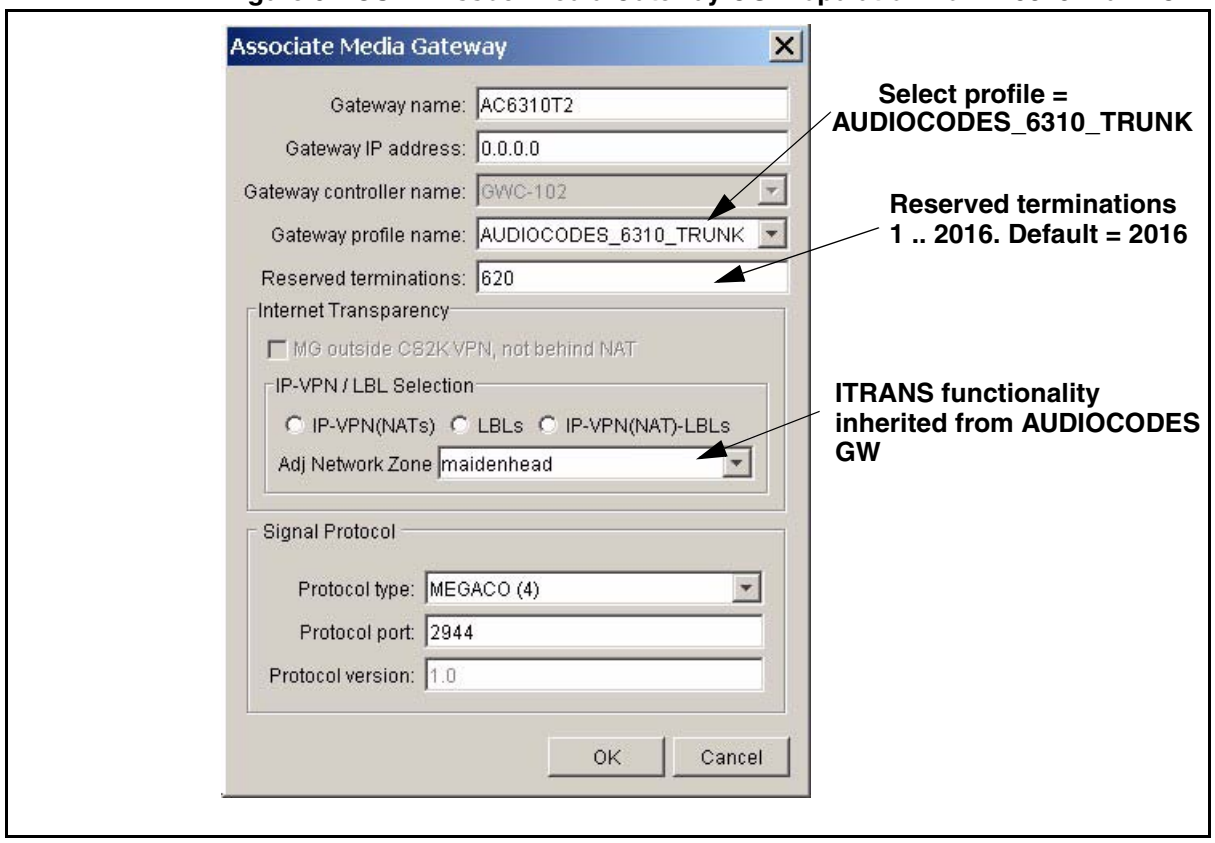


Table 2 Associate Media Gateway Field Population

Field	Contents
Gateway name	Provisioned GW Name. Max 32 characters. Upper case alphanumerical characters only.
Gateway IP address	IP address for Audiocodes GW - or 0.0.0.0 if behind a NAT / LBL
Gateway controller name	GWC-nnn Name of a valid GWC provisioned with a large lines supporting profile.
Gateway profile name	AUDIOCODES_6310_LINE for TP6310 card as large line GW
Reserved terminations	In range 1 .. 2016. Defines number of terminations to reserve for use with this GW. If the field is left empty the default behaviour is to reserve 2016 terminations. As DS1 carriers require 24 terminations and E1 carriers 31 terminations the actual number of reserved terminations should form a multiple of 24 or 31 to avoid wastage. Note: A fully equipped TP6310 Trunk GW with E1 carriers will require 1953 terminations.
Adj Network Zone	ITRANS network zone GW is adjacent to if behind a NAT / LBL.
Protocol type	MEGACO - H.248
Protocol port	defaults to 2944 but may be edited if desired
Protocol version	Fixed to version 1.0

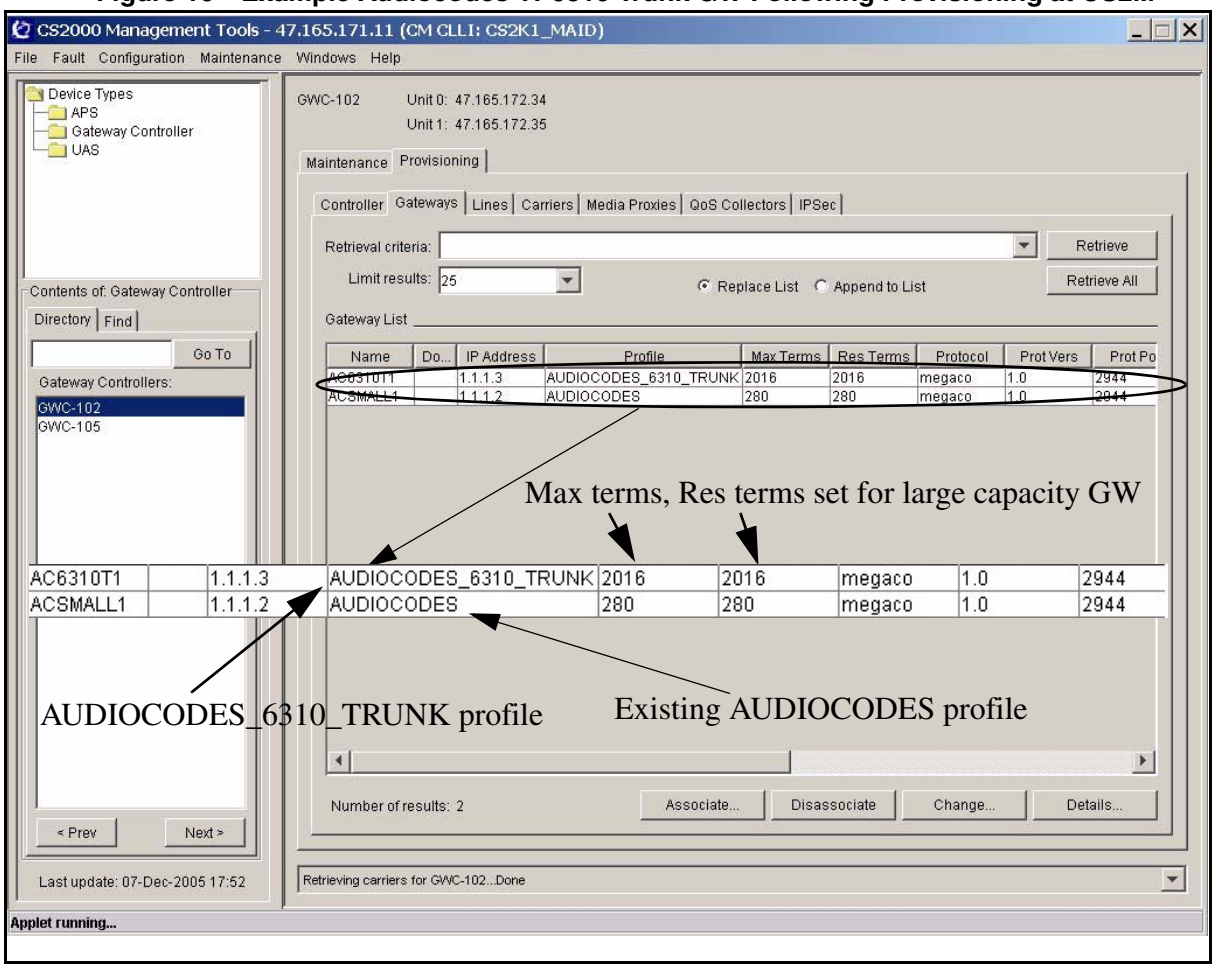
Following successful provisioning of the Audiocodes TP6310 Line GW, the following will have occurred:

- GW will have been created at GWC.
- GW will exist within CS2M database.
- GW will be displayed at CS2M GUI (upon gateway list refresh).

Initially there will be no carriers provisioned at the GWC or CM, however the capacity to provision the required number of carrier terminations will have been reserved.

Figure 10, on page 610 shows an example of 2 provisioned Audiocodes GW as displayed by the CS2M Gateway List GUI.

Figure 10 Example Audiocodes TP6310 Trunk GW Following Provisioning at CS2M



39.2.15 Deprovisioning Of Audiocodes TP6310 Trunk GW

Functionality is identical to existing Audiocodes GW.

39.2.16 Modifying An Audiocodes TP6310 Large Line GW

Functionality is identical to existing Audiocodes GW.

39.2.17 Provisioning Of Audiocodes TP6310 Large Line GW - OSSGate XML Interface

Functionality is identical to existing Audiocodes GW.

39.2.18 Querying Of Provisioned GWs via the OSSGate XML Interface

Functionality is identical to existing Audiocodes GW.

39.2.19 Provisioning Carriers For The Audiocodes TP6310 Trunk GW

The Audiocodes TP6310 Trunk GW supports the provisioning of either E1 or DS1 carriers based on market fit. The trunk range is a super set of that supported by the existing Audiocodes profile.

Carriers may be added / deleted using the existing addCarrier interfaces from either the CS2M GUI or the OSSGate interface.

39.2.19.1 E1 Carrier Provisioning

E1 Carrier support is as follows:

- Carrier range: E1/01 ... E1/63
- Optional DPNSS IID range: 1 .. 63
- Each E1 carrier supports 31 terminations and the appropriate number of terminations must be reserved in advance. A fully equipped TP6310 with E1 carriers will require 63 x 31 = 1953 terminations.

39.2.19.2 DS1 Carrier Provisioning

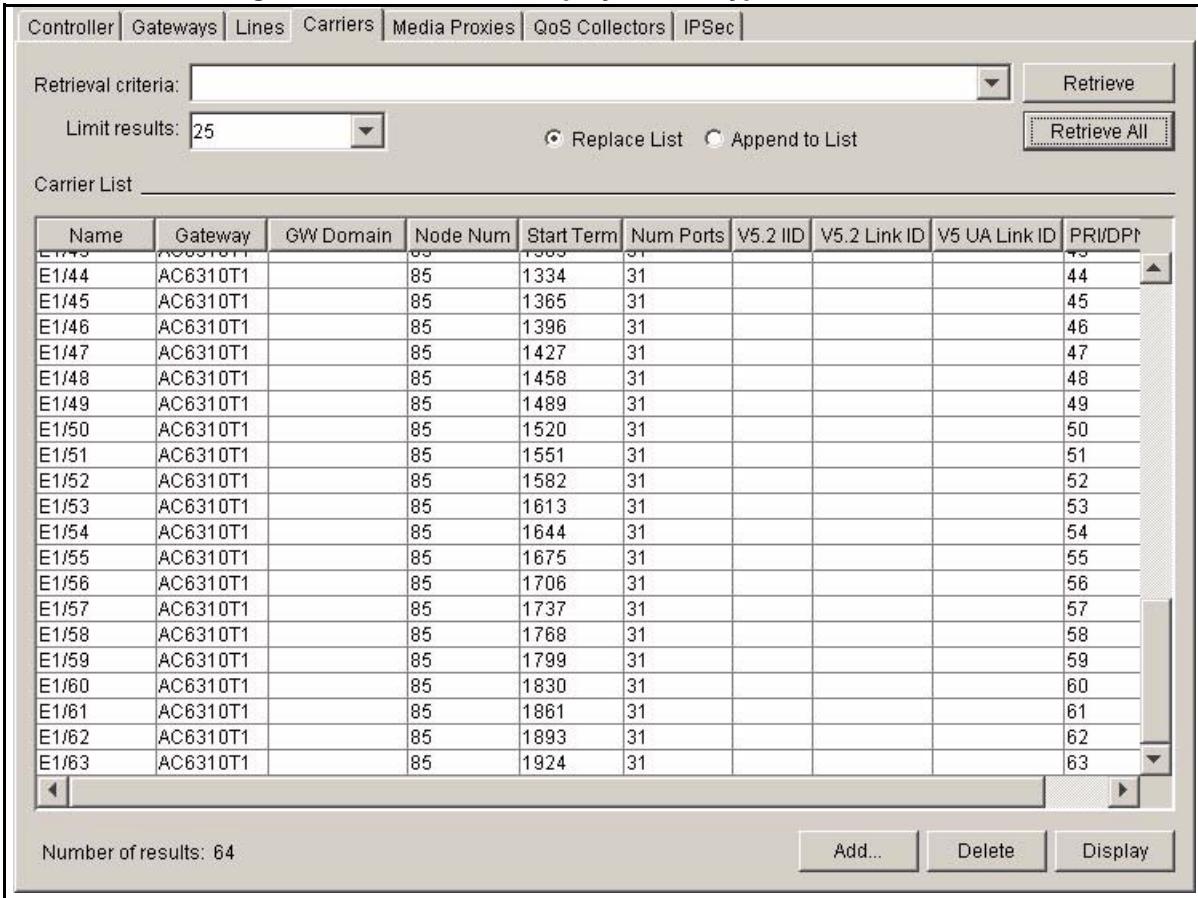
DS1 Carrier support is as follows:

- Carrier range: DS1/01 .. DS1/84
- Optional PRI IID range: 0 .. 31
- PRI IID value must be unique for a given GW.
- Each DS1 carrier supports 24 terminations and the appropriate number of terminations must be reserved in advance. A fully equipped TP6310 with DS1 carriers will require 84 x 24= 2016 terminations.
- PRI IID range upper bound may be set in the range 32 .. 63 as functionality is shared with DPNSS IID although the extended range is not supported.

39.2.20 Carrier Panel - E1 Carriers For Audiocodes TP6310 Trunk GW

The following figure shows the carrier list panel displaying E1 type carriers for an Audiocodes TP6310 Trunk GW.

Figure 11 Carrier List Display For E1 Type Carriers



Carrier names are an extension of that support for the existing Audiocodes GW

39.2.21 Data Logging

There are no changes to data logging associated with this feature.

39.3 Hardware Requirements or Dependencies

This feature requires the presence of an Audiocodes M8K shelf equipped with one or more TP6310 cards for line GW use. Where trunk GW use the M8K should be equipped with either TP1610 or TP6310 cards as appropriate.

39.4 Software Requirements or Dependencies

39.4.1 SN09FF Formal Delivery

Software should be at the following release level or later:

GWC: Gx091FC

CM: PSNW090FC + 2K LGRP Support Patch

CS2M: SESM_091_FC

Note: FC software versions will not be known until the end of the SN09.1 release.

39.5 Limitations and restrictions

Provisioning of large line GWs with 2048 size LGRPs reduces number of provisionable GWs at the GWC.

CM must be patched with the 2K LGRP patch when running the PSNW090FC load (SN09FC). For SN10 onwards this patch will not be required.

40: Functional Description (FN): A00013286

40.1 Feature name and Feature ID

A00013286: Core Flex Large Line GWC Prof (Ph1)

40.2 Description

This feature is intended to address the following requirement:

- Add generic support for 2048 size LGRPs.

The current support for large line GWs has the following restrictions:

LGRPs are always a fixed 1024 elements regardless of the number of endpoints that a GW supports and the actual number of reserved terminations. Currently the available GWC TID size for subtending nodes other than trunks is 27000. So a maximum of 26 LGRPs can be configured per GWC if the existing LGRPs (1024) are used.

Due to time scale and resources issues it is intended that this feature will only address the following issue - specifically adding support for a 2047 size LGRP to be used initially in conjunction with the Audiocodes M8K GW. With the introduction of the new LGRP type, 13 to 27 LGRPs can be provisioned per GWC.

As part of this activity, the following changes will be made:

- Creation of a new LGRP type, LL_3RDPTY_2K which will support 2047 endpoints.
- Enhanced LNINV table to support 2047 LENs for the newly created LGRP type.

The new lgrp is an enhancement of the existing lgrp, LL_3RDPTY. The major difference between the newly created LGRP type, LL_3RDPTY_2K and the existing 3rd party profile, LL_3RDPTY is that, the new type supports 2047 lines per LGRP whereas the existing type supports only 1024 lines per LGRP. Total number of possible endpoints is 2047 for the 2048 member LGRP as one TID will be reserved for signaling purposes.

40.2.1 LGRP Type Data - Table LGRPINV

Table LGRPINV is an existing table that is used to associate a LGRP type to a gateway. This activity shall allow support of a new LGRP type, LL_3RDPTY_2K. The new type will support large line gateways with 2047 endpoints. Total number of possible endpoints is 2047 for LL_3RDPTY_2K as one TID will be reserved for signaling purposes.

The following figure shows sample datafill for table LGRPINV.

Figure 1 Prompting sequence and Range values for LGRPINV table.

Fault Management (FM)

Introduction

This chapter describes impacts to fault management, such as logs and alarms, for the features planned for this release. Only those features with fault-management impacts are listed.

Featid	Title
A000006663.AB02	DDRM Alarms and Audits
A000008556.AA35	SIP Lines Core OAMP support
A00009120.AA17	Multi-Time Zone Enhancements
A000009245.AA12	Succession Test Trunks: T904 Support
A00009282	MG9KEM - International ESA and MLPP Support

1: Fault Management (FM): A00006663

1.1 Feature Name

DDRM Alarms and Audits

1.2 Fault management strategy

Hardware failure alarm messages for DDRM produces PM179 H/W exception report logs on DMS. Reason of the fault can be viewed from MAPCI maintenance level via QUERYPM FLT command. The faulty DDRM hardware is detected in this way and it should be corrected to remove the fault condition on DDRM node.

1.3 Fault management tools and utilities

MAPCI maintenance tools are employed as fault management tools and utilities for DDRM node.

1.4 Logs

1.4.1 Explanation

Log Title: PM179 HW EXCEPTION REPORT

Name: PM HW EXCEPTION REPORT

Description: PM hardware fault reported.

Event type: Severity depends on hardware fault type.

1.4.2 Format

Refer to DMS-100 MMP, Log Report Reference Manual Volume 6 of 7.

1.4.3 Field descriptions

Refer to DMS-100 MMP, Log Report Reference Manual Volume 6 of 7.

1.4.4 Action

Follow the standard procedures for maintenance of a faulty hardware on a PM

1.4.5 Associated Operational Measurements or Performance Measurements

No OM or PM is affected by this log in this feature.

1.5 Alarms

DDRM hardware alarms are expressed in terms of unit/node alarms because they lead to unit/node malfunction.

DDRM hardware fault alarms are maintained through MAPCI tool.

Alarm reason information is displayed with QueryPM FLT command.

To remove the alarm condition, related hardware fault must be fixed. PM179 HW Exception Report Log is generated with alarms.

2: Fault Management (FM): A00008556

2.1 Feature Name

SIP Lines Core OAMP support

2.2 Fault management strategy

The fault management information is provided using logs. The logs are generated due to maintenance and provisioning operations. In addition to these logs, the logs are generated when a NCAS link is established and when it is taken down. This feature uses the existing framework to add new logs.

2.3 Fault management tools and utilities

The LOGUTIL command interpreter is the utility used in the CS2K Core software. This utility will provide access to the log information. All existing tools and utilities are applicable in case of CS2K Core software.

2.4 Logs

The following logs are added as a part of this activity:

- SCPL100-It is generated when a NCAS link is established between Core and CS2KSS.
- SCPL200-It is generated when a NCAS link is lost between Core and CS2KSS.

2.4.1 Log Title/Log ID: SCPL100

2.4.1.1 Formats

- The format of SCPL100 log is

<Switch ID> SCPL100 <DATE> <TIME> INFO NCAS LINK UP

NCAS LINK FOR INSTANCE NUMBER &I CAME UP

DUE TO &25A

Example:

RTP308AS SCPL100 OCT01 12:54:31 7510 INFO NCAS Link UP

NCAS LINK FOR INSTANCE NUMBER 1 CAME UP

DUE TO COMMUP

2.4.1.2 NTSTD
Not Applicable.

2.4.1.3 SCC2
Not Applicable.

2.4.1.4 Syslog
Not Applicable.

2.4.1.5 SNMP
Not Applicable.

2.4.1.6 Explanation

- The CS2K server listens for an establish message from the CS2KSS. This establish message is a kind of notification received from the CS2KSS server.
- When a COMMUP notification is received by the application, an acknowledgement message will be sent to the CS2KSS. A corresponding log (SCPL100) is generated on the core side.

2.4.1.7 Field descriptions
There are no fields in the log. The string is self explanatory.

2.4.1.8 Action
Check the communication between the CS2K and CS2KSS.

2.4.1.9 Associated Operational Measurements or Performance Measurements
None.

2.4.1.10 Additional information
N/A

2.4.2 Log Title/Log ID: SCPL200

2.4.2.1 Formats

- The format of SCPL200 log is

<Switch ID> SCPL200 <DATE> <TIME> INFO NCAS LINK DOWN

NCAS LINK FOR INSTANCE NUMBER &I WENT DOWN

DUE TO &25A

Example:

RTP308AS SCPL200 OCT01 12:54:31 7510 INFO NCAS LINK DOWN

NCAS LINK FOR INSTANCE NUMBER 1 WENT DOWN

DUE TO SENDFAILURENOTIFICATION

2.4.2.2 NTSTD

Not Applicable.

2.4.2.3 SCC2

Not Applicable.

2.4.2.4 Syslog

Not Applicable.

2.4.2.5 SNMP

Not Applicable.

2.4.2.6 Explanation

- When a NCAS link is lost, the re-initiation of the NCAS link will be done from CS2KSS. The link is not supposed to be established from the core side. When a NCAS link is lost, a corresponding log(SCPL200) is generated on the core side.
- The core gets notified when a NCAS link is taken down in one of the following ways:
  - A STATUSCHG notification is received with status as SCTP_SHUTDOWN_RCVD and event as COMM_DN.
  - A COMMLOST notification is received.
  - A COMMERROR notification is received.
  - A SENDFAILURENOTIFICATION is received.

2.4.2.7 Field descriptions

There are no fields in the log. The string is self explanatory.

2.4.2.8 Action

Check the communication between the CS2K and CS2KSS.

2.4.2.9 Associated Operational Measurements or Performance Measurements

None.

2.4.2.10 Additional information

N/A.

2.5 Alarms

No new alarm added. This section is not applicable.

2.6 Related documentation

Appropriate NTP contains the details of various existing logs.

3: Fault Management (FM): A00009120

3.1 Feature Name

Multi-Time Zone Enhancements

3.2 Fault management strategy

Uses existing CS2K core fault management strategy

3.3 Fault management tools and utilities

3.3.1 Faults, Alarms and Logs

LOGUTIL level in CI

3.4 Logs

Log Title/Log ID: LINE125. LINE126, MCT103, MCT105

3.4.1 Formats

Note: Modification to DMS core logs only. Logs LINE125 and LINE126 appear in both North American and International products. Logs MCT103 and MCT105 in international products only.

3.4.1.1 NTSTD

New formats of logs LINE 125 & 126 and MCT 103 & 105

The log report format for LINE125 is as follows:

LINE125 mmmdd hh:mm:ss ssdd INFO TRACE_ON_MALICIOUS_CALL_INI...
len DN dn INCOMING TRUNK = CKT trkid
CALLID = callid
CALLING NUMBER = dn
SOURCE = source
LOCAL TIME = <Time>

An example of log report LINE125 follows:

LINE125 APR01 12:00:00 2112 INFO TRACE_ON_MALICIOUS_CALL_INITIATED
HOST 00 0 19 20 DN 2557811999
INCOMING TRUNK = CKT ICCAMA 15
CALLID = 123456
CALLING NUMBER = 2149975015
SOURCE = CALLING NUMBER

LOCAL TIME = 10:00:00

The format for log report LINE126 is as follows:

LINE126 mmmdd hh:mm:ss ssdd INFO TRACE_ON_MALICIOUS_CALL_ INITIATED
len DN dn
CALLING LINE = LEN len DN dn onitxt
CALLID = callid
LOCAL TIME = <Time>

An example of log report LINE126 follows.

LINE126 APR01 12:00:00 2112 INFO TRACE_ON_MALICIOUS_CALL_INITIATED
HOST 00 0 19 20 DN 2557811999
CALLING LINE = LEN HOST 05 1 15 16 DN 7812001
CALLID = 123456
LOCAL TIME = 10:00:00

The log report format for MCT 103 is as follows:

MCT103 mmmdd hh:mm:ss ssdd INFO TRACE_ONMALICIOUS_CALL_ACTIVATED
CALLING_PARTY : <cli> <originating agent>
CALLED_PARTY : <full number><terminating agent>
CALLING_PARTY_CATEGORY : <cpc>
LOCAL TIME = <Time>

An example of log report MCT 103 follows:

MCT103 APR01 12:00:00 2112 INFO TRACE_ON_MALICIOUS_CALL_ACTIVATED
CALLING_PARTY : CKT ICATUPTRUNK 1
CALLED_PARTY : 2762345 LEN HOST 00 0 01 10
CALING_PARTY_CATEGORY : 16
LOCAL TIME = 10:00:00

The log report format for MCT 105 is as follows:

MCT105 mmmdd hh:mm:ss ssdd INFO TRACE_ONMALICIOUS_CALL_ACTIVATED
CALLING_PARTY : <full number> CKT <originating agent>
CALLED_PARTY : <full number> CKT <terminating agent>
LOCAL TIME = <Time>

An example of log report MCT 105 follows:

MCT105 APR01 12:00:00 2112 INFO TRACE_ON_MALICIOUS_CALL_ACTIVATED
CALLING_PARTY : 9717718745 CKT ICATUPTRUNK 1
CALLED_PARTY : 2762345 CKT ICATUPTRUNK 12
LOCAL TIME = 10:00:00

3.4.1.5 Integrated Element Manager GUI Fields

For each new log, populate the following table with the values displayed in the IEMS Alarm Manager GUI. (Non-legacy logs only). n/a

Table 3 IEMS Alarm GUI Field descriptions

Field	Value
Category	
Severity	
LogName	
LogNumber	
EventType	
EventLabel	
ProbableCause	
SpecificProblem	
BodyText	

3.4.2 Explanation

Description: The new field LOCAL TIME is added to the MCT logs specified to support multiple time zones. It's value is calculated based on the switch time modified by the value in table MULTITM assuming option MTZ is assigned to that line. If the MTZ option isn't assigned it is populated with the switch time.

3.4.3 Field descriptions

One new field added to LINE125 &126 and MCT103 &105

Table 4 Field descriptions

Field	Value	Description
LOCAL TIME	time - hours, minutes, seconds	The local time for this line, which may differ from the callserver time if the line is in a different time zone than the callserver

3.4.4 Action

The new field is present irrespective of whether the line is in a different time zone or not. It is either populated with the amended local time or the switch time.

3.4.5 Associated Operational Measurements or Performance Measurements

4: Fault Management (FM): A00009245

4.1 Feature Name

Succession Test Trunks: T904 Support

4.2 Fault management strategy

T904 is a two-way transmitting test. Five logs exist for legacy T904 when the test is executed from the TTP MAP level. They are:

- TSTK940: Test Success
- TSTK941: Communication establishment failure
- TSTK942: Tone transmit and receive failure
- TSTK943: Tone analysis failure on the terminating side.
- TSTK944: Tone analysis failure on the originating side.

The TSTK940 log remains unchanged from legacy. The TSTK941, TSTK942, TSTK943 and TSTK944 logs are reused for succession but may contain new fault reasons. Additional information on these logs are outlined below.

4.3 Fault management tools and utilities

4.3.1 Faults, Alarms and Logs

No change to Fault management tools and utilities.

4.4 Logs

Log Title/Log ID: **TSTTK941** (changed)

4.4.1 Formats

TEST FL

Switch ***+TSTK941 mmmdd hh:mm:ss 6600 FAIL T904 ABORTED

CKT trunk id

Test eq. test equipment id

Reason: text

Example:

TEST FL

RTPY08AY ***+TSTK941 FEB25 09:41:17 6600 FAIL T904 ABORTED

CKT ISNETSIISUPV2OUT 1

Test eq. TESTTRKANN 0

Reason: TESTTRKANN OOS

4.4.2 Explanation

Description: The originating switch generates this log message after the T904 test has failed. The reason varies but occurs when there is no connection between the originating and terminating switches, outpulsing failed, no connection with the test equipment, etc.

4.4.3 Field descriptions

Table 1: Field descriptions

Field	Value	Description
Reason	NO ANNOUNCEMENT TID	No announcement members on free queue
	NO TLINE ACCESS CODE	Cannot find digits to dial for test
	TESTTRKANN DATAFILL	Datafill for the announcement CLLI may be missing from table CLLI
	TESTTRKANN OOS	All announcement members on this AUD node are on busy queue
	TESTTRKANN BUSY	This announcement member is CP busy or CP busy deload
	CONNECTION TIMEOUT	Did not receive an integrity found message in the expected time
	CONNECTION FAULT	If the TLT tasks times out waiting for integrity, it sends an integrity lost message.
	NO TEST EQUIPMENT	GWC reports test equipment unavailable
	TEST EQUIPMENT FAULT	GWC reports test equipment fault
	NO RESPONSE RECEIVED	Receive timeout while waiting for the test results.
	UNEXPECTED MESSAGE	Receive unexpected message
	INVALID RESPONSE MSG	Incoming TLT response not valid for this test

Table 1: Field descriptions

Field	Value	Description
	UNEXPECTED RESPONSE	Incoming tlt result msg not what is expected
	MAX TEST CONNECTIONS	Maximum connections defined in table anns has been reached
	FAR END DISCONNECTED	Receive clear back message from call processing
	HIGH AND DRY	No answer or tone received from far end
	CONNECTION LOST	Receive integrity lost message while waiting for test response.
	SOFTWARE FAULT	Basic software failure
	GWC FAULT	GWC reports GWC internal fault
	NO GATEWAY RESOURCES	GWC reports gateway pool unavailable or busy
	GW RESOURCES INUSE	GWC reports test equipment in use
	GATEWAY UNAVAILABLE	GWC reports gateway unavailable
	GATEWAY FAULT	GWC reports gateway internal fault
	UNKNOWN FAULT	Unknown reason
	GW NO BEARER PATH	AMS does not have a bearer path connected.

Table 1: Field descriptions

Field	Value	Description
	TRK HARDWARE FAILED STOP DIAL SIG RCVD NO START DIAL SIGNAL OUTPULSING TROUBLE INVALID REPLY SUBSCRIBER BUSY ADDRESS INCOMPLETE LINE OUT OF SERVICE FAR-END UNAVAILABLE SWITCH EQP CONGESTED SUBSCRIBER XFERRED	Test call errors where test call did not return a pass. Gets output when outpulsing trouble is identified.

4.4.4 Action

Depending on the reason, check the datafill, verify translations, and verify that trunks (outgoing and incoming) and test trunk announcement are in service.

4.4.5 Associated Operational Measurements or Performance Measurements

N/A

4.4.6 Additional information

None

Log Title/Log ID: **TSTTK942** (changed)

4.4.7 Formats

TEST FL

Switch ***+TSTK942 mmmdd hh:mm:ss 6700 FAIL T904 ABORTED

CKT trunk id

Test eq. test equipment id

Reason: text

Example:

TEST FL

RTPY08AY ***+TSTK942 FEB25 09:45:17 6700 FAIL T904 ABORTED

CKT ISNETSIISUPV2OUT 1

Test eq. TESTTRKANN 0

Reason: F-N UNSTEADY TONE

4.4.8 Explanation

Description: The originating switch generates this log message after the T904 test has failed. It fails when the originating switch receives the answer message, but the tone to/from the terminating switch is not correct.

4.4.9 Field descriptions

Table 2: Field descriptions

Field	Value	Description
Reason	NO TONE DETECTED	Answer received, but no tone detected from far end
	NO TONE AFTER TPT	Test was attempted but the tone was not detected from the far end - assumed that the TPT (test progress tone) was received if max db value is given
	F-N UNSTEADY TONE	Far to near tone is unsteady

4.4.10 Action

Verify all connections. Try other trunk members. Check padding datafill.

4.6 Related documentation

5: Fault Management (FM): A00009282

5.1 Feature Name

MG9KEM - International ESA and MLPP Support

5.2 Fault management strategy

The standard MG9k EM Fault Management strategy will apply to the faults for this feature. Alarms will be displayed by the MG9K EM Alarm Browser, logged in NT standard format to the SSPFS CUST logs and forwarded to northbound OSS.

5.3 Fault management tools and utilities

Alarm Browser - Reports alarms from registered events. When an alarm is generated, it is displayed in the Alarm Browser along with the date and time, the NE Id, the resource (where the alarm was generated), the severity and probable cause. Highlighting the alarm displays the description of the alarm in the text box at the bottom of the Alarm Browser.

Log Adaptor - Generates logs from registered events. The log names and numbers are predetermined and are matched with the incoming event. A log with the corresponding name and number which contains the date, time, physical location, severity and any other pertinent information is generated and placed into a separate file.

5.4 Logs and Alarms

No new alarms will be added. A new alarm reason will be generated for ESA download problems from the Core when the timestamp of the Core file is more than 48 hours old.

The alarm will be displayed at the Alarm Browser at the subnet as well as the well as the alarm browser for each corresponding network element. A log is also generated. Both are NE level alarms.

5.4.1 Explanation

5.4.1.1 ESA311

Title: Core Download Failed

Name: ESA

Description: This log is generated by the EM in when a problem is detected when trying to download the datafile from the core.

This new condition is when the Core datafile is more than 48 hours old, indicating that the file on the Core is not being generated nightly.

Severity: Minor

Event type: ESA Core Data Download

5.4.2 Field descriptions

5.4.2.1 ESA311 (nnEsaCoiFault)

Table 1 Field descriptions ESA304

Field	Value	Description
office identification	String	Identifies the switch that generates the log. This field is optional. The maximum length of this field is 12 characters.
alarm	***,**,*, or blank	Indicates the alarm type of the log report. ***=critical, **=major, *=minor, blank = no alarms/warning
threshold	+ or blank	Indicates if a threshold is set for the log report. Plus (+) sign indicates that a threshold was set; if a blank, a threshold was not set.
report identification	AAAA nnn	Identifies the log subsystem that generates the report. This field uses 2-4 alphabetical characters and the number 100-999 of the log report in this subsystem. For this log AAAA= MGC and nnn=600.
day	String	Identifies the day of the week.
mmmmdd	January-December (01-31)	Identifies the month and date the report generates.
hh:mm:ss	00-23 00-59 00-59	Identifies the hour, the minute, and the second the report generates.
zone	PST, EST, MST, CST, AST	Identifies the time zone.
yyyy	0000-9999	Year

Table 1 Field descriptions ESA304

Field	Value	Description
ssdd	0000-9999	Defines a different sequence number for each log report generated.
event type	TBL, INFO, etc	Trouble, Service Summary, State Change, Information, Threshold and Expert. TBL for this log.
event id	String	The Log Title.
NE Number	integer	Number of the NE
NE Name	string	Name of the NE
Fault Type	string	The type of the fault: ESA Community of Interest
nnUemgEventTime	DateandTime	The Date and Time the event occurred in the following format: day mmmmdd hh:mm:ss zone yyyy
nnUemgAlarmSeverity	String	Major
Description	string	Failed to ping members of community of interest

5.4.2.2 ESA312 (Internodal ESA Provisioning Fault)

Table 2 Field descriptions ESA304

Field	Value	Description
office identification	String	Identifies the switch that generates the log. This field is optional. The maximum length of this field is 12 characters.
alarm	***,**,*, or blank	Indicates the alarm type of the log report. ***=critical, **=major, *=minor, blank = no alarms/warning
threshold	+ or blank	Indicates if a threshold is set for the log report. Plus (+) sign indicates that a threshold was set; if a blank, a threshold was not set.

Table 2 Field descriptions ESA304

Field	Value	Description
report identification	AAAA nnn	Identifies the log subsystem that generates the report. This field uses 2-4 alphabetical characters and the number 100-999 of the log report in this subsystem. For this log AAAA= MGC and nnn=600.
day	String	Identifies the day of the week.
mmmmdd	January-December (01-31)	Identifies the month and date the report generates.
hh:mm:ss	00-23 00-59 00-59	Identifies the hour, the minute, and the second the report generates.
zone	PST, EST, MST, CST, AST	Identifies the time zone.
yyyy	0000-9999	Year
ssdd	0000-9999	Defines a different sequence number for each log report generated.
event type	TBL, INFO, etc	Trouble, Service Summary, State Change, Information, Threshold and Expert. TBL for this log.
event id	String	The Log Title.
NE Number	integer	Number of the NE
NE Name	string	Name of the NE
Fault Type	string	The type of the fault: Processing Error
nnUemgEventTime	DateandTime	The Date and Time the event occurred in the following format: day mmmmdd hh:mm:ss zone yyyy
nnUemgAlarmSeverity	String	Major
Description	string	Internodal ESA provisioning failure

5.4.3 Action

ESA304 (nnEsaCoiFault):

Check failure cause in alarm or log text and perform corrective action This will typically require network route troubleshooting. The MG9000 will clear the alarm autonomously once the root cause is fixed.

ESA312 (Internodal ESA provisioning failure):

Check failure log in the alarm or log text (most common is communication failure between the MG9000 EM and the MG9000). Once the root cause is fixed the alarm can be cleared by running and audit on the affected NE, or hitting “Apply” button on the Internodal ESA configuration GUI.

5.4.4 Associated Operational Measurements or Performance Measurements

None.

Configuration Management (CN)

Introduction

This chapter describes impacts to configuration management, such as hardware/software requirements, data schemas, and service orders for the International features planned for this release. Only those features with configuration-management impacts are listed.

Featid	Title
A00006664.AB05	DDRM Line Testing
A00007289.AA06	RT Selector Enhancement for Metering
A00008429.AA09	Ring Back When Free (RBWF) Enhancements
A00008477.AA10	Increase size of table MSGRTE
A00008484.AA07	IN Terminating Trigger Feature Interactions
A00008556.AA35	SIP Lines Core OAMP support
A00009037.AA06	CORE - Enhanced ESA for International MG9000
A00009145.AA10	Record Feature Usage
A00009216.AA10	JI-ISUP to Base ETSI ISUP V2 Mapping Enhancement
A00009282	MG9KEM - International ESA and MLPP Support
A00009321.AA15	NMC Code Blocking
A00009322.AA16	Call Lock and Do Not Disturb Enhancements
A00009489.AA11	CHT: Call Waiting Enhancement
A00013275	C&W: CS2M support for variable sized LGRP

1.10.1.1 Command type: MENU

1.10.1.2 Command target: BRISC

1.10.1.3 Command availability: RES

1.10.1.4 Command description

The Diag command is used to perform an diagnostic test suit on a posted line in the control position that is in the IDL or MB state and to display the results on the LTP screen.

1.10.1.5 Command syntax

This command operates on DDRM lines in the same manner as for other POTS line types.

1.10.1.6 Qualifications and warnings

- The command is applicable for only testable DDRM lines (DRDLCP and DRMLCP).
- Optional parameters are not applicable for DDRM lines.
- The following message is printed for unavailable test cards such as LTT and TMS:

'LTT/TMS test cards are not available in DDRM.'

1.10.2.3 Command availability: RES

1.10.2.4 Command description

The LCO command is used to operate or release the cutoff relay of the line circuit in the control position.

1.10.2.5 Command syntax

This command operates on DDRM lines in the same manner as for other POTS line types. There are no changes to command syntax or functions.

1.10.2.6 Qualifications and warnings

- The command is supported for only DDRM lines with over voltage (DRBLCP, DRDLCP and DRMLCP).

- When the LCO command is entered with o parameter, the line state changes to CUT. When the LCO command is entered with r parameter, the line returns to its previous state.

1.10.2.7 Responses

This command responses on supported DDRM lines in the same manner as for other POTS line types. The following message is printed for unsupported DDRM lines:

'Command is not valid on this type of DDRM line.'

1.10.2.8 Example

Table 3 Usage examples for LCO command

Description of task	Operates the cutoff relay for the line circuit in the control position
Command:	lco o
MAP response:	Cutoff Relay Operated
Description of task	Release the cutoff relay for the posted line
Command:	lco r
MAP response:	Cutoff relay released

1.10.3 Command: Loss

1.10.3.1 Command type: MENU

1.10.3.2 Command target: BRISC

1.10.3.3 Command availability: RES

1.10.3.4 Command description

The LOSS command measures the insertion loss of a test tone sent from the subscriber end of a loop to the switch.

1.10.3.5 Command syntax

This command operates on DDRM lines in the same manner as for other POTS line types. There are no changes to command syntax or functions.

1.10.3.6 Qualifications and warnings

- The RlsConn command released the DDRM line and test resources.

1.10.3.7 Responses

This command responses on DDRM lines in the same manner as for other POTS line types.

1.10.3.8 Example

Table 4 Usage example for LOSS command

Description of task	Measure the insertion loss of a test tone
Command:	loss
MAP response:	A number is displayed under the header RESULT for the line in the control position in dBm.

1.10.4 Command: Noise

1.10.4.1 Command type: MENU

1.10.4.2 Command target: BRISC

1.10.4.3 Command availability: RES

1.10.4.4 Command description

The NOISE command measures the C-message weighted circuit noise on a subscriber loop.

1.10.4.5 Command syntax

This command operates on DDRM lines in the same manner as for other POTS line types. There are no changes to command syntax or functions.

1.10.4.6 Qualifications and warnings

- The RlsConn command releases the DDRM line and test resources.

1.10.4.7 Responses

This command responses on DDRM lines in the same manner as for other POTS line types.

1.10.4.8 Example

Table 5 Usage example for NOISE command

Description of task	Display the C-message weighted circuit noise on a subscriber loop.
Command:	noise
MAP response:	A number is displayed under the header RESULT for the line in the control position in dBRNC.

1.10.5 Command: ToneGen

1.10.5.1 Command type: MENU

1.10.5.2 Command target: BRISC

1.10.5.3 Command availability: RES

1.10.5.4 Command description

The ToneGen command is used to transmit a tone on a subscriber loop.

1.10.5.5 Command syntax

This command operates on DDRM lines in the same manner as for other POTS line types.

1.10.5.6 Qualifications and warnings

- The command is supported for only testable DDRM lines (DRDLCP and DRMLCP).
- The RlsConn command releases the DDRM line and test resources.
- The metallic option is not available for DDRM lines.

1.10.5.7 Responses

This command responses on supported DDRM lines in the same manner as for other POTS line types.

1.10.5.8 Example

Table 6 Usage examples for ToneGen command

Description of task	Generate a default tone of 1004 Hz, 0 dB to the subscriber loop through the line card.
Command:	tonegen
MAP response:	Requested tone is connected
Description of task	Generate a default tone of 100 Hz, 10 dB to the subscriber loop through the line card.
Command:	tonegen 100 10
MAP response:	Requested tone is connected

1.10.6 Command: TstRing

1.10.6.1 Command type: MENU

1.10.6.2 Command target: BRISC

1.10.6.3 Command availability: RES

1.10.6.4 Command description

The TSTRING command tests the ringing relay in the line card for proper functioning.

1.10.6.5 Command syntax

This command operates on DDRM lines in the same manner as for other POTS line types. There are no changes to command syntax or functions.

1.10.6.6 Qualifications and warnings

- The command is supported for only testable DDRM lines (DRDLCP and DRMLCP).

1.10.6.7 Responses

This command responses on DDRM lines in the same manner as for other POTS line types. Exceptional cases are listed below:

- The following message is printed for unsupported DDRM lines:

'Command is not valid on this type of DDRM line.'

1.10.6.8 Example

Table 7 Usage example for TstRing command

Description of task	Test the ringing relay in the line card.
Command:	tstring
MAP response:	TEST PASSED

1.10.7 Command: RlsConn

1.10.7.1 Command type: MENU

1.10.7.2 Command target: BRISC

1.10.7.3 Command availability: RES

1.10.7.4 Command description

The RLSCONN command releases test equipment that is connected to line.

1.10.7.5 Command syntax

This command operates on DDRM lines in the same manner as for other POTS line types. There are no changes to command syntax or functions.

1.10.7.6 Qualifications and warnings

- The command is supported for only testable DDRM lines (DRDLCP and DRMLCP).

1.10.7.7 Responses

This command responses on DDRM lines in the same manner as for other POTS line types. Exceptional cases are listed below:

- The following message is printed for unsupported DDRM lines:

'Command is not valid on this type of DDRM line.'

1.10.7.8 Example

Table 8 Usage example for RlsConn command

Description of task	Release the test resources that are used.
Command:	rlsconn
MAP response:	Connections released.

1.10.8 Command: MonLTA

1.10.8.1 Command type: MENU

1.10.8.2 Command target: BRISC

1.10.8.3 Command availability: RES

1.10.8.4 Command description

The MONLTA command connects a monitor circuit to a subscriber line. It establishes a monitor connection between a HSET trunk and a CPB or MB subscriber line via a direct network connection (MB) or a 3-port conference circuit (CPB).

1.10.8.5 Command syntax

This command operates on DDRM lines in the same manner as for other POTS line types.

1.10.8.6 Qualifications and warnings

- Before establishing talk connection, the line state should be Call Processing Busy (CPB), Call Processing Deload (CPD) or Maintenance Busy (MB).

- The monitor connection is released by using LTA RLS command.

1.10.8.7 Responses

This command responses on DDRM lines in the same manner as for other POTS line types. Exceptional cases are listed below:

- The state of the line in the control position is not valid for the TalkLTA command (Valid line states are Call Processing Busy (CPB), Call Processing Deload (CPD), Maintenance Busy (MB)). The following message is printed to inform that:

  'Line state INVALID, must be MB or CPB'

- The following message is printed for the command when no 3-port conference circuits are currently available.

  'Conference circuit not available'

1.10.8.8 Example

Table 9 Usage example for TalkLTA command

Description of task	Make a monitor connection.
Command:	monlta
MAP response:	Monitor connected to line

1.10.9 Command: TalkLTA

1.10.9.1 Command type: MENU

1.10.9.2 Command target: BRISC

1.10.9.3 Command availability: RES

1.10.9.4 Command description

The TALKLTA command connects a talk circuit to a subscriber line. It establishes a talk connection between a HSET trunk and a CPB or MB subscriber line via a direct network connection (MB) or a 3-port conference circuit (CPB).

1.10.9.5 Command syntax

This command operates on DDRM lines in the same manner as for other POTS line types.

1.10.9.6 Qualifications and warnings

- The battery option is not available for DDRM lines.

- Before establishing talk connection, the line state should be Call Processing Busy (CPB), Call Processing Deload (CPD) or Maintenance Busy (MB).
- The talk connection is released by using LTA RLS command.

1.10.9.7 Responses

This command responses on DDRM lines in the same manner as for other POTS line types. Exceptional cases are listed below:

- The state of the line in the control position is not valid for the TalkLTA command (Valid line states are Call Processing Busy (CPB), Call Processing Deload (CPD), Maintenance Busy (MB)). The following message is printed to inform that:

  'Line state INVALID, must be MB or CPB'

- The following message is printed for the command when no 3-port conference circuits are currently available.

  'Conference circuit not available'

1.10.9.8 Example

Table 10 Usage example for TalkLTA command

Description of task	Make a talk connection.
Command:	talklta
MAP response:	Talk connected to line

1.10.10 Command: LnTst

1.10.10.1 Command type: MENU

1.10.10.2 Command target: BRISC

1.10.10.3 Command availability: RES

1.10.10.4 Command description

The LNTST command performs resistance, capacitance, and voltage tests on a line.

1.10.10.5 Command syntax

This command operates on DDRM lines in the same manner as for other POTS line types. There are no changes to command syntax or functions.

1.10.10.6 Qualifications and warnings

- The command is supported for only testable DDRM lines (DRDLCP and DRMLCP).

1.10.10.7 Responses

This command responses on DDRM lines in the same manner as for other POTS line types. Exceptional cases are listed below:

- The following message is printed for unsupported DDRM lines:

  '**Command is not valid on this type of DDRM line.**'

- The following message is printed for unavailable test cards such as LTT and TMS:

  '**LTT/TMS test cards are not available in DDRM.**'

1.10.10.8 Example

Table 11 Usage example for LnTst command

Description of task	Perform the command on a line control position that is not in the state call processing busy (CPB) or the state call processing deload (CPD).
Command:	lntst
MAP response:	Resistance, capacitance, and voltage measurements are displayed in the lower part of the command interpreter (CI) output area. The measurements are displayed under the headers RES, CAP, VAC and VDC respectively; and in line with line identifiers TIP, RING and TIP to RING: Test OK RES CAP VAC VDC TIP 999.0K 0.020UF 0 0 RNG 999.0K 0.020UF 0 0 TIP TO RNG 999.0K 0.000UF

1.10.11 Command: VDC

1.10.11.1 Command type: MENU

1.10.11.2 Command target: BRISC

1.10.11.3 Command availability: RES

1.10.11.4 Command description

The VDC command performs a dc voltage measurement on a subscriber loop.

1.10.11.5 Command syntax

This command operates on DDRM lines in the same manner as for other POTS line types.

1.10.11.6 Qualifications and warnings

- The command is supported for only testable DDRM lines (DRDLCP and DRMLCP).
- Voltages are measured from -150 to +150 in one volt steps.
- The c parameter is not applicable for DDRM lines.

1.10.11.7 Responses

This command responses on DDRM lines in the same manner as for other POTS line types. Exceptional cases are listed below:

- The following message is printed for unsupported DDRM lines:

  'Command is not valid on this type of DDRM line.'

- The following message is printed for unavailable test cards such as LTT and TMS:

  'LTT/TMS test cards are not available in DDRM.'

1.10.11.8 Example

Table 12 Usage example for VDC command

Description of task	Perform the specified DC voltage measurement and display the result under the VDC header.
Command:	vdc
MAP response:	A voltage measurement is displayed in the lower part of the command interpreter (CI) output area under the header VDC, and in line with the line identifier TIP, RING, or both of them: Test OK T 0 R -51

1.10.12 Command: VAC

1.10.12.1 Command type: MENU

1.10.12.2 Command target: BRISC

1.10.12.3 Command availability: RES

1.10.12.4 Command description

The VAC command performs a ac voltage measurement on a subscriber loop.

1.10.12.5 Command syntax

This command operates on DDRM lines in the same manner as for other POTS line types.

1.10.12.6 Qualifications and warnings

- The command is supported for only testable DDRM lines (DRDLCP and DRMLCP).
- Voltages are measured from 0 to 150 in one volt steps.
- The c parameter is not applicable for DDRM lines.

1.10.12.7 Responses

This command responses on DDRM lines in the same manner as for other POTS line types. Exceptional cases are listed below:

- The following message is printed for unsupported DDRM lines:

  'Command is not valid on this type of DDRM line.'

- The following message is printed for unavailable test cards such as LTT and TMS:

  'LTT/TMS test cards are not available in DDRM.'

1.10.12.8 Example

Table 13 Usage example for VAC command

Description of task	Perform the specified voltage measurement.
Command:	vac
MAP response:	A voltage measurement is displayed in the lower part of the command interpreter (CI) output area under the header VAC, and in line with the line identifier TIP, RING, or both of them: Test OK T 0 R 0

1.10.13 Command: Res

1.10.13.1 Command type: MENU

1.10.13.2 Command target: BRISC

1.10.13.3 Command availability: RES

1.10.13.4 Command description

The RES command performs a resistance measurement on a subscriber loop.

1.10.13.5 Command syntax

This command operates on DDRM lines in the same manner as for other POTS line types.

1.10.13.6 Qualifications and warnings

- The command is supported for only testable DDRM lines (DRDLCP and DRMLCP).
- Resistance is measured from 0 to 999 in one ohm steps, and from 1K to 1M to three significant digits.
- The c parameter is not applicable for DDRM lines.

1.10.13.7 Responses

This command responses on DDRM lines in the same manner as for other POTS line types. Exceptional cases are listed below:

- The following message is printed for unsupported DDRM lines:

  '**Command is not valid on this type of DDRM line.**'

- The following message is printed for unavailable test cards such as LTT and TMS:

  '**LTT/TMS test cards are not available in DDRM.**'

1.10.13.8 Example

Table 14 Usage example for Res command

Description of task	Perform the specified DC voltage measurement and display the result under the VDC header.
Command:	res
MAP response:	A voltage measurement is displayed in the lower part of the command interpreter (CI) output area under the header VDC, and in line with the line identifier TIP, RING, or both of them: Test OK T 0 R -51

1.10.14 Command: Cap

1.10.14.1 Command type: MENU

1.10.14.2 Command target: BRISC

1.10.14.3 Command availability: RES

1.10.14.4 Command description

The CAP command performs a capacitance measurement on a subscriber loop.

1.10.14.5 Command syntax

This command operates on DDRM lines in the same manner as for other POTS line types.

1.10.14.6 Qualifications and warnings

- The command is supported for only testable DDRM lines (DRDLCP and DRMLCP).
- Capacitance is measured from 0 to 5 microfarads in .001 microfarad steps.
- The c parameter is not applicable for DDRM lines.

1.10.14.7 Responses

This command responses on DDRM lines in the same manner as for other POTS line types. Exceptional cases are listed below:

- The following message is printed for unsupported DDRM lines:

  '**Command is not valid on this type of DDRM line.**'

- The following message is printed for unavailable test cards such as LTT and TMS:

  '**LTT/TMS test cards are not available in DDRM.**'

1.10.14.8 Example

Table 15 Usage example for Cap command

Description of task	Perform the command
Command:	cap
MAP response:	Test OK T 0.020UF R 0.020UF TR 0.010UF

1.10.15 Command: LTA

1.10.15.1 Command type: MENU

1.10.15.2 Command target: BRISC

1.10.15.3 Command availability: RES

1.10.15.4 Command description

The LTA command is used to connect the line test access (LTA) to a line card, or release the LTA from it.

1.10.15.5 Command syntax

This command operates on DDRM lines in the same manner as for other POTS line types.There are no changes to command syntax or functions.

1.10.15.6 Qualifications and warnings

- The command is supported for only testable DDRM lines (DRDLCP and DRMLCP).
- When the command LTA is used without a parameter, each subsequent use will alternate the connection of the LTA between the ‘in’ and ‘out’ modes.

1.10.15.7 Responses

This command responses on DDRM lines in the same manner as for other POTS line types. Exceptional cases are listed below:

- The following message is printed for unsupported DDRM lines:

  ‘Command is not valid on this type of DDRM line.’

- The following message is printed for unavailable test cards such as LTT and TMS:

  ‘LTT/TMS test cards are not available in DDRM.’

1.10.15.8 Example

Table 16 Usage example for LTA command

Description of task	Prepare the line for testing into the line card and out to the loop.
Command:	lta in
MAP response:	LTA IN

1.10.16 Command: Ring

1.10.16.1 Command type: MENU

1.10.16.2 Command target: BRISC

1.10.16.3 Command availability: RES

1.10.16.4 Command description

The Ring command is used to place ringing voltage on the loop of a subscriber line.

1.10.16.5 Command syntax

This command operates on DDRM lines in the same manner as for other POTS line types.

1.10.16.6 Qualifications and warnings

- There are no optional parameters for DDRM lines.
- A monitor or talk connection should be established before using the command.

1.10.16.7 Responses

This command responses on DDRM lines in the same manner as for other POTS line types.

1.10.16.8 Example

Table 17 Usage example for Ring command

Description of task	Transmit a ringing signal from the on-hook line in the control position to the subscriber's station.
Command:	ring
MAP response:	****RINGING LINE****

1.10.17 Command: DgtTst

1.10.17.1 Command type: MENU

1.10.17.2 Command target: BRISC

1.10.17.3 Command availability: RES

1.10.17.4 Command description

The DgtTst command is used to test the Digitone (DGT) pad or dial on the subscriber action.

1.10.17.5 Command syntax

This command operates on DDRM lines in the same manner as for other POTS line types.

1.10.17.6 Qualifications and warnings

- A talk connection should be established before using the command.

1.10.17.7 Responses

This command responses on DDRM lines in the same manner as for other POTS line types.

1.10.17.8 Example

Table 18 Usage example for DgtTst command

Description of task	Perform the command to test the dial on the subscriber action.

Command:	dgttst
MAP response:	TEST PASSED, DIGITS RECEIVED: <n>

Note: The system received and displayed the expected digits. The character <n> represents the digits that were received at the LTP.

N/A

3.8 Software optionality control (SOC)

Main functionalities of this activity are controlled by two new SOC options, SVBI Multiple RBWF and SVBI RBWF Enh. Both of these SOCs are state SOCs, which can be either in SOC_ON or SOC_IDLE state.

SVBI Multiple RBWF SOC controls the following:

- Allowing N RBWF request to be activated by the RAGOR.
- Rejecting N+1th request.

Table 10 SVBI Multiple RBWF SOC

SOC option name:	SVBI0037
SOC option title:	Multiple RBWF
SOC option control type:	State
New SOC option?	Yes
SOC option order code	
Option defined in DRU:	WT22
Affected products:	DMS100 - MMP

SVBI RBWF Enh SOC controls the following:

- Allowing nodal RBWF between different customer groups via ignoring INTRAGRP flag.
- Billing of nodal RBWF usage.
- Deactivation and interrogation functionalities with new dialling sequences.

Please note that datafilling of any option, which is introduced by this activity, is allowed even if these SOCs are IDLE. But new functionalities are only available when related SOC(s) is ON.

Table 11 SVBI RBWF Enh SOC

SOC option name:	SVBI0036
SOC option title:	RBWF Enh
SOC option control type:	State
New SOC option?	Yes
SOC option order code	
Option defined in DRU:	WT22

Table/MIB name	NEW/CHANGED/ or DELETED/	Table Control (NEW/ OLD/UNCHANGED)
MSGRTE2	New	New

4.4.2 Table/MIB/Remote Database Schema information

4.4.2.1 Name: MSGRTE2

Message Routing Table (2)

4.4.2.1.1 Functional description

New table MSGRTE2 is used for routing and processing of facility messages of some protocols (e.g. PRA, DPNSS, etc.) in a manner identical to that performed by the existing table MSGRTE (Please refer to FN section of AD1315 for more details about the functional model of the table MSGRTE). This table determines if the message terminates on the current switch or is sent to another switch. This is done through the use of the origination and destination information elements.

New table MSGRTE2 has the same format as the existing table MSGRTE, and shares the same functionality provided by the MSGRTE table. The difference, and hence the need for a new table, is that the new table supports upto 100,000 entries while the existing table has a limit of 32K-1 digilator blocks. The selection of which table will be active is achieved by the SOC XLAS0057.

4.4.2.1.2 Usage sequence and implications (CM Only)

Datafill order of the new table MSGRTE2 is the same as the current datafill order of the existing table MSGRTE.

The following tables must be datafilled before the table MSGRTE2:

- NETNAMES
- TRKMEM
- C7RTESET

All network names in the table MSGRTE2 must already exist in table NETNAMES. Table MSGRTE2 is indexed by the NETID datafilled in Table NETNAMES, so this table must be datafilled before the table MSGRTE2. When an entry tried to deleted from the table NETNAMES, table MSGRTE2 is checked if there is a datafill with the specified NETID. The deletion from NETNAMES table is not allowed if the specified NETID is also datafilled in Table MSGRTE2.

To datafill a DPNSS selector, a source ISUP trunk CLLI must be specified along with a DPNSS selector, and the ISUP trunk CLLI must exist in tables TRKGRP and TRKSGRP.

4.4.2.1.3 Size

Table 2 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
MSGRTE2	0	100,000*	Memory is allocated dynamically on per tuple

* ***Note :*** *Table MSGRTE2 supports upto 100,000 tuples depending on the amount of the available free memory. The maximum number of tuples may vary due to compression and expansion of tuples.*

4.4.2.1.4 Table Fields

The following table lists fields for the Table MSGRTE2.

Table 3 Table MSGRTE2 field descriptions

Field	New or Changed	Subfield or Refinement	Range of Values	Description
MSGRTKEY	New			*Message Route Key* This is the key to table MSGRTE2 and consists of subfields NETID and DIGRANGE.
		NETID	String up to 32 characters	*Network Identifier* Network name datafilled in table NETNAMES
		DIGRANGE		*Digit Range* This field consists of subfields FROMDIGS and TODIGS.
		FROMDIGS	Alphanumeric (vector up to 10 characters, 0 to 9, A to F)	*From Digits* Digit string for the lower bound of the digit range to which the route list applies
		TODIGS	Alphanumeric (vector up to 10 characters, 0 to 9, A to F)	*To Digits* Digit string for the upper bound of the digit range to which the route list applies
MSGRTRES	New			*Message Route Result.* The list of routes used to transmit messages. Up to four routes can be datafilled.

Field	New or Changed	Subfield or Refinement	Range of Values	Description
		MSGRTSEL	DPNSS, LOCAL, PRA or SS7	*Message Route Selector* • DPNSS if TCAP NRAG messages are sent over DPNSS virtual trunks. • LOCAL if the message terminates on this switch. • PRA if the message is routed out on a specified PRA-D channel. • SS7 if a the message is routed over a specific SS7 route set.

Each Message Route Selector such as DPNSS, LOCAL, PRA and SS7 has its own special refinement.

MSGRTESEL = LOCAL

If the entry for field MSGRTSEL is LOCAL, the refinement is as followed.

Table 4 Structure of LOCAL Refinement

Field	Subfield or Refinement	Range of Values	Description
	DELDIGS	0 to 15	*Delete Digits* Number of deleted digits from the destination address
	PREDIGS	Numeric or N (vector of up to 11 characters)	*Prefix Digits* Digit string prefixed to the destination address

MSGRTESEL = DPNSS

If the entry for field MSGRTSEL is DPNSS, the refinement is as followed.

Table 5 Structure of DPNSS Refinement

Field	Subfield or Refinement	Range of Values	Description
	ISUPTRK	Alphanumeric (up to 16 characters)	*ISUP Trunk CLLI Name*
	DELDIGS	0 to 15	*Delete digits*
	PREDIGS	Numeric or N (vector of up to 11 characters)	*Prefix digits*
	OPTIONS	NEWNET	*DPNSS Option*
	NETNAME	String up to 32 characters	*Network Identifier* Network name datafilled in table NETNAMES

MSGRTESEL = PRA

If the entry for field MSGRTSEL is PRA, the refinement is as followed.

Table 6 Structure of PRA Refinement

Field	Subfield or Refinement	Range of Values	Description
	TRKCLLI	Alphanumeric (up to 16 characters)	*Trunk Common Language Location Identifier* Trunk CLLI name
	DELDIGS	0 to 15	*Delete Digits*
	PREDIGS	Numeric or N (vector of up to 11 characters)	*Prefix Digits*
	OPTIONS	NEWNET or NEWTOR	*PRA Options* • NEWNET for a new network and datafill subfield NETNAME. • NEWTOR for a new type of route and datafill subfield TYPEOFRT.
	NETNAME	String up to 32 characters	*Network Identifier* Network name datafilled in table NETNAMES

Field	Subfield or Refinement	Range of Values	Description
	TYPEOFRT	PUB or PVT	*Type of Route* • PUB for a public route. • PVT for a private route.

MSGRTESEL = SS7
If the entry for field MSGRTSEL is SS7, the refinement is as followed.

Table 7 Structure of SS7 Refinement

Field	Subfield or Refinement	Range of Values	Description
	DPC	Alphanumeric (up to 16 characters)	*Destination Point Code*
	DELDIGS	0 to 15	*Delete Digits*
	PREDIGS	Numeric or N (vector of up to 11 characters)	*Prefix Digits*
	OPTIONS	NEWNET	*SS7 Option*
	NETNAME	String up to 32 characters	*Network Identifier* datafilled in table NETNAMES

4.4.2.1.5 Datafill example

The following example shows sample datafill for table MSGRTE2.

Figure 1 Sample Datafill of Table MSGRTE2

```
TABLE: MSGRTE2
MSGRTKEY
MSGRTRES
-------------------------------------------------------------
PUBLIC 12345 12345 (SS7 ANSIAB_ROUTES 4 0 (NEWNET NEWPUB) $)$
```

4.4.2.1.6 Table release history update

Table is newly created.

4.4.2.1.7 Supplementary information

None.

4.5 Service Orders (SO) (CM & SESM)

N/A

4.6 Software optionality control (SOC)

Table 8 SOC

SOC option name:	XLAS MSGRTE2
SOC option title:	XLAS
SOC option control type:	STATE
New SOC option?	Yes
SOC option order code	XLAS0057
Option defined in DRU:	WT
Affected products:	ISN09

MSGRTE and MSGRTE2 tables are not effective at the same time - both tables could be datafilled but only one of them will be in effect. The selection of which table will be used is achieved through the SOC option XLAS0057. When the state of the SOC option is ON, MSGRTE table will be disabled and call processing will begin to use the new table MSGRTE2. When the SOC option is IDLE, MSGRTE2 table will be disabled and the MSGRTE table will be in effect.

SERVINFO	CHANGED	UNCHANGED

5.6.2 Table/MIB/Remote Database Schema information

5.6.2.1 Name: SERVINFO

Service Information Table

5.6.2.1.1 Functional description

It is not a new table.

5.6.2.1.2 Usage sequence and implications (CM Only)

Current datafill order unchanged.

5.6.2.1.3 Size

It is not a new table and the new option does not change the size.

5.6.2.1.4 Fields/OIDs

The following table lists fields/OIDs for SERVINFO.

Table 2 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
FI	Changed		CONV_DESK option is added to the possible values.	When CONV_DESK is added to a tuple under FI then the corresponding IN triggers show converged desktop behaviour as follows: IN can co-exist with line based DMS services as described in the FN along with some limitations and restrictions to the existing IN functionality.

5.6.2.1.5 Datafill example

The following example shows sample datafill for table SERVINFO.

Table 3 SERVINFO Sample Datafill

```
SERVIDX                                                    OPTION
-------------------------------------------------------------------------------
    19   (INITDP_PARMS ( SERVKEY) (CDPA) (CLI) (EVENT_TYPE) (OCN) (RDN)
         (RD_INFO) $)
         (FI (RETRIG_OPTION ALLOW GTE 1) (CONV_DESK ) $)$
```

5.6.2.1.6 Table release history update

IN can co-exist with line based DMS services as described in the FN along with some limitations and restrictions to the existing IN functionality.

5.6.2.1.7 Supplementary information

None.

5.6.2.1.8 Translation verification and other tools

The new option does not change the way SERVINFO and translation verification tools interact.

5.7 Service Orders (SO) (CM & SESM)

6: Configuration (CN): A00008556

6.1 Feature Name

SIP Lines Core OAMP support

6.2 Hardware and Software Requirements

No new hardware or software requirements are created by this activity.

6.3 Initial Configuration

At initial configurations, it is assumed that standard datafill exists in the DMS/CS2K, GWC and CS2KSS. Since a usage SOC is used for this feature, the SOC limit decides whether any service will be provided initially by the design components applicable after the DPL line is provisioned.

6.4 Office/Subnet parameters (OP/SP) (CM & SESM)

N/A

6.5 Upgrade Considerations

None.

6.6 Data schema (DS) (CM, MIBS, RDB)

6.6.1 New/modified tables, MIBs, or Database Schema

Table 1 below shows a list of new/modified tables.

Table 1 New or modified tables

Table/MIB name	NEW/CHANGED/ or DELETED/	Table Control (NEW/ OLD/UNCHANGED)
SERVRINV	CHANGED	UNCHANGED
LGRPINV	CHANGED	UNCHANGED
IPAPPL	CHANGED	UNCHANGED
IBNFEAT	CHANGED	UNCHANGED
LCCOPT	CHANGED	UNCHANGED
OPTOPT	CHANGED	UNCHANGED

6.6.2 Table/MIB/Remote Database Schema information

6.6.2.1 Name: SERVRINV

SERVER INVENTORY

6.6.2.1.1 Functional description

Server Inventory table stores the information on GWC. Each entry in this table provides information about a specific GWC which includes the following:

- Server type and numeric ID, e.g. GWC 7.
- Packet network type (IP or ATM).
- GWC IP address.
  Note: The last element of this address must be a multiple of four, because four IP addresses are used by each GWC; the three IP addresses next in sequence are assigned automatically.
- The server exec(s) to be used, which determines the type of call processing to be performed by the GWC. A new entry is specified for this field by this feature.
- Toneset to be used.
- Bearer Networks.
- Optional attributes to be associated with this GWC.

6.6.2.1.2 Usage sequence and implications (CM Only)

The table SERVRINV can be datafilled independently through SESM. There is no change in the current table datafill order.

6.6.2.1.3 Size

Table 2 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
SERVRINV	0	256	Memory is dynamically allocated at 16 tuples per allocation.

6.6.2.1.4 Fields/OIDs

The following table lists fields/OIDs for SERVRINV.

Table 3 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
SRVREXEC	Changed	TERM_TYPE EXEC_LINEUP	DPL_TERM DPLEX	This field now supports a new term_type DPL_TERM and a new exec_lineup DPLEX.

6.6.2.1.5 Datafill example

The following example shows sample datafill for table SERVRINV.

Table SERVRINV:

SRVRNAME SRVRADDR ***SRVREXEC*** *SRVRTONE BEARNETS SRVROPTS*
GWC 0 IP 45 46 47 48 ***(DPL_TERM DPLEX)*** *$ NORTHAA (NET_IP Y) $ $*

6.6.2.1.6 Table release history update

The table SERVRINV is enhanced to support new SRVREXEC entry DPL DPLEX. This entry for a new terminal_type and new exec_lineup is specifically going to be used to support the DPL agents on the GWC.

6.6.2.1.7 Supplementary information

None.

6.6.2.1.8 Translation verification and other tools

None.

6.6.2.2 Name: LGRPINV

LOGICAL GROUP INVENTORY

6.6.2.2.1 Functional description

Logical group inventory table defines the gateways or nodes supported under the gateway controller. The gateway or node entries are:

- Logical group number (site name, frame no, shelf no) e.g. LG 2 3
- Server name (GWC datafilled in table SERVRINV)e.g GWC 7
- Logical group type: This field is to specify the group type. Existing logical group types are

S MG9K large lines gateways
M CICM large lines gateways
C Small lines gateways
LL_3RDPTY Large Line Third Party gateways
SSDPL DPL lines.

- When the LGRPINV is provisioned with a LGRP ‘SSDPL’, then a termtype ‘DPL’ is specified in LNINV table. When lines are provisioned in table LNINV, then an exec_lineup DPLEX corresponding to termtype ‘DPL’ will be downloaded to the GWC. Also, the cardcode of the DPL lines is restricted to RDTLSG for North American market and GWLPOT for International market.
- Logical group options
  Existing options are:(MTSTAPT, LGRPLOC, GTWYKEY)

6.6.2.2.2 Usage sequence and implications (CM Only)

The table LGRPINV depends upon the table SERVRINV. It references the server name from the table SERVRINV.

6.6.2.2.3 Size

The following table lists the size of LGRPINV table.

Table 4 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
LGRPINV	0	1000	Memory is dynamically allocated at 10 tuples per allocation.

6.6.2.2.4 Fields/OIDs

The following table lists fields/OIDs for LGRPINV

Table 5 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
GRPTYPE	Changed	N/A	SSDPL	A new LGRP SSDPL has been introduced to support DPL lines.

6.6.2.2.5 Datafill example

The following example shows sample datafill for table LGRPINV

Table LGRPINV:

LGRP_NO	*SRVR_NAME*	***GRPTYPE***	*LGRPOPTS*
LG 1 1	*GWC 5*	***SSDPL***	*$*

6.6.2.2.6 Table release history update

The table LGRPINV is enhanced to support DPL agents. As part of this enhancement new lgrp_type ‘SSDPL’ is introduced.

6.6.2.2.7 Supplementary information

None.

6.6.2.2.8 Translation verification and other tools

None.

6.6.2.3

6.6.2.4 Name: IPAPPL

Internet Protocol Application

6.6.2.4.1 Functional description

Table IPAPPL datafill provides instance of various connections to the DMS. The use of SCTP transport requires that the application store the specific remote IP addresses and local Port number. Therefore table IPAPPL is datafilled in order to provide these details. Table IPAPPL includes following fields.

TABLE IPAPPL Fields and description are as follows:

- InstKey is datafilled in order to map this instance with an internally assigned instance number. This field is the unique key to the tuple.
- InstanceName is datafilled in order for the telco personnel to be able to distinguish one connection from the other.
- Transport is datafilled in order to classify the instance to which transport protocol be used. Currently the table will support SCTP functionality ONLY.
- IPDevice is datafilled to indicate which IP interface hardware will be used. This table currently supports EIU and HIOP.
- IP addresses (upto 4 addresses) are allowed in one instance tuple. This may be used to support multihoming. The first IP address in the list will be used as the primary address. IPV4 type IP addresses are supported.Only one IP address will be used for DPL, the IP address of the CS2KSS Provisioning Manager.
- Port Number is the local port number at which the DMS-Core will expect to receive messages from this instance. (Note that the remote port is received during the INIT message from the far-end). Valid range of Source port allowed to be configured on the CORE is from 4900 to 4982

- OptList field may be datafilled with “SETPRIME” to set any of the IP address in an instance to be used as to set the primary destination address.
- Optlist sub-field “APPLICATION” can be datafilled to specify the application eg:DPL. Here the SIPMTC(Application) option is incorporated along with AIN option.
- Optlist sub-field “mode” is to specify the mode SERVER/CLIENT.
- Optlist sub-field “multihoming” is used to specify if the remote node supports multihoming. This option is currently only supported on the HIOP ipdevice.

6.6.2.4.2 Usage sequence and implications (CM Only)

The table IPAPPL is an independent table.

6.6.2.4.3 Size

Table 6 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
IPAPPL	0	64	Memory is automatically allocated for 64 Intelligent Network SCTP instances

6.6.2.4.4 Fields/OIDs

The following table lists fields/OIDs for IPAPPL.

Table 7 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
OPTS	Changed	Application	SIPMTC	A new application ‘SIPMTC’ is added to option list.

6.6.2.4.5 Datafill example

The following example shows sample datafill for table IPAPPL:

Table IPAPPL:

InstKey InstName Transport IPDevice IPaddrs port optlist

*1 a sctp hiop 198.202.188.121 4982 (application **sipmtc**)*

(setprime 1)

6.6.2.4.6 Table release history update

The table IPAPPL is enhanced to create a instance for SIPMTC service.

6.6.2.4.7 Supplementary information

- The NCAS link association is going to be used for the new QSIP command.
- The SIPMTC application is supported over HIOP only.
- The multihoming functionality is not supported in SIPMTC application.
- The port number allocated for SIPMTC application is 4982.
- Multiple instances for SIPMTC are not allowed i.e. in table IPAPPL, there can be only one instance datafilled for SIPMTC.

6.6.2.4.8 Translation verification and other tools

None.

6.6.2.5 Name: IBNFEAT

IBN Feature

6.6.2.5.1 Functional description

IBNFEAT (IBN Line Feature) lists line features that are assigned to the IBN lines listed in table IBNLINES.

Table IBNFEAT fields and description are as follows:
LEN: Line equipment number. This field consists of the subfields SITE, FRAME, UNIT, DRAWER, LSG and CIRCUIT.

DNNO_RANGE: Directory number. This field specifies the DN of the LEN being referenced. Enter a value from 0 to 6 for the DN.

DF : Data feature. This field specifies the data feature assigned to the line.

FEATURE: Data feature. This field specifies the data feature assigned to the line.

DATA: SIP: Bool. Enter Y if a SIP line

MAX_NUM_CALLS: Enter a value between 1-10.

ALLOW_BSY_TERM: Bool. It determines whether or not a busy SIP line can take an additional call termination.

Only Servord can be used to datafill the DPL option. It cannot be done via table control.

6.6.2.5.2 Usage sequence and implications (CM Only)

- In table LCCOPT, DPL option should be made compatible with IBN LCC.
- The table IBNLINES should have the LEN datafilled before the DPL option can be added on it.

6.6.2.5.3 Size

6.6.2.5.4 Fields/OIDs

Table 8 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
IBNFEAT	0	TBD	TBD

The following table lists fields/OIDs for IBNFEAT.

Table 9 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
DF	Changed	N/A	DPL	A new feature DPL to be assigned to an IBN line.
Feature	Changed	N/A	DPL	A new feature DPL to be assigned to an IBN line.
DATA	Changed	SIP MAX_NUM_CALLS Allow_Bsy_Term	Y/N 1-10 Y/N	Enter Y if a SIP line Max Simultaneous Call Appearances. It determines whether or not a busy SIP line can take an additional call termination.

6.6.2.5.5 Datafill example

The following example shows sample datafill for table IBNFEAT.

Table IBNFEAT:

LEN DNNO DF FEATURE DATA
LG 01 1 00 14 0 DPL DPL Y 10 Y

6.6.2.5.6 Table release history update

Table IBNFEAT has been enhanced to support a new feature DPL which will convert the IBN line into a DPL line.

6.6.2.5.7 Supplementary information

None.

6.6.2.5.8 Translation verification and other tools

None.

6.7 Service Orders (SO) (CM & SESM)

SERVORD+ will accept three new options related to DPL lines provisioning: DPL, SIP_PASSWORD and SIP_DATA. When provisioning a SIP line all three of the options described above must be present in the SERVORD+ NEW command. They can not be added later via ADO.

6.7.0.1 LCC and options

New line option DPL is introduced by this feature. It is compatible with RES and IBN line class codes only.DPL is not compatible with huntgrps, scmp, MADN, FTRG.

Table 10 Meridian digital centrex feature assignment requirements

Feature	500 2500	MDC SET	ISDN SET	MDC Set ISDN Set Relationship							
				SET	SUBSET	KEY	DN	DEDKEY	LAMP	CODE	DISPLAY
DPL	Y	N	N	N							

The feature in the table above requires a handsfree Business Set. This feature must be assigned to key 1.

6.7.1 New commands

No new commands are introduced with this feature.

6.7.1.1 How service order commands are presented

6.7.1.1.1 Description

The NEW command is used to associate a DN with a LEN due to which the line state changes from HASU(hardware assigned-software unassigned) to IDL i.e. puts the line into service.

6.7.1.1.2 Applicability

The DPL line option can only be added with the NEW command. Other commands that prompt for options such as EST, ADD, DE0, ADO and NEWACD will be rejected if the DPL option is present with these commands. A warning message will be output. The CDN and CLN commands will be blocked if the DPL option is present on the line. The line must be OUTed and NEWed to effect a change of LEN or endpoint or DN. CHG of line class code will be blocked if DPL is present on the line.
The DPL option should only be added via SESM. It cannot be added via table control.

6.7.1.1.3 Example

The examples below show how SERVORD+ command NEW can be used to provision the DPL line. Servord+ should be used to add the DPL option. Th e prompt mode is shown as an example of the fields only. Note that SIP_PASSWORD and SIP_DATA are not valid options on the core and are shown here for example only.

6.7.1.2 How service order options are presented

6.7.1.2.1 Description

A new option DPL is introduced as a part of this activity. This option DPL converts an IBN line into DPL line. The following sections lists how the DPL option and the sub-options associated with the DPL option are assigned through SERVORD.

6.7.1.2.2 Example

The following examples show how a new option DPL and its sub-options are added to a line to convert it into a DPL line.

Figure 4 Example of the DPL option in prompt mode (SERVORD only)

```
Option:
>DPL
SIP:
>Y
MAX_NUM_CALLS:
>3
```

Figure 5 Example of the DPL option in no-prompt mode

```
DPL Y 3 xx bobby mb1
```

6.7.1.2.3 Option prompts

Table 11 System prompts for DPL option

Prompt	Valid input	Description	Areas affected by prompt
SIP	Y	Bool	
MAX_NUM_CALLS	1-10	Integer	

6.7.1.2.4 Line class code compatibility

The new DPL option is applicable only for the IBN and RES lines.

Table 12 DPL compatibility to LCC

Line class code	Compatible?
IBN	Yes
RES	Yes

6.7.1.2.5 Assignability

DPL is not a valid keyset option.
The following functionalities apply to this option:

- set functionality: <yes or no>
- subset functionality: <yes or no>
- DN functionality: <yes or no>
- key functionality: <yes or no>

6.7.1.2.6 Option prerequisites
None.

6.7.1.2.7 Notes

The subfields SIP and MAX_NUM_CALLS which will be prompted for will have the default values of Y and 1 shown respectively. For SN08, these are the only valid values and cannot be changed.

6.7.1.2.8 SERVORD+ Exceptions
None.

6.7.2 Line equipment format changes

6.7.2.1 LEN
There are no changes made in the LEN format.

6.7.2.2 Media gateway endpoint format
The MG endpoint format is similar to the LEN format to make the mapping between them easier.

The suggested endpoint format is:
<GW NAME> <SITE>/NNN/G/TTtt where
GW_NAME = up to 32 chars
<SITE> = a site name datafilled in Table SITE and used as the first part of the LGRPINV key.
NNN = logical frame number from core table LGRPINV
G = group number 0-9 from core table LGRPINV
TT = 00 to 10
tt = 00 to 99 except when TT = 10 then tt = 00 to 22
Example:
SIPVMG1.tampa.vz.com TMP1/000/2/0478 maps to LEN: TMP1 000 2 04 78

6.8 Software optionality control (SOC)

This feature will be controlled by standard usage based SOC. The limit will define the maximum number of DPL lines that can be provisioned in the switch.

- The default usage limit will be zero, indicating that the DPL option can not be provisioned. New limits can be purchased via SOC in increments of 1 subscriber at a time if desired.
- There will not be a maximum limit. Hence, any limit can be assigned to the SOC CS2C0005.
- When a new DPL line is provisioned, the current DPL count (SOC usage count) will be compared to the purchased limit (SOC usage limit). If the limit has already been reached, the new line can not be provisioned. If the

limit has not been reached, the new line is allowed, and the SOC usage count is incremented.

- When an existing DPL line is removed, the current SOC usage count will be decremented, but the SOC limit will not change.
- If the SOC limit is ever decreased to a value below the current usage count, existing DPL line agents will continue to function properly. However, new DPL lines can not be added. Further, if existing DPL lines are removed, they can not be re-added until the current count is below the limit.
- The SOC audit will generate a warning log on each pass if the usage count is above the usage limit.
- The SOC code is functional whenver a line is provisioned with DPL option whether through table control / servord.
- The usage control of the SOC utility allows the activation/deactivation for provisioning of DPL lines.
- A new module will be created to contain the new SOC code. The new module will belong to a new user group called DPLOAMP.
- It is strongly recommended that the SOC code be sourced in SN08 if possible. This is due to the fact that patching of a usage based SOC can introduce certain obstacles regarding usage limits and usage counts being updated during ONP. To minimize these obstacles, the SOC code can be sourced in SN08.
- Table 13 below shows the SOC details.

Table 13 SOC

SOC option name:	CS2C0005
SOC option title:	Number of SIP CLient
SOC option control type:	USAGE
New SOC option?	Yes
SOC option order code	CS2C0005
Option defined in DRU:	CCM
Affected products:	CS2K

6.9 Element Management

Not Applicable.

6.10 User interface changes

6.10.1 Directory:

N/A

6.10.2 Command: QSIP

6.10.2.1 Command type: NON-MENU

6.10.2.2 Command target: BRISC, POWERPC

6.10.2.3 Command availability: NONRES

6.10.2.4 Command description

The QSIP command at the CI level will query the CS2KSS to get the SIP information. QSIP command will query the following for the DPL agent:

SIP URI

Registration State

Allow Post Busy Termination

Number of Contacts

Contacts

Service Package

Services

Endpt ID

Virtual Media Gateway

Zone ID List

Client Type

Static Client

Node number and Terminal number of the VIDs of all the Active Call Appearances

Number of Active Sessions in CS2000 Session Server

- The CS2KSS will handle the query from the CS2K via the NCAS link for the QSIP command and respond back to the CS2K with the requested data.

- The default time interval for getting a response to the QSIP query is 15 seconds. Time can be set from 1 to 30 seconds. If any value lesser than 1

and greater than 30 is given then the time value will be set to the default value of 15. It is an optional parameter in the QSIP command.

- The QSIP command's format is listed below

```
CI:
>q qsip
DISPLAY SIP LINE INFORMATION
    COMMAND FORMAT: QSIP <DR_LEN_TYPE>
    PARMS:  [<TIMEOUT> {1 TO 30}]
```

- If the NCAS Link is unavailable or the CS2KSS did not respond, the QSIP command's timer will expire with the following message:

```
>qsip 8675309
SIP DATA CANNOT BE DISPLAYED DUE TO RESPONSE
TIMEOUT FROM CS2000 SESSION
```

6.10.2.5 Command syntax

Table 14 QSIP command parameters and variables

Command	Parameters and variables
QSIP	<DR_LEN_TYPE> [<Timeout> {1 to 30}]
Parameters and variables	Description
DR_LEN_TYPE	The DN/LEN of a SIP line agent is specified
TIMEOUT	Maximum time for which QSIP waits for a response from CS2KSS. Min value:1 seconds Max value:30 seconds Default value:15 seconds

6.10.2.6 Qualifications and warnings

QSIP query takes place through the NCAS link. Hence, the command response depends upon the availability of the NCAS link.

When the response is not received in a specified time interval, a message is displayed at the console:

"NO RESPONSE FROM CS2KSS WITHIN TIMEOUT OF 15 SECONDS".

6.10.2.7 Responses

Table 15 MAP outputs with associated meanings and actions

Command
Example 1: >qsip 8675309 --- SIP USER DATA ========== SIP URI: 6138675309@NORTELNETWORKS.COM ACCOUNT STATUS: ACTIVE REGISTERED: Y ALLOW POST BSY TERMINATIONS: N NUMBER OF CONTACTS: 12 CONTACTS: 6138675309@4.3.2.1:5060 6138675309@4.3.2.1:5061 6138675309@1.2.3.4:5062 SERVICE PACKAGE: DEFAULT_PKG SERVICES: ADHOC 4 ADDRBK 50 VMAIL SIP LINE DATA ========== ENDPT ID: PHX/003/0/1000 VMG: vmg ZONE ID(s): 1234 1234 3456 CLIENT TYPE: ONT STATIC CLIENT: N SIP CALL DATA ========== ACTIVE CALL APPEARANCES: NODENO TERMNO NUMBER OF ACTIVE SESSIONS IN SIP LINE SERVER: 12 ---
Meaning: The querying was successful. All the data obtained is displayed.
System or user actions: None.

Table 15 MAP outputs with associated meanings and actions

Command
Unsuccessful Query: **Example 2:** >qsip 8675309 SIP DATA CANNOT BE DISPLAYED DUE TO RESPONSE TIMEOUT FROM CS2000 SESSION SERVER **Meaning:** The response was not received before the QSIP timer expired either because the NCAS link is either busy/not available or the CS2KSS did not respond before the timeout occured. **System or user actions:** The user is expected to run QSIP again. **Example 3:** >qsip 122456783 QSIP SHOULD BE GIVEN FOR SIP LINES ONLY **Meaning:** The DN supplied is not a SIP line. **System or user actions:** The user is expected to give a valid SIP Line DN for QSIP. Example 4: >qsip 122456783 INVALID DN SPECIFIED FOR THE QSIP COMMAND Meaning: The DN supplied is not a valid DN. System or user actions: The user is expected to give a valid SIP Line DN for QSIP. Example 5: >qsip LG 0 2 3 4 INVALID LEN SPECIFIED FOR THE QSIP COMMAND Meaning: The LEN supplied is not a valid LEN. System or user actions: The user is expected to give a valid SIP Line LEN for QSIP. Example 6: >qsip 8675309 SIP DATA CANNOT BE DISPLAYED DUE TO BAD MESSAGE RECEIVED FROM CS2000 SESSION SERVER Meaning: The response received from CS2KSS in not valid. System or user actions: The user is expected to run QSIP again. Example 7: >qsip 8675309 SIP DATA CANNOT BE DISPLAYED BECAUSE NO DATA RECEIVED FROM CS2000 SESSON SERVER Meaning: The response received from CS2KSS does not have any data to display System or user actions: None.

Example 8:

```
>qsip 8675309
SIP DATA CANNOT BE DISPLAYED DUE TO QSIP SEND REQUEST
FAILURE
```

Meaning: An error occured while the QSIP sent the query to the CS2KSS.

System or user actions: The user is expected to run QSIP again.

Example 8:

```
>qsip 8675309
PARTIAL DATA RECEIVED FROM THE CS2000 SESSION SERVER.

Table 1 New or modified tables

Table/MIB name	NEW/CHANGED/ or DELETED/	Table Control (NEW/ OLD/UNCHANGED)
ESADGCOD	NEW	NEW

7.6.2 Table/MIB/Remote Database Schema information

7.6.2.1 Name: ESADGCOD

Emergency Stand Alone Digit Analysis Code Table

7.6.2.1.1 Functional description

This table contains customer group information and the digit analysis data that applies to specified types of calls in ESA mode of MG9000. According to datafill in ESADGCOD, number of digits to collect in ESA mode is determined.

7.6.2.1.2 Usage sequence and implications (CM Only)

This table can be datafilled after CUSTENG is datafilled.

7.6.2.1.3 Size

Table 2 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
ESADGCOD	0	3000	Memory is automatically allocated. Minimum memory consumption if it has no datafill.

7.6.2.1.4 Fields/OIDs

The following table lists fields/OIDs for ESADGCOD table.

Table 3 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
KEY	NEW	DGNAME	alphanumeric (up to 16 chars)	Character entries can be entered up to 16 Chars. But, only “IBN_ESA_DEFAULT” and customer group names (datafilled in CUSTENG table) can be accepted.
		FROMD	up to eight digits(0 to 9, B, or C)	From digits.
		TOD	up to eight digits(0 to 9, B, or C)	To Digits
NUMDGTS	NEW	N/A.	Number {0 to 15}	NUMDGTS:Number of digits to collect (including prefix digits).
ADDIGS	NEW	N/A.	up to fifteen digits (0 to 9, B or C)	ADDIGS: The digits stream which will be added to collected digits.
STRIP	NEW	N/A.	Number {0 to 15}	STRIP: Number of digits to be removed from collected digits.

7.6.2.1.5 Datafill example

The following example shows sample datafill for table ESADGCOD.

CUST783 0 0 8 216 1

7.6.2.1.6 Table release history update

N/A.

7.6.2.1.7 Supplementary information

ESADGCOD table has the verify procedure. Therefore, error messages are displayed if wrong datafill is entered. Followings are the error conditions and its error texts:

- If the table is full (which means table has 3000 tuple), new tuple cannot be datafilled, following error is displayed:

  "ESADGCOD TABLE IS FULL"

- If the table if full and telco worker tries to change a subset of existing key with different values. For example, table has following entry:

  CUST783 0 9 10 $ 2

  If the worker tries to change CUST783 3 3 entry with 11 $ 3 values, then table would have

  CUST783 0 2 10 $ 2

  CUST783 3 3 11 $ 3

  CUST783 4 9 10 $ 2

  The tuple is divided into 3 tuples. In this case following error would be displayed:

  "CHANGE operation is not allowed for this subrange."

  "Please change entire tuple range: <dgname> <fromdig> <todig>"

- If the table if full and telco worker tries to delete a subset of existing key. For example, table has following entry:

  CUST783 0 9 10 $ 2

  The worker tries to delete CUST783 5 5 datafill. Then Table would have following entries after deletion.

  CUST783 0 4 10 $ 2

  CUST783 6 9 10 $ 2

  The tuple divided into two tuples. In this case, if the table is full, then following error would be displayed.

"DELETE operation is not allowed for this subrange."

"Please delete entire tuple range: <dgname> <fromdig> <todig>"

- Table ESADGCOD accepts customer group names datafilled in table CUSTENG or accepts "IBN_ESA_DEFAULT" string. For the other conditions, following error would be displayed:

"The DGNAME "given name" is not datafilled in the CUSTENG table."

- TOD field should be greater than or equal to FROMD field. In case of wrong datafill, following error would be displayed:

"The TODIGs must be greater than the FROMDIGs"

- FROMD and TOD fields should contain at least one digit. In case of wrong datafill, following error would be displayed:

"At least one digit must be specified in both

the FROMD and the TOD fields."

- If the FROMD and TOD fields contain invalid digits (D, E, F, N), error would be displayed.

"Invalid digit(s) in field FROMD" if FROMD includes invalid digits.

"Invalid digit(s) in field TOD" if TOD includes invalid digits.

- Since NUMDGTS field indicates the total number of digits which will be dialled by end user, number of digits in FROMD and TOD fields should not be greater than NUMDGTS field. In case of wrong datafill, error message would be displayed:

"Number of digits in FROMD field cannot be greater than NUMDGTS." for FROMD field.

"Number of digits in TOD field cannot be greater than NUMDGTS." for TOD field.

- Telco worker tries to delete a subset of existing key. For example, table has following entry:

CUST783 0 9 4 $ 0

The worker tries to delete CUST783 50055 50055 datafill. Then Table may have following entries if deletion is permitted.

CUST783 0 50054 4 $ 0

CUST783 500056 9 4 $ 0

Since above tuples cannot be accepted, table gives following error and no tuple is deleted.

"DELETE operation is not allowed for this subrange."

"Please delete entire tuple range: <dgname> <fromdig> <todig>"

- STRIP field value cannot be greater than NUMDGTS value. In this case table gives following error message.

  "STRIP value cannot be greater than NUMDGTS value."

- If the ADDIGS field contains invalid digits (D, E, F, N), error would be displayed.

  "Invalid digit(s) in field ADDIGS"

- (Number of digits in ADDIGS field + NUMDGTS - STRIP) value cannot be greater than 15. Otherwise, following error would be displayed:

  "(ADDIGS + NUMDGTS - STRIP) value cannot be greater than 15."

```

8.6.2.2 Functional description

This ISN09 activity is targeted to provide recording of the subscriber initiated feature actions in the form of AMA billing records.

It is required that this capability is able to be turned off and on. Therefore, a new AMAOPTS option, MC611_FOR_RFU, is created. When this option is set to ON, a billing record is created for the feature actions (Please refer to the

FN document for the list of supported features and actions) initiated by subscribers. Otherwise, the billing flow is not impacted.

10.9.2.1.8 CLUI Interface

N/A

10.9.2.2 ESA Translation List View

10.9.2.2.1 Functional description

This GUI is being enhanced to now indicate the source of the CORE translator that the translation entry came from. Also if the translation entry is of the type DGCOD then the existing Digits field will be split in the middle to separate the To and From digits.

10.9.2.2.2 GUI usage and implications

This is an existing GUI and there are no changes to the order that the GUIs must be datafilled. The fields added are for display only.

10.9.2.2.3 GUI size

N/A

10.9.2.2.4 GUI fields

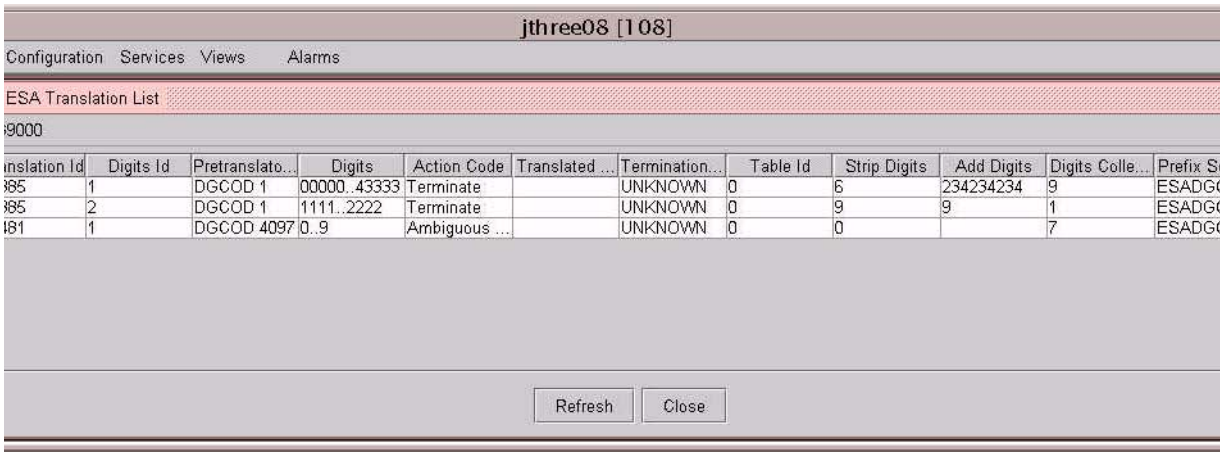
The following table lists the modified fields for the ESA Translation List View

Table 3 GUI field descriptions

Field	New or Changed	Subfield	Entry	Explanation and action	Associated MIB entry
Source	New	N/A	ESAPLXA IBNXLA and ESADGCOD	Indicates which CORE translator the entry came from.	None
Digits	Changed	N/A	TO..From	For ESADGCOD translation entries this field will display the To and From digits in the 111..222 format.	nnESAPrefix Digits

10.9.2.2.5 Usage example

The following is an example of the new ESA Translation List View:



10.9.2.2.6 GUI release history update

The following fields were added:

- Source

The following fields were modified:

- Digits

10.9.2.2.7 Supplementary information

None

10.9.2.2.8 CLUI Interface

N/A

10.9.2.3 ESA Customer Group List View

10.9.2.3.1 Functional description

This GUI is being enhanced indicate whether the Extension IDs are actually indexes into the EXTN table or the DGCOD table. This will be performed by modifying the existing “Extension ID” column name to “DGCOD ID” when the indexes are for DGCOD.

10.9.2.3.2 GUI usage and implications

This is an existing GUI and there are no changes to the order that the GUIs must be datafilled. The fields added are for display only.

10.9.2.3.3 GUI size

N/A

10.9.2.3.4 GUI fields

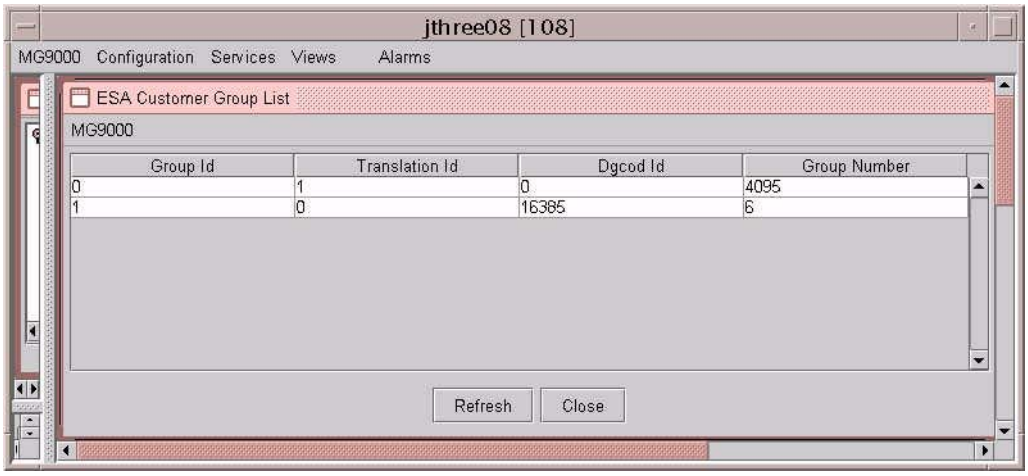
The following table lists the modified fields for the ESA Translation List View

Table 4 GUI field descriptions

Field	New or Changed	Subfield	Entry	Explanation and action	Associated MIB entry
Extension ID/ DGCOD ID	New	N/A	read only	The Extension or DGCOD index.	

10.9.2.3.5 Usage example

The following is an example of the new ESA Translation List View:



10.9.2.3.6 GUI release history update

The Extension ID column name will now read DGCOD ID whenever the indexes are for a DGCOD table, international.

10.9.2.3.7 Supplementary information

11.10.1 Directory: GNWMCODEDIR

11.10.1.1 Directory description

CodeCtrl commands are to List, Apply and Remove code controls. PCT option is available in these code control commands.

11.10.1.2 Accessing directory: GNWMCODEDIR

11.10.1.2.1 Access to directory or MAP level and return to CI

To access: `MAPCI;NMW;CODECTRL`

To return to CI: `QUIT ALL`

11.10.2 Command: LIST

11.10.2.1 Command type: MENU

11.10.2.2 Command target: SUPERNODE

11.10.2.3 Command availability: RES

11.10.2.4 Command description

This command is used to display the active Code Blocking Controls. This list command is executed from the CodeCtrl menu level.

11.10.2.5 Command syntax

Table 1 CODECTRL command parameters and variables

Command	Parameters and variables
List	LIST - list code controls Parms: <CTRL> {CBK <BLOCKTYPE> {PCT, GAP}, PRP, HTRF} <XLASYS> {AC, PX, CT, FA, OFC, FT, NSC} [<XLANAME> STRING] [<Code|ALL> STRING]
Parameters and variables	Description
CTRL	Specifies the code control type
BLOCKTYPE	Specifies the Code Block type
XLASYS	Specifies the translation system
[XLANAME]	Specifies the translation name for the specified XLASYS from which the control is to be displayed.
[Code|ALL]	Control(s) should be displayed for the specified Code. ALL specifies that the control should be listed for all code for the specified XLASYS and XLANAME

11.10.2.7 Responses

11.10.2.7.1 Response

Table 2 MAP outputs with associated meanings and actions

Command
Response: Control not active **Meaning:** There are no controls of that type currently active. **System or user actions:** None.
Response: Specified XLANAME is not valid for specified XLASYS. Check CODE table of speified XLASYS for valid XLANAME values **Meaning:** The specified XLANAME does not exist for the XLASYS which was specified for the control **System actions:** None **User actions:** Check the CODE table to determine what range of XLANAME can be specified.
Response: No matching control **Meaning:** The command was issued with parameters that did not match any applied controls. **System actions:** None **User actions:** Select control parameters which match the control or controls which are required to be listed.

Table 2 MAP outputs with associated meanings and actions

Command
Response: XLA From To Level Ann Block Pass PX CSXLA 8308001 8308004 50.0 NCA 12345 12345 **Meaning:** The command has been entered requesting details of the CBK call percentage control applied to code from 8308001 to 8308004 in XLASYS PX and XLANAME CSXLA. The output shows the details of the control(s) within whose code range the specidied code falls. It shows that the percentage is 50% and that blocked calls are sent to NCA treatment. It also shows that 12345 calls have been blocked by the control and 12345 calls have been passed. **System actions:** The system displayed the data associated with the specified control. **User actions:** None.
Response: CBK GAP Page 1 of 1 XLA From To Level Ann Block Pass PX CSXLA 8308001 8308004 50.0 NCA 12345 12345 **Meaning:** The command has been entered requesting details of the CBK call percentage control applied to code from 8308001 to 8308004 in XLASYS PX and XLANAME CSXLA. The output shows the only one control is currently applied. It shows that the percentage is 50% and that blocked calls are sent to NCA treatment. It also shows that 12345 calls have been blocked by the control and 12345 calls have been passed. **System actions:** The system displayed the data associated with the specified control. **User actions:** None.

11.10.2.8 Example

Table 3 Usage examples for LIST command

Description of task:	Command: MAP response:
all the percentage code blocking controls that applied which enters UXLA with an XLASYS of PX and an XLANAME of CSXLA will be displayed	`LIST CBK PCT PX CSXLA ALL`

Table 3 Usage examples for LIST command

all the percentage code blocking controls that applied which enters UXLA with an XLASYS of PX will be displayed	`LIST CBK PCT PX`
all the percentage code blocking controls that applied which enters UXLA with an XLASYS of PX and an XLANAME of CSXLA and digits starting in the range from '8308001' will be displayed	`LIST CBK PCT PX CSXLA '8308001'`

11.10.3 Command: APPLY

11.10.3.1 Command type: MENU

11.10.3.2 Command target: SUPERNODE

11.10.3.3 Command availability: RES

11.10.3.4 Command description

This command is used to activate a specified control for the XLASYS, XLANAME and digit range. This apply command is executed from the CodeCtrl menu level.

11.10.3.5 Command syntax

Table 4 CODECTRL command parameters and variables

Command	Parameters and variables
Apply	APPLY - add a code control Parms: <CTRL> {CBK <BLOCKTYPE> {PCT <XLASYS> {AC, PX, CT, FA, OFC, FT, NSC} <XLANAME> STRING <FROM-CODE> STRING <TO-CODE> STRING <LEVEL> {1 TO 100} <ANN> {NCA, EA1, EA2}, GAP <XLASYS> {AC, PX, CT, FA, OFC, FT, NSC} <XLANAME> STRING <FROM-CODE> STRING <TO-CODE> STRING <GAP> STRING <ANN> {NCA, EA1, EA2}}, PRP <XLASYS> {AC, PX, CT, FA, OFC, FT, NSC} <XLANAME> STRING <FROM-CODE> STRING <TO-CODE> STRING, HTRF <XLASYS> {AC, PX, CT, FA, OFC, FT, NSC} <XLANAME> STRING <FROM-CODE> STRING <TO-CODE> STRING}

Table 4 CODECTRL command parameters and variables

Command	Parameters and variables
CTRL	Specifies the code control type
BLOCKTYPE	Specifies the Code Block type
XLASYS	Specifies the translation system
XLANAME	Specifies the translation name for the specified XLASYS from which the control is to be displayed.
From-Code	Specifies the start of the code range to which the control is being applied
To-Code	Specifies the end of the code range to which the control is to be applied
GAP	Specifies the gapping period (in seconds) for a CBK control of GAP flavor. Specified as a string of digits with a single decimal place
LEVEL	Specifies the percentage (in percent) for a CBK control of PCT.
ANN	Specifies the treatment to which blocked calls are to be sent

11.10.3.6 Qualifications and warnings

N/A

11.10.3.7 Responses

11.10.3.7.1 Response

Table 5 MAP outputs with associated meanings and actions

Command
Response: OK **Meaning:** The command has been successful. **System actions:** The specified control is applied. **user actions:** None.
Response: Specified XLANAME is not valid for specified XLASYS. Check CODE table of specified XLASYS for valid XLANAME values. **Meaning:** The specified XLANAME does not exist for the XLASYS which was specified for the control **System actions:** None **User actions:** Check the CODE table to determine what range of XLANAME can be specified.

Table 5 MAP outputs with associated meanings and actions

Command
Response: Start of digits range (FROM-CODE) must be less than end of digit range (TO-CODE). **Meaning:** The user entered FORM-CODE digits which were greater than the TO-CODE digits. It should be noted that this is not a numerical relationship. For example, the specification FORM-CODE=157 and TO-CODE=16 is valid because the 16 will be treated as 169 in digit terms and hence the control will apply to digit range 157, 158, 159 ... 169. However, the specification FORM-CODE=16 and TO-CODE=157 is invalid because in digit terms 16 (treated as 160) comes after 157. **System actions:** None **User actions:** Change the digits range specification accordingly.
Response: No room to add control. **Meaning:** The maximum number of controls have been defined, there are no available resources to add a further control. **System actions:** None **User actions:** Remove an existing control to enable new control to be added.
Response: Value not in range ‘0.0’ to ‘600.0’ **Meaning:** The GAP time speified is not within the range 0.0 seconds to 600.0 seconds. The period must be within these bounds specified in increments of 0.1. **System actions:** None. **User actions:** Re-enter the command specifying a valid GAP period.
Response: Can not apply: Control is already active in code range **Meaning:** Code control(s) is already active for the specified XLASYS, XLANAME and part or all of the specified digit range. **System actions:** None. **User actions:** Delete the pre-existing control(s) and re-enter the new control; delete the pre-existing control(s) and re-apply it over a different range which does not confilict with the new control and then apply the new control; or re-apply the new control with a digit range which does not overlap the existing control(s).

Table 5 MAP outputs with associated meanings and actions

Command
Response: Out of range: <LEVEL> {1 TO 100} **Meaning:** The percentage specified is not within the range 1 percent to 100 percent. **System actions:** None. **User actions:** Re-enter the command specifying a valid percentage.
Response: Memory allocate failed **Meaning:** No memory is allocated to store the Mass Call Control information. **System actions:** None. **User actions:** Reboot the switch or run NWMMCTCI IPL.

11.10.3.8 Example

Table 6 Usage examples for APPLY command

Description of task:	Command: MAP response:
In this example, only 50 percent of calls which enters UXLA with an XLASYS of PX and XLANAME of CSXLA with called party digits starting in range from ’8308001’ to ’8308004’ will be allowed to complete, all other calls will be sent to NCA treatment.	`APPLY CBK PCT PX CSXLA '8308001' '8308004' 50 NCA`
In this example, only one call per 60 seconds which enters UXLA with an XLASYS of PX XLANAME of CSXLA with digits starting in range from ’8308001’ to ’8308004’ will be allowed to complete, all other calls will be sent to NCA treatment.	`APPLY CBK GAP PX CSXLA '8308001' '8308004' '60.0' NCA`

11.10.4 Command: REMOVE

11.10.4.1 Command type: MENU

11.10.4.2 Command target: SUPERNODE

11.10.4.3 Command availability: RES

11.10.4.4 Command description

This command is used to remove a code control of specified type from the given XLASYS, XLANAME and digit range. If ALL digits are specified then all controls of the specified type will be removed from the given XLASYS and XLANAME. This remove command is executed from the CodeCtrl menu level.

11.10.4.5 Command syntax

Table 7 CODECTRL command parameters and variables

Command	Parameters and variables
Remove	REMOVE - delete a code control Parms: <CTRL> {CBK <BLOCKTYPE> {PCT, GAP}, PRP, HTRF} <XLASYS> {AC, PX, CT, FA, OFC, FT, NSC} <XLANAME> STRING <From-Code|ALL> STRING [<To-Code> STRING]
Parameters and variables	Description
CTRL	Specifies the code control type
BLOCKTYPE	Specifies the Code Block type
XLASYS	Specifies the translation system to which the control is to be applied
XLANAME	Specifies the translation name for the specified XLASYS to which the control is to be applied
[From-Code|ALL]	If a control is being removed from a specific code range, specifies the start of the code range. ALL specifies that the control should be removed from all code ranges for the specified XLASYS and XLANAME
[To-Code]	If a From-Code is specified then specifies the end of the code range from which the control is to be removed

N/A

11.10.4.7 Responses

11.10.4.7.1 Response

Table 8 MAP outputs with associated meanings and actions

Command
Response: OK **Meaning:** The command has been successful. **System actions:** The specified control is removed either from the specified code range for the given XLASYS and XLANAME or from ALL code ranges for the specified XLASYS and XLANAME. The status display is updateed accordingly. **user actions:** None.
Response: Control not active **Meaning:** The command was issued with parameters that did not match any currently active controls. **System actions:** None **User actions:** Select control parameters which match the control or controls which are required to be removed.
Response: Specified XLANAME is not valid for specified XLASYS. Check CODE table of specified XLASYS for valid XLANAME values **Meaning:** The specified XLANAME does not exist for the XLASYS which was specified for the control **System actions:** None **User actions:** Check the CODE table to determine what range of XLANAME can be specified..
Response: TO-CODE digits must be specified **Meaning:** If the user entered FROM-CODE digits then the TO-CODE digits must be specified in order that a control can be removed. **System actions:** None **User actions:** Remove an existing control to enable new control to be added.

Table 8 MAP outputs with associated meanings and actions

Command
Response: Start of digits range (FROM-CODE) must be less than end of digit range (TO-CODE). **Meaning:** The user entered FORM-CODE digits which were greater than the TO-CODE digits. It should be noted that this is not a numerical relationship. For example, the specification FORM-CODE=157 and TO-CODE-16 is valid because the 16 will be treated as 169 in digit terms and hence the control will apply to digit range 157, 158, 159... 169. However, the specification FORM-CODE=16 and TO-CODE=157 is invalid because in digit terms 16 (treated as 160) comes after 157. **System actions:** None **User actions:** Change the digits range specification accordingly.
Response: Memory allocate failed **Meaning:** No memory is allocated to store the Mass Call Control information. **System actions:** None. **User actions:** Reboot the switch or run NWMMCTCI IPL.

11.10.4.8 Example

Table 9 Usage examples for REMOVE command

Description of task:	Command: MAP response:
In this example, the percentage code blocking control which enters UXLA with an XLASYS of PX and XLANAME of CSXLA with digits starting in range from ’8308001’ to ’8308004’will be removed.	`REMOVE CBK PCT PX CSXLA '8308001' '8308004'`
The gapping code blocking control which enters UXLA with an XLASYS of PX and XLANAME of CSXLA with digits starting in range from ’8308001’ to ’8308004’will be removed.	`REMOVE CBK GAP PX CSXLA '8308001' '8308004'`

Table 9 Usage examples for REMOVE command

All the percentage code blocking control with an XLASYS of PX and XLANAME of CSXLA with digits starting in range from will be removed.	REMOVE CBK PCT PX CSXLA ALL
All the gapping code blocking control with an XLASYS of PX and XLANAME of CSXLA with digits starting in range from will be removed.	REMOVE CBK GAP PX CSXLA ALL

11.10.5 Command: MASSCALL

11.10.5.1 Command type: MENU

11.10.5.2 Command target: SUPERNODE

11.10.5.3 Command availability: RES

11.10.5.4 Command description

This Mass Call CI command applies, removes or lists various MC controls without necessarily accessing the NWM menus. The command alias is MASSCALL. The MASSCALL command uses a selection of the same parameters as the CBK, PRP, HTRF and STR controls of the CodeCtrl and GrpCtrl menus.

In this feature, PCT is implemented as a new CBK option which provide the capability to block calls with percentage. The syntax of MASSCALL command is changed to add this new option.

11.10.5.5 Command syntax

Table 10 MASSCALL command parameters and variables

Command	Parameters and variables
MASSCALL	Masscall - Envoke a mass calling control Parms: <Action> {LIST <CTRL> {CBK <BLOCKTYPE> {PCT <XLASYS> {AC, PX, CT, FA, OFC, FT, NSC} [<XLANAME> STRING] [<Code|ALL> STRING], GAP <XLASYS> {AC, PX, CT, FA, OFC, FT, NSC} [<XLANAME> STRING] [<Code|ALL> STRING]}, HTRF <XLASYS> {AC, PX, CT, FA, OFC, FT, NSC} [<XLANAME> STRING] [<Code|ALL> STRING], PRP <XLASYS> {AC, PX, CT, FA, OFC, FT, NSC} [<XLANAME> STRING] [<Code|ALL> STRING], STR <fsclli|ALL> STRING}, APPLY <Cntrl> {CBK <BLOCKTYPE> {PCT <XLASYS> {AC, PX, CT, FA, OFC, FT, NSC} <XLANAME> STRING <FROM-CODE> STRING <TO-CODE> STRING <LEVEL> {1 TO 100} <ANN> {NCA, EA1, EA2},

Table 10 MASSCALL command parameters and variables

Command	Parameters and variables
MASSCALL	GAP <XLASYS> {AC, PX, CT, FA, OFC, FT, NSC} <XLANAME> STRING <FROM-CODE> STRING <TO-CODE> STRING <GAP> STRING <ANN> {NCA, EA1, EA2}}, HTRF <XLASYS> {AC, PX, CT, FA, OFC, FT, NSC} <XLANAME> STRING <FROM-CODE> STRING <TO-CODE> STRING, PRP <XLASYS> {AC, PX, CT, FA, OFC, FT, NSC} <XLANAME> STRING <FROM-CODE> STRING <TO-CODE> STRING, STR <fsclli> STRING <Lev1> {0 TO 63} [<Lev2> {0 TO 63}] [<Level> {0 TO 100}]}, REMOVE <CNTRL> {CBK <BLOCKTYPE> {PCT <XLASYS> {AC, PX, CT, FA, OFC, FT, NSC} <XLANAME> STRING <From-Code|ALL> STRING [<To-Code> STRING], GAP <XLASYS> {AC, PX, CT, FA, OFC, FT,

Table 10 MASSCALL command parameters and variables

Command	Parameters and variables
MASSCALL	NSC} <XLANAME> STRING <From-Code|ALL> STRING [<To-Code> STRING]}, HTRF <XLASYS> {AC, PX, CT, FA, OFC, FT, NSC} <XLANAME> STRING <From-Code|ALL> STRING [<To-Code> STRING], PRP <XLASYS> {AC, PX, CT, FA, OFC, FT, NSC} <XLANAME> STRING <From-Code|ALL> STRING [<To-Code> STRING], STR <fsclli|ALL> STRING}}
Parameters and variables	Description
ACTION	Specifies the action to be performed on the specific control type.
CTRL	Specifies the code control type
BLOCKTYPE	Specifies the Code Block type
XLASYS	Specifies the translation system to which the control is to be applied
XLANAME	Specifies the translation name for the specified XLASYS to which the control is to be applied
Code|ALL	If a control is being listed from a code specifies the code. ALL specifies that the control should be listed for all code for the specifies XLASYS and XLANAME
From-Code	Specifies the start of the code range to which the control is being applied or removed.
To-Code	Specifies the end of the code range to which the control is to be applied or removed.
GAP	Specifies the gapping period (in seconds) for a CBK control of GAP flavor. Specified as a string of digits with a single decimal place
LEVEL	Specifies the percentage for a CBK control of PCT.
ANN	Specifies the treatment to which blocked calls are to be sent

Table 10 MASSCALL command parameters and variables

Command	Parameters and variables
fsclli	This list of up to 9 variables identifies the trunk groups which are to be acted upon (used for STR control).
ALL	Specifies that all trunks group datafilled in table CLLIMTCE which have CTRL active are to be displayed or removed. (used for STR control).
Lev1	The upper trunk group reservation threshold (used for STR control).
[Lev2]	The lower trunk group reservation threshold (used for STR control).
[Level]	Percentage of traffic to be affected when thresholds are reached (used for STR control).

11.10.5.6 Qualifications and warnings

N/A

11.10.5.7 Responses

11.10.5.7.1 Response

All response are the same as those for the respective CODECTRL level commands.

11.10.5.8 Example

Table 11 Usage examples for MASSCALL command

Description of task:	Command: MAP response:
all the percentage code blocking controls that applied which enters UXLA with an XLASYS of PX and an XLANAME of CSXLA will be displayed	`MASSCALL LIST CBK PCT PX CSXLA ALL`
all the percentage code blocking controls that applied which enters UXLA with an XLASYS of PX will be displayed	`MASSCALL LIST CBK PCT PX`
all the percentage code blocking controls that applied which enters UXLA with an XLASYS of PX and an XLANAME of CSXLA and digits starting in the range from `8308001' will be displayed	`MASSCALL LIST CBK PCT PX CSXLA ‘8308001’`
In this example, only 50 percent of calls which enters UXLA with an XLASYS of PX and XLANAME of CSXLA with called party digits starting in range from ’8308001’ to ’8308004’ will be allowed to complete, all other calls will be sent to NCA treatment.	`MASSCALL APPLY CBK PCT PX CSXLA '8308001' '8308004' 50 NCA`

Table 11 Usage examples for MASSCALL command

In this example, only one call per 60 seconds which enters UXLA with an XLASYS of PX XLANAME of CSXLA with digits starting in range from ’8308001’ to ’8308004’ will be allowed to complete, all other calls will be sent to NCA treatment.	`MASSCALL APPLY CBK GAP PX CSXLA '8308001' '8308004' '60.0' NCA`
In this example, the percentage code blocking control which enters UXLA with an XLASYS of PX and XLANAME of CSXLA with digits starting in range from ’8308001’ to ’8308004’will be removed.	`MASSCALL REMOVE CBK PCT PX CSXLA '8308001' '8308004'`
The gapping code blocking control which enters UXLA with an XLASYS of PX and XLANAME of CSXLA with digits starting in range from ’8308001’ to ’8308004’will be removed.	`MASSCALL REMOVE CBK GAP PX CSXLA '8308001' '8308004'`
All the percentage code blocking control with an XLASYS of PX and XLANAME of CSXLA with digits starting in range from will be removed.	`MASSCALL REMOVE CBK PCT PX CSXLA ALL`
All the gapping code blocking control with an XLASYS of PX and XLANAME of CSXLA with digits starting in range from will be removed.	`MASSCALL REMOVE CBK GAP PX CSXLA ALL`

ISERVOPT table is modified.

Table 1 New or modified tables

Table/MIB name	NEW/CHANGED/ or DELETED/	Table Control (NEW/ OLD/UNCHANGED)
ISERVOPT	**CHANGED**	UNCHANGED

12.6.2 Table/MIB/Remote Database Schema information

Call Lock

12.6.2.1 Name: ISERVOPT

This table is used to configure switch wide information for service related feature.

12.6.2.1.1 Functional description

This activity extends the ILRCLS and CEPTPW tuple of the table ISERVOPT. Two new fields are added to ILRCLS tuple named ALLOW_ORIG_AFTER_DEACT and OVERRIDE_ILR_CLASS. And a new field is added to CEPTPW tuple named NEW_PWD_ONCE. The default value for these fields are ‘N’.

Fields of the ILRCLS tuple:

ALLOW_ORIG_AFTER_DEACT{BOOLEAN}: This field determines if the dial tone will be generated instead of confirm tone. If it is set as ‘Y’, dial tone is generated and the user can originate a new call directly after the successful deactivation without going on hook. Otherwise, confirm tone is generated. The default value for the field is ‘N’.

OVERRIDE_ILR_CLASS{BOOLEAN}: This field determines whether the user can overwrite the class of restriction when activating the ILR option without doing a ILR deactivation first or not. If it is set as ‘Y’, the user can overwrite the class of restriction, otherwise can’t. The default value for the field is ‘N’.

NEW_PWD_ONCE{BOOLEAN}: This field determines whether the user can change the password by the dialing sequence LH DT*SC*PWO*PWN#CT or not. If it is set as ‘Y’, the user can change the password by this dialing sequence. Otherwise the subscriber can change the password by the dialing sequence LH DT*SC*PWO*PWN*PWN#CT. The default value for the field is ‘N’.

AUTO_UNLOCK{BOOLEAN}: indicates whether the information of locked user will be recorded and the locked user will be unlocked in the following day automatically. If it is set as ‘Y’, the locked user will be unlocked automatically in the following day. The default value for the field is ‘N’.

12.6.2.1.2 Usage sequence and implications (CM Only)

There is no requirement to datafill tables in a specific order.

12.6.2.1.3 Size

Table 2 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
ISERVOPT	0	1	

12.6.2.1.4 Fields/OIDs

The following table lists fields/OIDs for ISERVOPT.

Table 3 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
ALLOW_ORIG_AFTER_DEACT	NEW		ILRCLS	Determines if the dial tone will be generated instead of confirm tone.

Table 3 Table field descriptions

Field	New or Changed	Subfield or refinement	Entry	Explanation and action
OVERRIDE_ILR_CLASS	NEW		ILRCLS	Determines whether the user can overwrite the class of restriction when activating the ILR option without doing a ILR deactivation first or not.
NEW_PWD_ONCE	NEW		CEPTPW	Determines whether the user can change the password by the dialing sequence LH DT*SC*PWO*PWN#CT or not.
AUTO_UNLOCK	NEW		CEPTPW	Determines whether the locked user can be unlocked in the following day.

Do Not Disturb

12.6.2.2 Name: ISERVOPT

This table is used to configure switch wide information for service related feature.

12.6.2.2.1 Functional description

This activity introduce a new tuple CDND into the table ISERVOPT. A new field is added to CDND tuple named ALLOW_ORIG_AFTER_DEACT. The default value for this field is ‘N’.

Field of the CDND tuple:

ALLOW_ORIG_AFTER_DEACT {BOOLEAN}: indicates that the dial tone will be generated or confirm tone will be generated after the deactivation activity. If it is set as ‘Y’, dial tone is generated. Otherwise, confirm tone is generated. The default value for the field is ‘N’.

12.6.2.2.2 Usage sequence and implications (CM Only)

There is no requirement to datafill tables in a specific order.

12.6.2.2.3 Size

Table 4 Table size

Call Waiting Tone

13.6.2.1 Name: ISERVOPT

This table is used to configure switch wide information for service related feature.

13.6.2.1.1 Functional description

This activity extends the ICWT tuple of the table ISERVOPT. Two new fields are added to ICWT tuple: ICWT_2PTY_TONE_B and ICWT_DFLT_RCODE. The default value for these fields are ‘N’.

Fields of the ICWT tuple:

ICWT_2PTY_TONE_B{BOOLEAN}: This field determines whether the Call Waiting Tone B shall be applied to both talking side infinitely after the Call Waiting Tone A is applied to the ICWT subscriber called by waiting side. If it is datafilled as ‘Y’, CWT B will be applied. The default value for the field is ‘N’.

ICWT_DFLT_RCODE{BOOLEAN}: This field determines whether R-code is needed when the controller flash hook to toggle between held parties. If it is datafilled as ‘Y’, the subscriber can toggle between held parties without any R-Code. The default value for the field is ‘N’.

13.6.2.1.2 Usage sequence and implications (CM Only)

There is no requirement to datafill tables in a specific order.

13.6.2.1.3 Size

Table 2 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory

International Three Way Calling

13.6.2.2 Name: ISERVOPT
This table is used to configure switch wide information for service related features.

13.6.2.2.1 Functional description
This activity introduces a new tuple I3WC into the table ISERVOPT. A new field is added to I3WC tuple named I3WC_DFLT_RCODE. The default value for this field is ‘N’.

Field of the I3WC tuple:

I3WC_DFLT_RCODE {BOOLEAN}: This field determines whether R-code is needed in I3WC feature. If it is datafilled as ‘Y’, the subscriber can setup a 3-way conference by hook-flash only without dialing any R-Code and in 3-way conference, the subscriber can disconnect part C by hook-flash only without dialing RCODE. The default value for the field is ‘N’.

Usage sequence and implications (CM Only)
There is no requirement to datafill tables in a specific order.

13.6.2.2.2 Size

Table 4 Table size

Abbreviated table name	Minimum tuples	Maximum tuples	Information on memory
ISERVOPT	0	1	

13.6.2.2.3 Fields/OIDs

13.13 Configuration Walkthrough

None

14: Configuration (CN): A00013275

14.1 Hardware and Software Requirements

CS2M: SESM091FC

GWC: GI091FC or GN091FC dependant on market.

CM: PSNW09BS + SN09.1 2K LGRP patch.

> ***Note 1:*** The CM patch is required to provide 2K LGRP Line GW support for the Audiocodes Mediant 8000 TP6310 card configured as a large line GW. This patch is not required where the TP6310 is to be configured as a Trunk GW.

14.2 Initial Configuration

CS2M and GWC components must be running the SN09.1FC software loads.

CM must be running the PSNW09BS with the 2K LGRP patch if provisioning of the Audiocodes Mediant 8000 TP6310 cards as large line GWs is required.

No patch is required if the TP6310 cards are to be used as Trunk GWs.

There are no additional initial configuration steps.

14.3 Office/Subnet parameters (OP/SP) (CM & SESM)

None.

14.4 Upgrade Considerations

For CS2M upgrade from versions 8.0, 9.0 to SN09.1.

14.4.1 Dump and Restore (CM)

Refer to feature A00013286.

14.4.2 Element Management Upgrade

For CS2M upgrade from versions 8.0, 9.0 to SN09.1.

No additional upgrade steps are required to the CS2M over and above the normal upgrade procedure.

14.4.3 Downgrade impact

None.

14.5 Data schema (DS) (CM, MIBS, RDB)

Unchanged.

14.6 Service Orders (SO) (CM & SESM)

14.6.1 Line equipment format changes

14.6.1.1 LEN

Provisioning of 2K LGRPs results in an extension to the existing LEN range supported for LL_3RDPTY LGRPs.

Lens will be of the format:

<LGRP> TT tt

TT = 00 .. 20

tt = 00 .. 99 where TT < 20

tt = 00 .. 46 where TT = 20

The LGRP is a valid entry from CM table LGRPINV formed from the SITE + frame number + shelf number where

SITE = a valid entry from the CM table SITE.

frame number = logical frame number in range 00 .. 99

shelf number = logical shelf number in range 0 .. 9

For the Audiocodes TP6310 card provisioned as a large line GW a subset of the available LEN range will be required to support the full endpoint range (2016 endpoints / LENs in total). LEN assignment is user defined using functionality provided by features A00007071 / A00007072 however it is recommended that LENs are mapped directly to endpoints and run in the range: <lgrp> 00 00 ... <lgrp> 20 15.

14.6.1.2 Media gateway endpoint format

The Audiocodes Mediant 8000 TP6310 card provisioned as a large line GW supports endpoints for the format:

tp/nnnn where nnnn is in the range 1 ... 2016 is not padded.

i.e: tp/1 ... tp/2016

14.7 Software optionality control (SOC)

Unchanged.

14.8 Element Management

The CS2M configuration manager: GWCEM has been modified to support the provisioning of large line GWs with a capacity of up to 2047 endpoints within a single LGRP.

The CS2M configuration manager: GWCEM has been modified to support the provisioning of the Audiocodes Mediant 8000 TP6310 card configured as either a large line or a trunk GW.

14.8.1 New/modified GUIs

Unchanged.

14.8.2 Change To Certificate Model For Large Line GWs

This feature has modified the certificate schema used to process gateway certificates from that originally introduced by feature A00007071 and A00007072. Going forwards all creators of gateway certificate profiles designed for large line GWs must include LGRP Size support when generating a certificate.

Directly following the <LgrpType> tag value pair a new field <LgrpSize> is introduced. This must be set to one of the following 2 settings:

- <LgrpSize>1024</LgrpSize>
- <LgrpSize>2048</LgrpSize>

In the current release LgrpSize is directly coupled to LgrpType and the 2 must be aligned based on the following table.

Table 1: LgrpType To LgrpSize Alignment

LgrpType	LgrpSize
S	1024
M	1024
C	1024
LL_3RDPTY	1024
CALIX_C7	1024
SSDPL	1024
LL_3RDPTY_2K	2048

Any incorrect alignment of LgrpType against LgrpSize will result in either a reduction of capacity or wastage of resources.

Note 1: To maintain backwards compatibility with existing 3rd party gateway profile certificates, should the LgrpSize tag be missing from a large line GW certificate, it is assumed that the required size is 1024.

Note 2: It is forbidden to include the LgrpSize tag into gateway profiles that are not intended to support large line GWs.

14.9 User interface changes

Unchanged.

14.10 OSSGate Interface Changes

14.10.1 XML Command Changes

Extension to LEN range indirectly impacts the addLineEndpoint and delLineEndpoint interfaces. The circuitNumber tag within these interfaces will support a greater range of associated LENs.

For the TP6310 configured as a large line GW the endpoint range will be tp/1 ... tp/2016.

The TP6310 configured as a Trunk GW indirectly impacts the addCarrier and deleteCarrier interfaces as follows:

CarrierName field may be in range E1/01 ... E1/63 or DS1/01 ... DS1/84

DPNSS IID field may be in the range 1 ... 63 for E1 carriers.

14.10.1.1 Command XML

Figure 1 addLineEndpoint - Endpoint In Upper Half Of 2K LGRP

```
<?xml version="1.0" encoding="UTF-8"?>
<CommandList>

14.12 Configuration Walkthrough

14.12.1 Provisioning an AUDIOCODES TP6310 Card As Large Line GW

CS2M and GWC are running SN09.1 FC loads. GWC is provisioned with a profile supporting large line GWs and has sufficient spare termination capacity to support an AUDIOCODES TP6310 card provisioned as a large line GW.

CM is running SN09 FC Load (PSNW09BS) with patch applied for large LGRP support (patch not required for SN10 onwards).

From the CS2M GUI interface (alternatively use OSSGate assocmg interface) launch the “Associate Media Gateway” dialog.

In the “Gateway profile name” selector locate “AUDIOCODES_6310_LINE”.

Set the “Gateway Site Name” selector to be a suitable SITE entry to support this gateway.

Set the Frame number and Unit number entries to values that will generate a unique LGRP entry in conjunction with the Site Name.

Populate the remainder of the fields as per normal for a H.248 supporting gateway and press the “OK” button to confirm.

Using either the bulk provisioning tool or OSSGate addLineEndpoint interface, add the desired number of endpoints in the range tp/1 ... tp/2016, associated circuit numbers will be in the range 0 ... 2015.

Using servord+ provision POTS type line services using the assigned endpoints.

14.12.2 Deprovisioning an AUDIOCODES TP6310 Card As Large Line GW

Using Servord+, remove all line services associated with GW endpoints.

Using the bulk provisioning tool or OSSGate delLineEndpoint interface, remove all endpoints associated with the GW.

Using either the CS2M GUI or OSSGate disassocmg interface delete the GW.

14.12.3 Provisioning an AUDIOCODES TP6310 Card As A Trunk GW

CS2M and GWC are running SN09.1 FC loads. GWC is provisioned with a profile supporting trunk GWs and has sufficient spare termination capacity to support an AUDIOCODES TP6310 card provisioned as a trunk GW.

CM is running SN09 FC Load (PSNW09BS). The large LGRP patch is considered optional in this scenario.

From the CS2M GUI interface (alternatively use OSSGate assocmg interface) launch the “Associate Media Gateway” dialog.

In the “Gateway profile name” selector locate “AUDIOCODES_6310_TRUNK”.

Data fill the dialog in exactly the same way as for an AUDIOCODES MG3200 / MG3500 GW. ITRANS may be specified if required - however the maximum termination setting is increased to 2016. Be aware that if E1 carriers are provisioned a maximum of 1953 terminations will be required for a fully equipped GW so the reserved terminations value may be lowered to save GWC capacity.

Using either the CS2M GUI Add Carrier dialog or corresponding OSSGate interface add the desired number of carriers to the GW. For E1 carriers the range is E1/01 to E1/63. For DS1 carriers the range is DS1/01 to DS1/84.

Where DPNSS support is required the IID may be set in the range 1 .. 63. Where PRI support is required the IID may be set in the range 0 .. 31. Be aware that the PRI upper bound is not enforced by the provisioning system and may be incorrectly set in the range 0.. 63. Be aware that the DPNSS IID may be incorrectly set to 0 by the provisioning system.

14.12.4 Deprovisioning an AUDIOCODES TP6310 Card As A Trunk GW

Using either OSSGate or the CS2M “delete carrier” dialog remove all carriers associated with the GW.

Using either the CS2M GUI or OSSGate disassocmg interface delete the GW.

TDM/Carrier VoIP
