## iSN07 Feature Deltas 45

Product = CS 2000 45

A00001935 -- Provisioning Support for Centrex-IP Nodes and Lines (Int'l PT-IP) 45

A00002252 -- MG9K Lines Preprovisioning (Int'l PT-IP) 53

A00002291 - Trunk Offering Expansion (Succession on DMS) 61

A00002365 -- CWR Support over Trunks for Brazil market (Int'l IAW) 85

A00002367 -- BRI Preset Conference Base (Succession on DMS) 98

A00002377 -- 10 AFC Keys for BRI Directory Number (Succession on DMS) 122

A00002512 -- GWCEM Internet Transparency VCAC Provisioning  
(Intl IAW, Intl IAC) 137

A00002558 -- LDI display for Class phone (Succession on DMS) 183

A00002639 -- CEPT PSTN: Analogue Call Waiting Indication (Intl UA-IP) 189

A00002642 -- CEPT PSTN: Analogue Query and 3PTY (Intl UA-IP) 213

A00002644 -- Common Topology Elements for Inter CS2K Internet Transparency  
solution (Intl IAW, Intl IAC) 219

A00002654 -- CEPT AR (CLASS Call Back for Telefonica) (Int'l UA-IP) 247

A00002655 -- CEPT ACRJ for Telefonica (Int'l IAW, Int'l UA-IP) 283

A00002678 -- Telefonica IN Enhancements (Int'l UA-IP) 288

A00002680 -- CEPT/Telefonica Spain Changed Number Indication (Int'l UA-IP) 321

A00002713 -- Spanish ISUP enhancements for Telefonica (Intl UA-IP) 333

A00002754 -- China INAP Compliance Enhancement Part 1 (Succession on DMS) 359

A00002755 -- China Line Service Compliance (Succession on DMS) 374

A00002756 -- Japan Trunk Services (Succession on DMS) 432

A00002884 -- ETSI BRI Preset Conference Service Interactions (Succession on DMS) 503

A00002900 -- China INAP Compliance Enhancement Part 2 (Succession on DMS) 522

---

A00002904 -- CTI Toggle (Succession on DMS) 536  
A00003147 -- DP Digit Reception Control (Succession on DMS) 559  
A00003410 -- New ETSI ISUP variant for Honduras (Succession on DMS) 565  
A00003411 -- New Toneset for Honduras (Succession on DMS) 578  
A00003465 -- ETSI BRI Channel Reservation Override (Succession on DMS) 596  
A00003467 -- Reverse Translations Enhancements via CUSTMOD Option  
(Succession on DMS) 604  
A00003627 -- T.38 FAX Support for H.323 (Intl IAW) 652  
A00003695 -- ANSI ISUP FGD on CS2K (Int'l PT-IP) 680  
A59036475 -- ISUP FGD (ISDN User Part Feature Group "D") - Phase 1 (Int'l UA-IP) 681  
A00003696 -- G-ISUP Routing enhancements (Int'l PT-IP) 867  
A00003951 -- CICM i2001 Support (Int'l IAC) 911  
A00004205 -- Japan PRI Backward Voice Path Solution (Succession on DMS) 934  
A00004931 -- Indian ISUP (Int'l PT-IP) 944  
A00004933 -- Indian ISUP Charging (Int'l PT-IP) 967  
A00004981 -- GWC-EM Internet Transparency VCAC provisioning support for  
CentrexIP gateways (Int'l IAW, Int'l IAC) 984  
Product = World Trade 1001  
A00001914 -- CEPT International Line Restriction Enhancements  
(Succession on DMS) 1001  
A00001918 -- CEPT Feature Warning with Announcement for Bangladesh  
(Succession on DMs) 1020  
A00001919 -- CEPT Services Password Enhancement (Succession on DMS) 1037  
A00001920 -- Metering OOS Enhancements (Succession on DMS) 1112  
A00001921 -- CIS Toll Call Ringing (Succession on DMS) 1135  
A00001923 -- CIS Subscriber Categories (Succession on DMS) 1152  
A00001930 -- Last and Total Call Meter Inquiry Services (Succession on DMS) 1178  
A00002053 -- AMA Records for Metered features (Succession on DMS) 1230  
A00002101 -- Allow ITX Only SSUTR2 (Succession on DMS) 1248  
A00002173 -- System of Operative-Searching Measures (SOSM) - X25 Messaging  
Interface & Speech Connection (Succession on DMS) 1289  
A00002319 -- MWI Control via ISUP (Succession on DMS) 1476  
A00002364 -- CLI/RDN/OCN capture in Billing Record (CDR) for ANSI ISUP  
and HK ISUP on DRU GSP20 (Succession on DMS) 1493  
A00002641 -- CEPT PSTN: Analogue OCB (Intl UA-IP) 1501  
A00002702 -- No Line Origination without Charging (Succession on DMS Int'l) 1509  
A00002754 -- China INAP Compliance Development Part 1 (Succession on DMS) 1518  
A00002761 -- ACRJ enhancement for Hong Kong (Succession on DMS) 1535  
A00002844 -- Excessive Metering Detection (EMD) support for Metered Trunks  
(Succession on DMS) 1538  
A00002907 -- T-INAP Operations Support (PT-IP) 1554  
A00003227 -- IN Support for User to User Service (UUS) (Succession on DMS-Int'l) 1579  
A00003466 -- MLPP Default Precedence Level on Termination (Succession on DMS) 1587

A00003686 -- Re-routing based on Release Cause Value (Succession on DMS-Int'l) 1589  
A00004503 -- Calling Party Number Serving Country Code (Succession on DMS) 1597  
A00004563 -- Moroccan ISUP V2 on DMS100 (Succession on DMS) 1622  
A00004565 -- Line to Moroccan ISUP V2 Interworking (Succession on DMS) 1651  
A00004743 -- Line Originations CLI modification through CALLCNTL  
(Succession on DMS) 1700  
A00004750 -- Even Bit Inversion (EBI) Support on DTCO2 (Succession on DMS) 1708  
A00005802 -- SPM Companding law provisioning (Succession on DMS) 1715  
A00006001 -- Russian ISUP and Tones for International SPM (Succession on DMS) 1725

# About this document

## Overview

This document supports Nortel's International Succession Solutions ISN07 release. It describes ISN07 features that affect inputs to or outputs from the solutions. These changes, therefore, affect the use of the Operations Support System (OSS) for ISN07. The document includes copies of feature descriptions used in software design.

**Information in this document is believed to be accurate at the time of publication, but it is subject to change. Use of this document should be restricted to resource planning and estimating for ISN07. Do not use this document to make changes to existing software.**

## How this document is organized

This document is divided into the following sections:

- *Global features.* This section contains a table listing the OSS-affecting features which apply to both the North American and International markets. These features are documented in detail in equivalent North American documents (see "Related documents", below).
- *Activity mapping table.* The table relates the activity identifier associated with each International-only feature to:
  - the product/application/network element, or market area affected
  - affected software object types (data schema, for example)
- *New or changed for ISN07.* This section provides a table for each software object type, as follows:
  - Office parameters
  - Logs and faults
  - Operational and Performance Measurements (OMs and PMs)

- Data Schema tables or MIBs
- User Interface (commands)
- Service Orders
- AMA/billing
- Software Optionality Control (SOC)

Each table gives a summary of the changes caused per feature. Within each table, features are arranged by product/application, network element, or market.

- *Feature descriptions.* This section provides feature descriptions, based on design documents. These are organized by product/application/network element, or market.
- *Appendices* that support specific product lines, such as MG9K

## Related documents

Global information that applies to both the North American and the International markets can be found in the following North American (SN06.2) documents:

- PLN-072AT-OSS, *SN07 OSS Guide (ATM)*
- PLN-07IP-OSS, *SN07 OSS Guide (IP)*

The documents contain details of OSS-affecting features that apply to both SN07 (North America) and ISN07 (International), referenced from section “Global features” in this document.

Other relevant descriptions contained in the North American documents are as follows:

- Audio Provisioning Server
- Compact Call Agent
- CMT
- SAM21 (Logs/faults as an Appendix)
- CS2000 XA-Core
- GWC
- SPM (all variants)
- Storm
- MG 9000 (OMs/PMs as an Appendix)
- Network Patch Manager (NPM)

- CS 2000 Core Manager
- TOPS
- Passport 8600
- Passport 15000 (Alarm logs as an Appendix)
- MDM (Alarm logs as an Appendix)
- PNM
- UAS (Logs/faults as an Appendix)
- USP (Logs/faults and OMs/PMs as an Appendix)
- OSSGate User Guide

## Audience

This document is intended for Nortel Networks personnel, third-party OSS vendors, and customers who need to plan resources and estimate network impacts for this release.

## How to check the version and issue of this document

The document release information on the title page and the footers of this document indicate the version and issue, for example, 01.01.

The first two digits indicate the version. The version number increases each time the document is updated to support a new software release. For example, the first release of a document is 01.01. In the next software release cycle, the first release of the same document is 02.01.

The second two digits indicate the issue. The issue number increases each time a document is revised but re-released in the same software release cycle. For example, the second release of a document in the same software release cycle would be 01.02.

## Writing conventions

Descriptions of commands, parameters, and responses in this document use the following conventions:

### Input prompt

An input prompt (> or #) indicates that the information that follows is a command:

>LIST

### Commands and fixed parameters

Commands and fixed parameters that are entered at the MAP terminal are shown in uppercase letters:

>LIST ALL

**Variables**

Variables that are entered at a MAP terminal are shown in lowercase letters:

>TABLE table\_name

# Global features mapping

## Introduction

This section contains a table that lists the OSS-affecting features that apply to both the International and North American market. These features are covered in the following North American documents:

- SN07 OSS Guide (IP), PLN-07IP-OSS
- SN07 OSS Guide (ATM), PLN-07AT-OSS

## Global Features

| SN07 Solutions                  |           | Solutions Affected |             |           |           |             |                   | SW object types or areas impacted |             |               |         |                 |          |             |             |

# ISN07 Activity mapping table

## Introduction

This document contains advance information about differences in operations, administration, maintenance, and provisioning (OAM&P) for International Succession Networks Release 7 (ISN07). The purpose of this document is to provide early information about new, modified or deleted items related to OSS-impacting areas.

The table below shows the mapping from the activity identifier (ACTID) associated with each new feature to the following:

- the associated product, application, network element, or market
- the international solution that the feature affects, of the following:
  - International PT-AAL2
  - International PT-IP
  - International IAC
  - International IAW
  - International UA-IP
  - International Succession on DMS
- the software object type or area that the feature affects, of the following:
  - Logs/faults
  - Data schema tables/MIBs
  - Office parameters
  - Service orders (ServOrd)
  - User interface/human-machine interface
  - Operational and performance measurements (OMs/PMs)
  - Automatic Message Accounting (AMA)/billing
  - Software Optionality Control (SOC)

**Activity Mapping Table: Solutions Affected**

| PRODUCT or APPLICATION | ACTID                        | SN07 Solutions |             |           |           |             | Int'l Succ on DMS |
|------------------------|------------------------------|----------------|-------------|-----------|-----------|-------------|-------------------|

## New or changed for iSN07

### Introduction

This section of the document contains tables which give an overview of the feature-based changes occurring in this release for:

- Office parameters
- Logs/faults
- Operational measurements (OMs) and performance measurements (PMs)
- Data Schema tables or MIBs
- User interface (commands)
- Servord
- AMA/billing
- Software Optionality Control (SOC)

Within each table, the changes are arranged by associated product, and the activity identifier (ACTID) of the feature which causes the change.

### Office Parameter changes overview

The following office parameters are new or changed for iSN07. More complete descriptions appear in the Feature Descriptions section of this document.

#### Summary of new or changed Office Parameters

| Office Parm Name         | New or Changed | Description                                                                                                                                                                                                                                           |
|--------------------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Product = CS 2000</b> |                |                                                                                                                                                                                                                                                       |
| FEATURE_TO NE_SET        | Changed        | A00002252 (Int'l PT-IP) alters the functionality of office parameter RDT_SUCC_AUTOCREATE_LNINV for MG9K lines. For MG9K lines the value of ACTIVE is ignored, and no auto provisioning of table LNINV is allowed. DEFAULT_MNO is used for MG9K lines. |

**Summary of new or changed Office Parameters**

| Office Parm Name                    | New or Changed | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------------------------------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| WTIN_TDP4_ACTIVE                    | New            | A00002675 (Int'l UA-IP) creates two new parameters in table OFCENG:                                                                                                                                                                                                                                                                                                                                                                                                 |
| INAP_ASF_FILTERING_TIMEOUT_DURATION |                | <ul style="list-style-type: none"> <li>WTIN_TDP4_ACTIVE (Intelligent Networks Trigger Detection Point 4 Active) should be set to TRUE if TDP-4 triggering is required in the office. If set to FALSE, TDP-4 triggering is disabled, regardless of datafill in table TRIGGRP.</li> <li>INAP_ASF_FILTERING_TIMEOUT_DURATION (Intelligent Network Application Part ActivateService Filtering Timeout Duration) specifies the network-specific ASF duration.</li> </ul> |
| INAP_VARIANT                        | Changed        | A00002675 (Int'l UA-IP) adds the new value TELEFONICA for the Spanish national market.                                                                                                                                                                                                                                                                                                                                                                              |
| ORIGNETID                           | New            | A00002713 (Int'l UA-IP) creates this new parameter in Table OFCVAR to determine the originating network identification number. The default value is 0. For Interconnect trunks, this value will be different and will be datafilled in the table TRKOPTS against the corresponding spanish ISUP V2 trunk.                                                                                                                                                           |
| INAP_TSSF_WFI_TIMER                 | Changed        | A00002754 (Succession on DMS) changes the range of this parameter from 1-10 to 1-60, and changes the datafillable value from 1-10 to 1-10, 15, 20, 25, 30, 35, 40, 45, 50, 55, 60.                                                                                                                                                                                                                                                                                  |
| DISABLE_DP_RECEPTION_ON_DGT         | Changed        | A00003147(Succession on DMS) creates this new parameter in Table OFCENG to disable DP digit collection on lines assigned DGT option; only offhook, flashes and DTMF tones are permitted.                                                                                                                                                                                                                                                                            |
| FEATURE_TONE_SET                    | Changed        | A00003411 (Succession on DMS) expands this parameter in table OFCENG to include the new HONTONES toneset that is required for the Honduras market.                                                                                                                                                                                                                                                                                                                  |
| CAPTURE_ISC_PC                      | New            | A00003696 (Int'l PT-IP) creates this new parameter (Capture International Switching Center Point Code) to enable/disable the printing of LOG (ISC6000) that captures ISC Point Code information.                                                                                                                                                                                                                                                                    |
| <b>Product = World Trade</b>        |                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## Summary of new or changed Office Parameters

| Office Parm Name         | New or Changed | Description                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------------|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Various                  | Deleted        | <p>A00001921 (Succession on DMS) removes these 6 office parameters from table OFCENG. Their functionality is taken over by new tuple LONG_DIST_ALERT in table ISERVOPT:</p> <ul style="list-style-type: none"> <li>• <b>LDA_ENABLED</b></li> <li>• <b>LDA_DEFAULT_CALLTYPE</b></li> <li>• <b>LDA_OM_ENABLED</b></li> <li>• <b>LDA_ALERT_NO_CLID</b></li> <li>• <b>LDA_CWT_TIMEOUT</b></li> <li>• <b>LDA_PATTERN</b></li> </ul> |
| FTR_RECORDER_FOR_ICR_OPT | Changed        | <p>A00002053 (Succession on DMS) creates this parameter in table OFCVAR to make the FTR record generation optional for metered actions of ICR feature option. When the subscriber having ICR option is charged for the ICR operations (assignment / deassignment / usage), the FTR record is generated only if the FTR_RECORD_FOR_ICR_OPT is Y.</p>                                                                            |
| INAP_TSSF_WFI_TIMER      | Changed        | <p>A00002754 (Succession on DMS) changes the range of INAP_TSSF_WFI_TIMER in table OFCENG from '1-10' to '1-60', and changes the datafillable value from '1-10' to '1-10, 15, 20, 25, 30, 35, 40, 45, 50, 55, 60'.</p>                                                                                                                                                                                                         |
| NI_INCOMPL_ACRJ          | New            | <p>A00002761 (Succession on DMS) creates this parameter in OFCVAR to enhance the existing ACRJ functionality to accept or reject the HKISUP to line calls with NI=1 in incoming HKISUP IAM/INF.</p>                                                                                                                                                                                                                            |
| Q955_COMPLIANT           | Changed        | <p>A00003466 (Succession on DMS) modifies this parameter to provide assigning precedence level ROUTINE to calls originated from non-MLPP sources when terminating to an MLPP BRI loop if Q955_COMPLIANT is set to N.</p>                                                                                                                                                                                                       |

## Logs/faults changes overview

The following logs/faults are new or changed for ISN07. More complete descriptions appear in the Feature Descriptions section of this document.

### Summary of new or changed Logs/Faults for ISN06

| Log/Fault Type               | Log/Fault Name          | New/Modified/Deleted, ACTID and Solution                                                                                                                                                                                                              |
|------------------------------|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Product = CS 2000</b>     |                         |                                                                                                                                                                                                                                                       |
| LINE logs                    | All LINE logs (changed) | Per A00002252 (Int'l PT-IP) all LINE logs will use the new MG9K LEN format that reflects the physical location of the line.                                                                                                                           |
| ISC logs                     | ISC600 (new)            | A00003696 (Int'l PT-IP) creates ISC600 to display the Point Codes and the respective counts for all the calls received on a GISUP trunk routing to a National variant.                                                                                |
| MCID logs                    | MCID600 (new)           | A00003696 (Int'l PT-IP) creates MCID600 as an extension of the MCID logs, introduced for DTAG holding service. It provides information about the Called agent, calling number, called number and the date and time of the call.                       |
| <b>Product = World Trade</b> |                         |                                                                                                                                                                                                                                                       |
| CEPT logs                    | CEPT100 (new)           | A00001919 (Succession on DMS) creates CEPT100, generated when CEPT Features' Password (CEPTPW) is locked remotely which means the subscriber exceeded the maximum wrong PIN entry for CEPTPW feature.                                                 |
|                              | CEPT101 (new)           | A00001919 (Succession on DMS) creates CEPT101, generated when the subscriber attempts to use supported CEPT features (ILR, IWUC, CEPTPW, CFD, CFU and CFB) from remote agents via CEPTRA.                                                             |
| MTR logs                     | MTR150 (new)            | A00001920 (Succession on DMS) creates info log MTR150, generated when there is no space available in MTRDEASS table for a new entry.                                                                                                                  |
|                              | MTR156 (changed)        | A00002053 (Succession on DMS) makes the generation of the MTR156 log dependent on the SOC option RBIL0014. If this option is set to ON, instead of MTR156, FTR record and its optional AMAB156 log are generated with the same information as MTR156. |

**Summary of new or changed Logs/Faults for ISN06**

| Log/Fault Type | Log/Fault Name                             | New/Modified/Deleted, ACTID and Solution                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------|--------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AMAB log       | AMAB156 (new)                              | A00002053 (Succession on DMS) creates this log in place of MTR156 when SOC option RBIL0014 is set to ON. It is optionally generated depending on the existing AMA parameter LOGAMA in table AMAOPTS. If the LOGAMA option is ON, AMAB156 log is printed whenever the FTR record is generated.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| CDR log        | CDR601 (changed)                           | A00002364 (Succession on DMS) adds new field CLGNUM_IND to include the corresponding indicator set in CDR.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| MTR log        | MTR158 (changed)                           | A00002702 (Succession on DMS) enhances this log to support the additional SMDR and MOG &SMDR interaction restrictions, and adds field DR to the log data text for SMDR activation from translation cases. This log is generated when a line origination from IBN, ISDNKSET or P-phone without a valid charging option is attempted. This log is generated only if the 'No Line Origination Without Charging' feature is activated by setting NCW_CHRG to DISALLOWED.                                                                                                                                                                                                                                                                                                                                            |
| EMD log        | EMD101 (new)                               | A00002754 (Succession on DMS) creates new Info log EMD101, generated when a trunk subscriber's meter counts are increased by more than a threshold value in a given time period.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| MTR logs       | MTR161<br>MTR162 (new)<br>MTR113 (changed) | A00004565 (Succession on DMS) creates two new MTR logs and modifies an existing log: <ul style="list-style-type: none"> <li>MTR161 is generated if a corresponding MTRTARIF tuple could not be found for a received tariff index within ISUP CRG message.</li> <li>MTR162 is generated when a mismatch occurs between calculated software meter count and reported hardware metering pulse count for local type backward metering, AND when a mismatch occurs between received meter count and reported hardware metering pulse count for distance type backward metering.</li> <li>MTR113 is generated when the system attempts to meter a call and one of the following tables has invalid or missing data for universal translations or metering. New reason text is added for backward metering.</li> </ul> |

## Operational Measurements/Performance Measurement changes overview

The following OMs or PMs are new or changed for ISN07. More complete descriptions appear in the Feature Descriptions section of this document.

### Summary of new or changed OMs/PMs

| OM Group or PM name          | New or Changed | Description                                                                                                                                                                                                                                                                                                                                                                                 |
|------------------------------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Product = CS 2000</b>     |                |                                                                                                                                                                                                                                                                                                                                                                                             |
| SCAISRV4                     | Changed        | A00002904 adds new registers TOGCLLRR and TOGCLLRE to peg application-specific outgoing SCAL messages.                                                                                                                                                                                                                                                                                      |
| <b>Product = World Trade</b> |                |                                                                                                                                                                                                                                                                                                                                                                                             |
| ILR1                         | Deleted        | The ILR1 OM group is deleted, because all information is stored in the flexible ILR OM group.                                                                                                                                                                                                                                                                                               |
| ILR                          | New            | A00001914 (Succession on DMS) creates the flexible ILR OM group to support the flexible definition of the barring programs in table ILRCLASS. The ILR OM provides per OM group the number of activations, deactivations, usages and unsuccessful deactivations. Two new OM registers are defined for successful deactivation and unsuccessful temporary deactivation: TEMPDAC and TEMPUDAC. |
| CEPTPW                       | New            | A00001919 creates OM group CEPTPW to provide information about the usage and performance of the CEPT features password. This OM group stores in 9 registers the counts of activation, programming, interrogation, unsuccessful attempts for all actions and error cases of CEPTPW feature.                                                                                                  |
| CEPTRA                       | New            | A00001919 creates OM group CEPTRA to provide information about the usage and performance of Cept Features Remote Access (CEPTRA). This OM group stores in 5 registers the counts of hardware and software overflow, successful usage, unsuccessful attempts for all actions and error cases of CEPTPW feature.                                                                              |
| CMI                          | New            | A00001930 creates OM group CMI to provide information about the successful and unsuccessful usage and performance of CMI features (SVBI0033 SOC must be ON). These OM registers are pegged by LCMI and TCMI features.                                                                                                                                                                       |

## Data Schema tables/MIBs changes overview

The following Data Schema tables or MIBs are new or changed for ISN07. More complete descriptions appear in the Feature Descriptions section of this document.

| DS Table/MIB             | Changed or New                                                                                                                                                                                                                                                                                                                                      |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Product = CS 2000</b> |                                                                                                                                                                                                                                                                                                                                                     |
| LGRPINV (changed)        | A00001935 (Int'l PT-IP) adds new entry M in the GRPTYPE field to indicate that the logical group is assigned to a CICM gateway. The table LGRPINV is provisioned by the SESM. No manual datafill or change is allowed. Manual changes to this table will cause data corruption.                                                                     |
| LNINV (changed)          | A00001935 (Int'l PT-IP) modifies the SUBGROUP and CIRCUIT fields of table LNINV based on their associated LGRPINV GRPTYPE field.                                                                                                                                                                                                                    |
| LGRPINV (changed)        | A00002252 (Int'l PT-IP) uses field GRPTYPE to denote a specific type of LGRP. The values for GRPTYPE are S, M, and C. This feature disables SERVORD auto provisioning for GRPTYPE S for groups on shelves 0 to 3; refer to the FN section for more info. Currently, GRPTYPE S will denote a set of LGRPs that for now will only include MG9K LGRPs. |
| PADDATA (changed)        | A00002252 (Int'l PT-IP) adds two new pad groups which will be used by gateway lines. Pad group PKLNL will be used by gateways lines with LGRP GRPTYPE set to S. PKNIL will be used by gateway lines with LGRP GRPTYPE set to C.                                                                                                                     |
| TRKOPTS (changed)        | A00002291 (Succession on DMS) adds new entry TKO_FDCP in the OPTINFO field to be assigned to incoming FDCP trunks.                                                                                                                                                                                                                                  |
| ISERVOPT (changed)       | A00002365 (Int'l IAW) adds new option CWR_ON_TRUNK to field SOPTSVAR, containing subfields ETSI_ISUP, ISUP, and R2.                                                                                                                                                                                                                                 |
| TRKOPTS (changed)        | A00002365 (Int'l IAW) adds new option CWR_OFF to field OPTINFO.                                                                                                                                                                                                                                                                                     |
| PRECONF (changed)        | Per A00002367 and A00002884 (Succession on DMS), to enable the originator of a preset conference to add on conferees as local call, once the preset conference is established, field ADDON must be set to "yes."                                                                                                                                    |
| TRKOPTS (new)            | A00002558 (Succession on DMS) creates table TRKOPTS to store the CLLI of all trunk groups carrying incoming toll-completing traffic. LDI evaluates the CLLI name to determine the long distance status.                                                                                                                                             |

| DS Table/MIB                                                       | Changed or New                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ISERVOPT<br>(changed)                                              | A00002639 (Succession on DMS) adds new entry ICWT to field SOPTSKEY and SOPTSVAR/OPTION to indicate whether the Call Waiting Announcements is to be applied to the Waiting (Calling) party.                                                                                                                                                                                                                                                                 |
| ISERVOPT<br>(changed)                                              | A00002642 (Int'l UA-IP) adds new entries ICONF_WARNING_TONE, PREVENT_WML_DURING_ENQUIRY, and PREVENT_HELD_TONE to field SOPTSVAR.                                                                                                                                                                                                                                                                                                                           |
| IBNFEAT<br><br>xxCODE (applies to any XLA CODE table)<br>(changed) | A00002654 (Int'l UA-IP) makes the following changes to these tables. <ul style="list-style-type: none"> <li>• IBNFEAT modifies the SEC feature option to include the AR and ACRJ options in its Features List.</li> <li>• xxCODE is modified to add the additional features AR and ACRJ in the feature option selector (i.e., FTR) of the XLA feature selector (i.e., FEAT) of the XLA CODE table.</li> </ul>                                               |
| CUSTSTN                                                            | A00002655 (Int'l UA-IP, Int'l IAW) adds the CEPT interface, PIN protection optionality, and CEPT billing to MMP ACRJ by adding CEPT to the applicable customer group in table CUSTSTN. CEPT ACRJ is available only for IBN lines.                                                                                                                                                                                                                           |
| TRIGGRP<br><br>SERVINFO<br>(changed)                               | A00002678 (Int'l UA-IP) makes the following changes to these tables. <ul style="list-style-type: none"> <li>• TRIGGRP adds new CRITERIA types of CPC and CAUSE.</li> <li>• SERVINFO adds new FCI_OPT option TELEFONICA and INITDP_PARMS option CAUSE.</li> </ul>                                                                                                                                                                                            |
| ANNPHLST<br>(changed)                                              | A00002680 (Int'l UA-IP) enables the Automatic Intercept System by utilizing existing tables as follows: <ul style="list-style-type: none"> <li>• These tables require specific datafill but do not have new fields nor values (refer to the FN for details): CLLI, ANNS, ANNMEMS, PAUSPATT, ISCASSGN, AISDBS.</li> <li>• ANNPHLST adds new external phrase names AISBASEDN and AISREFDN to represent the base DN and reference DN, respectively.</li> </ul> |
| SERVINFO                                                           | A00002754 (Succession on DMS) introduces new selection: CIRP into CS1R option to indicate that: If CIRP is datafilled in the CS1R option of table SERVINFO, the outgoing CIRP will use the CS-1R format, the legID will not be included.                                                                                                                                                                                                                    |

| DS Table/MIB          | Changed or New                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ISERVOPT<br>(changed) | <p>A00002755 (Succession on DMS) makes the following modifications to the tuple CEPTONCENTREX:</p> <ul style="list-style-type: none"> <li>• adds new field MARKET to indicate in which market the line service is used.</li> <li>• adds several new entries in the OPTIONS field to indicate if the corresponding CEPT line services are allowed to work on IBN line without CEPT line option or not.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| ISERVOPT<br>(changed) | <p>A00002755 (Succession on DMS) makes the following modifications:</p> <ul style="list-style-type: none"> <li>• adds new field SHOW_CHG_PSWD in the tuple ILRCLS to allow the ILR password to be displayed and changed.</li> <li>• adds new field ABORT_IF_IN_USE in the tuple IWUC to indicate if the wakeup request is aborted or not when the line is in use at the scheduled time.</li> <li>• adds new field ICWT_IGNORE_WAITING_TMO in the tuple ICWT to specify the time-out of the timer "Called Party Ignores Waiting Call" for ICWT service.</li> <li>• adds new field COLLECT_DNPIN_IN_DIFF_STAGES in the tuple CEPTPW to indicate if the new DN and PIN dialing sequence is adopted for CEPTRA service.</li> <li>• changes field CEPTANNID in the tuple CEPTPW to add new announcement IDs for the new DN and PIN dialing sequence.</li> </ul> |
| SERVINFO              | <p>Per A00002900 (Succession on DMS), option INITDP_PARM of table SERVINFO is extended to add two new fields IP_AVA and IPSSP_CAP to indicate whether parameters IPAvailable and IPSSPCapabilities will be carried in IDP.</p> <p>Also, option SRF_INFO is extended to add new field IP_INFO to provide detailed information of the IP capability within SSP.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| DS Table/MIB                 | Changed or New                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| SCAISSRV (changed)           | <p>A00002904 (Succession on DMS) makes the following modifications in the table SCAISSRV:</p> <ul style="list-style-type: none"> <li>A new default tuple TPCC16\$ under category TPCC will be created with the new function TOGGCALL for the new message dv_toggle_call. TPCC16\$ will also contain the optional parameter HDUHDLEG of the function CALLHELD and CALLUNHELD set to Y.</li> <li>A new default tuple SCAI3WC15\$ under the category SCAI3WC will be created with the new function TOGGCALL, for the new message dv_toggle_call.</li> <li>A new default tuple SCAICC10\$ under the category SCAICC will be created with the optional parameter HDUHDLEG of the function CALLHELD and CALLUNHELD set to Y.</li> </ul> |
| TRKSGRP (changed)            | A00003410 (Succession on DMS) changes field VARIANT to add the HONDURAS entry.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| LTCINV (changed)             | A00003411 (Succession on DMS) adds the HONTONES value to the TONE_SET_TYPE type.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| TRKOPTS (changed)            | A00003695 (Int'l PT-IP) references feature A59036475 for changes to table TRKOPTS.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| KKSCRN (new)                 | A00003696 (Int'l PT-IP) creates this table to facilitate KK, IPI and TMR based screening and routing. The customer group for the call can be specified uniquely for each KK/IPI/BC combination.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| ISERVOPT (changed)           | A00004205 (Succession on DMS) adds new entry JAPANPRI to fields SOPTSKEY and SOPTSVAR and adds new option ALLOW_BACKWARD_VOICE_PATH to the JAPANPRI.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| TRKSGRP (changed)            | A00004931 (Int'l PT-IP) provides the ability to datafill Indian ISUP variant in table TRKSGRP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| TRKOPTS (changed)            | <p>A59036475 (Int'l PT-IP) makes the following changes:</p> <ul style="list-style-type: none"> <li>FGD was created as a new TRKOPTS option. IXC was created as a new sub-option for this option.</li> <li>FCI was created as a new TRKOPTS option. NATL and INTL were created as new sub-options for this option.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Product = World Trade</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| ISERVOPT (changed)           | A00001914 (Succession on DMS) extends the ILRCLS tuple of the table ISERVOPT. A new subfield is added named SDT.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| DS Table/MIB                                      | Changed or New                                                                                                                                                                                                                                                                                                                                                       |
|---------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| XXCODE and XXHEAD (changed)                       | A00001914 (Succession on DMS) introduces a new translation feature function TEMPDEACT used for temporary deactivation of a service. This feature can be datafilled at all XXCODE and XXHEAD tables. Table ACCODE is used for CEPT feature service code datafills.                                                                                                    |
| ISERVOPT (changed)                                | A00001918 (Succession on DMS) introduces a new tuple named CEPT_ANN in ISERVOPT table and a new field SPECIAL_DIAL_TONE for the existing tuple CEPT_CFX.                                                                                                                                                                                                             |
| ISERVOPT (changed)                                | A00001919 (Succession on DMS) introduces a new tuple named CEPTPW with 6 fields.                                                                                                                                                                                                                                                                                     |
| MTRDEASS (new)                                    | A00001920 (Succession on DMS) introduces the new deassigned meters table to track deassigned meters of the subscriber to be able to restore them when a MOG reprovisioning is done.                                                                                                                                                                                  |
| TRKOPTS<br><br>ISERVOPT (changed)                 | A00001921 (Succession on DMS) modifies these tables as follows: <ul style="list-style-type: none"> <li>• TRKOPTS adds a new boolean field CHECK_NOA related with the LDA feature.</li> <li>• ISERVOPT introduces new tuple LONG_DIST_ALERT to provide CIS market requirement related to the "Toll Call Ringing" feature.</li> </ul>                                  |
| ISERVOPT<br><br>CUSTSTN<br><br>CPCOPMAP (changed) | A00001923 (Succession on DMS) modifies these tables as follows: <ul style="list-style-type: none"> <li>• ISERVOPT introduces new tuple ZONETOLL_SCRN to activate zone toll screening for the office.</li> <li>• CUSTSTN adds new field CPC, used to assign CPC value to customer groups.</li> <li>• CPCOPMAP adds new fields CPCMKEY, ISUPCPC, and MFCAC.</li> </ul> |
| CISCPCPR                                          | A00001923 (Succession on DMS) introduces table "Commonwealth of Independent States Calling Party Category PRivileges" in the CIS network to define network and service access privileges in terms of CPC value and call translation class.                                                                                                                           |
| CUSTSTN<br><br>IBNXLA (changed)                   | A00001930 (Succession on DMS) modifies these tables as follows: <ul style="list-style-type: none"> <li>• CUSTSTN adds new customer group option CMI.</li> <li>• IBNXLA adds new values TCMI and LCMI in field FEATURE.</li> </ul>                                                                                                                                    |
| TRKOPTS (changed)                                 | A00002053 (Succession on DMS) adds new entry VMI as a possible value for the CND_RTE_CONDITION type in field CNDSEL.                                                                                                                                                                                                                                                 |

| DS Table/MIB                            | Changed or New                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PXRTE (changed)                         | A00002319 (Succession on DMS) adds new entry VMI as a possible value for the CND_RTE_CONDITION type in field CNDSEL.                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| TRKOPTS (changed)                       | A00002101 (Succession on DMS) adds new option TELETAXE_ITX_SIG in the OPTION field.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| SOSMMPC<br>SOSMTRK<br>SOSMPARM<br>(new) | <p>A00002173 (Succession on DMS) creates the following System of Operative Searching Measures tables:</p> <ul style="list-style-type: none"> <li>SOSMMPC provides the mechanism to allocate MPC cards for the DMS-Control Point X.25 Interface of SOSM feature. For each pair of channels, a tuple is added to this table.</li> <li>SOSMTRK is used for mapping generic trunk groups into dedicated SOSM trunks. Each entry identifies a trunk group to be used for the PCM-30 group of MCLs.</li> <li>SOSMPARM is used by the SOSM system for saving SOSM-specific parameters.</li> </ul> |
| CLICNTL (changed)                       | A00002364 (Succession on DMS) adds new option OCN as one of the selectors of BILLING_OPTIONS. It can be assigned to any CLICTKEY whose direction is incoming, but only when the CLICTKEY with OCN option is assigned to an ANSI ISUP or HK ISUP trunk.                                                                                                                                                                                                                                                                                                                                     |
| ISERVOPT (changed)                      | Per A00002365 (Int'l IAW), new option CWR_OFF is introduced to disable CWR over trunk for a specific trunk group without the need of disabling the whole trunk type.                                                                                                                                                                                                                                                                                                                                                                                                                       |
| ILRCLASS (new)                          | A00002641 (Int'l UA-IP) creates this new table which contains the barring programs for the ILR line option.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| ISERVOPT (changed)                      | Per A00002641 (Int'l UA-IP), the OPTIONS value for field SOPTSVAR is deleted. The information contained in this field is now available in table ILRCLASS                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| MTRSYSPM (changed)                      | A00002702 (Succession on DMS) renames existing metering system parameter NCW_MOG to NCW_CHG.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| ISUPSVC (changed)                       | Per A00002713 (Int'l UA-IP), table ISUPSVC is modified to add new option ORIGNETID which is associated to the trunk group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| SERVINFO (changed)                      | A00002754 (Succession on DMS) adds new selection CIRP into the CS1R option to indicate that the outgoing CIRP will use the CS-1R format, and the legID will not be included.                                                                                                                                                                                                                                                                                                                                                                                                               |
| MTRSYSPM (changed)                      | A00002844 (Succession on DMS) adds new subfield TRUNK THRESHOLD in the EMD field. Also, the existing THRESHOLD field is renamed as LINE_THRESHOLD.                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| DS Table/MIB                                                        | Changed or New                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| SERVINFO<br>(changed)                                               | A00003227 (Succession on DMS) adds new selection UUI to field INITDP_PARMS to indicate whether parameter UUI data contained in an incoming ETSI ISUP V2 is carried in InitDP.                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Universal translations tables (i.e., PXCODE)<br>(changed)           | A00003467 (Succession on DMS) enhances option CUSTMOD by adding new field REV_XLA(Reverse Translations Grigger) and its refinement DELDIGS (Delete Prefix Digits). Functionality is controlled by SOC.                                                                                                                                                                                                                                                                                                                                                                                                                              |
| TRKGRP (changed)                                                    | A00004503 (Succession on DMS) adds new field CGSCCDEA to provide a control mechanism in order to activate/deactivate terminating SCC processing for CGPN.                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| TRKSGRP<br>(changed)                                                | A00004563 (Succession on DMS) adds new value MOROCCO in Subfield VARIANT of field SGRPVAR.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| C7UPTMR<br><br>ISUPSVC<br><br>xxHEAD<br><br>xxCODE<br><br>(changed) | A00004565 (Succession on DMS) modifies these tables as follows: <ul style="list-style-type: none"> <li>• C7UPTMR adds new ISUP timer CRG which is started to wait CRG messages after ANM/CON messages in backward metered ISUP calls. This timer is provisioned only for OG and 2W trunks.</li> <li>• ISUPSVC is modified to include a default tuple for the new Moroccan variant, MOROCCAN_EIV2.</li> <li>• xxHEAD tables add the BCKWMTR option to the OSEL (option selector) subfield of the DFOP field.</li> <li>• xxCODE tables add the BCKWMTR option to the OSEL (option selector) subfield of the XLADATA field.</li> </ul> |
| Subtables<br>CGPNDA and<br>CDPNDA of table<br>CGPNSCRN<br>(changed) | A00004743 (Succession on DMS) adds option BILL_CLI in CGPNOPT list and in the CDPNOPT list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| LTCINV (changed)                                                    | A00004750 (Succession on DMS) adds new optional attribute EBI. When added to a DTCO2 tuple in LTCINV, it downloads EBI support feature to DTCO2 during static data download. The LIUINV table should be compatible with the far end setting. EBI can only be added when TYPE_OF_NETWORK in table OFCENG is set to NORTH_AMERICA and the PM is a CPM-based DTCO2.                                                                                                                                                                                                                                                                    |

| DS Table/MIB       | Changed or New                                                                                                                                                                                                                                                            |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MNNODE (changed)   | A00005802 (Succession on DMS) adds two new fields <b>complaw</b> and <b>bitinv</b> of enum type to DMSCP class of SPM as a vector <b>compopt</b> . They allow the craftsperson to change the p-side companding law and bit inversion option for a OC3-SPM of DMSCP class. |
| MNCKTPAK (changed) | A00005802 (Succession on DMS) adds a new warning message if the p-side companding law in table MNNODE is A-law while adding an OC3-SPM.                                                                                                                                   |

## User Interface (commands) changes overview

The following User Interface GUIs or Commands are new or changed for ISN07. More complete descriptions appear in the Feature Descriptions section of this document,

| Field                                 | Command/User Interface Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| CS2000 Management Tools GUI (changed) | A00001935 (Int'l PT-IP) modifies this GUI by making alterations to the Associate Media Gateway dialog box. CICM gateways provisioned prior to SN07 will have their profile names changed to an obsolete value (e.g. "OBSOLETE_CICM") to allow them to continue to function within the various provisioning systems as they did in SN06.                                                                                                                                                                                                                                                                                                               |
| CI Commands using LEN                 | Per A00002252 (Int'l UA-IP), any CI command that requires a LEN for input must use the new format for a gateway line with GRPTYPE set to S in table LGRPINV. Likewise, any gateway LEN with GRPTYPE set to S in table LGRPINV display via a CI command (or MAPCI) will be displayed in the new format.                                                                                                                                                                                                                                                                                                                                                |

|--------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| queryCallAgent Id,<br>setCallAgentID (new) | A00002644 (Int'l IAC, Int'l IAW) creates the following new XML commands: <ul style="list-style-type: none"> <li>queryCallAgent Id</li> <li>setCallAgentID</li> </ul>                                                                                                                                                                                                                                           |
|                                            | A00002756 (Succession on DMS) migrates Japan trunk services "Notification of Time and Charge" (NTC), "Carrier Name Notification" (CNN) and "Account Code" (ACCT) from the legacy MMP product to CS2K Hybrid product IP side in ISN07.                                                                                                                                                                          |
|                                            | A00003465 (Succession on DMS) allows the user to override the channel reservations for the calls on a loop. This enables the user to steal channel reserved for any other non-CW incoming alerting call for another call. Incoming alerting call is a call which ALERT is sent by the set to the switch.                                                                                                       |
|                                            | A00003465 (Succession on DMS) modifies existing GUIs to allow the user to provision the carrier (only for SONET and not for SDH) in "Channelized" mode in addition to the previously existing functionality by selecting the DCC card and clicking on the "Carrier à Provisioning" option listed in the Menu. The new GUI pages are entitled "Carrier Provisioning," "Carrier Controls," and "Carrier Status." |
| i2001 interface functionality              | A00003951 (Int'l IAC) describes the functionality and interface for the i2001 Phase II Unistim Terminal.                                                                                                                                                                                                                                                                                                       |
| Updated GUIs                               | A00004981 (Int'l IAC, Int'l IAW) modifies the following GUIs (see the FN section of this feature for details): <ul style="list-style-type: none"> <li>Associate Media Gateway Dialog</li> <li>Change Gateway Dialog</li> <li>Gateway Provisioning Panel</li> </ul>                                                                                                                                             |
| Modified XML commands                      | A00004981 (Int'l IAC, Int'l IAW) modifies the following XML commands (see the FN section of this feature for details): <ul style="list-style-type: none"> <li>AssocMG</li> <li>ChangeRootMiddleBoxes</li> <li>QueryMG</li> </ul>                                                                                                                                                                               |
| <b>Product = World Trade</b>               |                                                                                                                                                                                                                                                                                                                                                                                                                |
| DEASSCLR                                   | A00001920 adds this command to clear all content of MTRDEASS table.                                                                                                                                                                                                                                                                                                                                            |

| Field                             | Command/User Interface Description                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>MTRCOUNT</b>                   | <p><b>A00001930 modifies MTRCOUNT</b> in order to display the last call meter count, last feature meter count, and the total of all meter counts assigned to the subscriber when SVBI0033 SOC is ON.</p> <p><b>It also modifies QFPS in order to display the last call meter count, last feature meter count, and the total of all meter counts assigned to the subscriber when SVBI0033 SOC is ON.</b></p> |
| <b>SOSMCONF at CI level (new)</b> | <b>A00002173 creates the new CI level SOSMCONF (SOSM Configuration) to restrict access to the SOSM configuration tables.</b>                                                                                                                                                                                                                                                                                |

## Service Order changes overview

The following Service Order information is new or changed for ISN07. More complete descriptions appear in the Feature Descriptions section of this document.

### Summary of new or changed Service Orders

| Area                       | New or Changed | ServOrd Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------------------|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Product = CS 2000</b>   |                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| USERID and PASSWD options  | Changed        | Per A00001935 (Int'l PT-IP), the USERID and PASSWD options are used to specify CICM client information in the various SERVORD+ commands which create or modify lines.                                                                                                                                                                                                                                                                                                                      |
| Pad groups PKLNL and PKNIL | Changed        | Per A00002252 (Int'l PT-IP), pad group PKLNL will be assigned to gateway lines that have LGRP GRPTYPE set to S via SERVORD. Pad group PKNIL will be assigned to gateway lines that have LGRP GRPTYPE set to C via SERVORD. Attempts to change the pad group via SESM or SERVORD will not be successful. The appropriate gateway pad group will be assigned. However, the pad group can be changed in table LNINV via table control if need be.                                             |
| AFC line option            | New            | A00002377 (Succession on DMS) increases the provisioning number of AFC Keys to 10 per DN for the DMS ETSI BRI implementation. The master DN, known as SFC (Single Functional Call) key is able to have up to 10 AFC Keys associated with it. This can be specified through servord by using the AFC line option. If the AFC line option is added to a DN on a BRI set, the user is prompted for NUMCALLS indicating the number of call references permitted to be associated with that DN. |

**Summary of new or changed Service Orders**

| <b>Area</b>                  | <b>New or Changed</b> | <b>ServOrd Description</b>                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------------------|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>SEC option</b>            | <b>Changed</b>        | A00002654 (Int'l UA-IP) expands the existing SEC (Security Code) option to accept two more additional values (AR and ACRJ) when it is prompted for its feature list. The feature list contains a list of features for which the Security Code PIN applies.                                                                                                                                                                     |
| <b>Product = World Trade</b> |                       |                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>ILR line option</b>       | <b>Changed</b>        | <b>A00001914 (Succession on DMS) adds two new restriction classes:</b> <ul style="list-style-type: none"> <li>• <b>DNATL (Deny only NATional)</b>--In this restriction class, only outgoing national calls will be restricted while other call classes are not.</li> <li>• <b>DLCL (Deny only LoCaL)</b>--In this restriction class, only outgoing local calls will be restricted while other call classes are not.</li> </ul> |
| <b>CEPTPW line option</b>    | <b>New</b>            | <b>A00001919 (Succession on DMS) creates the CEPTPW line option which can be assigned to each IBN and ETSI ISDN BRI line via service order session.</b>                                                                                                                                                                                                                                                                        |
| <b>CPC line option</b>       | <b>Changed</b>        | <b>A00001923 (Succession on DMS) introduces new value RSRVD.</b>                                                                                                                                                                                                                                                                                                                                                               |
| <b>CMI line options</b>      | <b>Changed</b>        | <b>A00001930 (Succession on DMS) adds new line options TCMI and LCMI for IBN and ETSI BRI lines.</b>                                                                                                                                                                                                                                                                                                                           |

**AMA/billing changes overview**

The following AMA/billing information is new or changed for ISN07. More complete descriptions appear in the Feature Descriptions section of this document.

**Summary of new or changed AMA/billing**

| <b>AMA/billing item</b>   | <b>New or Changed</b> | <b>Description</b>                                                                                                                                                                                                                                                     |
|---------------------------|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Product = CS 20000</b> |                       |                                                                                                                                                                                                                                                                        |
| <b>CEPT services</b>      | <b>New</b>            | A00002654 (Int'l UA-IP) implements the ability for all CEPT services to produce NAOC-defined billing records and NAOC meter counts for the following CEPT-defined capabilities: activation, deactivation, interrogation, invocation, erasure, and security key change. |

**Summary of new or changed AMA/billing**

| AMA/billing item             | New or Changed | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|------------------------------|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AMAOPTS table                | Changed        | Per A00004933 (Int'l PT-IP), in the Local exchange (i.e. CGP) a new option <b>Capt_Charge_Band_Number</b> should be selected and AMASEL should be made ON to generate AMA record.                                                                                                                                                                                                                                                                                                    |
| FTR record                   | New            | <b>A00002053 creates new FTR record to provide detailed information for feature subscriber's metered functions. The generation of the FTR record for the metered actions of ICR feature option depends on the new office parameter FTR_RECORD_FOR_ICR_OPT in table OFCVAR. This parameter makes the generation of FTR record optional when the subscriber is charged for the ICR operations assignment / deassignment / usage. This feature applies to meterable IBN lines only.</b> |
| <b>Product = World Trade</b> |                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| CDR                          | Changed        | <b>A00002364</b> provides CLI/RDN/OCN and corresponding indicator within CDR records generated on calls whose originating physical port is ISUP trunk according to the capture logic.                                                                                                                                                                                                                                                                                                |

**Software Optionality Control (SOC) changes overview**

The following SOC information is new or changed for ISN07. More complete descriptions appear in the Feature Descriptions section of this document.

**Summary of new or changed SOC**s

| SOC code                     | New or Changed | Description                                                                                                                                                                                                                                                                        |
|------------------------------|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Product = CS 2000</b>     |                |                                                                                                                                                                                                                                                                                    |
| SULN0028                     | New            | Per A00002377 (Succession on DMS), this SOC code is used to restrict the usage of the "10 AFC KEYS for BRI DIRECTORY NUMBER" functionality. If the SOC is active, provisioning of 10 AFC Keys for a DN is possible only for Point-to-Multipoint configuration of ETSI BRI variant. |
| NETK0024                     | New            | Per A00004933 (Int'l PT-IP), this SOC code enables Network AOC tariff information.                                                                                                                                                                                                 |
| <b>Product = World Trade</b> |                |                                                                                                                                                                                                                                                                                    |

**Summary of new or changed SOC's**

| <b>SOC code</b> | <b>New or Changed</b> | <b>Description</b>                                                                                                                                                                                                                                                                       |
|-----------------|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| METR0016        | New                   | Per A00001920 (Succession on DMS), this SOC code is used to restrict the usage of the "10 AFC KEYS for BRI DIRECTORY NUMBER" functionality. If the SOC is active, provisioning of 10 AFC Keys for a DN is possible only for Point-to-Multipoint configuration of ETSI BRI variant.       |
| METR0017        | New                   | Per A00001920 (Int'l PT-IP), this SOC code enables Network AOC tariff information.                                                                                                                                                                                                       |
| SVBI0033        | New                   | <b>A00001930 (Succession on DMS) introduces this SOC to control the office-wide functionality of the TCMI and LCMI services.</b>                                                                                                                                                         |
| RBIL0014        | Changed               | <b>A00002053 (Succession on DMS) modifies this SOC so that</b> for the metered feature actions, the FTR record and AMAB156 log are generated instead of the MTR156 log if the SOC option RBIL0014 is set to ON. When the SOC option RBIL0014 is IDLE, MTR156 log is generated as before. |
| SOSM0001        | New                   | <b>A00002173 (Succession on DMS) creates this SOC to control access to SOSM provisioning, including the SOSM configuration CI level and SOSM configuration tables.</b>                                                                                                                   |
| XLAS0054        | New                   | <b>A00003467 (Succession on DMS) creates this SOC to activate the Reverse Trnslations feature.</b>                                                                                                                                                                                       |
| XLAS0053        | New                   | <b>A00003686 (Succession on DMS) creates this SOC to activate the XLAS Reroute Rel Cause feature.</b>                                                                                                                                                                                    |

## iSN07 Feature Deltas

### *Product = CS 2000*

### **A0001935 -- Provisioning Support for Centrex-IP Nodes and Lines (Int'l PT-IP)**

#### ***Functional Description***

Feature A0001935 will deliver the lines flow through and pre-provisioning functionality in the Succession Element and Sub-element Manager (SESM) required for the Centrex IP Client Manager (CICM) integration with Succession. The design will be split into Nodes provisioning for CICM Gateways (GWs), and lines provisioning for CICM terminations. The Nodes provisioning feature component will provide for the provisioning of CICM GWs. Nodes provisioning will also provide functionality to pre-provision the CICM terminations in the GWC-EM and to pre-provision LENs (Line Equipment Numbers) in XACore table LNINV. The Lines Provisioning component will provide flow through of service information entered at OSSGate (SERVORD+ commands). New line provisioning functionality will be delivered to allow line data to be transmitted to the CICM Element Manager (CICM-EM).

#### **Hardware Requirements or Dependencies**

Not applicable.

#### **Software Requirements or Dependencies**

Not applicable.

#### **Limitations and restrictions**

None.

#### **Interactions**

This feature will integrate the Centrex-IP client provisioning with the existing Succession SERVORD+ system. Centrex-IP client commands/data will be distributed to the CICM-EM from the SERVORD+ system within the SESM.

The following commands will trigger data distribution to the CICM-EM from SESM SERVORD+:

- NEW, EST, ADD, OUT, DEL, CDN, CHDN, CLN/CTP, CKLN/CKTP, ADO, DEO, CHF

This list is subject to change until final DSUM approval.

## ***Configuration for A00001935***

### **Hardware and Software Requirements**

Not applicable.

### **Initial Configuration**

Not applicable.

### **Office/Subnet parameters (OP/SP) (CM & SESM)**

Not applicable. This feature leverages a previously defined gateway profile for CICM gateways.

### **Upgrade Impact**

#### **Dump and Restore**

Not applicable.

## Element Management Upgrade

Not applicable.

Upgrade of CICM data to SN07 is not supported. SN06.1 and SN06.2 data must be removed and then re-added in SN07 in order to leverage any flow through capabilities delivered by this feature. Both new and old format CICM data will be allowed to co-exist in SN07, however the SN06 format CICM will be managed generically (same as in SN06).

## Data schema (DS) (CM, MIBS, RDB)

### New/modified tables, MIBs, or Database Schema

#### New or modified tables

| Table/MIB name | NEW/CHANGED/ or DELETED/ | Table Control (NEW/ OLD/UNCHANGED) |
|----------------|--------------------------|------------------------------------|
| LGRPINV        | CHANGED                  | UNCHANGED                          |
| LNINV          | CHANGED                  | UNCHANGED                          |

### Table/MIB/Remote Database Schema information

#### Name: LGRPINV

Logical Group Inventory

#### Functional description

In SN06, the field GRPTYPE of the table LGRPINV is set to “C” for non-MG9K logical groups and to “S” for MG9K logical groups. In SN07, the unused value “M” will be used in this field to indicate that the logical group is assigned to a CICM gateway.

#### Usage sequence and implications (CM Only)

The table LGRPINV is provisioned by the SESM. No manual datafill or change is allowed. Manual changes to this table will cause data corruption.

#### Size

Not applicable.

#### Fields/OIDs

Not applicable. This feature will use an already defined and supported field.

#### Datafill example

The following example shows sample datafill for table LGRPINV.

Preprovisioned MG(e.g MG9K) : SLOA 00 0 GWC 3 S \$

Preprovisioned CICM gateways : CICM 00 0 GWC 3 M \$

Non preprovisioned MG(e.g. Cable MG) : LG 01 0 GWC 3 C \$

**Table release history update**

Not applicable.

**Supplementary information**

Not applicable.

**Translation verification other tools**

Not applicable.

**Name: LNINV**

Line Inventory

**Functional description**

In SN07, the field SUBGROUP and CIRCUIT fields of the table LNINV are refined based on their associated LGRPINV GRPTYPE field.

The SUBGROUP/SLOT and CIRCUIT fields are defined as follows:

(GRPTYPE C) LINE SUBGROUP {0 TO 10}

(GRPTYPE M) LINE SUBGROUP {0 TO 10}

(GRPTYPE S) SLOT {2-9, 14-21}

(GRPTYPE C) CIRCUIT {0 TO 99}

(GRPTYPE M) CIRCUIT {0 TO 99} FOR SUBGROUP {0 TO 10}

(GRPTYPE S) CIRCUIT {0 TO 47}

**Usage sequence and implications (CM Only)**

Entries will be automatically configured by SESM at CICM gateway provisioning time.

**Size**

Not applicable.

**Fields**

The following table lists fields for LNINV.

**Table field descriptions**

| Field    | New or Changed | Subfield or refinement | Entry     | Explanation and action |
|----------|----------------|------------------------|-----------|------------------------|
| SUBGROUP | Changed        | M                      | {0 to 10} |                        |
| CIRCUIT  | Changed        | M                      | {0 to 99} |                        |

**Datafill example**

The following example shows sample datafill for table LNINV.

Preprovisioned MG(e.g MG9K) line:

SLOA 00 0 21 31 RDTLSG PKLNL HASU N NL N NIL

Preprovisioned CICM gateway line:

International - HOST 00 0 10 22 **GWLEBS** NPDGP HASU N NL N NIL

North America - HOST 00 0 10 22 **RDTEBS** NPDGP HASU N NL N NIL

Non preprovisioned MG(e.g. Cable MG) line:

LG 01 0 00 00 RDTLSG PKLNL WORKING N NL N NIL

**Table release history update**

Not applicable.

**Supplementary information**

Not applicable.

**Translation verification other tools**

Not applicable.

**Gateway and Termination Name Mapping to Logical Group and Line Equipment Number (LEN)****Functional description**

The definitions of the various portions of the logical group, LEN, GW and termination names are defined to provide a visual correlation between their respective values.

**GW**

<GWNAME>-<NNN>, e.g. "CICM-142"

where:

<GWNAME> = String

CICM Identifier (configurable)

<NNN> = 000-511

The CICM gateway identifier.

**Logical Group**

<SITE> <NNN> <G>, e.g. "HOST 142 0", "CICM 142 0", etc.

where:

<SITE> = SITE name chosen at gateway provisioning time. Matching gateway name to SITE name is not an enforced rule, however it is suggested that a "CICM" SITE name be defined in the XACore and that all CICM gateway provisioning utilize the "CICM" SITE name. "HOST" is used in this example simply to show the flexibility of the provisioning system (any SITE name may be chosen at CICM gateway provisioning time). Actual utilization of the "HOST" SITE name is NOT recommended as it may collide with legacy LCM definitions in the XACore.

<NNN> defined as in GW name.

<G> = 0-2

The group number. Each gateway will span 3 logical groups.

**Termination/Endpoint**

tp/<G>/<TTtt>, eg. "tp/0/1013"

where:

<G> defined as in the logical group.

<TT> = 00-10

<tt> = 00-99, except where <TT> = 10 in which case <tt> = 00-22.

**LEN Format**

<SITE> <NNN> <G> <TT> <tt>, e.g. "CICM 142 0 10 13"

where:

<SITE>, <NNN>, <G>, <TT>, and <tt>, defined as in gateway and logical group.

### Logical Group and LEN to GW and Termination Correlation for a CICM Processor Pair

- One CICM “GW” mapped to Three logical groups in the XACore.
- 3069 CICM terminations mapped to the three logical group's LENs in the XACore.
- 3 terminal numbers are reserved in the XACore (one for each logical group) for maintenance/messaging.

### LEN to GW, Termination and Terminal Number Mapping

| LEN              | GW       | Termination | Terminal Number |
|------------------|----------|-------------|-----------------|
| CICM 142 0 00 00 | CICM-142 | tp/0/0000   | 1 **            |
| CICM 142 0 00 01 | CICM-142 | tp/0/0001   | 2               |
| :                | :        | :           | :               |
| CICM 142 0 10 22 | CICM-142 | tp/0/1022   | 1023            |
| CICM 142 1 00 00 | CICM-142 | tp/1/0000   | 1 **            |
| CICM 142 1 00 01 | CICM-142 | tp/1/0001   | 2               |
| :                | :        | :           | :               |
| CICM 142 1 10 22 | CICM-142 | tp/1/1022   | 1023            |
| CICM 142 2 00 00 | CICM-142 | tp/2/0000   | 1 **            |
| CICM 142 2 00 01 | CICM-142 | tp/2/0001   | 2               |
| :                | :        | :           | :               |
| CICM 142 2 10 22 | CICM-142 | tp/2/1022   | 1023            |

\*\* Terminal number 0 is reserved in the XACore for the maintenance/messaging terminal on the node. The formula currently used by the XACore to convert non-MG9K LEN to terminal number is as follows:

$$\text{terminal number} = ((100 * TT) + tt + 1)$$

### Service Orders (SO) (CM & SESM)

#### Service order change details

No new service orders are introduced by this feature. CICM client-specific SERVORD+ commands (NEW, EST, OUT, etc.) may contain USERID and PASSWD option flags which will be stripped from the command by SESM before being processed by the CM.

## How service order options are presented

### Description

The USERID and PASSWD options are used to specify CICM client information in the various SERVORD+ commands which create or modify lines. These options may be provisioned using any valid key number on the CICM client, however they are not key specific options (they affect the entire set).

### Example

Example of the USERID option in no-prompt mode for SERVORD+

```
NEW $ 6137210992 M5216 PRADEFAULT 0 0 1 N LATA1 9 CICM 142 0 10 13 1 7 USERID 123456
```

### Line class code compatibility

USERID to LCC compatibility

<abbreviated option name> compatibility to LCC

| Line class code | Compatible?                        |
|-----------------|------------------------------------|
| M5216           | Yes                                |
| All others      | No (but not functionally enforced) |

### SERVORD+ Exceptions

No SERVORD+ command exclusions although some servord commands will not be integrated with CICM provisioning. The non-integrated commands will still function normally from a SERVORD+ and XA-Core perspective.

## Software optionality control (SOC)

Not applicable.

## Element Management

### New/modified GUIs

The CS2000 Management Tools GUI is modified by this feature. Specifically the Associate Media Gateway dialog box will be altered.

The profile name “CICM” which was added in SN06 to the list of profiles that appears in the Gateway profile name drop down list, will be unmodified in SN07. The Reserved terminations for this profile will be 3069.

CICM gateways provisioned prior to SN07, will have their profile names changed to an obsolete value (e.g. “OBSOLETE\_CICM”) to allow them to

continue to function within the various provisioning systems as they did in SN06.

### **Command interface changes**

Not applicable.

### **Security**

Not delivered under this feature.

### **Configuration Walkthrough**

The general order of provisioning is as follows:

- Provision table SITE in XACore. SITE values for CICM should be restricted from use for other logical group types.
- Provision table PADDDATA in XACore (PKLNL and PKNIL entries).
- Provision CICM gateway in SESM (autocreates LGRPINV and LNINV entries).
- Configure CICM gateway at the CICM-EM (some data is retrieved from SESM via OSSGate)
- Execute SERVORD+ commands via OSSGate (service is assigned to LENS in LNINV).
- USERNAME and PASSWD data is configured (via OSSGate SERVORD+) on the CICM client to enable service.

## ***Product = CS 2000***

### **A00002252 -- MG9K Lines Preprovisioning (Int'l PT-IP)**

#### ***Functional Description***

Feature 89009298 implements the core code changes required for increasing MG9K line provisioning throughput by preprovisioning. Please refer to ActID 89008025 which details the overall goals of the preprovisioning work effort.

The 89009298 core changes have three components:

1. The format of an MG9K LEN will reflect a physical location. Previously, no correlation existed between an MG9K LEN and its physical location. Instead the LEN correlated to the terminal id of the line. The new format shows a circuit range of 0 to 47. Currently, only 32 circuit line cards are supported for the MG9K.

## OLD FORMAT

<SITE> <0 to 511> <0 to 9> <subgroup, 0 to 10> <circuit, 0 to 99>

## NEW FORMAT

<SITE> <frame, 0 to 511> <shelf, 0 to 9> <slot, 2 to 9, 14 to 21> <circuit, 0 to 47>

2. When SESM provisions an MG9K node on shelves 0 to 3 and LGRP data, table LNINV will be automatically datafilled with the available circuits. Subsequent SERVORD+ commands issued by SESM will not add or delete MG9K line datafill from table LNINV. Essentially, autoprovisioning of table LNINV will be disabled for MG9K lines.

This new functionality will supersede the setting of office parm RDT\_SUCC\_AUTOCREATE\_LNINV for determining the autoprovisioning of table LNINV. This feature, however, does not restrict the MNO\_DEFAULT value associated with RDT\_SUCC\_AUTOCREATE\_LNINV. We can assume multiple gateway offices where setting the default MNO would be desirable for all gateways including MG9K. It is the ACTIVE setting that is ignored for MG9K lines.

3. Two new pad groups will be defined for use by gateway lines. PKLNL will be created for use by gateway lines that have LGRP GRPTYPE set to S. PKNIL will be created for use by gateway lines that have LGRP GRPTYPE set to C. These pad group will always be applied to gateway lines during SERVORD provisioning and during SESM provisioning and preprovisioning. Changing of gateway line pad group from these two new groups is permitted via changing the pad group in table LNINV. Default pad levels will also be set for Legacy interaction.

## Hardware Requirements or Dependencies

None.

## Software Requirements or Dependencies

The changes implemented under feature 89009298 require associated code changes in SESM line provisioning and MG EM in order to deliver the described functionality. However, the core changes are completely transparent to existing functionalities. Interactions are detailed below.

## Limitations and restrictions

This feature is specific to MG9K lines.

## Interactions

The feature 89008782 “MG EM - LINE CARD DATA DELIVERY TO SESM” implements the MG9K-EM part of the preprovisioning. It is required for this feature to work properly. It is a compliment of this feature.

The feature 89008025 implements the SESM line provisioning changes that are required by MG9K lines for this feature to work.

Feature 00000420 introduces the office parm  
RDT\_SUCC\_AUTOCREATE\_LNINV which enables autoprovisioning for  
non-MG9K line gateways.

| Term  | Description                                |
|-------|--------------------------------------------|
| EM    | Element Manager                            |
| LEN   | Line Equipment Number                      |
| LGRP  | Logical Group (of lines)                   |
| LNINV | Line Inventory (table)                     |
| MG    | Media Gateway                              |
| MG9K  | Media Gateway 9000                         |
| SESM  | Succession Element and Sub-element Manager |

## ***Fault Management for A00002252***

### **Fault management strategy**

ActID 89009298 changes the format of MG9K LENs. Prior to SN06 (CCM19), an MG9K LEN had the following format.

<SITE> <0 to 511> <0 to 9> <subgroup, 0 to 10> <circuit, 0 to 99>

Because of the formula used to calculate terminal ids (TermID) in the core, the MG9K LEN reflects the TermID/terminal number and not the physical location of the MG9K line. For example, the following shows a QLEN on an SN05 MG9K LEN:

>QLEN CO10 00 0 01 67

```

-----
LEN:   CO10 00 0 01 67
TYPE:  SINGLE PARTY LINE
SNPA:  619
DIRECTORY NUMBER:  5210621
LINE CLASS CODE:   1FR
SIGNALLING TYPE:  DIGITONE
LINE TREATMENT GROUP:  0
LINE ATTRIBUTE INDEX:  0
CARDCODE:  RDTLSG  GND: N PADGRP: NPDGP BNV: NL MNO: N
PM NODE NUMBER   :  103
PM TERMINAL NUMBER :  168
OPTIONS:
DGT
-----

```

Note that the terminal number is the LEN slot/circuit + 1.

The new MG9K LEN format reflects the physical location of the line.

<SITE> <frame, 0 to 511> <shelf, 0 to 9> <slot, 2 to 9, 14 to 21> <circuit, 0 to 47>

### **Fault management tools and utilities**

As stated above ActID 89009298 changes the format of an MG9K LEN. Any OAM&P utility that uses LENs will require the new MG9K LEN format for MG9K lines, and any OAM&P utility that displays LENs will display MG9K LENs in the new format. A sampling of OAM&P that will require or reflect the new MG9K LEN follows. The complete list of changed utilities is essentially everything that uses LENs. Reference the Logs section below for MG9K LEN values and ranges.

- MAPCI: Posting MG9K lines via LEN at the LTP level will require the new format.

- LINE logs in logutil will use the new format.
- SERVORD will require the new format for MG9K lines (SESM).

## Logs

### Explanation

All LINE logs generated for MG9K lines will utilize the new LEN format.

### Field descriptions

The new MG9K LEN contains the following fields.

#### Field descriptions

| Field           | Value            | Description                      |
|-----------------|------------------|----------------------------------|
| <site>          | character vector | name of the site from table site |
| <frame or cf>   | 0 to 511         | frame number in the office       |
| <shelf or rs>   | 0 to 9           | shelf number in the frame        |
| <slot or ss>    | 2 to 9, 14 to 21 | card slot number                 |
| <circuit or cc> | 0 to 47          | circuit on card                  |

### Action

Persons responsible for maintenance must realize the MG9K LEN format has changed. The crafts person can now use the log to pinpoint the physical location of the reported MG9K circuit.

## *Configuration for A00002252*

### Hardware and Software Requirements

Act ID 89009298 functionality is resident in the CCM19 and CNA19 software layers in the core. While this functionality may be resident, it is dormant unless features 89008782 and 89008025 are present. These features reside in MG9K EM and SESM respectively. Feature 89008025 specifically provisions MG9K lines with the new LEN format.

### Initial Configuration

This specific feature does not require changes to initial configuration.

## Office/Subnet parameters (OP/SP) (CM & SESM)

The functionality of office parm RDT\_SUCC\_AUTOCREATE\_LNINV is altered with this feature for MG9K lines. For MG9K lines the value of ACTIVE is ignored, and no autoprovisioning of table LNINV is allowed. DEFAULT\_MNO is used for MG9K lines.

## Upgrade Impact

This feature does not directly impact a system upgrade. However, upgrading a Succession MG9K GW network from SN05 to SN06 does require special handling. Essentially, existing MG9K LENS and terminal ids will be migrated to use the new LEN format. All of this will be driven by MG9K EM and will be completely transparent for a core SN05 to SN06 upgrade. Please refer to 89008025 documentation for more info.

## Dump and Restore

This feature does not impact dump and restore on upgrades.

## Element Management Upgrade

This feature does not impact EMs.

## Data schema (DS) (CM, MIBS, RDB)

### New/modified tables, MIBs, or Database Schema

The previously unused field GRPTYPE in Table LGRPINV is used in this feature to denote a specific type of LGRP. The values for GRPTYPE are S, M, and C. This feature disables SERVORD autoprovisioning for GRPTYPE S for groups on shelves 0 to 3; refer to the FN section for more info. Currently, GRPTYPE S will denote a set of LGRPs that for now will only include MG9K LGRPs.

#### New or modified tables

| Table/MIB name | NEW/CHANGED/ or DELETED/ | Table Control (NEW/ OLD/UNCHANGED) |
|----------------|--------------------------|------------------------------------|
| LGRPINV        | CHANGED                  | UNCHANGED                          |
| PADDATA        | CHANGED                  | UNCHANGED                          |

Table PADDATA will have two new pad groups which will be used by gateway lines. Pad group PKLNL will be used by gateway lines with LGRP GRPTYPE set to S. PKNIL will be used by gateway lines with LGRP GRPTYPE set to C.

## Table/MIB/Remote Database Schema information

### Name: LGRPINV

Logical Group Inventory Table

**Functional description**

Table LGRPINV contains logical group information for gateway lines.

**Usage sequence and implications (CM Only)**

SESM will provision table LGRPINV for LGRPs with GRPTYPE S.

**Size**

Table size is not changed via this feature.

**Fields**

The following table details the GRPTYPE field in table LGRPINV.

**Table field descriptions**

| Field   | New or Changed | Subfield or refinement | Entry       | Explanation and action                                                                                                       |
|---------|----------------|------------------------|-------------|------------------------------------------------------------------------------------------------------------------------------|
| GRPTYPE | Changed        | None                   | S<br>C<br>M | S denotes a specific set of LGRPs that includes MG9K LGRPs.<br><br>C denotes all other LGRPs<br><br>M is currently not used. |

**Datafill example**

The following example shows sample datafill for table LGRPINV.

| GRPNO     | SRVRNAME | GRPTYPE | LGRPOPTS |
|-----------|----------|---------|----------|
| CO10 00 0 | GWC 1    | S       | \$       |

**Table release history update**

A GRPTYPE value of S denotes a specific set of LGRPs that include MG9K LGRPs. A GRPTYPE value of C is used for all other gateway LGRPs. GRPTYPE M is currently not used.

**Supplementary information**

None.

**Translation verification other tools**

Table LGRPINV is not displayed for TRAVER.

**Name: PADDDATA**

Pad Data Table

**Functional description**

Table PADDDATA contains attenuation and boost settings for different device interactions. Pads are applied to devices in order to balance volume levels.

**Usage sequence and implications (CM Only)**

Pad groups PKLNL and PKNIL will be defined and will appear in table PADDDATA in the nodatafill base load.

**Size**

Pad value settings will be created for the two new pad groups. New table size will be within the allocated size.

**Fields**

Fields will not change with these changes.

**Datafill example**

The following example would apply a 3db attenuation to a line with pad group PKLNL and a 3db gain to a line with pad group STDNL whenever the lines are connected:

```
PKTLN STDNL 3L 3G
```

**Table release history update**

Pad group PKLNL is to be used only by gateway lines that have LGRP GRPTYPE set to S. Pad group PKNIL is to be used only by gateway lines that have LGRP GRPTYPE set to C. Gateway lines will automatically have the appropriate pad group assigned when they are provisioned.

**Supplementary information**

None.

**Translation verification other tools**

Table PADDDATA is not used in TRAVER.

**Service Orders (SO) (CM & SESM)****Service order change details**

Act ID 89009298 disables SERVORD autoprovisioning for gateway lines that have an LGRP type of S (table LGRPINV field GRPTYPE) that reside on shelves 0 to 3. Autoprovisioning provisions or deletes datafill to table LNINV for specific SERVORD+ commands received from SESM. SESM will preprovision table LNINV at the time of node provisioning; reference

documentation for Act ID 89008025. This functionality supercedes the setting of office parm RDT\_SUCC\_AUTOCREATE\_LNINV which is applicable to other types of line gateways. Previously, office parm RDT\_SO\_AUTOCREATE\_LNINV was used for setting autoprovisioning for gateway lines (SN05). RDT\_SUCC\_AUTOCREATE\_LNINV was introduced in SN06 specifically for gateway line autoprovisioning. Neither office parm is applicable for MG9K gateway lines.

Pad group PKLNL will be assigned to gateway lines that have LGRP GRPTYPE set to S via SERVORD. Pad group PKNIL will be assigned to gateway lines that have LGRP GRPTYPE set to C via SERVORD. Attempts to change the pad group via SESM or SERVORD will not be successful. The appropriate gateway pad group will be assigned. However, the pad group can be changed in table LNINV via table control if need be.

### **Software optionality control (SOC)**

This feature has no effect on SOC.

### **Element Management**

This feature has no effect on EM. However, Act ID 89008782 does.

### **Command interface changes**

Act ID 89009298 changes the format for gateway LENS that have GRPTYPE set to S in table LGRPINV. Please refer to the FN for detailed information on the change. Consequently, any CI command that requires a LEN for input must use the new format for a gateway line with GRPTYPE set to S in table LGRPINV. Likewise, any gateway LEN with GRPTYPE set to S in table LGRPINV display via a CI command (or MAPCI) will be displayed in the new format.

### **Security**

None.

### **Configuration Walkthrough**

Please reference Act ID 89008782 documentation.

## ***Product = CS 2000***

### **A00002291 - Trunk Offering Expansion (Succession on DMS)**

“Trunk Offering” (TKO, TOF) is a software package that allows an operator to inform a busy subscriber that another subscriber wants to speak to him. The operator can break into an existing call and inform the busy subscriber verbally

about a new, pending call. If the busy subscriber wants to receive the new call, one of the parties in the existing call goes onhook, then the operator can connect him to the new caller immediately.

#### Trunk Offering configuration

TKO over ETSI ISUP trunks is already supported for some markets in the World-Trade software starting from the WT14 stream. This FN reflects the functionality that supports the TKO feature both over ETSI ISUP and FDCP / MFC-R2 trunks for all markets using the default FDCP variant.

#### TKO support today

|                         | Telrad markets                | other WT markets |
|-------------------------|-------------------------------|------------------|
| <b>ETSI ISUP trunks</b> | supported in off-stream only. | supported.       |
| <b>FDCP/MFC trunks</b>  | supported in off-stream only. | not supported.   |

In order to provide Telrad markets with TKO feature in on-stream release, this feature propagates the TKO support to MMP20 for the following protocols:

- ETSI ISUP V2 for Ethiopia market,
- ETSI ISUP V2 for Costa-Rica market,
- ETSI ISUP V2 for Vietnam market,
- ETSI ISUP V2 for Georgia market,
- FDCP MFC / R2 and TYPE A.

In addition this FN reflects the Warning tone functionality for Ethiopia market.

## LOGICAL VIEW

## TKO support over ETSI ISUP trunks

### ETSI ISUP TKO protocol differences

**MFC/R2 FOT messaging flow: Basic case B: B OnHook after conference**

**MFC/R2 FOT messaging flow: Basic case C: A reject the operator call**

## TKO support in Interworking switch of FDCP <-> ETSI ISUP trunks cross

This feature supports cross situations between the two protocols FDCP and ETSI ISUP in the tandem switch, that includes the following cases:

1. Interworking switch of ETSI ISUP to ETSI ISUP trunks cross.
2. Interworking switch of ETSI ISUP to FDCP trunks cross.
3. Interworking switch of FDCP to ETSI ISUP trunks cross.
4. Interworking switch of FDCP to FDCP trunks cross.

### ISUP - FDCP equivalence

| ISUP Signal | R2 MFC Equivalent Signal | Notes                                                                                                                                                                                                                                                                         |
|-------------|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ISUP_ACM    | Line busy                | Sent as a response to IAM event by TKO. This is done because CPC=Operator, and ACM is sent instead of RLS.<br><br>For R2-MFC, busy signal (B-3) is sent by CALLP BEFORE feature is activated, regardless of the fact that CPC=Operator.                                       |
| ISUP_SUS    | FANS (False Answer)      | 'FALSE_ANSWER' signal - Notify operator switch of one of the following events: <ul style="list-style-type: none"> <li>Terminator is onhook and operator-terminator call is now being established.</li> <li>Terminator has gone onhook while talking with operator.</li> </ul> |
| ISUP_ANM    | ANS (Answer Message)     | Used to notify operator that terminator has gone offhook.                                                                                                                                                                                                                     |

## TKO call on tandem switch with ISUP-FDCP cross

**TKO call on tandem switch with FDCP-ISUP cross**

## Warning tone for Ethiopia market

This feature supports warning tone for the existing TLR425 toneset.

The warning tone is used in the Fix Price Service (FPS) feature.

The warning tone is given when FPS credit limit is exhausted and timer to clear call started.

### Warning tone requirements

| Frequency<br>(Hz) | Level<br>(dbm0) | Tone Id.<br>in hex |
|-------------------|-----------------|--------------------|
| 1400              | -10             | 9D                 |

The tone consists from 3 repeated patterns of tone 08 for 0.5 secs with a break for 11.5 secs between the tones (tone-brake-tone-brake-tone).

## Hardware Requirements or Dependencies

N/A

## Software Requirements or Dependencies

N/A

## Data Requirements or Dependencies

To enable the Trunk Offering feature in the switch, the office parameter TBI\_OFFER in table OFCVAR should be set to one of the following values:

- “MANUAL”, which means that the operator has to send a TKO signal manually in order to enter into A-B call, or:
- “AUTO”, which means that a TKO signal is not needed, and the operator enters A-B call automatically after the intrusion tone is heard.

In the off-stream TLR13 CM load, eight office parameters defined in tables OFCOPT and OFCENG are used for Trunk Offering.

In the on-stream MMP19 CM load, five office parameters defined in table OFCVAR are already used for Trunk Offering.

Merging the off-stream parameters in the on-stream release is done as follows:

1. The parameters TBI\_OFFER and TBI\_OPR\_TIMEOUT are used by this feature in MMP instead of the TLR off-stream parameters TKO\_IS\_ACTIVE, TKO\_AUTO and TKO\_TIMEOUT.
2. The parameters:
  - TKO\_INTRUSION\_TONE,
  - TKO\_TONE,

- TKO\_RERING\_SIGNAL\_REQ,
- TKO\_OPER\_ONLY\_CAN\_DISC,
- TKO\_BREAK\_FTR,

are added by this feature in MMP20.

3. The new parameters are added in table OFCENG, to comply with the definition of the existing parameters in MMP.
4. The new parameter TKO\_INTRUSION\_TONE is used in combination with the existing parameter TBI\_BACKGROUND\_TONE, thus allowing the user to select the desired tone from the toneset. The original hardcoded tone is used as default.

#### Office parameters for TKO in MMP20

| Table      | Office Parameter        | New /<br>Unchanged<br>in WT20 | Range                | Default<br>value | Description                                                                                                                                                                                                                                                                                                    | Notes                                                                                                                                                                                                                                                                 |
|------------|-------------------------|-------------------------------|----------------------|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OFC<br>VAR | TBI_OFFER               | Unchanged                     | OFF, AUTO,<br>MANUAL | OFF              | Sets feature activity and mode                                                                                                                                                                                                                                                                                 | For Telrad markets, this parameter replaces TKO_IS_ACTIVE and TKO_AUTO used in TLR.                                                                                                                                                                                   |
| OFC<br>VAR | TBI_OPR_TIMEO<br>UT     | Unchanged                     | 100 TO 300<br>sec    | 100              | Timeout value for operator message                                                                                                                                                                                                                                                                             | Same as TKO_TIMEOUT in TLR.                                                                                                                                                                                                                                           |

**Limitations and restrictions**

The new trunk option TKO\_FDCP should be assigned to incoming FDCP trunk in the table TRKOPTS. It will allow TKO feature **for specific incoming directions**.

Trunk Offering via ETSI ISUP Trunks will be supported only for Costa-Rica, Vietnam, Ethiopia and Georgia markets.

Trunk Offering via FDCP Trunks will not be supported for 2W Trunks.

OPERATOR to Busy ISDN subscriber: OPERATOR can not break in.

**TREATMENT**

In case of TKO can not be applied, a PTOF (Premature\_Trunk\_Offering) treatment should be applied to the InComing Trunk.

## Interactions

### **OPERATOR to call with regret time.**

In a scenario where the OPERATOR tries to call A and A is involved in a call with B: If A or B are in regret time, the OPERATOR can break in and disconnect B.

In case a scenario where A or B has been involved in a CWT or 3WC features before OPERATOR call, if A or B was On-Hook and now A or B are in regret time: in this case OPERATOR can not break in.

Example for above mentioned case:

- A (CWT option) in call with B.
- C calls A. A was got CWT tone.
- C On-Hook.
- A and B continue to be in conversation.
- A On-Hook.
- OPERATOR can not break in.

### **OPERATOR to call with OPERATOR on line**

In a scenario where the OPERATOR tries to call A and A is involved in a call with another OPERATOR, the operator can not break in.

When an OPERATOR is in the process of breaking in to a call another OPERATOR can not initiate a break in process.

### **OPERATOR to noneTALKING call**

OPERATOR can not break in to the following call states: Off-Hook before dialing, dialing and ringing.

### **Call Wait (CWT)**

The possible situations are:

A has the CWT feature but he is involved in a regular call - The OPERATOR can break in to the call (regular call).

A is involved in a CWT call - Break in can not be effected.

B is involved in a CWT call and A is on the same office - Break in can not be effected.

B is involved in a CWT call and A is not on the same office - There is therefor, no indication that B is involved in a CWT call - The OPERATOR can break in.

A cannot FLASH after OPERATOR enter the call.

### **3WC**

The possible situations are:

A has the 3WC feature but he is involved in a regular call - The OPERATOR can break in to the call (regular call).

A is involved in a 3WC call - Break in can not be effected.

B is involved in a 3WC call and A is on the same office - Break in can not be effected.

B is involved in a 3WC call and A is not on the same office - There is therefor, no indication that B is involved in a 3WC call - The OPERATOR can break in.

A cannot FLASH after OPERATOR entered the call.

### **Call Forward (CFW) / CFBL / CFDA**

The call forward is transferred. If the second call is BUSY the OPERATOR can break in.

### **Denied Terminator (DTM)**

The OPERATOR can break in only if office parameter TKO\_BREAK\_FTR is set to Y.

*Note.* Office parameter TKO\_BREAK\_FTR for connection via FDCP trunks works only in case when calling party category was received before all the called party digits were delivered to the switch. For this purpose appropriate entry in the table R2PROT should be datafilled with option ANI\_AFTER\_1\_DIG or CAT\_AFTER\_1\_DIG.

### **SUS / RSUS**

The OPERATOR can not break in.

### **MCT**

The OPERATOR can not break in to any call involving MCT.

The OPERATOR can not break in - When B has MCT and the AB call is a line to line call or the AB call is a line to trunk call and when A receives a holding indication.

The OPERATOR can not break in - When A has activated MCT by pressing FLASH.

A cannot FLASH after OPERATOR enter the call.

### **OPERATOR to Line who was connected to TREATMENT or TONE call**

The OPERATOR can not break in.

**OPERATOR to HUNT GROUP**

In case of all HUNT GROUP (DNH) members are in Busy state, the operator can break in last busy member call.

**OPERATOR to Busy ISDN subscriber**

OPERATOR can not break in.

**OPERATOR to Line with CLI option**

In case of OPERATOR calls Line with CLI option, no information Log will be printed - neither when line is in the call, nor when line is idle.

## ***Product = CS2000***

### **A00002365 -- CWR Support over Trunks for Brazil market (Int'l IAW)**

#### ***Functional Description***

This activity adds the support for the Call Waiting Ringback (CWR)<sup>1</sup> service over ETSI ISUP including national variants, SIP-T, IBN7 and R2 trunks for the Brazilian Market.

When a call is made to a subscriber with CWR and Call Waiting Terminating (CWT) enabled, the CWR service provides an indication to the originating line as to the state of the terminating line. If the terminating line is currently engaged in a stable two-port call that is available for call waiting, a distinctive audible ringback is returned to the originating agent. Otherwise standard audible ringback or busy tone is provided.

The CWR feature is already available. A detailed description of the feature CWR is available in the following documents:

- Activity AF1271 (PLS OLDOC3)

This activity focuses on the support for CWR over trunks (ETSI ISUP including national variants, SIP-T, IBN7 and R2) for both TDM and CS2K. This feature enables the support of CWR over trunks if the CWR option is set for the specific trunk types in table ISERVOPT.

As an additional part, a CWR deactivation utility is provided for specific trunk groups. This option provides the possibility to exclude specific trunk groups from the support of CWR.

#### **CWR Option in Table ISERVOPT**

In table ISERVOPT a new option (CWR\_ON\_TRUNK) is introduced to support CWR over specific trunk types. The CWR\_ON\_TRUNK option contains the following trunk types:

- ETSI\_ISUP
- IBN7
- R2

If CWR is desired for a trunk type the corresponding trunk type in option CWR\_ON\_TRUNK needs to be set to 'Y'. All the trunks groups that belong to a trunk type listed above will support CWR as soon as the trunk type is set

---

1. GVT Anatel 252 Compliance

to 'Y' in table ISERVOPT. The following figure shows the structure of the new option CWR\_ON\_TRUNK.

#### New Option in Table ISERVOPT

#### CWR Activation for Trunk Type

The standard audible ringback is the default tone for CWR over trunk that is provided to the originating party. The new option CWR\_ON\_TRUNK needs to be added in table ISERVOPT to allow distinctive audible ringback (CWR tone) for a trunk type. Every trunk type can be set to either 'Y' or 'N' individually. The trunk type in option CWR\_ON\_TRUNK is set to 'Y' if the activation of CWR over this trunk type is desired. The following figure shows an example on how the option CWR\_ON\_TRUNK is added and activated for the trunk types ETSI\_ISUP and R2 in table ISERVOPT.

**Example for Adding and Activating CWR\_ON\_TRUNK**

```
>table iservopt
>pos cwr_on_trunk
TUPLE NOT FOUND
>add cwr_on_trunk
>y
OPTION:
>cwr_on_trunk
ETSI_ISUP:
>y
IBN7:
>n
R2:
>y
TUPLE TO BE ADDED:
    CWR_ON_TRUNK
                                CWR_ON_TRUNK Y N Y
ENTER Y TO CONFIRM, N TO REJECT OR E TO EDIT.
>y
TUPLE ADDED
>pos cwr_on_trunk
    CWR_ON_TRUNK
                                CWR_ON_TRUNK Y N Y
>
```

The following figure shows an example of how to change the content of the existing option CWR\_ON\_TRUNK. The trunk type IBN7 will be enabled for CWR over trunk.

**Example for Changing Option CWR\_ON\_TRUNK**

```

>table iservopt
>pos cwr_on_trunk
      CWR_ON_TRUNK
                                CWR_ON_TRUNK Y N Y
>cha
>y

                                CWR_ON_TRUNK Y Y Y
ENTER Y TO CONFIRM, N TO REJECT OR E TO EDIT.
>y
TUPLE CHANGED
>pos cwr_on_trunk
      CWR_ON_TRUNK
                                CWR_ON_TRUNK Y Y Y
>

```

**CWR Deactivation for Trunk Type**

The option CWR\_ON\_TRUNK controls the settings for the trunk types ETSI\_ISUP, IBN7 and R2. Each trunk type is considered individually, therefore it is possible to enable or disable CWR over trunk for each trunk type. If the deactivation of CWR over trunk is desired, the corresponding trunk type is set to 'N' in option CWR\_ON\_TRUNK.

There are two possibilities to disable CWR over trunk for the trunk type:

- Change the setting for a trunk type from 'Y' to 'N':  
In this case only the trunk type that does not require the CWR over trunk ability is disabled. The option CWR\_ON\_TRUNK remains in table ISERVOPT. The deactivation of a trunk type is shown in the following figure.

**Deactivation of a Trunk Type**

```

>table iservopt
>pos cwr_on_trunk
      CWR_ON_TRUNK
                                CWR_ON_TRUNK Y Y Y

>cha
>y
OPTION: CWR_ON_TRUNK
>
ETSI_ISUP: Y
>
IBN7: Y
>
R2: Y
>n
TUPLE TO BE CHANGED:
      CWR_ON_TRUNK
                                CWR_ON_TRUNK Y Y N

ENTER Y TO CONFIRM, N TO REJECT OR E TO EDIT.
>y
TUPLE CHANGED
>pos cwr_on_trunk

ENTER Y TO CONFIRM, N TO REJECT OR E TO EDIT.
>y
TUPLE DELETED
>pos cwr_on_trunk
TUPLE NOT FOUND

>

```

## CWR\_OFF Option in Table TRKOPTS

The option CWR\_ON\_TRUNK in table ISERVOPT enables CWR over trunk for the trunk type including all the trunk groups of this trunk type. The new option CWR\_OFF in table TRKOPTS provides the possibility to disable CWR over trunk for a specific trunk group without the need of disabling the whole trunk type.

If the CWR\_OFF option is assigned to a trunk group in table TRKOPTS the CWR over trunk ability is disabled for the trunk group even if the trunk type is enabled for CWR in option CWR\_ON\_TRUNK. The option CWR\_OFF is independent of the settings in option CWR\_ON\_TRUNK in table ISERVOPT. The following figure shows the structure of the new option in table TRKOPTS.

### New Option in Table TRKOPTS

### Deactivation of CWR for Specific Trunk Group

The new option CWR\_OFF is assigned to the trunk group in table TRKOPTS to disable CWR over trunk only for this trunk group. An example of assigning the new option to a trunk group is shown in the following figure.

**Deactivate CWR for Specific Trunk Group**

```

>table trkopts
>add rua501isupv2lp cwr_off
>y
OPTION:
>cwr_off
TUPLE TO BE ADDED:
  RUA501ISUPV2LP          CWR_OFF          CWR_OFF
ENTER Y TO CONFIRM, N TO REJECT OR E TO EDIT.
>y
TUPLE ADDED
>pos rua501isupv2lp cwr_off
  RUA501ISUPV2LP          CWR_OFF          CWR_OFF
>

```

The CWR\_OFF option in table TRKOPTS disables CWR over trunk for the specific trunk group independent from the settings of option CWR\_ON\_TRUNK in table ISERVOPT.

If the CWR\_OFF option is removed from a trunk group the settings in option CWR\_ON\_TRUNK are considered again for CWR over trunk ability. The following figure shows how the CWR\_OFF option is removed from a trunk.

**Remove CWR\_OFF from Trunk Group**

```

>table trkopts
>pos rua501isupv2lp cwr_off
  RUA501ISUPV2LP          CWR_OFF          CWR_OFF
>del rua501isupv2lp cwr_off cwr_off
>y
TUPLE TO BE DELETED:
  RUA501ISUPV2LP          CWR_OFF          CWR_OFF
ENTER Y TO CONFIRM, N TO REJECT OR E TO EDIT.
>y
TUPLE DELETED
>pos rua501isupv2lp cwr_off
TUPLE NOT FOUND
>

```

**Note:**

There is no explicit relationship or dependency between the settings in table ISERVOPT and TRKOPTS. It is possible to assign the CWR\_OFF option to a trunk group even if the trunk type of the trunk group is disabled in option CWR\_ON\_TRUNK.

## Hardware Requirements or Dependencies

N/A - Refer to “Limitations and restrictions”.

## Software Requirements or Dependencies

N/A - Refer to “Limitations and restrictions”.

## Limitations and restrictions

### TDM Trunks

This activity instructs the PDTC to play distinctive audible ringback (CWR tone) to the originating party. The PDTC must be capable of providing the CWR tone.

The Brazilian toneset, e.g. on the PDTC, supports the CWR tone.

### Succession Trunks

This activity instructs the trunk gateway to play distinctive audible ringback (CWR tone) to the originating party. The gateway must be capable of providing the CWR tone.

### SIP-T Trunks

SIP-T trunks require an APG in order to play distinctive audible ringback (CWR tone) to the originating party. The APG must be capable of providing the CWR tone.

## Interactions

The interactions are unchanged.

Please refer to Activity AF1271 (PLS OLDOC3)

***Product = CS 2000*****A00002367 -- BRI Preset Conference Base (Succession on DMS)*****Functional Description***

This activity allows an ETSI BRI (p-to-mp) station or ETSI ISUP V2 trunk to set up a preset conference with up to 35 conferees by dialling a specific directory number. This invokes simultaneous ringing of preselected conference members. The originator of a preset conference (served user) which has AFC & HOLD line options, is able to add-on additional local conferees once the conference is established.

This activity is based on the existing IBN Preset Conference and uses same datafill requirements and restrictions for IBN Preset conference. See the appendix A- section for IBN preset conference background.

In additional, this feature also provides supporting IEs related to CGN, GAP, MLPP, UII to be sent to conferees.

**Preset Conference Call establishment and termination****Preconditions**

The datafill of existing IBN preset preconf table PRECONF meets the BRI preset Conference requirements.

According to the requirements of spec 'SIM: PRCONF\_BRI issue3' related to conference call establish, add-on functionality and takedown process, the existing table PRECONF should be datafilled as follows:

- BRI Preset Conference should be datafilled to be allowed for the customer group. And the preset conference originator (served user) is a member of the preset conference's customer group. Conferees does not need to belong to the same customer group.
- ADDON bool must be set to 'yes' in the existing table PRECONF. Only originator can add on conferees.
- In order to enable add-on functionality, line options AFC and HOLD should be assigned to preset conference originator via Servord first.
- The conferees are specified in advance in a data table. According to the existing feature AF2014 -Preset conference (large), already allows 50

conferee numbers can be assigned to each preset conference DN (Directory Number). In other words, the preset conference can have up to 50 conferees. This includes the originator, all preset conferees and all add on conferees.

- Maximum 64 preset conference DN can be datafilled per office.
- The preset conference may be datafilled up to 14 digits and conferee numbers may be a string of up to 30 digits.
- It is required that when the first conferee answers, the conference begins. In order to provide this functionality, the field IMMSTART of PRECONF should be datafilled as 'yes.'
- The field ORIGCONT should be set to 'yes' to allow that the served user is in control of the conference. when he goes on-hook, the conference is taken down even if there are conferees still on the bridge.
- Associated with each conferee DN will be timeout interval of 15 to 60 seconds and an optional one alternate DN. If the conferee does not answer within the timeout interval, the call attempt ends. But if an alternate DN is datafilled, two call attempts are made on primary address with no answer, then the call is routed to alternate address. Two call attempts will be also directed to the alternate address

### Example of BRI Preset Conference

Table "PRECONF Datafill example" on page 100 gives the example of BRI preset conference datafill. In this datafill example;

- a. 7835599 is the predefined preset conference DN. The customer group of the originator should be 'CONF6C' option in the table CUSTENG to be activated conference. Up to 64 preset conference DN can be datafilled in the table PRECONF.
- b. 7831016 and 7831002 are the conferees for preset conference DN by index 0. 35 conferees can be datafilled for preset conference DN (7835599). First conferee has the alternate address. Second conferee has no alternate address. The timeouts interval is 15 seconds for both conferees and its alternate address.

-If the conferee 7831002 does not answer within the timeout interval, the call attempt ends.

-If the conferee 7831016 does not answer within two trials, two call attempts will be directed to alternate address.

For the more datafill details for PRECONF table, please see Appendix A.

#### PRECONF Datafill example

#### Preset conference initiation

A served user initiates one preset conference (PRECONF) by dialling a predefined DN, which is associated with conference. The directory number is recognized as a request for a preset conference. Translations check the originator's data against the data of preset conference DN. A check is made if required number of six-port conference bridges can be seized for the conference and the conference is not already in use. If call is valid, the originator will hear audible ringing while calls are originated to all the addresses stored for the desired preset conference. If invalid, the originator will be routed to treatment.

Dialling PRECONF DN invokes simultaneous ringing of the preselected conference members.

There could be more than one served user for a conference, when an attempt is made to originate a conference which has already been initiated, the second served user will be routed to busy tone.

The served user's directory number (DN) can be part of preset conference list of numbers. But originator can not be called as conferee for this preset conference. In other words, if the originator is a predefined preset conferee, we do not call this conferee unless the call is over trunk call.

The conference starts as soon as the first conferee answers (IMMSTART = Y in PRECONF). In this case, the answer will cause the audible ringing to the originator to stop and the conference to begin. Attempts to complete the calls to unanswered conferees will continue, with no audible ringing to originator.

**Preset Conference Initiation****Add-on functionality**

The originator of a preset conference can add on conferees as local call, once the preset conference is established. In order to provide this functionality, the field ADDON of the table PRECONF should be set to 'yes' and line options AFC and HOLD. Once the maximum number of conferees is reached, no more conferees may be added. The add-on functionality is based on the existing ETSI BRI 6-part conference

**Coding Requirements for DSS1**

All components (invoke, return result, return error and reject) is included within a Facility information element. Facility information element can be conveyed in any appropriate message. Setup, Connect, Facility and Disconnect messages are used within this specification.

**ETSI -Q.931 FACILITY Information Element (FIE) with a Service Component embedded.**

| FACILITY IE                 |   |   |   |   |   |   |   |         |

```

The served user sends a Facility message with the call reference of the existing call and a facility information element including beginCONF-invoke component. This component may contain a ConfSize parameter, if not the conference size sets to a network dependent value by the network. The beginCONF-return-result component sent to the user includes a ConferenceId and a PartyId parameter which is used to identify the remote user.

To add a new party, the connection to the conference bridge can be either in the (Active, Idle) state or in the (Active, Held) state and the connection to the party to be added can either be in (Active, Idle) state or in the (Active, Held) state. Which means that one of the connections should be held and other should be in (active, idle) state. A Facility message with the call reference of the call to be added and an Add-CONF-invoke component including conferenceId parameter is sent by the user to the network. Then the network sends a DISCONNECT message with AddCONF-return-result component including PartyId parameter which identifies the added party.

CRx, CRy: Call Reference used-

A-B :call between user A and PRCONF

A-C :call between user A and user C

FIE:Facility information element

CR1, A-B (Active, Held)

CR2, A-C (Active, Idle)

**Add-on conferee, when preset conference is in held state**

CR1, A-C (active-held)

CR2, A-B (active, idle)

**Add-on conferee, when preset conference is active**

### Unsuccessful cases

Network receives a BeginCONF-inv in a state other then Active(N10)

Adding a party which causes interworking restriction violations

Served user indicates an inappropriate bearer capability.

**ConferenceId used is not associated with a conference known to the network****Adding a party when the maximum conference size is reached****BRI Facility information Element formats****BEGINCONFinvoke**

| 09                                                                  | Facility Length             |
| 91                                                                  | Supplementary Service Spare |
| A3                                                                  | Return Error Operation      |
| 06                                                                  | Return Error Length         |
| 02 - Universal Integer                                              | Invoke ID Tag               |
| 01                                                                  | Invoke ID Length            |
| Invoke identifier from the previous ADDCONF FAC IE Invoke component | Invoke ID                   |
| 02 - Universal Integer                                              | Error Value Tag             |
| 01                                                                  | Error Value Length          |

**ADDCONF ReturnError**

| Number of parties exceeded                    | Error Value |
|-----------------------------------------------|-------------|
| Not allowed                                   |             |
| supplementary service interaction not allowed |             |
| invalid callstate                             |             |

**Preset Call Termination**

According to the datafill (ORIGCONT field is set to yes), the originator is in control of conference. In this case when he goes on-hook, the conference is taken down, even if there are conferees are still on the bridge.

**Supporting Information Elements**

If information elements (IEs) explained below, is preset in the SETUP message which is sent by originator of preset conference, it is required that these IEs are included in SETUP/IAM messages to all conferees.

The following IEs are supported by this activity:

- 1 Calling Number (CGN) IE
- 2 Generic Address Parameter (GAP) IE

**Note:** NOSCREEN should be datafilled for origination in LTDEF table. And CGN IE should be exist in SETUP message sent by originator.

- 3 Multi Level Precedence Preemption (MLPP) IE
- 4 User to User Implicit (UUI) IE

Mapping of the IEs to conferees are supported for the following interworkings:

- ETSI BRI (ptomp)-CONF port- ETSI BRI(ptomp),
- ETSI BRI (ptomp)- CONF port-ETSI ISUP V2,
- ETSI ISUP V2-CONF port- ETSI BRI (ptomp) ,
- ETSI ISUP V2-CONF port-ETSI ISUP V2

**Functional Behavior Diagram****CGN IE and GAP IE**

The purpose of the calling party number information element is to identify the origin of a call. This information element may be present in the SETUP message transmitted by the originator to network and in the SETUP message transmitted by the network to conferees. Calling party number field in the SETUP message which is sent from originator may be either actual network number or presentation number (GAP IE is available when NOSCREEN datafill is entered) that the originator wishes to display. In other words, the user is allowed to send any CGN to the switch and the switch does not screen this CGN and does not override it with the provisioned DN. (NOSCREEN datafill is not required for incoming ISUP)

According to spec SIM.PRCONF\_BRI issue3, It is required that CGN IE sent by originator (in the SETUP) and GAP IE are sent to all conferees in the SETUP/IAM messages

**Mapping CGN IE/GAP IE**

## MLPP IE

The MLPP IE may be present in the SETUP message sent by origination which has MLPP line option to network. It is required that in the SETUP/IAM messages sent by network to conferees should include MLPP IE, if originator has MLPP

### Mapping MLPP IE

## UII IE

Only User to User implicit IE will be propagated to conferees, if originator sends SETUP message with UII IE.

### Mapping UII IE

### OM class for Preset Conference

Since this activity is based on the existing IBN preset conference, the existing OM class PCNF is used.

### Billing

No AMA/Billing changes for this activity.

## Hardware Requirements or Dependencies

The NT3X67 six-party conference card provides conference facilities on a single card for use with DMS-100 switches. This activity uses same hardware as IBN Preset Conference.

## Software Requirements or Dependencies

The existing IBN preset Conference is used by this activity.

## Limitations and restrictions

Since the feature is based on the existing IBN Preset Conference, the restrictions of IBN preset conference are also valid for this activity.

Only Local calls can be add-on to conference.

The originator of Preset Conference can not start another preset conference.

The call attempts end to a conferee when it is unplugged.

Recommended datafill explained in this FN, should be provided for required functionality

- Served user is in the control of conference (ORIGCONT field is set to yes)
- When the first conferee answers, the conference begins (IMMSTART field is set to yes)
- In order to enable the add-on functionality, ADDON field is set to yes.
- 35 conferee can be datafilled in PRECONF.

This activity is implemented for the following interworkings only, the rest of the interworkings are out of scope of this feature:

- ETSI BRI(ptomp)-CONF port- ETSI BRI(ptomp),
- ETSI BRI(ptomp)- CONF port-ETSI ISUP V2,
- ETSI ISUP V2-CONF port- ETSI BRI (ptomp) ,
- ETSI ISUP V2-CONF port-ETSI ISUP V2

## Interactions

### Calling Line Identification Presentation/Presentation Restriction

This activity only supports CGN IE to be sent to the conferees in the terminating message. For Special Arrangement (no screening option), if required datafill exists, GAP IE is sent to conferees.

**User to User Signalling**

This activity only provides UUI IE in setup message to conferees. UUS1 explicit is ignored. But if the originator requests in the FAC IE of the SETUP message that UUS1 is required and the terminator does not accept it, the call should be released according to the UUS1 ETSI spec.

**MLPP**

The served user provides MLPP information, the same MLPP Information is included into call setup to conferees.

For all feature interactions please refer to the activity A00002884 - 'ETSI BRI Preset Conference service interactions' available elsewhere in this document.

## Appendix A for A00002367 - IBN Preset Conference background

The originator (conference controller / served user) dials the predefined DN (specified in table PRECONF) to start the Preset Conference. Once the DN is dialled, the preset conference feature will try to connect to all of the pre-selected conference members simultaneously. Audible ringing is provided to all of the conferees. These conferees are specified in advance in a data table PRECONF indexed by conference number and conferee number. (The preset conference DN is always first entry and the conferee number is zero)

These conferees are datafilled in table PRECONF indexed by conference number and conferee number. If the preset predefined DN is dialled a check is made if the required number of six-port conference bridges can be seized for the conference. There are enough six-port conference bridges available the originator receives audible ringing while calls are originated to all the addresses stored for the desired preset conference.

An IMMSTART option can be set in the PRECONF table so that the conference starts as soon as the first conferee answers.

Associated with each conferee DN is a timeout interval and an optional alternate DN. Automatic retrial is attempted on all conferees that have not returned answer within a customer datafillable interval (TIMEOUT option of table PRECONF) of 15 to 60 seconds after the call to conferee was initiated. If a call to a primary address fails to complete within two retrials, and the conferee is provided with an alternate address (ALTADDR option of table PRECONF), then two additional attempts are made on the alternate DN.

Once the preset conference is established, add-on of additional conferees can begin if allowed by PRECONF table option ADDON.

The conference is terminated when all conferees disconnect, or if specified by ORIGCONT option in table PRECONF, when the originator of the conference goes on hook.

The following figure gives the brief description of the fields of PRECON.

**Table PRECONF**

| <b>Datafilling PRECONF</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## The range information for the fields of PRECONF

Table PRECONF

| Range of fields in PRECONF                                     |
|----------------------------------------------------------------|
| PRECONF : {0 TO 63}.                                           |
| CONFeree: {0 TO 49}                                            |
| CONFADDR: VECTOR OF UP TO 30 DIGIT'S.( THIRTY_DIGIT_REGISTER.) |
| CLASS: {P,A,C,D} .                                             |
| CUSTGRP: CUSTOMER_GROUP when D is selected.                    |
| NCOS:{0 TO 511} .                                              |
| ALTADDR: VECTOR OF UP TO 30 DIGIT'S (THIRTY_DIGIT_REGISTER .)  |
| ORIGCOUNT:{N,Y} ..                                             |
| TIMEOUT: {15 TO 300}..                                         |
| ADDON: {N,Y}..                                                 |
| DIDORIG: {N,Y.                                                 |
| IMMSTART:{N,Y}..                                               |

The preset conference DN can be datafilled up to 14 digits according to universal numbering plan .The conferee DN and alternate DN can be datafilled up to 30 digits.

## *Product = CS 2000*

### **A00002377 -- 10 AFC Keys for BRI Directory Number (Succession on DMS)**

#### *Functional Description*

This feature is required as part of the requirements for the German DBArt in ISN07. This feature allows up to 10 AFC (Additional Functional Call) Keys (and therefore 11 calls) on one DN (Directory Number). The master DN, known as SFC (Single Functional Call) key can have up to 10 AFC Keys associated with it.

This activity allows 11 Call Hold (all calls can be HELD calls) on one DN and 8 Call Waiting per loop if the customer is subscribed to these services.

This service is supported only in point-to-multipoint configurations.

The old capability allowed provisioning up to 4 AFC Keys (and therefore 5 calls) on one DN. This activity increases the provisioning number of AFC Keys to 10 per DN (and therefore 11 calls) for the DMS ETSI BRI implementation.

ETSI does not limit the number of calls on a TEI (Terminal Endpoint Identifier).

The old capability restricted the maximum call waiting calls per access with 2 and the maximum number of calls allowed on loop with six for terminations. Maximum call waiting calls per access is increased to 8 and maximum number of calls restriction for terminations is removed by this activity.

Summary of the capabilities provided by this activity:

- The maximum number of calls within an ETSI BRI (p-mp) configuration is 11 calls per DN.  
Number of calls per loop depends on the terminal capabilities.  
The maximum number per DN is provisionable in a range from 1 to 11.
- The maximum number of held calls within an ETSI BRI (p-mp) configuration is 11 calls per DN.  
All calls can be HELD calls.  
These values are not provisionable.
- The maximum number of waiting calls within an ETSI BRI (p-mp) configuration is 8 calls per access.  
These values are not provisionable.

A summary of the number of the AFC Keys per DN, HELD calls per DN and CW calls per loop depending on PtoMP and PtoP configurations is shown in the following table:

|                             | Before the activity |      | After the activity |      |
|-----------------------------|---------------------|------|--------------------|------|
|                             | PtoMP               | PtoP | PtoMP              | PtoP |
| Number of AFC Keys per DN   | 4                   | 4    | 10                 | 4    |
| Number of HELD calls per DN | 5                   | -    | 11                 | -    |
| Number of CW calls per loop | 2                   | -    | 8                  | -    |

**Note:** This activity is only applied to Point-to-Multipoint configurations and Point-to-Point configurations are kept unchanged as before the activity.

### **Software Optionality Control (SOC) Option**

A new SOC option SULN0028, 'SULN BRI Call Queuing' is introduced to restrict the usage of the "10 AFC KEYS for BRI DIRECTORY NUMBER" functionality. The following "10 AFC KEYS for BRI DIRECTORY NUMBER" functionality is dependent on the SOC option:

- Provisioning of 10 AFC Keys for a DN is possible only for Point-to-Multipoint configuration of ETSI BRI variant and if the SOC is in active state.

The SOC option restricts the datafilling of more than 4 AFC keys instead of restricting functionality of the AFC keys in this activity. In order to prevent the 10 AFC keys option is functioned while the SOC state is IDLE (this can be occur if 10 AFC keys option is assigned to a DN while SOC state is ON and then the SOC state is changed to the IDLE), referring to the Software Optionality Control Application Guidelines, prior to the SOC state transition from ON to IDLE, existing customer datafills for more than 4 AFC keys are determined and a warning is returned to the SOC. Also, a new CI command AFCLIS is created to list the available LTIDs with more than 4 AFC keys. After removing all datafills for more than 4 AFC keys, it can be possible to change the SOC state from ON to IDLE.

### **Hardware Requirements or Dependencies**

N/A

### **Software Requirements or Dependencies**

N/A

### **Limitations and Restrictions**

N/A

### **Interactions**

Since the number of AFC keys for BRI directory number and the number of waiting calls per loop are changed, there are some service interactions with some of the available BRI services. These service interactions are explained in this section.

### **Call Hold**

#### **Background**

Call Hold supplementary service allows a user to interrupt communications on an existing call and then, if desired, re-establish the communication.

When the Call Hold supplementary service is invoked, communication on a B-channel is interrupted and the B-channel is released from use by the existing call. A B-channel shall be reserved for use by the terminal (based on the TEI of the terminal) used to invoke Call Hold supplementary service and enable the user to retrieve a call from hold, originate a new call, and establish connection to an incoming call (Activity AR2179 Multi Party Services).

#### **Changes on the supplementary service with this activity**

This feature allows up to 10 AFC Keys (and therefore 11 calls) on one DN (Directory Number). The master DN, known as SFC (Single Functional Call) key can have up to 10 AFC Keys associated with it. This allows 11 Call Hold (all calls can be HELD calls) on one DN if the customer is subscribed to this service.

This activity increases the AFC range from {1 to 4} to {1 to 10} per DN.

This activity only increases the number of AFC and indirectly affect the HOLD supplementary service. This activity does not make any change on the functionality of HOLD supplementary service.

### **Call Waiting**

#### **Background**

Call waiting supplementary service enables the call can be offered without a B-channel. In CM terminating utilities exists that are dealing with B-channel idle or busy determination (Activity AR2179 Multi Party Services).

#### **Changes on the supplementary service with this activity**

This activity allows 8 Call Waiting per loop if the customer is subscribed to this service.

This activity increases the AFC range from {1 - 4} to {1 - 10} per DN and waiting call limit from 2 to 8 per loop.

This activity does not make any change on the functionality of CW supplementary service.

### **ECT**

#### **Background**

The user is engaged in a telephone call and additional connections have been established. The user can interconnect two of the partners (ECT - Explicit Call Transfer) (Activity A59023626 BRI Explicit Call Transfer).

#### **Implicit ECT Background**

If there is only one held call on a DN, an ECTExecute message is sent from that HELD call and network connects that call with the active idle call. If there

are more than one HELD call on a DN, user selects one of the HELD call. Then an ECTExecute message is sent from that selected call and network connects that selected HELD call with the active idle call.

### **Explicit ECT Background**

A LinkIDRequest message is sent from the active idle call. Then, network sends a LinkID to the user. If there is only one held call on a DN, an ECTExecute message is sent from that HELD call with the LinkID and network connects that call with the active idle call. If there are more than one HELD call on a DN, user selects one of the HELD call. Then an ECTExecute message is sent from that selected call with the LinkID and network connects that call with the active idle call.

### **Changes on the supplementary service with this activity**

#### **Implicit ECT**

Because the active held call is selected using the CR in the FAC message, there is no impact to ECT of allowing additional HELD calls.

This activity does not make any change on the implicit ECT supplementary service.

#### **Explicit ECT**

Because the active held call is selected using the CR in the FAC message, there is no impact to ECT of allowing additional HELD calls.

This activity does not make any change on the explicit ECT supplementary service.

### **Three Party Conference**

#### **Background**

The Three Party Conference (3PTY) supplementary service enables the subscribed user to establish, participate in and control a three-way conversation. It is invoked by the subscribed user who is involved in two calls (one active call and one held call), either of which may be an incoming or outgoing call. The connections are established on each of the two calls prior to invocation of 3PTY supplementary service (Activity AR2179 Multi Party Services).

### **Changes on the supplementary service with this activity**

In the old code, if there were more than one Active-Idle connection exists for the same TEI, the network accepted the transfer request and connected the parties.

This activity does not change this behavior and rejects the request if there are more than one Active-Idle connection exists for the same TEI.

## **Hunt Groups (MLH, DNH, DLH)**

### **Background**

ETSI BRI lines can have only one AFC assigned if they are in MLH (Multiline Hunt), DNH (Directory Number Hunt), DLH (Distributed Line Hunt) hunt groups. More than one AFC can not be assigned.

Up to two terminations are allowed on ETSI BRI terminals in hunt groups. One on the SFC key and on one AFC key.

### **Changes on the supplementary service with this activity**

This activity does not change this restriction and therefore this activity has no interaction with hunt groups.

## **Six Party Conference / Add On Conference**

### **Background**

The conference (Add On CONF) supplementary service enables a user who is connected to the network via a point to multipoint ISDN ETSI BRI to establish, participate in and control a simultaneous communication involving a number of users. The DMS implementation of the Add On CONF supplementary service restricts the total number of conference parties to 6 (Activity A59027439 ETSI BRI 6 PARTY CONFERENCE).

### **Changes on the supplementary service with this activity**

Since only one active held call on a DN was possible before this activity, adding a new party which is on HELD state to the CONFERENCE while conference is also on HELD state (two HOLD method) was not possible.

After the activity, since more than one HELD call on a DN is possible, adding a new party which is on HELD state to the CONFERENCE while conference is also on HELD state (two HOLD method) is possible.

This activity does not make any change on the Add On Conference supplementary service. It just allows two hold method as mentioned above.

### **Preset Conference**

The service interaction with 'Preset Conference' is handled under 'Preset Conference' activity.

Please refer to the ISN07 activity "A00002884 - ETSI BRI Preset Conference Service Interactions".

### **Office/Subnet parameters (OP/SP) (CM & SESM)**

N/A

### **Upgrade Impact**

N/A

### **Data schema (DS) (CM, MIBS, RDB)**

N/A

### **Service Orders (SO) (CM & SESM)**

This activity does not add a new service order (SO), it just increases the upper limit of the provisionable number of AFC Keys.

The old code allowed provisioning up to 4 AFC Keys on one DN. This activity increases the provisioning number of AFC Keys to 10 per DN for the DMS ETSI BRI implementation.

The master DN, known as SFC (Single Functional Call) key is able to have up to 10 AFC Keys associated with it. This can be specified through servord by

using the AFC line option. If the AFC line option is added to a DN on a BRI set, the user is prompted for NUMCALLS indicating the number of call references permitted to be associated with that DN.

### Service order change details

Increasing the upper limit of the provisionable number of AFC Keys just affects the DMS ETSI BRI variant. Other DRUs (such as NA) and other BRI variants (such as VN4 and AUSTEL) is not affected from the SO change.

### New commands

N/A

### **A00002512 -- GWCEM Internet Transparency VCAC Provisioning (Intl IAW, Intl IAC)**

#### ***Functional Description***

The Internet Transparency (“ITrans”) solution, implemented in the SN06.x stream, provides a means for CS2K to enable IP-telephony across and between VPNs (Virtual Private Networks). This is achieved by taking into account the presence of NAT (Network Address Translator) middleboxes between MGs (Media Gateways) and the ‘outside world’, and inserting publicly-addressable MP (Media Proxy) devices into the media path where required.

The SN06 provisioning component of this work dealt with:

- datafilling of Media Proxy and (virtual) NAT devices
- association of MGs to an ‘adjacent’ NAT
- association of MPs to GWCs (Gateway Controllers)
- downloading of MP/NAT information to GWCs as necessary

The present feature (SN07) builds on this provisioning functionality to add support for:

- datafilling of LBL (Limited Bandwidth Link) middleboxes in addition to NATs

- datafilling of RU (Resource Usage) data for use in the VCAC (Virtual Connections & Admissions Control) function of LBLs
- manual or automatic assignment of a GWC to carry out the RU capacity counting function on behalf of an LBL
- ‘chaining’ of middleboxes (NATs/LBLs) in a hierarchical network topology.
- downloading of MP/NAT/LBL/RU information to GWCs as necessary.

## VCAC Background

LBLs are a virtual representation of ‘policed’ capacity-restricted links in the network. An LBL carries a number (“max count”) representing maximum capacity through the link. Call set-up through the link causes a running total of used capacity to be incremented, and call take-down causes the running total to be decremented. If call set-up will cause the running total to exceed the LBL’s maximum capacity figure, the call attempt is rejected and routed to treatment (congestion tone).

The specific amount used to increment/decrement the running total is supplied by the Resource Usage entry used by the LBL. Each Resource Usage entry has a set of ‘capacity-used-per-call’ values, depending on the codec and packetization rate in use on the call.

The running total is maintained by a counting device - in the SN07 release this device is a GWC. The counting device for a particular LBL is identified by entering the counter’s address into the LBL’s IP address field. There are two methods for allocating the LBL’s counting device:

- “auto-generated” - the LBL’s address field is left empty, and is filled automatically when the LBL is first downloaded to a GWC.
- manually - the IP address of a specific counting device is entered in the LBL’s address field during provisioning.

## Hardware Requirements or Dependencies

### System Configuration

**Note:** The components outlined in blue will be affected by this provisioning activity.

Requirements for the whole Pre-midcom solution:

- CS2K.
- SESM Platform (Succession Element and Sub-Element Manager).
- IMS manager to handle provisioning of the Media Proxy.
- Uncontrolled NATs.
- Media Proxies.
- MGs.

## Software Requirements or Dependencies

Dependencies:

- GWC should be running a software load of an equivalent stream to that of the SESM/GWC-EM, and should be running under a profile that enables ITrans functionality.

## Limitations and restrictions

- There is only one NAT exit point from a local network.
- A Media Gateway has one or no adjacent middlebox. A NAT/LBL has one or no parent middlebox.
- The maximum length of sequentially ‘chained’ middleboxes (e.g. A --> B --> C, etc.) is five.
- If two gateways are behind the same NAT then they can set up a call without requiring a Media Proxy.
- If two gateways are behind the same LBL, a call between them is not considered to use capacity on that LBL.
- The DQoS IAC solution (ACTID 59039082/59006771) uses “PepServer” middleboxes. The ITrans IAW solution uses NAT/LBL middleboxes. These two solutions are mutually exclusive as defined in the gateway profile service type (i.e. DQOS and ITRANS cannot be defined together in a profile).
- Where an LBL is ‘shared’ between two or more Succession Call Server networks (see ACTID.A00002644 “Common Topology Identifier Provisioning”), the LBL must be provisioned with exactly the same details on each network.

## Interactions

The provisioning of LBL/RU data brings changes to the following GUIs:

- GWC-EM Network Panel ([“Unmodified \(SN06\) view of GWC-EM Network Panel” on page 142](#), [“Modified Network Panel \(1\)” on page 143](#), [“Modified Network Panel \(2\)” on page 144](#))
- Associate Media Gateway window ([“Associate/Change Middlebox to a Media Gateway” on page 150](#)).

The following features will also make changes in the Network Panel GUI:

- ACTID.A00002644 “Common Topology Identifier Provisioning” available elsewhere in this document.

This feature provisions data for use by the SN07 GWC CallP feature ACTID A00002739 “Virtual Connections Admissions Control”.

### User Interface - GUI

The upper section of the GWC-EM Network Panel GUI is reorganized to put the existing three subsections into tabbed panes. VCAC Resource Usage data is provisioned via the new RU table in a fourth tab in the upper section.

NATs are provisioned as before, except that:

- the tab is renamed “IP-VPNs (Virtual NATs)”
- a new field is added to provision a “Parent” (northbound neighbor) middlebox in the topology.

LBLs are provisioned via a table in a new tab added to the central section of the Network Panel.

The following figure along with [“Modified Network Panel \(1\)” on page 143](#) and [“Modified Network Panel \(2\)” on page 144](#) show the Network Panel:

- before reorganization (SN06 version)
- after reorganization, NAT table visible
- after reorganization, new LBL table visible

The new RU data table can be seen in the upper part of the reorganized view.

**Provisioning Resource Usage data: Add, Change, Delete**

These operations are accessed by clicking the appropriate buttons on the tabbed pane of the VCAC Resource Usage table.

**Add Resource Usage data:** click the “Add” button in the Resource Usage tab to obtain the following box.

Add Resource Usage Data

RU Description:

RU Value (G.711/10 ms):

RU Value (G.711/20 ms):

RU Value (G.729/10 ms):

RU Value (G.729/20 ms):

OK Cancel

Enter a valid text description, and non-negative integer entries for each “RU Value” (zero is provided as a default). Click “OK” to confirm.

**Change Resource Usage data:** select an RU table entry and click the “Change” button to obtain the following box:

A dialog box titled "Change Resource Usage Data" with a close button (X) in the top right corner. It contains five input fields and two buttons at the bottom. The fields are labeled as follows:

| Field Label             | Value         |
|-------------------------|---------------|
| RU Description:         | voip-ethernet |
| RU Value (G.711/10 ms): | 130           |
| RU Value (G.711/20 ms): | 97            |
| RU Value (G.729/10 ms): | 74            |
| RU Value (G.729/20 ms): | 41            |

At the bottom right, there are two buttons: "OK" and "Cancel".

Modify the required data fields and click “OK” to confirm.

**Delete Resource Usage data:** select an RU table entry and click the “Delete” button to obtain the following confirmation box:

A confirmation dialog box titled "Confirm VCAC RU Delete" with a close button (X) in the top right corner. It contains a question mark icon, a text prompt, and two buttons at the bottom.

Do you want to delete the Resource Usage factor "voip-frameRelay"?

At the bottom, there are two buttons: "Yes" and "No".

Click “Yes” to confirm. Note that the operation will be rejected if the RU Factor is currently ‘in use’, i.e. is currently referred to by an LBL.

### Provisioning NAT middleboxes: Add, Change, Delete

These operations are accessed by clicking the appropriate buttons on the tabbed pane of the IP/VPN table (Figure “Modified Network Panel (1)” on page 143).

**Add NAT middlebox:** click the “Add” button on the “IP-VPNs (Virtual NATs)” tab to obtain the following box:

The dialog box titled "Add IP-VPN (NAT MiddleBox)" contains the following fields and controls:

- Name:** An empty text input field.
- NAT Type:** A dropdown menu with "Non-Controlled" selected.
- Parent MiddleBox Selection (create hierarchy):** A group box containing:
  - Three radio buttons: ☒ ALL, ☐ IP-VPNs, and ☐ LBLs.
  - A dropdown menu for "Parent MiddleBox" with "<none>" selected.
- Buttons:** "OK" and "Cancel" buttons at the bottom right.

Enter a unique (DNS compliant, see ref 1) name. If appropriate use the filtered selection box to select a Parent Middlebox. Filtering is performed by one or both of:

- radio button selection to limit the choice to only NATs or only LBLs
- typing the starting letters of the Parent middlebox name to limit selection to those with matching starting letters.

An example of filtered selection is shown below:

The dialog box titled "Add IP-VPN (NAT MiddleBox)" is shown with the following values and state:

- Name:** "newNAT.myCorp.com"
- NAT Type:** "Non-Controlled"
- Parent MiddleBox Selection (create hierarchy):**
  - Radio buttons: ☐ ALL, ☐ IP-VPNs, ☒ LBLs.
  - The "Parent MiddleBox" dropdown menu is open, showing a filtered list of options: "<none>" and "dublinPOP.uk.acmeISP.com". The text "du" is visible in the input field of the dropdown, indicating the filter applied.
- Buttons:** "OK" and "Cancel" buttons are partially visible at the bottom.

Selection of Parent middlebox is restricted to already provisioned middleboxes. Both NAT and LBL middleboxes can have either a NAT or an LBL as parent. Click “OK” to confirm.

**Change NAT middlebox:** select a NAT table entry and click the “Change” button to obtain the following box:

Modify the selected Parent middlebox as required (i.e. select another middlebox or <none>), and click “OK” to confirm.

**Delete NAT middlebox:** select a NAT table entry and click the “Delete” button to obtain the following confirmation box:

Click “Yes” to confirm. Note that the operation will be rejected if the NAT is currently ‘in use’, i.e. is currently referred to:

- as a parent by another middlebox
- as an adjacent middlebox by a Media Gateway.

**Provisioning LBL middleboxes: Add, Change, Delete**

These operations are accessed by clicking the appropriate buttons on the tabbed pane of the Low B/W Links table (Figure “Modified Network Panel (2)” on page 144).

**Add LBL middlebox:** click the “Add” button on the “Low B/W Links (VCAC)” tab to obtain the following box:

**Add Limited B/W Link [VCAC MiddleBox]**

Name:

Default Counter GWC: ☒

Counter GWC:

Resource Usage:

Max Count Value:

Parent MiddleBox Selection (create hierarchy)

☒ ALL ☐ IP-VPNs ☐ LBLs

Parent MiddleBox:

OK Cancel

Enter the following information:

- valid text name (DNS compliant, see ref. 1)
- deselect the “Default Counter GWC” check-box and enter in the “Counter GWC” field the IP address of the GWC chosen as VCAC counter, or leave the check-box selected to leave the selection of counter as automatic.
- select RU Factor from the list provided
- enter a non-negative integer value for “Max Count Value”
- select Parent middlebox from the (filtered) list. Remember that an LBL can have either another LBL or a NAT as Parent middlebox.

Click “OK” to confirm.

**Change LBL middlebox:** select an LBL table entry and click the “Change” button to obtain the following box:

The dialog box titled "Change Limited B/W Link (VCAC MiddleBox)" contains the following fields and controls:

- Name:
- Default Counter GWC: ☒
- Counter GWC:
- Resource Usage:
- Max Count Value:
- Parent MiddleBox Selection (create hierarchy):
  - ☒ ALL ☐ IP-VPNs ☐ LBLs
  - Parent MiddleBox:
- Buttons: OK, Cancel

The name field is not modifiable, other fields may be edited as required. Parent middlebox may be changed to either another middlebox or <none>. Click “OK” to confirm. NB: the RU Factor and the Parent may not be changed in the same operation - they must be modified in separate change operations.

**Delete LBL middlebox:** select an LBL table entry and click the “Change” button to obtain the following confirmation box:

The dialog box titled "Confirm LBL Delete" contains the following elements:

- Question: Do you want to delete the LBL MiddleBox "upton1.eastEndFoods.co.uk"?
- Buttons: Yes, No

Click “Yes” to confirm. Note that the operation will be rejected if the LBL is currently ‘in use’, i.e. is currently referred to:

- as a parent by another middlebox
- as an adjacent middlebox by a Media Gateway.

### Associate/Change Middlebox to a Media Gateway

This is unchanged from SN06 functionality except that filtered selection is used to choose an Adjacent Middlebox, as shown below for the Associate operation:

**Associate Media Gateway**

Gateway name: aslwg4.1.upton1

Gateway IP address:

Gateway controller name: GWC-102

Gateway profile name: ASKEY\_LINE\_GW\_4

Reserved terminations: 4

Gateway site name: LG

Internet Transparency

☐ MG outside CB2K VPN, not behind NAT

IP/VPN Site Selection

☐ VPNs/NATs ☒ LBLs

MiddleBox: up

<none>

Signal Protocol: upton1.eastEndFoods.co.uk

Protocol type:

Protocol port:

Protocol version:

OK Cancel

**Note:** Attempting to remove an adjacent middlebox from a Media Gateway will be rejected if the middlebox or any member of it's 'northbound' topology chain is a NAT.

### XML Interfaces

Modified Interfaces in SN07

- Add/Query NATs - added parent middlebox attribute

New Interfaces introduced in SN07 are as follows:

- Change NATs
- Add/Delete and Change Media Proxies.
- Add/Delete/Query and Change Resource Usage profiles
- Add/Delete/Query and Change LBL entries.

### Add NAT XML command

Add NAT is modified SN07 the <parentMB> tag has been added. The value of this tag must have been previously provisioned into the system to successfully complete this command.

The XML for this command is shown in Figure “XML command to Add NAT device” and Figure “XML response to Add NAT”. Error messages returned are described in Appendix B.

### XML command to Add NAT device

```
<?xml version="1.0" encoding="UTF-8" ?>
<CommandList>
  <Command>
    <Interface>ITranslf</Interface>
    <Methods>
      <addNAT usn="1" version="1.0">
        <Parameters>
          <NATname>NAT-A</NATname>
          <ParentMB>VPN-Eastenders</ParentMB>
        </Parameters>
      </addNAT>
    </Methods>
  </Command>
</CommandList>
```

**XML response to Add NAT**

```
<?xml version='1.0'?>
<CommandList>
  <Response>
    <Interface>ITranslf</Interface>
    <Methods>
      <addNAT usn="1" version="1.0">
        <ReturnData>
          <ReturnCode value="0" text="Successful result" />
        </ReturnData>
      </addNAT>
    </Methods>
  </Response>
</CommandList>
```

**Query NAT XML command**

The Query NAT response is modified SN07 the <parentMB> tag has been added

The XML for this command is shown in Figure “XML command to Query a NAT”, Figure “XML response to Query NAT”. Error messages returned are described in Appendix B.

**XML command to Query a NAT**

```
<?xml version="1.0" encoding="UTF-8" ?>
<CommandList>
  <Command>
    <Interface>ITranslf</Interface>
    <Methods>
      <queryNAT usn="1" version="1.0">
        <Parameters>
          <NATName>NAT-A</NATName>
        </Parameters>
      </queryNAT>
    </Methods>
  </Command>
</CommandList>
```

**XML response to Query NAT**

```
<?xml version='1.0'?>
<CommandList>
  <Response>
    <Interface>ITranslf</Interface>
    <Methods>
      <queryNAT usn="1" version="1.0">
        <ReturnData>
          <NATname>NAT-A</NATname>
          <ParentMB>VPN-Eastenders</ParentMB>
          <ReturnCode value="0" text="Successful result" />
        </ReturnData>
      </queryNAT>
    </Methods>
  </Response>
</CommandList>
```

**Change NAT XML command**

Change NAT is new to SN07 because there was no data in the SN06 releases to change, in SN07 the only attribute that can change is the <ParentMB> tag. The value of this tag must have been previously provisioned into the system to successfully complete this command.

The XML for this command is shown in the following two figures. Error messages returned are described in Appendix B.

**XML command to Change specified NAT parent middlebox**

```
<?xml version="1.0" encoding="UTF-8" ?>
<CommandList>
  <Command>
    <Interface>ITranslf</Interface>
    <Methods>
      <changeNAT usn="1" version="1.0">
        <Parameters>
          <NATname>NAT-A</NATname>
          <ParentMB>VPN-Eastenders</ParentMB>
        </Parameters>
      </changeNAT>
    </Methods>
  </Command>
</CommandList>
```

**XML response to Change specified NAT**

```
<?xml version='1.0'?>
<CommandList>
  <Response>
    <Interface>ITranslf</Interface>
    <Methods>
      <changeNAT usn="1" version="1.0">
        <ReturnData>
          <ReturnCode value="0" text="Successful result" />
        </ReturnData>
      </changeNAT>
    </Methods>
  </Response>
</CommandList>
```

**Add Media Proxy XML command**

Media Proxy provisioning via XML is new to SN07.

The XML for this command is shown in Figure “XML command to Create a new Media Proxy” and Figure “XML response to Creating a new Media Proxy command”. Error messages returned are described in Appendix B.

**XML command to Create a new Media Proxy**

```
<?xml version="1.0" encoding="UTF-8" ?>
<CommandList>
  <Command>
    <Interface>ITranslf</Interface>
    <Methods>
      <addMP usn="1" version="1.0">
        <Parameters>
          <MPname>MP-A</MPname>
          <IPAddress>47.165.32.23</IPAddress>
          <Protocol>MGCP+</Protocol>
          <ProtocolVersion>1.1</ProtocolVersion>
        </Parameters>
      </addMP>
    </Methods>
  </Command>
```

**XML response to Creating a new Media Proxy command**

```
<?xml version='1.0'?>
<CommandList>
  <Response>
    <Interface>ITranslf</Interface>
    <Methods>
      <addMP usn="1" version="1.0">
        <ReturnData>
          <ReturnCode value="0" text="Successful result" />
        </ReturnData>
      </addMP>
    </Methods>
  </Response>
</CommandList>
```

**Change Media Proxy XML command**

Media Proxy provisioning via XML is new to SN07.

The XML for this command is shown in Figure “XML command to Change IP data of a Media Proxy” and Figure “XML response to Change Media Proxy IP data”. Error messages returned are described in Appendix B.

**XML command to Change IP data of a Media Proxy**

```
<?xml version="1.0" encoding="UTF-8" ?>
<CommandList>
  <Command>
    <Interface>ITranslf</Interface>
    <Methods>
      <changeMP usn="1" version="1.0">
        <Parameters>
          <MPname>MP-A</MPname>
          <IPAddress>47.165.32.22</IPAddress>
        </Parameters>
      </changeMP>
    </Methods>
  </Command>
</CommandList>
```

**XML response to Change Media Proxy IP data**

```
<?xml version='1.0'?>
<CommandList>
  <Response>
    <Interface>ITransIf</Interface>
    <Methods>
      <changeMP usn="1" version="1.0">
        <ReturnData>
          <ReturnCode value="0" text="Successful result" />
        </ReturnData>
      </changeMP>
    </Methods>
  </Response>
</CommandList>
```

**Delete Media Proxy XML command**

Media Proxy provisioning via XML is new to SN07.

The XML for this command is shown in Figure “XML command to Delete a Media Proxy” and Figure “XML response to Deleting Media Proxy”. Error messages returned are described in Appendix B.

**XML command to Delete a Media Proxy**

```
<?xml version="1.0" encoding="UTF-8" ?>
<CommandList>
  <Command>
    <Interface>ITransIf</Interface>
    <Methods>
      <deleteMP usn="1" version="1.0">
        <Parameters>
          <MPname>MP-A</MPname>
        </Parameters>
      </deleteMP>
    </Methods>
  </Command>
</CommandList>
```

**XML response to Deleting Media Proxy**

```
<?xml version='1.0'?>
<CommandList>
  <Response>
    <Interface>ITranslf</Interface>
    <Methods>
      <deleteMP usn="1" version="1.0">
        <ReturnData>
          <ReturnCode value="0" text="Successful result" />
        </ReturnData>
      </deleteMP>
    </Methods>
  </Response>
</CommandList>
```

**Creating RU profile command**

Resource Usage provisioning is new to SN07. To successfully create an RU profile the XML client must provide every Codec/packetRate combination that has been entered into the CS2K config manager.

The XML for this command is shown in Figure “XML command to Create an RU profile” and Figure “XML response to Creating an RU profile” on page 159. Error messages returned are described in Appendix B.

**XML command to Create an RU profile**

```
<?xml version="1.0" encoding="UTF-8" ?>
<CommandList>
  <Command>
    <Interface>ITranslf</Interface>
    <Methods>
      <addRU usn="1" version="1.0">
        <Parameters>
          <RUDescription>AAL1/IP40</RUDescription>
          <RUValue>
            <Codec>G.711</Codec>
            <PacketRate>10 ms</PacketRate>
            <Value>103</Value>
          </RUValue>
          <RUValue>
            <Codec>G.711</Codec>
            <PacketRate>20 ms</PacketRate>
            <Value>133</Value>
          </RUValue>
          <RUValue>
            <Codec>G.729</Codec>
            <PacketRate>10 ms</PacketRate>
            <Value>132</Value>
          </RUValue>
          <RUValue>
            <Codec>G.729</Codec>
            <PacketRate>20 ms</PacketRate>
            <Value>103</Value>
          </RUValue>
        </Parameters>
      </addRU>
    </Methods>
  </Command>
</CommandList>
```

**XML response to Creating an RU profile**

```
<?xml version='1.0'?>
<CommandList>
  <Response>
    <Interface>ITranslf</Interface>
    <Methods>
      <addRU usn="1" version="1.0">
        <ReturnData>
          <ReturnCode value="0" text="Successful result" />
        </ReturnData>
      </addRU>
    </Methods>
  </Response>
</CommandList>
```

**Changing RU profile command**

Resource Usage provisioning is new to SN07. To successfully change an RU profile the XML client must either provide a <RUNewDescription> OR every Codec/packetRate combination that has been entered into the CS2K config manager.

The XML for this command is shown in Figure “XML to Change an RU profile Description”, Figure “XML command Change RU profile data” on page 160 and Figure “XML response to Changing an RU profile” on page 160. Error messages returned are described in Appendix B.

**XML to Change an RU profile Description**

```
<?xml version='1.0'?>
<CommandList>
  <Response>
    <Interface>ITranslf</Interface>
    <Methods>
      <changeRU usn="1" version="1.0">
        <Parameters>
          <RUDescription>AAL1/IP40</RUDescription>
          <RUNewDescription>AAL1/IP71 </RUNewDescription>
        </Parameters>
      </changeRU>
    </Methods>
  </Response>
</CommandList>
```

**XML command Change RU profile data**

```
<?xml version="1.0" encoding="UTF-8" ?>
<CommandList>
  <Command>
    <Interface>ITranslf</Interface>
    <Methods>
      <changeRU usn="1" version="1.0">
        <Parameters>
          <RUDescription>AAL1/IP40</RUDescription>
          <RUValue>
            <Codec>G.711</Codec>
            <PacketRate>10 ms</PacketRate>
            <Value>123</Value>
          </RUValue>
          <RUValue>
            <Codec>G.711</Codec>
            <PacketRate>20 ms</PacketRate>
            <Value>133</Value>
          </RUValue>
          <RUValue>
            <Codec>G.729</Codec>
            <PacketRate>10 ms</PacketRate>
            <Value>152</Value>
          </RUValue>
          <RUValue>
            <Codec>G.729</Codec>
            <PacketRate>20 ms</PacketRate>
            <Value>163</Value>
          </RUValue>
        </Parameters>
      </changeRU>
    </Methods>
  </Command>
</CommandList>
```

**XML response to Changing an RU profile**

```
<?xml version='1.0'?>
<CommandList>
  <Response>
    <Interface>ITranslf</Interface>
    <Methods>
      <changeRU usn="1" version="1.0">
        <ReturnData>
          <ReturnCode value="0" text="Successful result" />
        </ReturnData>
      </changeRU>
    </Methods>
  </Response>
</CommandList>
```

## Query RU profile XML command

Resource Usage provisioning is new to SN07. The XML client has the option to either Query all the RU profiles, or the RU data for a particular profile.

The XML for this command is shown in Figure “XML command to Query all RU Profiles”, Figure “XML response to query all RU profiles”, Figure “XML command to Query an RU Profile data” on page 162 and Figure “XML response to Querying an RU profile” on page 162. Error messages returned are described in Appendix B.

### XML command to Query all RU Profiles

```
<?xml version="1.0" encoding="UTF-8" ?>
<CommandList>
  <Command>
    <Interface>ITranslf</Interface>
    <Methods>
      <queryRU usn="1" version="1.0">
        <Parameters>
        </Parameters>
      </queryRU>
    </Methods>
  </Command>
</CommandList>
```

### XML response to query all RU profiles

```
<?xml version='1.0'?>
<CommandList>
  <Response>
    <Interface>ITranslf</Interface>
    <Methods>
      <queryRU usn="1" version="1.0">
        <ReturnData>
          <RUDescription>AAL1/IP40</RUDescription>
          <RUDescription>AAL2/IP40</RUDescription>
          <RUDescription>AAL1/IP40-B</RUDescription>
          <RUDescription>AAL2/IP40-B</RUDescription>
          <ReturnCode value="0" text="Successful result" />
        </ReturnData>
      </queryRU>
    </Methods>
  </Response>
</CommandList>
```

**XML command to Query an RU Profile data**

```

<?xml version="1.0" encoding="UTF-8" ?>

  <Command>
    <Interface>ITranslf</Interface>
    <Methods>
      <queryRU usn="1" version="1.0">
        <Parameters>
          <RUDescription>AAL1/IP40</RUDescription>
        </Parameters>
      </queryRU>
    </Methods>
  </Command>
</CommandList>

```

**XML response to Querying an RU profile**

```

<?xml version='1.0'?>
<CommandList>
  <Response>
    <Interface>ITranslf</Interface>
    <Methods>
      <queryRU usn="1" version="1.0">
        <ReturnData>
          <RUDescription>AAL1/IP40</RUDescription>
          <RUValue>
            <Codec>G.711</Codec>
            <PacketRate>10 ms</PacketRate>
            <Value>123</Value>
          </RUValue>
          <RUValue>
            <Codec>G.711</Codec>
            <PacketRate>20 ms</PacketRate>
            <Value>133</Value>
          </RUValue>
          <RUValue>
            <Codec>G.729</Codec>
            <PacketRate>10 ms</PacketRate>
            <Value>152</Value>
          </RUValue>
          <RUValue>
            <Codec>G.729</Codec>
            <PacketRate>20 ms</PacketRate>
            <Value>163</Value>
          </RUValue>
        </ReturnData>
        <ReturnCode value="0" text="Successful result" />
      </queryRU>
    </Methods>
  </Response>
</CommandList>

```

## Delete RU profile XML command

Resource Usage provisioning is new to SN07.

The XML for this command is shown in Figure “XML command to Delete an RU Profile” on page 163 and Figure “XML response to Deleting an RU profile” on page 163. Error messages returned are described in Appendix B.

### XML command to Delete an RU Profile

```
<?xml version="1.0" encoding="UTF-8" ?>
<CommandList>
  <Command>
    <Interface>ITranslf</Interface>
    <Methods>
      <deleteRU usn="1" version="1.0">
        <Parameters>
          <RUDescription>AAL1/IP40</RUDescription>
        </Parameters>
      </deleteRU>
    </Methods>
  </Command>
</CommandList>
```

### XML response to Deleting an RU profile

```
<?xml version='1.0'?>
<CommandList>
  <Response>
    <Interface>ITranslf</Interface>
    <Methods>
      <deleteRU usn="1" version="1.0">
        <ReturnData>
          <ReturnCode value="0" text="Successful result" />
        </ReturnData>
      </deleteRU>
    </Methods>
  </Response>
</CommandList>
```

## Add LBL XML command

Limited Bandwidth Links provisioning is new to SN07. The <CounterGWC> tag is optional, if omitted the counterGWC is automatically assigned. The <RUDescription> and <ParentMB> values must have been previously provisioned into the system to successfully complete this operation.

The XML for this command is shown in Figure “XML command to Create an LBL device” on page 164 and Figure “XML response to Creating an LBL device” on page 164. Error messages returned are described in Appendix B.

**XML command to Create an LBL device**

```
<?xml version="1.0" encoding="UTF-8" ?>
<CommandList>
  <Command>
    <Interface>ITranslf</Interface>
    <Methods>
      <addLBL usn="1" version="1.0">
        <Parameters>
          <LBLname>LBL1</LBLname>
          <CounterGWC>47.132.132.12</CounterGWC>
          <RUDescription>AAL1/ip40</RUDescription>
          <MaxCount>1000</MaxCount>
          <ParentMB>VPN-A</ParentMB>
        </Parameters>
      </addLBL>
    </Methods>
  </Command>
</CommandList>
```

**XML response to Creating an LBL device**

```
<?xml version='1.0'?>
<CommandList>
  <Response>
    <Interface>ITranslf</Interface>
    <Methods>
      <addLBL usn="1" version="1.0">
        <ReturnData>
          <ReturnCode value="0" text="Successful result" />
        </ReturnData>
      </addLBL>
    </Methods>
  </Response>
</CommandList>
```

**Change LBL XML command**

Limited Bandwidth Links provisioning is new to SN07. The <LBLname> tag is required the other changing data tags are optional. The <RUDescription> and <ParentMB> values must have been previously provisioned into the system to successfully complete this operation.

The XML for this command is shown in Figure “XML command to Change an LBL device RU profile” on page 165 and Figure “XML response to Changing an LBL device” on page 165. Error messages returned are described in Appendix B.

**XML command to Change an LBL device RU profile**

```
<?xml version="1.0" encoding="UTF-8" ?>
<CommandList>
  <Command>
    <Interface>ITransIf</Interface>
    <Methods>
      <changeLBL usn="1" version="1.0">
        <Parameters>
          <LBLname>LBL1</LBLname>
          <RUDescription>AAL2/ip40</RUDescription>
        </Parameters>
      </changeLBL>
    </Methods>
  </Command>
</CommandList>
```

**XML response to Changing an LBL device**

```
<?xml version='1.0'?>
<CommandList>
  <Response>
    <Interface>ITransIf</Interface>
    <Methods>
      <changeLBL usn="1" version="1.0">
        <ReturnData>
          <ReturnCode value="0" text="Successful result" />
        </ReturnData>
      </changeLBL>
    </Methods>
  </Response>
</CommandList>
```

**Query LBL XML command**

The Query LBL is new to SN07

The XML for this command is shown in Figure “XML command to Query an LBL” on page 166 and Figure “XML response to Query LBL” on page 166. Error messages returned are described in Appendix B.

**XML command to Query an LBL**

```
<?xml version="1.0" encoding="UTF-8" ?>
<CommandList>
  <Command>
    <Interface>ITransIf</Interface>
    <Methods>
      <queryLBL usn="1" version="1.0">
        <Parameters>
          <LBLname>LBL-A</LBLname>
        </Parameters>
      </queryLBL>
    </Methods>
  </Command>
</CommandList>
```

**XML response to Query LBL**

```
<?xml version='1.0'?>
<CommandList>
  <Response>
    <Interface>ITransIf</Interface>
    <Methods>
      <queryLBL usn="1" version="1.0">
        <ReturnData>
          <LBLname>LBL1</LBLname>
          <CounterGWC>47.132.132.12</CounterGWC>
          <RUDescription>AAL1/ip40</RUDescription>
          <MaxCount>1000</MaxCount>
          <ParentMB>VPN-A</ParentMB>
          <ReturnCode value="0" text="Successful result" />
        </ReturnData>
      </queryLBL>
    </Methods>
  </Response>
</CommandList>
```

**Delete LBL XML command**

Limited Bandwidth Links provisioning is new to SN07.

The XML for this command is shown in Figure “XML command to Delete an LBL device” on page 167 and Figure “XML response to Deleting an LBL device” on page 167. Error messages returned are described in Appendix B.

**XML command to Delete an LBL device**

```
<?xml version="1.0" encoding="UTF-8" ?>
<CommandList>
  <Command>
    <Interface>ITranslf</Interface>
    <Methods>
      <deleteLBL usn="1" version="1.0">
        <Parameters>
          <LBLname>LBL1</LBLname>
        </Parameters>
      </deleteLBL>
    </Methods>
  </Command>
</CommandList>
```

**XML response to Deleting an LBL device**

```
<?xml version='1.0'?>
<CommandList>
  <Response>
    <Interface>ITranslf</Interface>
    <Methods>
      <deleteLBL usn="1" version="1.0">
        <ReturnData>
          <ReturnCode value="0" text="Successful result" />
        </ReturnData>
      </deleteLBL>
    </Methods>
  </Response>
</CommandList>
```

**Authorization for Commands**

The security for the GUI Client and OSSgate interface includes support for permission or 'Authorization' levels for commands. Each command is associated with one or more user groups. In order to execute a command, a user must belong to at least one of the associated user groups. The user groups associated with the new /modified commands associated with this feature are specified in the following table.

**Internet Transparency Commands Authorization**

| Command          | User Group |       |        |         |       |
|------------------|------------|-------|--------|---------|-------|
|                  | mgcadm     | mgcrw | mgcmte | mgcprov | mgcro |
| <b>addNat</b>    | X          | X     |        |         |       |
| <b>changeNAT</b> | X          | X     |        |         |       |
| <b>queryNAT</b>  | X          | X     | X      | X       | X     |
| <b>addMP</b>     | X          | X     |        |         |       |
| <b>changeMP</b>  | X          | X     |        |         |       |
| <b>deleteMP</b>  | X          | X     |        |         |       |
| <b>addRU</b>     | X          | X     |        |         |       |
| <b>changeRU</b>  | X          | X     |        |         |       |
| <b>queryRU</b>   | X          | X     | X      | X       | X     |
| <b>deleteRU</b>  | X          | X     |        |         |       |
| <b>addLBL</b>    | X          | X     |        |         |       |
| <b>changeLBL</b> | X          | X     |        |         |       |
| <b>queryLBL</b>  | X          | X     | X      | X       | X     |
| <b>deleteLBL</b> | X          | X     |        |         |       |

## Appendix A for A00002512: ITrans/VCAC Provisioning Steps

This section provides a high-level overview of the provisioning steps required to set up the ITrans VCAC functionality NEW installation SN07.

- 1 Network Analysis/Modelling: identify the key locations in the network for NAT and LBL **functions** (not physical devices). Model and provision the Resource Usage values required for the VCAC functionality (see the Engineering Information section of this document).
- 2 On the CS2K Config Manager provision model as defined by step 1. Starting with individual NAT/LBL middleboxes: these are provisioned in top-down hierarchical order, i.e. starting with those closest to the network core. Remember that a 'parent' middlebox must be already provisioned before a 'child' that refers to it can be provisioned.
- 3 On the CS2K Config Manager provision MGs: select the appropriate ITrans middlebox (NAT or LBL) from the topological model as the 'adjacent middlebox' for the MG.

Existing ITrans network models (SN06.x stream, NATs and MGs) may be adapted to the SN07 form by:

- 1 following steps 1 and 2 above for new middleboxes.
- 2 changing the parent middlebox fields of existing (NAT) middleboxes as required to insert them at the correct location in the topology.
- 3 changing the adjacent middlebox field of existing MGs as required to associate them to the appropriate middlebox (NAT or LBL) in the topology.

## Appendix D: XML Commands: description of method parameters

### Parameter definitions (new in SN07)

- **ParentMB** - The name of the parent Middlebox for this device. This allows ITrans devices to be connected into a hierarchy. A value of <none> indicates that this device has no parent. TYPE *NoSpaceNameType*. (32 character token without spaces, see xsd definitions in Appendix A).
- **MPname** - The unique name of the Media Proxy. This must be in a valid DNS format. TYPE *NoSpaceNameType*.
- **IPAddress** - The Media Proxy IP address. TYPE *IPAddressType*.
- **Protocol** - The Media Proxy communication protocol (GWC to MP). This must be either MGCP+ or MPCP. TYPE *NoSpaceNameType*.
- **ProtocolVersion** - The Media Proxy communication protocol version. This must be 1.0 or 2.0?????? TO DO. TYPE *NoSpaceNameType*.
- **RUDescription** - The Resource Usage profile name. TYPE *NoSpaceNameType*.
- **RUValue** - a composite of the following parameters. Codec, PacketRate, Value TYPE *CodecPacketValue*
- **Codec** - A valid codec that has been entered in the CS2K config manager. E.G. G.711 or G.729. TYPE *CodecType*
- **PacketRate** - A valid Packetisation rate. E.G. 10 ms, 20 ms. TYPE *PacketType*
- **Value** - A resource usage value that one call will use. This is the basic call count value that VCAC uses to measure calls through a Limited Bandwidth Link. TYPE *NoSpaceNumberType*
- **RUNewDescription** - The new name of an RU profile. TYPE *NoSpaceNameType*
- **LBLName** - The unique name of the Limited Bandwidth Link device. This must be in a valid DNS format. TYPE *NoSpaceNameType*.
- **CounterGWC** - The VCAC counter GWC IP address. TYPE *IPAddressType*
- **MaxCount** - The VCAC count maximum limit. TYPE?

### Method Parameters

Method parameters are defined below. Input data is mandatory except where indicated otherwise.

1. **addNAT** - Method to create a new NAT (virtual NAT function). This method has the following parameters:

- Input data:
    - usn
    - version
    - NATname. The unique name of the NAT device
    - ParentMB (Optional). The name of the parent Middlebox for this device. This allows ITrans devices to be connected into a hierarchy. A value of <none> indicates that this device has no parent. (default = <none>)
  - Output data:
    - usn (value should be the same as the input)
    - version (value should be the same as the input)
    - CallAgentId - The value of the Call Agent Id for this Call Agent (CS2k).
    - ReturnCode - indicates via an integer value if the command has been successful or, if not, the error type and includes a brief textual message with further information.
2. **queryNAT** - Method to list the NATs. Optional parameters allow the client to choose the data returned. This method has the following parameters:
- Input data:
    - usn
    - version
    - NATname (Optional, cannot be included as well as GWCname)- A Unique Name of a NAT device, to get full info on a device
    - GWCname (Optional, cannot be included as well as NATname) - To obtain a list of all NATs on a GWC (Use GWC-XX format)
    - ListNATid (Optional) - Set to true if the NAT ids are required.
  - Output data:
    - usn (value should be the same as the input)
    - version (value should be the same as the input)
    - GWCname (only when the GWCname option requested)
    - NATname
    - ParentMB (only when the full details are requested)
    - NATType (returned only when the full details are requested)
    - NATid (returned only when ListNATid is set to 'true' in the input data)
    - ReturnCode - indicates via an integer value if the command has been successful or, if not, the error type and includes a brief textual message with further information.

3. **changeNAT** - Method that changes a provisioned NAT information into the CS2k Mgr. This method has the following parameters:
  - Input data:
    - usn
    - version
    - NATname - unique name for the NAT to be changed
    - ParentMB - The new parent middlebox name. Enter <none> to remove the topology for this NAT device. Note: the parent Middlebox name entered must have been already provisioned into the CS2k Mgr.
  - Output data:
    - usn (value should be the same as the input)
    - version (value should be the same as the input)
    - ReturnCode
4. **addMP** - Method that creates a Media Proxy device into the CS2k Mgr. This method has the following parameters:
  - Input data:
    - usn
    - version
    - MPname - unique name for the MP to be provisioned
    - IPAddress - The IP address of the MP device
    - Protocol - Enter “MGCP+” for the control protocol of the device
    - ProtocolVersion - Enter “1.1” for the control protocol version.
  - Output data:
    - usn (value should be the same as the input)
    - version (value should be the same as the input)
    - ReturnCode
5. **changeMP** - Method that changes a provisioned MP information into the CS2k Mgr. This method has the following parameters:
  - Input data:
    - usn
    - version
    - MPname - unique name for the MP to be changed
    - IPAddress - The new IPAddress of the MP device.
  - Output data:

- usn (value should be the same as the input)
  - version (value should be the same as the input)
  - ReturnCode
6. **deleteMP** - Method that deletes provisioned MP information from the CS2k Mgr. This method has the following parameters:
- Input data:
  - usn
  - version
  - MPname - unique name for the MP to be deleted
  - Output data:
  - usn (value should be the same as the input)
  - version (value should be the same as the input)
  - ReturnCode
7. **addRU** - Method that creates resource usage information into the CS2k Mgr. This method has the following parameters:
- Input data:
  - usn
  - version
  - RUDescription - A unique String to label this RU profile
  - RUValue - an RU Value must be entered for every Codec/Packetrate combination that has been created in the CS2k Mgr. An RUValue consists of the following three parameters.
  - Codec - The Codec that this value refers to
  - PacketRate - The packetisation rate this value refers to
  - Value - The VCAC value for a call using this codec/packetrate.
  - Output data:
  - usn (value should be the same as the input)
  - version (value should be the same as the input)
  - ReturnCode
8. **changeRU** - Method that changes provisioned RU information into the CS2k Mgr. This method has the following parameters:
- Input data:
  - usn
  - version

- RUDescription - The RU profile to change
- RUNewDescription (Optional - not allowed with RUValue)- The New name of the RU profile
- RUValue (Optional - not allowed with RUNewDescription) - The full list of RU values for this RU profile, this will overwrite the existing values.
- Codec (Optional - not allowed with RUNewDescription) - The Codec that this value refers to
- PacketRate (Optional - not allowed with RUNewDescription) - The packetisation rate this value refers to
- Value (Optional - not allowed with RUNewDescription) - The VCAC value for a call using this codec/packetrates.
- Output data:
- usn (value should be the same as the input)
- version (value should be the same as the input)
- ReturnCode

**9. queryRU** - Method that queries provisioned RU information from the CS2k Mgr. This method has the following parameters:

- Input data:
- usn
- version
- RUDescription (Optional if omitted all RU profiles are returned)- The RU profile to query
- Output data:
- usn (value should be the same as the input)
- version (value should be the same as the input)
- RUDescription - If RUDescription omitted from query then a list of multiple description fields are returned.
- RUValue returned if a RUDescription query was requested. A value for every Codec/Packetrates combination is returned, this comprises of the following three parameters.
- Codec returned if a RUDescription query was requested.
- PacketRate returned if a RUDescription query was requested.
- Value returned if a RUDescription query was requested.
- ReturnCode

**10. deleteRU** - Method that deletes provisioned RU information from the CS2k Mgr. This method has the following parameters:

- Input data:
    - usn
    - version
    - RUDescription - The RU profile to be deleted
  - Output data:
    - usn (value should be the same as the input)
    - version (value should be the same as the input)
    - ReturnCode
- 11. addLBL** - Method that creates Limited Bandwidth Link information into the CS2k Mgr. This method has the following parameters:
- Input data:
    - usn
    - version
    - LBLname - A unique name for the LBL device
    - CounterGWC (optional) a Counter GWC IP address, if omitted the Counter IPaddress is automatically allocated.
    - RUDescription - The RU profile that this LBL device is using, the RU profile must exist already in the CS2k Mgr.
    - MaxCount - The maximum value that this LBL can handle with respect to the number of calls using the Codec/Packetrate as defined in the RU profile.
    - ParentMB - The parent middlebox name, a link into a middlebox hierarchy. The parent middlebox device must already be in the CS2k Mgr.
  - Output data:
    - usn (value should be the same as the input)
    - version (value should be the same as the input)
    - ReturnCode
- 12. changeLBL**- Method that changes provisioned LBL information in the CS2k Mgr. This method has the following parameters:
- Input data:
    - usn
    - version
    - LBLname - The name for the LBL device to change.
    - CounterGWC (optional) a new Counter GWC IP address.

- RUDescription (optional) - The new RU profile, the RU profile must exist already in the CS2k Mgr.
  - MaxCount (Optional)- The new maximum value.
  - ParentMB (Optional)- The new parent middlebox name. The parent middlebox device must already be in the CS2k Mgr.
    - Output data:
  - usn (value should be the same as the input)
  - version (value should be the same as the input)
  - ReturnCode
- 13. queryLBL** - Method that queries provisioned LBL information from the CS2k Mgr. This method has the following parameters:
- Input data:
  - usn
  - version
  - LBLname (Optional, cannot be included as well as GWCname)- A Unique Name of a LBL device, to get full info on a device
  - GWCname (Optional, cannot be included as well as LBLname) - To obtain a list of all LBLs on a GWC (Use GWC-XX format)
    - Output data:
  - usn (value should be the same as the input)
  - version (value should be the same as the input)
  - LBLname - if GWCname option used above, then a list of LBLnames returned without the full info on each device
  - CounterGWC returned if LBLname option used.
  - RUDescription returned if LBLname option used.
  - MaxCount returned if LBLname option used.
  - ParentMB returned if LBLname option used.
  - ReturnCode
- 14. deleteLBL** - Method that deletes provisioned LBL information from the CS2k Mgr. This method has the following parameters:
- Input data:
  - usn
  - version
  - LBLname - The LBL device to be deleted

- Output data:
  - usn (value should be the same as the input)
  - version (value should be the same as the input)
  - ReturnCode

# ISN07 Feature Deltas

***Product = CS2000***

**A00002558 -- LDI display for Class phone (Succession on DMS)**

## ***Functional Description***

### **Overview**

The Long Distance Indicator (LDI) feature identifies long distance calls and provides the LDI indicator information to the subscriber. The feature works with CND, CNAMD, DDN features that use the Multiple Data Message (MDM) format.

### **Functional Behavior Diagram**

The preceding figure shows an example of an ISN07 office which is a terminating exchange. When a long distance call reaches the subscriber set,

LDI evaluates the call. A call is deemed long distance when any of the following condition is satisfied:

- Reverse translation - The dialable DN's first digit is 1 and it has a total of 8 or 11 digits; or
- Table TOLLTRKS - The incoming trunk group CLLI present in table TOLLTRKS.

If a call is deemed long distance, the system delivers the LDI to the line through MGCP. The LDI is delivered as the character L. Following is the message which captured by tool CALLTRAK.

```

OUTGOING 02:07:15.859 NODE TYPE= LCM_NODE
DS512: ENCAP MS_CARD= 6 MS_PORT= 20 NODE= 8216
NN= 0041 TN= 0004 MSGTAG= 00 ROUTE= 2018 ERROR= 00 LENGTH= 30

        31 31 31 31 31 31 31 31 31 06 01 4C

```

The LDI is displayed as the example below:

“12345656L Name “ or

“12345656  
L Name“

## Datafill

### Reverse translation

The following is an example of how to make a call be deemed as a long distance call through reverse translation:

#### Table DNREGION

TEST 0 9

#### Table DNREVLXA

TEST1 0 9 (TEST 0 N N) \$

#### Table CUSTNTWK

GDNTCUST PUBLIC 1 (PUBLIC TEST1 11) \$ (CLID  
OFFNET) (RNID OFFNET) \$

### Table TOLLTRKS

If the trunk is datafilled in table TOLLTRKS, the call is deemed as a long distance call too. The following shows an example on how to datafill TOLLTRKS. For more information of this table, please refer to the CN section of this document.

#### Table TRKGRP

HKISUP IBNT2 0 NPDGP NCRT GDNTCUS2 0 MIDL 0 N  
ANSDISC 0 Y N N N N N Y 0 0 N 0 0 0 0 N N N N N N  
N N INTL \$

#### Table TOLLTRKS

### **Hardware and Software Requirements**

None

### **Initial Configuration**

None

### **Office/Subnet parameters (OP/SP) (CM & SESM)**

None

### **Upgrade Impact**

None

### **Data schema (DS) (CM, MIBS, RDB)**

#### **New/modified tables, MIBs, or Database Schema**

##### **New or modified tables**

| <b>Table/MIB name</b> | <b>NEW/CHANGED/ or DELETED/</b> | <b>Table Control (NEW/ OLD/UNCHANGED)</b> |
|-----------------------|---------------------------------|-------------------------------------------|
| TOLLTRKS              | NEW                             | NEW                                       |

#### **Table/MIB/Remote Database Schema information**

**Name:** TOLLTRKS

##### **Functional description**

Table TOLLTRKS stores the common language location identifiers (CLLI) of all trunk groups carrying incoming toll completing traffic, and LDI evaluates the CLLI name to determine the long distance status.

##### **Usage sequence and implications (CM Only)**

Tables must be datafilled in the following sequence:

TRKGRP

TOLLTRKS

**Size**

| Abbreviated table name | Minimum tuples | Maximum tuples | Information on memory              |
|------------------------|----------------|----------------|------------------------------------|
| TOLLTRKS               | 0              | 8192           | Memory is automatically allocated. |

**Fields/OIDs**

The following table lists fields/OIDs for TOLLTRKS.

**Table field descriptions**

| Field | New or Changed | Subfield or refinement | Entry                             | Explanation and action                                                                                                                                                          |
|-------|----------------|------------------------|-----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CLLI  | New            | N/A                    | alphanumeric (1 to 16 characters) | Common language location identifier. This field specifies the trunk over which long distance calls can come into an office. Enter a CLLI from table TRKGRP (1 to 16 characters) |

**Datafill example**

The following example shows sample datafill for table TOLLTRKS:

|          |
|----------|
| CLLI     |
| ANSIISUP |
| ETSIISUP |
| HKISUP   |
| CTUP     |

***Product = CS2000*****A00002639 -- CEPT PSTN: Analogue Call Waiting Indication (Intl UA-IP)*****Functional Description***

This activity provides the following functionality in addition to the existing CEPT Analogue Call Waiting Indication functionality implemented by the activity A59019288, CEPT Call Waiting:

- “Caller Call Waiting” announcement: The waiting party gets an announcement played that the call is waited. Then normal ringing tone is played. The announcement is optional and controlled by datafill.

- “Called Party Ignores Waiting Call” announcement: After 30sec period (hardcoded), the waiting party hears an announcement followed by a datafillable treatment (please refer to the bullet “Call Waiting Timeout Treatment” below). The announcement is optional and controlled by datafill.
- “Call Waiting Timeout Treatment”. After 30 secs timer expiry (and after the Called Party Ignores Waiting Call announcement, if being applied), a treatment (busy, answer, no\_service\_circuit timeout etc.) is applied to the Call Waiting Line. The treatment is defined by datafill.

### **Caller Call Waiting Announcement**

The Caller Call Waiting Announcement is applied to the Calling Party if:

- The Called Party has ICWT line option datafilled and activated as covered in section “Datafilling and activating ICWT (CEPT CWT) option” on page 192,  
or
- the Customer Group of the Called Party has ICWT option datafilled in table CUSTSTN and activated by the Called Party as covered in section “Datafilling and activating Customer Group Based ICWT option” on page 193,
- The ICWT announcement datafill covered in section “Datafilling ICWT Announcements” on page 194 is done, and
- The boolean ICWT\_ANN\_ACTIVE of option ICWT is activated (i.e. is set to ‘Y’) as described in section “Activation of boolean ICWT\_ANN\_ACTIVE” on page 195.

The announcement is followed by the standard ring back tone.

If the boolean ICWT\_ANN\_ACTIVE of option ICWT is set to ‘N’ and if the Called Party has ICWT option datafilled, the standard ring back tone is applied to the Calling Party.

**Caller Call Waiting Indication****“Called Party Ignores the Waiting Call” Announcement**

If the Called Party ignores the Waiting Call, the “Called Party Ignores the Waiting Call” announcement is applied to the Calling Party to indicate that the Called Party ignored the call if:

- The Called Party has ICWT line option datafilled and activated as covered in section “Datafilling and activating ICWT (CEPT CWT) option” on page 192,  
or  
the Customer Group of the Called Party has ICWT option datafilled in table CUSTSTN and activated by the Called Party as covered in section “Datafilling and activating Customer Group Based ICWT option” on page 193,
- The ICWT announcement datafill covered in section “Datafilling ICWT Announcements” on page 194 is done, and
- The boolean ICWT\_TMO\_ANN\_ACTIVE of option ICWT is activated (i.e. is set to ‘Y’) as described in section “Activation of boolean ICWT\_TMO\_ANN\_ACTIVE” on page 197.

The announcement is followed by the treatment datafilled in ICWT\_TMO\_ANN\_ACTIVE sub-field of ICWT tuple.

If the boolean ICWT\_TMO\_ANN\_ACTIVE is set to 'N' and if the Called Party ignores the Waiting (Calling) Call, the treatment datafilled in ICWT\_TMO\_ANN\_ACTIVE sub-field of ICWT tuple is applied to the calling party. For datafilling the ICWT timeout treatment, please refer to [“Datafilling of ICWT\\_TIMEOUT\\_TREATMENT” on page 199](#).

#### Called Party Ignores Waiting Call

#### Datafilling and activating ICWT (CEPT CWT) option

The following figure shows the steps for adding and activating the ICWT line option to the Called Party:

**Steps for adding and activating ICWT line option to the Called Party**

```
>servord
SO:
>ado $ 8888587771001
OPTION:
>CEPT
OPTION:
>ICWT
ICWT_ACTIVE:
>y
OPTION:
>$
COMMAND AS ENTERED:
ADO NOW 3 6 7 PM 8888587771001 ( CEPT ) ( ICWT Y ) $
ENTER Y TO CONFIRM,N TO REJECT OR E TO EDIT
>y
```

**Datafilling and activating Customer Group Based ICWT option**

The following figure shows the steps for adding and activating the Customer Group Based ICWT option to the Customer Group of Called Party:

**Steps for adding and activating Customer Group Based ICWT option**

```
>table custstn
>pos ruaccept cept
>cha
OPTION: CEPT
>
DEFAULT_FEATURE_ON: N
>y
DEFFTR:
>icwt
DEFFTR:
>$
TUPLE TO BE CHANGED:

ENTER Y TO CONFIRM, N TO REJECT OR E TO EDIT.
>y
```

For activating the ICWT option by the user, please refer to the FN section of activity A59019288, CEPT Call Waiting (sub-section, Feature Activation, Deactivation, Interrogation).

### Datafilling ICWT Announcements

The “Call Waiting” and “Called User Ignores Waiting Call” announcements are datafilled using the existing CS2K announcement capabilities. Please note that the CLLIs used for “Call Waiting” and “Called User Ignores Waiting Call” announcements are **hardcoded** to **ICWTANN** and **ICWTTMOANN**, respectively.

The following figure shows the steps for datafilling the ICWT announcements:

#### Example for datafilling ICWT Announcements

```
table cli
ove; ver off;
add ICWTANN 70 10 ICWT_ANNOUNCEMENT y y
add ICWTTMOANN 71 10 ICWT_ANNOUNCEMENT y y
quit

table anns
ove; ver off;
add ICWTANN NETWK 5 10 1 STND N 5
add ICWTTMOANN NETWK 5 10 1 STND N 5
quit

table annmems
ove; ver off;
add ICWTANN 0 UAS AUD 0 AUD 0
add ICWTTMOANN 0 UAS AUD 0 AUD 0
quit

table annphlst
ove; ver off;
add ICWTANN 0 AUD_546 $
add ICWTTMOANN 0 AUD_547 $
quit
```

The following figure shows the steps for bringing the ICWT announcement trunks inservice:

**Steps for bringing the ICWT announcement trunks Inservice**

```
mapci;mtc;trks;ttp  
  
post g ICWTANN  
bsy; rts  
  
post g ICWTTMOANN  
bsy; rts  
  
quit all
```

**ICWT Tuple in Table ISERVOPT**

In table ISERVOPT, a new option, ICWT, is introduced to indicate whether the Call Waiting Announcements to be applied to the Waiting (Calling) party.

Option ICWT has three sub fields, ICWT\_ANN\_ACTIVE, ICWT\_TMO\_ANN\_ACTIVE and ICWT\_TIMEOUT\_TREATMENT which activate/deactivate “Caller Call Waiting” announcement, “Called Party Ignores Waiting Call” announcement and datafills “Timeout Treatment Value”, respectively.

The Call Waiting Announcements can be activated/deactivated independent from each other.

**Activation of boolean ICWT\_ANN\_ACTIVE**

The standard audible ringback is the default tone for ICWT feature provided to the Calling Party. The new boolean ICWT\_ANN\_ACTIVE of option ICWT needs to be activated (i.e. set to ‘Y’) in table ISERVOPT to allow Caller Call Waiting announcement to the Calling party.

The following figure shows an example of how to add and activate the boolean ICWT\_ANN\_ACTIVE.

**Example for adding and activating ICWT\_ANN\_ACTIVE boolean**

```
>table iservopt
>add icwt
>y
OPTION:
>icwt
ICWT_ANN_ACTIVE:
>y
ICWT_TMO_ANN_ACTIVE:
>y/n
ICWT_TIMEOUT_TREATMENT:
> BUSY (one of the EXTENDED_TREATMENT)
TUPLE TO BE ADDED:
ICWT ICWT Y Y/N BUSY

ENTER Y TO CONFIRM, N TO REJECT OR E TO EDIT.
>y
```

The following figure shows an example of how to activate the boolean ICWT\_ANN\_ACTIVE if it is already deactivated.

**Example for activating ICWT\_ANN\_ACTIVE boolean**

```
>table iservopt
>format pack
>pos icwt
      ICWT ICWT N Y/N BUSY
>cha
>y
OPTION: ICWT
>
ICWT_ANN_ACTIVE:
>y
ICWT_TMO_ANN_ACTIVE:
>y/n
ICWT_TIMEOUT_TREATMENT:
> BUSY_LINE (one of the EXTENDED_TREATMENT)
TUPLE TO BE CHANGED:
      ICWT ICWT Y Y/N BUSY
ENTER Y TO CONFIRM, N TO REJECT OR E TO EDIT.
>y
TUPLE CHANGED
```

**Activation of boolean ICWT\_TMO\_ANN\_ACTIVE**

The standard busy tone is the default tone for ICWT feature provided to the Calling Party if the Called Party ignores the Waiting Party. The new boolean ICWT\_TMO\_ANN\_ACTIVE of option ICWT needs to be activated (i.e. set to 'Y') in table ISERVOPT to allow announcement to the Calling party indicating that the Called Party ignores the Waiting Party.

The following figure shows an example of how to add and activate the boolean ICWT\_TMO\_ANN\_ACTIVE.

**Example for adding and activating ICWT\_TMO\_ANN\_ACTIVE boolean**

```
>table iservopt
>add icwt
>y
OPTION:
>icwt
ICWT_ANN_ACTIVE:
>y/n
ICWT_TMO_ANN_ACTIVE:

>y
```

The following figure shows an example of how to activate the boolean ICWT\_TMO\_ANN\_ACTIVE if it is already deactivated.

**Example for activating ICWT\_TMO\_ANN\_ACTIVE boolean**

```
>table iservopt
>format pack
>pos icwt
      ICWT ICWT  Y/N N BUSY
>cha
>y
OPTION: ICWT
>
ICWT_ANN_ACTIVE:
>y/n
>ICWT_TMO_ANN_ACTIVE:
>y
ICWT_TIMEOUT_TREATMENT:
> BUSY (one of the EXTENDED_TREATMENT)

TUPLE TO BE CHANGED:
      ICWT  ICWT  Y/N  Y BUSY
ENTER Y TO CONFIRM, N TO REJECT OR E TO EDIT.
>y
TUPLE CHANGED
```

**Datafilling of ICWT\_TIMEOUT\_TREATMENT**

The third sub field of ICWT tuple in ISERVOPT is ICWT\_TIMEOUT\_TREATMENT which is used to select timeout treatment value. The type of the treatment is EXTENDED\_TREATMENT (please refer to following table).

UNDT (Undefined\_Treatment) is not supported as an ICWT Timeout Treatment and datafilling is prevented by the table control.

If the ICWT tuple is removed from the ISERVOPT table the default value of ICWT\_TIMEOUT\_TREATMENT is NOSC (no\_service\_circuit) treatment.

**Example for ICWT\_TIMEOUT\_TREATMENT datafill**

```

>table iservopt
>format pack
>pos icwt
      ICWT ICWT  Y/N N BUSY
>cha

## Deactivation of Caller Call Waiting Announcement

There are four ways of deactivation of applying Caller Call Waiting announcement to the Calling Party:

### By deactivating or deleting ICWT option

The following figure shows the steps for deleting the ICWT line option from the Called Party:

#### Steps for removing ICWT line option from the Called Party

```
>servord
SO:
>deo $ 8888587771001
OPTION:
>ICWT
OPTION:
>$
COMMAND AS ENTERED:
DEO NOW 3 6 13 PM 8888587771001 ( ICWT ) $
ENTER Y TO CONFIRM,N TO REJECT OR E TO EDIT
>y
JOURNAL FILE IS INACTIVE, SERVICE ORDERS NOT
ALLOWED
SHOULD ORDER BE DONE ANYWAY? (Y OR N)
>y
```

### By deactivating or deleting Customer Group Based ICWT option

For deactivation of the ICWT option, please refer to the FN section of activity A59019288, CEPT Call Waiting (sub-section, Feature Activation, Deactivation, Interrogation).

The following figure shows the steps for deleting the Customer Group Based ICWT option from the Customer Group of Called Party:

**Steps for removing ICWT line option from the Called Party**

```
>table sutstn
>pos ruaccept cept
RUACEPT CEPT CEPT Y (CFU) (ICWT) $
>cha
OPTION: CEPT

ENTER Y TO CONFIRM, N TO REJECT OR E TO EDIT.
>y
```

**By deleting the ICWT announcement datafill**

The Call Wait announcement is disabled if whole or one part of the announcement datafill for ICWTANN covered in section “Datafilling ICWT Announcements” on page 194, is deleted.

Then, only the standard ringing tone is applied to the Waiting Party.

**By changing the value of ICWT\_ANN\_ACTIVE to ‘N’**

The Caller Call Waiting announcement is disabled if the value of the boolean ICWT\_ANN\_ACTIVE of option ICWT is set to ‘N’ in table ISERVOPT.

The following figure shows an example of how to deactivate the boolean ICWT\_ANN\_ACTIVE.

**Example for deactivating boolean ICWT\_ANN\_ACTIVE**

```
>table iservopt
>format pack
>pos icwt
      ICWT  ICWT  Y  Y/N BUSY
>cha
>y
OPTION: ICWT
>
ICWT_ANN_ACTIVE:

ICWT_TIMEOUT_TREATMENT:
> BUSY (one of the EXTENDED_TREATMENT)

TUPLE TO BE CHANGED:
      ICWT  ICWT  Y/N  N BUSY
ENTER Y TO CONFIRM, N TO REJECT OR E TO EDIT.
>y
```

**By removing the option ICWT:**

The ICWT announcements are disabled if the option ICWT is deleted from table ISERVOPT. The following figure shows an example of how to delete the option ICWT.

**Deletion of Option ICWT**

```
>table iservopt
>pos icwt
      ICWT ICWT Y/N  Y BUSY
>del
>y
TUPLE TO BE DELETED:
      ICWT ICWT Y/N  Y BUSY
ENTER Y TO CONFIRM, N TO REJECT OR E TO EDIT.
>y
```

**Hardware Requirements or Dependencies**

Standard CS2K hardware.

## Software Requirements or Dependencies

Intl Succession Core and GWC loads.

## Limitations and restrictions

- The duration of ICWT Timeout is hardcoded to 30 seconds.
- The CLLIs of the ICWT announcement trunks are hardcoded to ICWTANN and ICWTTMOANN.
- If UNDT (undefined\_treatment) is tried to be datafilled for ICWT\_TIMEOUT\_TREATMENT sub field, it is prevented by the table control since it is not supported as ICWT Timeout Treatment.

## Interactions

- The interactions supported by the activity A59019288, CEPT Call Waiting, (FMDOC) also supported by this activity.
- When the Called User ignores the Waiting Call and if the Calling User has CCBS option, CCBS procedures take precedence over “Called Party Ignores the Waiting Call” announcement procedures.
- The limitations for ICWT interactions with IN also applies for this activity.

##### Table/MIB/Remote Database Schema information

###### Name: ISERVOPT

International Service Option

###### Functional description

A new tuple ICWT is introduced by this activity in table ISERVOPT. This tuple specifies whether CWT announcements to be applied to the Call Waiting Party. If the booleans ICWT\_ANN\_ACTIVE and ICWT\_TMO\_ANN\_ACTIVE are set to 'Y', the "Caller Call Waiting" and "Called Party Ignores Waiting Call" announcements are applied to the Call Waiting Party. ICWT\_TIMEOUT\_TREATMENT subfield controls after 30 secs timer expiry (and after the Called Party Ignores Waiting Call

announcement, if being applied), a treatment (busy, answer, no\_service\_circuit timeout etc.) is applied to the Call Waiting Line. The treatment is defined by datafill

For the functional details, please refer to the FN section of this activity.

### Usage sequence and implications (CM Only)

Not applicable.

### Size

Unchanged.

### Fields/OIDs

The following table lists fields/OIDs for ISERVOPT.

**Table field descriptions**

| Field    | New or Changed | Subfield or refinement | Entry                                | Explanation and action                                                                                                                            |
|----------|----------------|------------------------|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| SOPTSKEY | Changed        | -                      | ICWT                                 | New entry ICWT defined.                                                                                                                           |
| SOPTSVAR | Changed        | option                 | ICWT                                 | New entry ICWT defined.                                                                                                                           |
| SOPTSVAR | New            | icwt_ann_active        | {Y, N}                               | icwt_ann_active: Whether "Caller Call Waiting" announcement should be applied ore not.                                                            |
| SOPTSVAR | New            | icwt_tmo_ann_active    | {Y, N}                               | icwt_tmo_ann_active: Whether "Called Party Ignores Waiting Call" announcement should be applied ore not.                                          |
| SOPTSVAR | New            | icwt_timeout_treatment | one of the <i>extended_treatment</i> | icwt_timeout_treatment:After 30 secs timer expiry a treatment (busy, answer, no_service_circuit timeout etc.) is applied to the Call Waiting Line |

### Datafill example

The following examples shows sample datafill for table ISERVOPT.

- If CWT announcements to the Waiting Party should be turned ON:  
*ICWT ICWT Y Y UNDT*
- If CWT announcements to the Waiting Party should be turned OFF:  
*ICWT ICWT N N UNDT*
- To set a timeout treatment to BUSY ICWT\_TIMEOUT\_TREATMENT field should be changed:

*ICWT ICWT N N BUSY***Table release history update**

The following information was added:

Entry ICWT added to field SOPTSKEY and SOPTSVAR/OPTION.

New fields ICWT\_ANN\_ACTIVE, ICWT\_TMO\_ANN\_ACTIVE and ICWT\_TIMEOUT\_TREATMENT are added to entry ICWT in field SOPTSKEY and SOPTSVAR/OPTION.

**Supplementary information**

None.

**Translation verification other tools**

ISERVOPT does not use translation verification tools.

**Service Orders (SO) (CM & SESM)**

Not applicable.

**Software optionality control (SOC)**

Not applicable.

**Element Management**

Not applicable.

**Command interface changes**

Not applicable.

**Security**

Not applicable.

**Configuration Walkthrough**

In order to have CWT announcements to be applied to the Waiting Party, the following configuration is required:

- The Called Party has ICWT line option datafilled and activated,
- The CWT announcements datafilled and brought in service, and
- The ISERVOPT option ICWT is datafilled and its booleans ICWT\_ANN\_ACTIVE and ICWT\_TMO\_ANN\_ACTIVE are activated.
- In order to change timeout treatment, the initial value should be selected via ICWT\_TIMEOUT\_TREATMENT field in ICWT tuple.

## Datafilling ICWT Line Option

The following figure shows the steps for adding the ICWT line option to the Called Party:

### Steps for adding ICWT line option to the Called Party

```
>servord
SO:
>ado $ 8888587771001
OPTION:
>CEPT
OPTION:
>ICWT
ICWT_ACTIVE:
>y
OPTION:
>$
COMMAND AS ENTERED:
ADO NOW 3 6 7 PM 8888587771001 ( CEPT ) ( ICWT Y ) $
ENTER Y TO CONFIRM,N TO REJECT OR E TO EDIT
>y
```

## Datafilling CWT Announcements

The “Call Waiting” and “Called User Ignores Waiting Call” announcements are datafilled using the existing CS2K announcement capabilities. Note that the CLLIs used for “Call Waiting” and “Called User Ignores Waiting Call” announcements are **hardcoded** to **ICWTANN** and **ICWTTMOANN**, respectively.

The following figure shows the steps for datafilling the CWT announcements:

**Example for datafilling CWT Announcements**

```
table cli
ove; ver off;
add ICWTANN 70 10 ICWT_ANNOUNCEMENT y y
add ICWTTMOANN 71 10 ICWT_ANNOUNCEMENT y y
quit

table anns
ove; ver off;
add ICWTANN NETWK 5 10 1 STND N 5
add ICWTTMOANN NETWK 5 10 1 STND N 5
quit

table annmems
ove; ver off;
add ICWTANN 0 UAS AUD 0 AUD 0
add ICWTTMOANN 0 UAS AUD 0 AUD 0
quit

table annphlst
ove; ver off;
add ICWTANN 0 AUD_546 $
add ICWTTMOANN 0 AUD_547 $
quit
```

The following figure shows the steps for bringing the CWT announcement trunks inservice:

**Steps for bringing the CWT announcement trunks Inservice**

```
mapci;mtc;trks;ttp

post g ICWTANN
bsy; rts

post g ICWTTMOANN
bsy; rts

quit all
```

## Datafilling ISERVOPT Options

The following figure shows the steps for adding the ISERVOPT option ICWT and activating its booleans ICWT\_ANN\_ACTIVE and ICWT\_TMO\_ANN\_ACTIVE:

### Example for adding ICWT and activating its booleans

```
>table iservopt
>add icwt
>y
OPTION:
>icwt
ICWT_ANN_ACTIVE:
>y
ICWT_TMO_ANN_ACTIVE:
>y
ICWT_TIMEOUT_TREATMENT:
> BUSY (one of the EXTENDED_TREATMENT)
TUPLE TO BE ADDED:
ICWT ICWT Y Y BUSY

ENTER Y TO CONFIRM, N TO REJECT OR E TO EDIT.
>y
```

## ***Product = CS 2000***

### **A00002642 -- CEPT PSTN: Analogue Query and 3PTY (Intl UA-IP)**

#### ***Functional Description***

Activity A00002642 provides support for “Analogue Query and 3PTY” according to the Telefonica Specification ER.D4.062-6 “SUPPLEMENTARY TELEPHONE SERVICE CONSULT AND THREE PARTY CALL”

Additionally this activity covers a interworking issue between international call transfer and international warm line as documented in Telefonica Specification GT.ER.D4.462-16 “SUPPLEMENTARY TELEPHONE SERVICE CONSULTS AND CALLS TRANSFERENCE “.

As a last item this activity adds the option to turn off playing a hold tone to the held party via table ISERVOPT.

The supplementary services 3wc and call transfer covered in this activity had been implemented in MMP14 activity 59019281 “CEPT 3WC and ICT”

### **Warning Tone During 3WC Conferences**

This activity introduces a new field to the ICONF tuple in table ISERVOPT. If this field is set the CS2k conference circuit of the conference controller is supervised with the H.248 signal “cg/wt”. This field is initialized to “No” to retain existing behavior

The following tone definition is suggested:

- Frequency: 1400Hz
- Level: -25dB
- On: 400ms, Off: 18000ms, repeated endless

This field can only be set to “Yes” if an audio controller is datafilled in table SERVSINV. This warning tone is not played, if the conference uses a TDM conference circuit.

### **Warmline Interaction with Enquiry Mode**

This activity introduces a new field to the ICONF tuple in table ISERVOPT. If this field is set, the CS2k prevents WML during enquiry mode. This field is initialized to “No” to retain existing behavior.

### **Hold Tone during Enquiry Mode**

This activity introduces a new field to the ICONF tuple in table ISERVOPT. If this field is set, the CS2k does not play the hold tone to the held party.

### **Example**

Below an example of the ICONF tuple after this activity

**ICONF tuple in ISERVOPT**

```
>add iconf
ENTER Y TO CONTINUE PROCESSING OR N TO QUIT
>y
OPTION:
>iconf
ALLOW_ICT_IN_I3WC:
>y
CLF_FLASH_IGNORE:
>y
WARNING_TONE:
>Y
PREVENT_WML_DURING_ENQUIRY
>Y
PREVENT_HELD_TONE
>Y
TUPLE TO BE ADDED:
                                ICONF
                                ICONF Y Y Y Y Y

ENTER Y TO CONFIRM, N TO REJECT OR E TO EDIT.
>y
TUPLE ADDED
```

**Hardware Requirements or Dependencies**

The option to play the warning tone to the conference is only available to CS2k. All other functionality described in this document is applicable both to the DMS and the CS2k.

**Software Requirements or Dependencies**

None

**Limitations and restrictions**

- Warning Tone does not apply to other conference types than I3WC. I6WC or Meet Me conferences do not use the warning tone.
- I3WC does not support chaining of conferences on the same office.<sup>1</sup>

---

1. existing limitation, which is not changed by this activity

- In case I3WC conferences are chained via trunks, multiple warning tones might be encountered, if the other office also supports the warning tone.
- If PREVENT\_WML\_DURING\_ENQUIRY bool is set to “Y” it impacts the Bellcore versions of CT and 3WC in a manner, that WML is still possible on CT and 3WC. But it will use the initial digit time out instead of the WML time out.
- When the option PREVENT\_WML\_DURING\_ENQUIRY is set to Y, the first digit timeout is set to the value in LN\_PERM\_SIG\_TIME.
- When the enquiry/consult call leg triggers IN queries- InfoCollected TDP or Info Analyzed TDP, the enquiry/consult call is not permitted.
- The AudioCodes Media Server (AMS) does not support the warning tone. Please set WARNING\_TONE to “N” while using the AMS. (Q00937489)
- The SAM16 UAS does not support the H.248 Empty Event Parameter without curly brackets used by the GWC. This takes down the conference, when the conference leader tries to toggle between the other parties (Q00726512)

## Interactions

This activity does not change feature interactions unless documented above.

The following table lists fields for ISERVOPT.

**Table field descriptions**

| Field    | New or Changed | Subfield or refinement     | Entry | Explanation and action                                              |
|----------|----------------|----------------------------|-------|---------------------------------------------------------------------|
| SOPTSVAR | Changed        | ICONF<br>WARNING_TONE      | {Y,N} | Set to 'Y' to apply warning tone during I3WC conferences            |
|          |                | PREVENT_WML_DURING_ENQUIRY | {Y,N} | Set to 'Y' to prevent WML to be active during enquiry mode          |
|          |                | PREVENT_HELD_TONE          | {Y,N} | Set to 'Y' to prevent held tone to be applied for the party on hold |

**Datafill example**

The following example shows sample datafill for table ISERVOPT.

**ICONF tuple in ISERVOPT**

```
>add iconf
ENTER Y TO CONTINUE PROCESSING OR N TO QUIT
>Y
OPTION:
>iconf
ALLOW_ICT_IN_I3WC:
>Y
CLF_FLASH_IGNORE:
>Y
WARNING_TONE:
>Y
PREVENT_WML_DURING_ENQUIRY
>Y
PREVENT_HELD_TONE
>Y
TUPLE TO BE ADDED:
                                ICONF                                ICONF Y Y Y Y Y
ENTER Y TO CONFIRM, N TO REJECT OR E TO EDIT.
>Y
TUPLE ADDED
```

**Table release history update**

ISN07: refined ICONF to include WARNING\_TONE, PREVENT\_WML\_DURING\_ENQUIRY and PREVENT\_HELD\_TONE

**Supplementary information**

***Product = CS 2000*****A00002644 -- Common Topology Elements for Inter CS2K Internet Transparency solution (Intl IAW, Intl IAC)*****Functional Description***

The Internet Transparency feature, which allows Voice-Over-IP calls to take place in the presence of Network Address Translation (NAT)/IP VPNs, was

introduced into Succession in release 6.1. This feature optimizes network resource utilization by determining whether the call path crosses NAT/VPNs and inserting Media Proxies if necessary.

However, calls spanning multiple Call Agents (CS2ks) may result in the insertion of one or more Media Proxies into the call path, even if the call is contained within a single VPN. To avoid this, the inter-Call Agent trunks can be configured to be ‘intra-domain’ SIP-T trunks, thus causing the NAT/VPN information for both ends of the call to be compared. However, for this comparison to operate correctly, the following requirements must be met by the NAT’s numerical identifier within the Call Agents (CS2ks), i.e. by the NAT’s ‘Middlebox ID’:

- the middlebox ID for each NAT must be unique across all Call Agents
- each NAT must have the same Middlebox ID in all Call Agents

An example of this is shown in Figure , on page 222 .

This requirement on middlebox IDs is provided by the feature described in this note, hence allowing the configuration and use of intra-domain SIP-T trunks in SN07.

Each CS2k within the VoIP network must be allocated a unique Call Agent Identifier between 1 and 255. The user is responsible for administration of this number and its allocation among the CS2ks. Once a CS2k has been allocated a Call Agent ID, it should be provisioned into the CS2k Mgr using the capabilities provided by this feature. Ideally this should be co-ordinated with the CS2k upgrade to SN07, as described in section “ Upgrade to SN07” on page 238.

When a NAT is provisioned, a middlebox ID is automatically generated by the CS2k Mgr. From SN07 onwards, the CS2k Mgr incorporates the Call Agent into this automatically generated number, using the provisioned Call Agent ID for that CS2k. This helps to ensure uniqueness of middlebox IDs across multiple CS2ks.

For the special case in which the same NAT is provisioned into multiple CS2ks, it is necessary to ensure that the middlebox ID used for this NAT is the same in all CS2ks. Hence the middlebox ID allocated when the NAT is first provisioned into a CS2k must be used when the NAT is provisioned in subsequent CS2ks. In order to enable this, this feature provides the capability to

- read the middlebox ID of a provisioned NAT

- specify the middlebox ID as part of the data when provisioning a NAT.

Alternatively, the user may manually allocate any valid unique middlebox ID to a NAT and provision this value into all CS2ks, by-passing the CS2k Mgr middlebox-ID-auto-generation step. The middlebox ID must be an integer between 2 and 16777215 (ID = 1 is reserved by the system for internal use).

An example of ID allocations for a VoIP network with 2 CS2ks is shown in Figure , on page 222 .

If a NAT is provisioned into a CS2k Mgr and the automatically generated middlebox ID is then provisioned into other CS2k Mgrs, care must be taken when deleting this NAT. The NAT must be deleted last from the CS2kMgr that generated the middlebox ID - i.e. only after it has been deleted from all other CS2k Mgrs.

## VoIP network with multiple Call Agents (CS2ks)

▽ ME belonging to CS2kA

△ ME belonging to CS2kB

NAT-y is provisioned into CS2kA only.

NAT-z is provisioned into CS2kB only.

A call from ME1 to ME2 will reference both NATs, hence NAT-y and NAT-z must have different identifiers. This is ensured by the system incorporating the Call Agent ID as part of the middlebox ID for each NAT.

Some MEs behind NAT-x belong to CS2kA & others belong to CS2kB, hence NAT-x is provisioned into both Call Agents. NAT-x must have the same ID in both these Call Agents. Therefore NAT-x's identifier as allocated by CS2kA's Mgr (ID = 110008) must be specified when NAT-x is provisioned into CS2kB.

The user operations provided by this feature, which available via the GUI client and via the XML OSS interface, (" GUI Client and OSSGate interfaces" on page 223) are:

- Provision/set the Call Agent ID
- Display/list the Call Agent ID
- Specify the NAT middlebox ID during NAT provisioning
- Display/list the NAT Middlebox ID for a selected NAT
- Warning message on deletion of NAT middlebox.

In addition, the following internal functionality changes have been made as part of this feature:

- Automatic update of middlebox ids when Call Agent set for the first time
- Auto-generation of NAT and Pep Server middlebox id based on provisioned Call Agent ID

#### GUI Client and OSSGate interfaces

### Hardware Requirements or Dependencies

No new hardware is required or introduced by this feature. The application components provided by this feature execute as part of the SESM.

### Software Requirements or Dependencies

Dependencies:

- CR.Q00768898: Extend range in middlebox id in Guitar Controller

### Limitations and restrictions

Upgrade to SN07 should be carried out as described in section “Upgrade to SN07” on page 238

## Interactions

The following existing GUIs have been modified:

- Maintenance Settings Panel (see Figure , on page 227 ).
- Change Maintenance Settings Dialog (see Figure , on page 228 ).
- Network Devices Panel, NATs tab (see Figure , on page 231 ).
- Add NAT middlebox Dialog (see Figure , on page 232 , Figure , on page 232 )
- Delete NAT confirmation Dialog (see Figure , on page 238 )

The following existing XML commands have been modified:

- queryNAT (see Figure , on page 234 , Figure , on page 235 , Figure , on page 236 ).
- addNAT (see Figure , on page 237 ).

The following GUIs have been added:

- NAT middlebox ID display dialog (see Figure , on page 231 ).

The following XML commands have been added:

- queryCallAgentId (see Figure , on page 229 )
- setCallAgentId (see Figure , on page 230 )

The on-line help facility will be updated with information on the use, syntax and valid values for all the above modifications/additions.

## Call Agent Identifier

The Call Agent ID has an initial value of <not configured> in newly installed SN07 SESM systems. The Call Agent ID value should be set to a integer value between 1 and 255 by the user for normal operation. The Call Agent ID value must be set before the user can specify Middlebox IDs for NATs during NAT provisioning.

Note that in order to ensure optimum system operation is maintained during an upgrade, the Call Agent Id should be set just prior to upgrade of GWCs to SN07. Details of this are described in section “Upgrade to SN07” on page 238.

The first time the Call Agent ID is set by the user, the system performs any necessary internal changes for NAT middleboxes which have already been provisioned, to incorporate the newly provisioned Call Agent ID into the NAT middlebox IDs. GWC units which need to be synchronized to this new data will be identified by having data synchronization alarms raised against them.

Ideally, the Call Agent ID should only be set once and then not changed. However, setting the Call Agent Id more than once is not prohibited by the CS2k mgr. Note that, for subsequent changes, the new Call Agent ID will only be used in the middlebox ID for NATs provisioned after the change has been made. The middlebox IDs of previously provisioned NATs are not modified. This ensures consistency, in case NATs have been provisioned into multiple Call Agents. If the user does attempt change the Call Agent ID, a warning confirmation message is displayed.

## **GUI Client**

### **Display Call Agent ID**

The Call Agent ID is displayed in the Gateway Controller Main Panel, in the 'Maintenance Settings' area. This is shown in Figure , on page 227 and Figure , on page 227 .

### Provision Call Agent ID

The Call Agent ID can be provisioned/set using the 'Change' button in the Maintenance Setting area display (Figure , on page 227 ). This displays the Maintenance Settings change dialog (Figure ), which allows the user to set the Call Agent ID to an integer value between 1 and 255. Other maintenance settings may optionally be changed at the same time.

#### Change Maintenance Settings Dialog

A screenshot of the 'Change Maintenance Settings' dialog box. It has a blue title bar with a close button. The dialog contains three fields: 'GWC domain name:' with an empty text box, 'Call Agent Id:' with a text box containing the number '3', and a checkbox labeled 'Auto Image Enabled' which is currently unchecked. At the bottom right are 'OK' and 'Cancel' buttons.

Tool tips for the Call Agent ID are displayed when the cursor is placed within the text field. If the entered value is invalid, the text field is outlined in red and the OK button is disabled (Figure ).

#### Invalid Call Agent Id value

A screenshot of the 'Change Maintenance Settings' dialog box showing an invalid value. The 'Call Agent Id' text box now contains '555' and is outlined with a thick red border. A tooltip box is visible below the text box, displaying 'Valid Values: 1 to 255'. The 'OK' button is now disabled (grayed out), while the 'Cancel' button remains active. The other fields and the 'Auto Image Enabled' checkbox are unchanged.

## XML Interface

### List Call Agent ID

The Call Agent ID may be retrieved via the XML interface using the following command (Figure , on page 229 ). If the request is unsuccessful, an error message is returned as described in Appendix B.

### XML command queryCallAgentId

```
<?xml version="1.0" encoding="UTF-8" ?>
<CommandList>
  <Command>
    <Interface>ITransIf</Interface>
    <Methods>
      <queryCallAgentId usn="1" version="1.0" />
    </Methods>
  </Command>
</CommandList>
```

### XML Response for queryCallAgentId

```
<?xml version='1.0'?>
<CommandList>
  <Response>
    <Interface>ITransIf</Interface>
    <Methods>
      <queryCallAgentId usn="1" version="1.0">
        <ReturnData>
          <CallAgentId>3</CallAgentId>
          <ReturnCode value="0" text="Successful result" />
        </ReturnData>
      </queryCallAgentId>
    </Methods>
  </Response>
</CommandList>
```

### Provision Call Agent ID

The Call Agent ID can be specified via the XML interface using the setCallAgentId command (Figure , on page 230 ). If the Call Agent Id cannot be set, an error message is returned as described in Appendix B:

**XML Command: setCallAgentId**

```
<?xml version="1.0" encoding="UTF-8" ?>
<CommandList>
  <Command>
    <Interface>ITransIf</Interface>
    <Methods>
      <setCallAgentId usn="1" version="1.0">
        <Parameters>
          <CallAgentId>3</CallAgentId>
        </Parameters>
      </setCallAgentId>
    </Methods>
  </Command>
</CommandList>
```

**XML Response for setCallAgentId**

```
<?xml version='1.0'?>
<CommandList>
  <Response>
    <Interface>ITransIf</Interface>
    <Methods>
      <setCallAgentId usn="1" version="1.0">
        <ReturnData>
          <ReturnCode value="0" text="Successful result" />
        </ReturnData>
      </setCallAgentId>
    </Methods>
  </Response>
</CommandList>
```

**NAT middlebox Identifier**

When the user provisions a NAT, the system will automatically allocate a NAT middlebox ID. However, some NATs are provisioned into multiple CS2k Mgrs. For these NATs, it is necessary for the user to override the automatic middlebox ID allocation when the NAT is provisioned into the second and subsequent CS2ks. This is done by specifying the NAT middlebox ID during provisioning of the NAT. The middlebox ID must be a unique integer between 2 and 16777215

## GUI Client

### Display NAT middlebox ID

The middlebox ID for a NAT can be displayed via the 'Display ID' button on the NAT browser, which is available on the GWC Network Devices tabbed Panel

#### NATs tab on Network Devices Panel

This brings up an information box displaying the NAT middlebox ID (section ).

#### NAT middlebox ID display dialog

### Specify NAT middlebox ID during NAT provisioning

The middlebox ID for a NAT may be specified during NAT provisioning as follows:

- Use the 'Add' button on the NAT browser (see Figure ) to open the NAT provisioning dialog box (Figure ).

**Add NAT Middle Box dialog**A screenshot of the 'Add NAT Middle Box' dialog box. The title bar is blue with a white icon and the text 'Add NAT Middle Box' and a close button. The dialog has a light gray background. It contains three labels: 'Name:' followed by a text input field, 'NAT Type:' followed by a dropdown menu showing 'Non-Controlled', and a checkbox labeled 'Shared NAT' which is currently unchecked. At the bottom are 'OK' and 'Cancel' buttons.

**Add NAT Middle Box**

Name:

NAT Type:

☐ Shared NAT

OK Cancel

- Check the box marked 'Shared NAT'. This extends the dialog box to include the middlebox ID provisioning fields (Figure ).
- Enter valid values for NAT name and NAT ID and press OK (Figure , on page 233 ).

**Add NAT Middle Box dialog with Shared NAT checked**A screenshot of the 'Add NAT Middle Box' dialog box with the 'Shared NAT' checkbox checked. The layout is identical to the previous image, but the 'Shared NAT' checkbox is now checked, and a new 'NAT ID:' label with a text input field has appeared below it.

**Add NAT Middle Box**

Name:

NAT Type:

☒ Shared NAT

NAT ID:

OK Cancel

**Add NAT Middle Box with valid entries & OK enabled**

The dialog box titled "Add NAT Middle Box" contains the following fields and controls:

- Name: VPN-SOUTH
- NAT Type: Non-Controlled
- ☒ Shared NAT
- NAT ID: 14002348
- OK button
- Cancel button

Tool tips are displayed when the cursor is placed over each text field. If invalid values are entered, the text field with invalid data is outlined in red and the OK button is disabled (Figure ).

**Add NAT Middle Box dialog with invalid entry for NAT ID**

The dialog box titled "Add NAT Middle Box" contains the following fields and controls:

- Name: VPN-SOUTH
- NAT Type: Non-Controlled
- ☒ Shared NAT
- NAT ID: 1400234898 (The field is outlined in red, indicating an invalid entry.)
- Valid Values: 1 to 16777215 (A tooltip or message box is displayed below the NAT ID field.)
- OK button (disabled)
- Cancel button

**XML Interface command****List NAT middlebox ID**

The NAT middlebox ID can be listed as part of the information returned in the queryNAT request. This is done by including the <ListNATid> tag, set to 'true', in the XML command. If the tag is set to 'false', the NAT middlebox information is listed without the middlebox ID. If this tag is omitted, the NAT middlebox information again is listed without the middlebox ID, for backwards compatibility with previous releases. The XML for this command is shown in Figure , on page 234 , Figure , on page 235 , Figure , on page 236 . Error messages returned are described in Appendix B.

**XML command to query specified NAT, including middlebox ID**

```
<?xml version="1.0" encoding="UTF-8" ?>
<CommandList>
  <Command>
    <Interface>ITranslf</Interface>
    <Methods>
      <queryNAT usn="1" version="1.0">
        <Parameters>
          <NATname>NAT-A</NATname>
          <ListNATid>true</ListNATid>
        </Parameters>
      </queryNAT>
    </Methods>
  </Command>
</CommandList>
```

**XML response to query specified NAT, including middlebox ID**

```
<?xml version='1.0'?>
<CommandList>
  <Response>
    <Interface>ITranslf</Interface>
    <Methods>
      <queryNAT usn="1" version="1.0">
        <ReturnData>
          <NATname>NAT-A</NATname>
          <NATType>1</NATType>
          <NATid>131080</NATid>
          <ReturnCode value="0" text="Successful result" />
        </ReturnData>
      </queryNAT>
    </Methods>
  </Response>
</CommandList>
```

**XML command to query all NATs on a given GWC, with middlebox ID**

```
<?xml version="1.0" encoding="UTF-8" ?>
<CommandList>
  <Command>
    <Interface>ITranslf</Interface>
    <Methods>
      <queryNAT usn="1" version="1.0">
        <Parameters>
          <GWCname>GWC-0</GWCname>
          <ListNATid>true</ListNATid>
        </Parameters>
      </queryNAT>
    </Methods>
  </Command>
</CommandList>
```

**XML response for query all NATs on a given GWC, with middlebox ID**

```
<?xml version='1.0'?>
<CommandList>
  <Response>
    <Interface>ITranslf</Interface>
    <Methods>
      <queryNAT usn="1" version="1.0">
        <ReturnData>
          <NATname>NAT-B</NATname>
          <NATid>131081</NATid>
          <NATname>NAT-D</NATname>
          <NATid>131083</NATid>
          <ReturnCode value="0" text="Successful result" />
        </ReturnData>
      </queryNAT>
    </Methods>
  </Response>
</CommandList>
```

**XML Command: query all NATs, with middlebox id**

```
<?xml version="1.0" encoding="UTF-8" ?>
<CommandList>
  <Command>
    <Interface>ITransIf</Interface>
    <Methods>
      <queryNAT usn="1" version="1.0">
        <Parameters>
          <ListNATid>true</ListNATid>
        </Parameters>
      </queryNAT>
    </Methods>
  </Command>
</CommandList>
```

**XML Response: query all NATs, with middlebox id**

```
<?xml version='1.0'?>
<CommandList>
  <Response>
    <Interface>ITransIf</Interface>
    <Methods>
      <queryNAT usn="1" version="1.0">
        <ReturnData>
          <NATname>NAT-A</NATname>
          <NATid>131080</NATid>
          <NATname>NAT-B</NATname>
          <NATid>131081</NATid>
          <NATname>NAT-C</NATname>
          <NATid>131082</NATid>
          <NATname>NAT-D</NATname>
          <NATid>131083</NATid>
          <ReturnCode value="0" text="Successful result" />
        </ReturnData>
      </queryNAT>
    </Methods>
  </Response>
</CommandList>
```

**Specify NAT middlebox ID during NAT provisioning**

The middlebox ID can be specified during NAT provisioning over the XML interface by including the <NATid> tag in the addNAT command, as shown in Figure , on page 237 . Valid values must be provided for all fields. Error codes are given in Appendix B.

**XML Command: addNAT, including middlebox id:**

```
<?xml version="1.0" encoding="UTF-8" ?>
<CommandList>
  <Command>
    <Interface>ITransIf</Interface>
    <Methods>
      <addNAT usn="1" version="1.0">
        <Parameters>
          <NATname>nat1</NATname>
          <NATid>13378928</NATid>
        </Parameters>
      </addNAT>
    </Methods>
  </Command>
</CommandList>
```

**XML Response: addNAT, including middlebox id:**

```
X<?xml version='1.0'?>
<CommandList>
  <Response>
    <Interface>ITransIf</Interface>
    <Methods>
      <addNAT usn="1" version="1.0">
        <ReturnData>
          <ReturnCode value="0" text="Successful result" />
        </ReturnData>
      </addNAT>
    </Methods>
  </Response>
</CommandList>
```

**NAT deletion**

If the user has provisioned a NAT into multiple CS2ks, care should be taken when deleting the NAT. If the NAT middlebox ID used for the shared NAT has been automatically generated by one CS2k Mgr, the NAT should not be deleted from that CS2k Mgr while it is still provisioned in other CS2ks. It must be deleted from all other CS2k Mgrs first. The GUI client displays a warning when deletion of a NAT whose middlebox id has been generated by this CS2k Mgr is requested, as shown in Figure , on page 238 .

**Confirm NAT Delete dialog**

For other NATs, a general reminder is given that the delete operation results in deletion of the NAT middlebox from this CS2k only.

**Confirm NAT Delete dialog**

## Upgrade to SN07

During an upgrade to SN07, the need to upgrade the middlebox IDs of already provisioned NATs means that there is a possibility of temporary increase in usage of Media Proxies, depending on the exact network configuration. Hence if Media Proxy resources have been engineered so that this may cause problems, the period of time during which there are GWCs at different software versions should be minimized. It is suggested that one of the following sequences of operation, A or B, is used for upgrade. In steps A & B, 'Upgrade the CS2k Mgr' refers in particular to upgrade of the Node Provisioning and GWC EM applications.

### A. Upgrade without soak test

1. Upgrade CS2k Mgr to SN07
2. Set a unique Call Agent ID. This causes the SN07 CS2k Mgr to generate new middlebox IDs for already provisioned NATs (and Pep Servers).
3. Upgrade all GWCs that will support internet transparency Media Endpoints to SN07. As part of this upgrade (in particular because of the

busy/RTS/SWACT), the new middlebox IDs for already provisioned NATs will be downloaded to each GWC. During this step, GWCs with different versions of software may have different middlebox IDs for the same NAT and hence some additional Media Proxy usage may take place (depending on the exact network configuration and order in which GWCs are upgraded). Hence, if a temporary increase in Media Proxy usage is undesirable (e.g. for network engineering reasons), this step should be done within as short as possible a time window and during a low traffic period.

4. Repeat steps 1-3 for all other CS2ks in the network.

5. Intra-domain SIP-T trunks may now be configured.

### **B Upgrade with soak test**

1. Upgrade CS2k Mgr to SN07

2. Upgrade a small number of GWCs that support internet transparency Media Endpoints to SN07 for soak test

3. Once soak test is complete, set a unique Call Agent ID. This causes the SN07 CS2k Mgr to generate new middlebox IDs for already provisioned NATs (and Pep Servers).

4. Carry out a busy/RTS/SWACT for the (SN07) GWCs that have been soak tested. This will cause the new middlebox IDs to be downloaded to both sides of these GWCs.

5. Upgrade all other GWCs that will support internet transparency Media Endpoints to SN07. As part of this upgrade (in particular because of the busy/RTS/SWACT), the new middlebox IDs for already provisioned NATs will be downloaded to each GWC. During steps 4 & 5, GWCs with different versions of software may have different middlebox IDs for the same NAT and hence some additional Media Proxy usage may take place (depending on the exact network configuration and order in which GWCs are upgraded). Hence, if a temporary increase in Media Proxy usage is undesirable (e.g. for network engineering reasons), steps 4 & 5 should be done within as short as possible a time window and during a low traffic period.

6. Repeat steps 1-5 for all other CS2ks in the network.

7. Intra-domain SIP-T trunks may now be configured.

## Authorization for Commands

The security for the GUI Client and OSSgate interface includes support for permission or 'Authorization' levels for commands. Each command is associated with one or more user groups. In order to execute a command, a user must belong to at least one of the associated user groups. The user groups associated with the new /modified commands associated with this feature are specified in the table below.

### Internet Transparency Commands Authorization

| Command                                  | User Group |       |        |          |       |
|------------------------------------------|------------|-------|--------|----------|-------|
|                                          | mgcadm     | mgcrw | mgcmte | mgcsprov | mgcro |
| Display Call Agent ID (queryCallAgentId) | X          | X     | X      | X        | X     |
| Change Call Agent ID (setCallAgentId)    | X          | X     |        |          |       |
| Display NAT ID (queryNAT)                | X          | X     | X      | X        | X     |
| Provision NAT (addNAT)                   | X          | X     |        |          |       |

## Glossary

| Term  | Description                        |
|-------|------------------------------------|
| GUI   | Graphical User Interface           |
| GWC   | Gateway Controller                 |
| GWCEM | Gateway Controller Element Manager |
| ID    | Identifier                         |

## Appendix B for A00002644: Error codes and messages

### Return codes when command is unsuccessful

| Cause of error                                                                                                 | Return code | Example return messages                                  |
|----------------------------------------------------------------------------------------------------------------|-------------|----------------------------------------------------------|
| Platform applications internal error: OSS Interface applications cannot connect to required server application | 302         | Interfacing error                                        |
| Unable to provision requested NAT because a database error occurred                                            | 303         | Database error occurred during setting of Call Agent Id. |
| Unable to provision requested NAT/Call Agent Id of problem with the GWCEM component of the CS2k Mgr.           | 304         | Element Manager Initialization in progress               |
| No NAT data for this query. e.g. no NAT meets selection criteria or the NAT/GWC specified does not exist       | 305         | NAT not found<br>No NAT found for GWC                    |
| User is not a member of any of the user groups allowed to perform this action                                  | 501         | Insufficient permissions to perform this operation       |

## Example Error Message

```
<?xml version='1.0'?>
  <CommandList>
    <Response>
      <Interface>ITranslf</Interface>
      <Methods>
        <queryNAT usn="1.0" version="1.0">
          <ReturnData>
            <NATname>nat1111</NATname>
            <ReturnCode value= "305" text="NAT not found"/>
          </ReturnData>
        </queryNAT usn="1.0">
      </Methods>
    </Response>
  </CommandList>
```

## Appendix C for A00002644: XML Commands: description of method parameters

### Parameter definitions

- **encoding??**
- **version** - The version refers to the version of the method or operation - e.g., the addNAT operation may have version 1.0 and 2.0, where version 1.0 takes parameters X and Y and version 2.0 takes parms X, Y, and Z. TYPE *decimal*.
- **usn** - Unique Sequence Number. This parameter is introduced to facilitate sending multiple XML commands in one file. This parameter value will be used to match the responses with the requests. TYPE *integer*.
- **ReturnCode value**- A numeric value indicating the result of the attempted operation (see Table 3, for range and definitions of each possible value). TYPE *string*.
- **Return code text**- Appropriate text that describes the result of the operation. TYPE *string*.
- **CallAgentId** - The unique integer that has been assigned by the user to this Call Agent (e.g. this CS2k). This must be a value between 1 and 255. TYPE *integer*.
- **ListNATid** - Indication of whether the NAT id should be included in the response to this command. Set to 'true' if the NATid is required and 'false' if not. TYPE *NoSpaceNameType*.
- **NATname** - The name of the NAT that this command applies to. TYPE *NoSpaceNameType*. (32 character token without spaces, see xsd definitions in

Appendix A, section “ Appendix A for A00002644: XML validation schemas” on page 241)

- **NATid** - The unique middlebox id for this NAT. This must be an integer between 2 and 16777215. TYPE *integer*.
- **NATType** - Indicates the type of NAT, in particular, NATType = 1 indicates an uncontrolled NAT. No other values are used in this release. TYPE *string*.
- **GWCname** - The name of the GWC that this command applies to. TYPE *GWCNameType* (string of form GWC-xxxx, see xsd definitions in Appendix A, section “ Appendix A for A00002644: XML validation schemas” on page 241)

### Method Parameters

Method parameters are defined below. Input data is mandatory except where indicated otherwise.

1. **queryCallAgentId** - Method that gets the current value of the Call Agent Id for this Call Agent (CS2k). This method has the following parameters:
  - Input data:
    - usn
    - version
  - Output data:
    - usn (value should be the same as the input)
    - version (value should be the same as the input)
    - CallAgentId - The value of the Call Agent Id for this Call Agent (CS2k).
    - ReturnCode - indicates via an integer value if the command has been successful or, if not, the error type and includes a brief textual message with further information.
2. **setCallAgentId** - Method that sets to Call Agent Id for this Call Agent (CS2k) to the specified value. This method has the following parameters:
  - Input data:
    - usn
    - version
    - CallAgentId - The desired value for the Call Agent Id for this Call Agent (CS2k).
  - Output data:
    - usn (value should be the same as the input)
    - version (value should be the same as the input)

- ReturnCode - indicates via an integer value if the command has been successful or, if not, the error type and includes a brief textual message with further information.
- 3. **queryNAT** - Method that gets the information regarding a NAT or set of NATs, depending on the parameters specified. If neither a NATname nor a GWCname is included, then information is returned for ALL NATs provisioned in this CS2k Mgr. This method has the following parameters:
  - Input data:
    - usn
    - version
    - NATname (optional, cannot be included as well as GWCname) - indicates the NAT for which information should be returned
    - GWCname (optional, cannot be included as well as NATname) - returns information for all NATs associated with this GWC
    - ListNATid (optional) - if set to true, this returns the NAT id as part information for each NAT, if set to false or if the parameter is omitted the NAT id is not returned.
  - Output data:
    - usn (value should be the same as the input)
    - version (value should be the same as the input)
    - NATname
    - NATType (returned only when the NATname is specified)
    - NATid (returned only when ListNATid is set to 'true' in the input data)
- 4. **addNAT** - Method that provision a NAT into the CS2k Mgr. This method has the following parameters: If the NAT id is not specified then the CS2k Mgr generates a NAT middlebox id for the NAT.
  - Input data:
    - usn
    - version
    - NATname - unique name for the NAT to be provisioned
    - NATid (optional) - indicates the middlebox id that should be allocated to this NAT.
  - Output data:
    - usn (value should be the same as the input)
    - version (value should be the same as the input)

– ReturnCode

## ***Product = CS2000***

### **A00002654 -- CEPT AR (CLASS Call Back for Telefonica) (Int'l UA-IP)**

#### ***Functional Description***

The CEPT telephony service Call Back to Last Received Call enables a subscriber to inquire into the number of network origin of the last received call that was not answered, as well as the date and time in which the call took place, and to allow the subscriber to call back that number by pressing a single digit without the need to go on-hook.

This CEPT service is closely allied to the existing Automatic Recall (AR) service currently implemented in the MMP with the only major differences being that the CEPT service has a slightly different user interface and billing requirements. Thus, the CEPT Call Back to Last Received Call service will be assignable to subscribers as the current AR feature with modifications becoming active when the CEPT option is also provisioned on the line.

The first application of this feature will be for the Spanish market (Telefonica).

A summary of the modifications to the existing AR feature are as follows:

- Call processing - Current AR design only consists of invoking the feature using an access code. This activity will add the CEPT-defined capabilities of activation, deactivation, interrogation, and erasure to the AR feature. These capabilities will only apply to IBN lines with the CEPT line option.
- CEPT AR User Interface - Current AR design uses a telco-defined access code to enable the subscriber to invoke the feature. This activity will enable the subscriber to perform the following CEPT-defined capabilities for AR by using CEPT-defined dialing sequences: activation, deactivation, interrogation, invocation, erasure, and security key change.
- Security Key - Current AR design does not use a security key (i.e. PIN). This activity will add security key capabilities to the AR feature including the ability for both the subscriber and the telco to change the security key. These capabilities will only apply to IBN lines with the CEPT line option.
- Billing - Current AR design has an option to produce AMA billing records for feature use. However, the design uses the North American-defined Bellcore format. This activity will implement the ability for all

CEPT services to produce NAOC-defined billing records and NAOC meter counts for the following CEPT-defined capabilities: activation, deactivation, interrogation, invocation, erasure, and security key change.

### CEPT AR Feature Controls

This activity introduces 4 new feature controls in addition to the existing ability to invoke the feature. They are activation, deactivation, interrogation, and erasure. This activity also introduces a new dialing sequence for invoking the feature following the CEPT specification. NOTE: This new method not replace the existing method for invoking the feature, but will be used when the subscriber is a CEPT line.

With this activity, AR will no longer be activated once provisioned for CEPT lines. The subscriber will need to dial the CEPT-defined activation sequence to make the feature active. Once active, the subscriber may then invoke the feature. To prevent others from invoking the feature and thus incurring charges, the AR feature can be deactivated by dialing the CEPT-defined deactivation sequence. Activation and deactivation require the use of a PIN (Personal Identification Number) in order for the state of the feature to change.

For describing the dialing sequences of these feature controls, the following symbols will be used:

- LH - lift handset
- DT - receive dialtone
- PIN - Personal Identification Number (i.e. password, security key)
- ACK - a positive acknowledgement announcement or tone
- NACK - a negative acknowledgement announcement or tone
- RH - replace handset

The ACK/NACK tone is used only if announcement resources are not available. Incomplete activation sequences will result in NACK treatment. (However, an implied octothorpe will be assumed upon digit time-out.).

### Activation

The subscriber will have the ability to activate CEPT AR by using a special dialling sequence. To activate the CEPT AR feature, the subscriber must execute the sequence depicted in the following figure:

#### CEPT AR Subscriber Activation

|                             |                   |
|-----------------------------|-------------------|
| LH DT * 921 * PIN # ACK RH  | - if successful   |
| LH DT * 921 * PIN # NACK RH | - if unsuccessful |

The CEPT AR becomes active immediately after execution of this sequence.

### Deactivation

The subscriber will have the ability to deactivate CEPT AR by using a special dialling sequence. To deactivate the AR feature, the subscriber must execute the sequence depicted in the following figure:

#### CEPT AR Subscriber Deactivation

|                             |                   |
|-----------------------------|-------------------|
| LH DT # 921 * PIN # ACK RH  | - if successful   |
| LH DT # 921 * PIN # NACK RH | - if unsuccessful |

The CEPT AR is deactivated immediately after the execution of this sequence.

### Interrogation

The subscriber will have the ability to interrogate (i.e. check) the status of the AR feature by using a special dialling sequence. To interrogate the status of the AR feature, the subscriber must execute the sequence depicted in the following figure:

#### CEPT AR Subscriber Status Interrogation

|                        |                              |
|------------------------|------------------------------|
| LH DT *# 921 # ACK RH  | - if CEPT AR is active       |
| LH DT *# 921 # NACK RH | - if CEPT AR is not inactive |

### Erasure

The AR feature stores information about the last incoming call into a register called the Incoming Call Memory Block (ICMB). The subscriber will have the ability to erase the information in the ICMB of the AR feature by using a special dialling sequence. To erase the information in the ICMB, the subscriber must execute the sequence depicted in the following figure:

#### CEPT AR Erasure

|                      |                              |
|----------------------|------------------------------|
| LH DT # 92 # ACK RH  | - if erasure is successful   |
| LH DT # 92 # NACK RH | - if erasure is unsuccessful |

### Invocation

The subscriber will have the ability to invoke the CEPT AR feature by using a special dialing sequence. To invoke the CEPT AR feature, the subscriber must execute the sequence depicted in the following figure:

#### CEPT AR Invocation

|                                  |                                 |
|----------------------------------|---------------------------------|
| LH DT *92 # Feature Announcement | - if invocation is successful   |
| LH DT *92 # NACK RH              | - if invocation is unsuccessful |

### Error situations when using AR Feature controls

The subscriber will receive re-order tone and a FTR138 log showing FNAL treatment when dialing an AR feature control sequence in the following situations:

- CEPT and AR options are not assigned on the line.
- Improper feature control is datafilled in table xxCODE for CEPT AR.

### CEPT AR Translations

The CEPT AR feature controls must be datafilled using a feature translator in Universal Translations in any XLA xxCODE table, such as, ACCODE or PXC CODE. There are five tuples which translations will need datafilled, they are (example Travers are provided in “Appendix A for A00002654 - Translation Examples”):

- Activation & PIN change

These will be handled by the existing xxCODE feature selector using the option feature AR (new FTR) and existing option function ACT. An example tuple in a xxCODE table would look like:

```
AMBISTAR 921 921 FEAT ( FTR AR) ( PF 4) ( MM 3 15) (FUNC ACT)$
```

- Deactivation

This will be handled by the existing xxCODE feature selector using the option feature AR (new FTR) and existing option function DEACT. An example tuple in a xxCODE table would look like:

```
AMBIOCT 921 921 FEAT ( FTR AR) ( PF 4) ( MM 3 15) (FUNC DEACT)$
```

- Interrogation

This will be handled by the existing xxCODE feature selector using the option feature AR (new FTR) and existing option function INTER. An example tuple in a xxCODE table would look like:

```
STARCEPT C921 C921 FEAT ( FTR AR) ( PF 5) ( MM 4 15) (FUNC INTER)$
```

- Erasure

This will be handled by the existing xxCODE feature selector using the option feature AR (new FTR) and existing option function DELETE. An example tuple in a xxCODE table would look like:

```
OCT92XL 2 EQ FEAT ( FTR AR) ( PF 3) ( MM 2 15) (FUNC DELETE)$
```

- Invocation

This will be handled by the existing xxCODE feature selector using the option feature AR (new FTR) and existing option function USAGE. An example tuple in a xxCODE table would look like:

```
STAR92XL 2 EQ FEAT ( FTR AR) ( PF 3) ( MM 2 15) (FUNC USAGE)$
```

## Security Code (PIN) Assignment for Feature Act/Deactivation

The SEC (Security Code) option allows a common PIN to be assigned to specified services on that line. If a feature on a line is added to the SEC feature list, it becomes PIN protected. If a feature on a line is not in the SEC feature list, then it is not PIN-protected. Thus, there can be multiple features on a line, some PIN-protected and some not PIN-protected. Thus, a feature like CEPT AR which requires a PIN can co-exist on a line with a feature like CEPT ACRJ for which the PIN is optional (i.e. AR would be in the SEC feature list and ACRJ would not be.).

If none of the features on a line need PIN-protection, then, of course, the SEC option would not be added at all to the line. Thus if CEPT ACRJ is on a line with no other options and does not need to be PIN-protected, the SEC option need not be provisioned on that line.

### CEPT AR PIN Assignment

As mentioned previously, PIN protection is required for the CEPT AR service. To associate PIN protection to the AR service, the craftsperson must use SERVORD to add the SEC option to the line provisioned with CEPT AR.

For example, if LEN 0 1 10 5 already has the CEPT AR option, then the following SERVORD sequence shown in “Example of adding a PIN to CEPT AR using the SEC option” should be used to add the SEC option. “Sample QLEN of CEPT AR and SEC” and Figure , respectively, show the resulting QLEN and IBNFEAT tuple.

**Example of adding a PIN to CEPT AR using the SEC option**

```

SO:
>ado
SONUMBER:      NOW    3    6 16 PM
>
DN_OR_LEN:
>0 1 10 5
OPTION:
>sec
FEATURES:
>ar <----- The feature to which the SEC PIN applies
FEATURES:
>$
SEC_CODE:
>0000 <----- The default PIN set by the TELCO (1 to 7 digits)
OPTION:
>$
COMMAND AS ENTERED:
ADO NOW 3 6 16 PM HOST 00 1 10 05 ( SEC ( AR) $ 0000 ) $
ENTER Y TO CONFIRM,N TO REJECT OR E TO EDIT
>y

```

**Sample QLEN of CEPT AR and SEC**

```

>qlen 0 1 10 5
-----
LEN:      HOST    00 1 10 05
TYPE: SINGLE PARTY LINE
SNPA: 613
DIRECTORY NUMBER:      6212064
LINE CLASS CODE:  IBN
IBN TYPE: STATION
CUSTGRP:      IBNTST      SUBGRP: 0  NCOS: 0
SIGNALLING TYPE:  DIGITONE
CARDCODE:  6X17AA      GND: N  PADGRP: STDLN  BNV: NL MNO: N
PM NODE NUMBER      :      204
PM TERMINAL NUMBER :      326
OPTIONS:
CEPT AR NOAMA DGT SEC AR 0000
OFFICE OPTIONS:
AIN TIID
-----

```

**Sample IBNFEAT tuple with SEC**

```

TABLE: IBNFEAT
>format pack
>pos 0 1 10 5 0 sec
HOST 00 1 10 05 0 SEC SEC (AR) $ 0000

```

The reader should note the following regarding the PIN:

- The PIN specified with the SEC option applies to all features in the SEC feature list that are on that line. Thus, for example, if CEPT AR and CEPT ACRJ were both on the above LEN 0 1 10 5 and both features were included in the SEC feature list, both would share the same PIN of 0000.
- The PIN will be visible in Table IBNFEAT and also in the QLEN.
- The PIN length can range from 1 to 7 digits.

### **Security Code (PIN) Modification for Feature Act/Deactivation**

To modify the shared PIN, the service subscriber should dial their designated PIN activation sequence. For example, the CEPT AR subscriber would change their CEPT AR PIN by dialling the following sequence:

\* 921 \* Current PIN \* New PIN #

The CEPT ACRJ subscriber would change their CEPT ACRJ PIN by dialling the following sequence:

\* 934 \* Current PIN \* New PIN #

After the service subscriber dials the '#' (octothorpe) terminating their particular PIN modification sequence (or if the user indicates digit termination by allowing the interdigit timer to expire after the last digit entered), (s)he will be guided by pre-recorded announcements to reenter the new PIN. Figure illustrates the possible announcement sequences that could occur during a PIN change operation. The announcements will only start after the '#' has been entered and if there was successful validation of the *current* PIN.

Successful validation of the *current* PIN implies that the entered current PIN matches the stored PIN.

Successful validation of the *new* PIN implies that the entered new PIN was the correct length (1 to 7 digits) and that it was different than the stored PIN.

Upon successful validation of the new PIN, note that the new PIN will be shared by ALL features on the line which are in the SEC feature list.

Note that the PIN can only be changed from the subscriber's phone. Also note that the subscriber will NOT be required to change their PIN from the default PIN upon first usage of the AR or ACRJ feature.

**PIN Modification Announcement Sequence**

To enable the PIN change capability, the customer group SPP (Station Programmable PIN) option must be datafilled in Table CUSTSTN. It is in this CUSTSTN tuple that the PIN retry count is set as well. The range for the PIN retry count is 1 to 3. Refer to the following figure for an example of an SPP CUSTSTN tuple.

**Sample SPP Datafill**

|                                    |
|------------------------------------|
| TABLE: CUSTSTN<br>IBNTST SPP SPP 3 |
|------------------------------------|

SPP announcements also need to be configured. Refer to NTP 297-8001-350 “Call Forwarding Remote Activation” (CFRA) for more information about SPP as SPP was created as part of the CFRA feature. However, the reader should note that the SPP feature will be invoked automatically in the case of CEPT AR and ACRJ, and not explicitly by the subscriber as stated for CFRA.

**NAOC Billing and Metering for CEPT Services**

Currently, CEPT services only peg meter counts and produce billing records if World Metering is used. This activity in coordination with feature A00002638: PCA SW Metering Support for Billing [1] enhances CEPT services to peg meter counts and produce billing records based on a new table called NAOCFEAT and PCA Software Metering.

This activity introduces a new table, table NAOCFEAT, to be used to determine which feature controls for each CEPT feature will be metered and billed on a per Carrier/Carrier Reseller basis. The table also enables the telco to define what the charges will be for each feature control entered and to define a feature code to be used in the billing record for each feature on a per Carrier/Carrier Reseller basis. Refer to the CN section of this document for a complete description of this new table.

Please refer to the FN and CN sections of feature A00002638 [1] for examples and more details on the NAOC meter counts and billing records for CEPT Basic Call.

The NAOC feature billing will be recorded in an AMA record using the new module 612 extension as defined in A00002638 [1]. The information contained in the new AMA module is shown in Table , “Module 612 extension used for NAOC feature billing,” on page 256.

**Module 612 extension used for NAOC feature billing**

| BCD Char | Length | Meaning                                                                                                                                                                                                                                                                                                                                                                                                                            |
|----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 - 3    | 3      | <p><b>Rating Class at the beginning of the Call</b></p> <p>If the billing record is generated by basic call this field will contain the tariff index used for this call from Table TARFDATA, bound by an upper limit of 511 for the Spanish market.</p> <p>If the billing record is generated by a feature action this field will always be set to the value of "511".</p>                                                         |
| 4 - 11   | 8      | <p><b>Used Meter</b></p> <p>The total number of meter pulses <b>used</b> for this call or feature action.</p>                                                                                                                                                                                                                                                                                                                      |
| 12 - 15  | 4      | <p><b>Initial meter value MS</b></p> <p>The 4 most significant digits of the initial meter pulse value.</p>                                                                                                                                                                                                                                                                                                                        |
| 16 - 19  | 4      | <p><b>Initial meter value LS</b></p> <p>The 4 least significant digits of the initial meter pulse value.</p>                                                                                                                                                                                                                                                                                                                       |
| 20 - 27  | 8      | <p><b>Final Meter value</b></p> <p>The final meter pulse value, i.e., initial value + used value.</p>                                                                                                                                                                                                                                                                                                                              |
| 28 - 29  | 2      | <p><b>Call Type</b></p> <p>This field describes if this is a <b>basic call</b> or a <b>feature action</b>.</p> <p>If the billing record is generated by basic call this field will be equal to "00".</p> <p>If the billing record is generated by a feature action this field will be equal to a value based on the particular feature, i.e., the featcode, as it is provisioned in table NAOCFEAT (per the carrier/reseller).</p> |
| 30       | 1      | <p><b>Feature Action</b></p> <p>This field describes the type of feature action</p> <p>If the billing record is generated by basic call this field will be equal to "2".</p> <p>If the billing record is generated by a feature action this field will be equal to one of 10 values based on the type of action as shown in Table , "Feature Actions," on page 258.</p>                                                            |

An example (using calldump full) of the AMA billing record is shown in the following figure:

Software feature metering relies on the datafill of Table NAOCFEAT. This table defines the charging per carrier/reseller, per feature, per action.

The carrier/reseller name **must** be defined in either Table CARNAME or Table RESNAME/DNSCRN (for resellers) prior to use in Table NAOCFEAT.

The CEPT features can be associated with software metering with any of the following actions defined in the following table:

#### Feature Actions

| Action   | Description                 | Value In Billing Record |
|----------|-----------------------------|-------------------------|
| assign   | assignment                  | 0                       |
| deassign | deassignment                | 1                       |
| admact   | administrative activation   | 2                       |
| admdeact | administrative deactivation | 3                       |
| admprog  | administrative programming  | 4                       |
| subact   | subscriber activation       | 5                       |
| subdeact | subscriber deactivation     | 6                       |
| subprog  | subscriber programming      | 7                       |
| usage    | usage                       | 8                       |
| interrog | interrogation               | 9                       |

If there is no entry for a particular carrier/feature/action combination, then no software metered billing will be created or used for that particular combination.

The following figure contains an example of datafill in Table NAOCFEAT for carrier CAR100<sup>2</sup>, feature AR.

#### Example entry in Table NAOCFEAT

| CARRSNAM | FEATNAME | FEATCODE | ACTIONS                                |
|----------|----------|----------|----------------------------------------|
| CAR100   | AR       | 55       | (USAGE 7) (ASSIGN 10) (DEASSIGN 10) \$ |

To determine what the **used meter** value will be in module 612 for a particular feature action you will need to consider the following: **The provisioned unit value for each action in Table NAOCFEAT is 1/10 of a monetary unit, i.e.,**

2. As datafilled in Table CARNAME prior to being used in Table NAOCFEAT.

**0.10.** Therefore, if 1 metering pulse is equal to 0.06 monetary units per pulse then (based on the example in Figure ):

- **usage** in meter pulses =  $((0.1 * 7) / 0.06) = 11.67$

To determine what **call type** will appear in the module 612 (for AR usage), it's simply the feature code as provisioned in table NAOCFEAT, i.e., 55. The **feature action** field will be equal to the value 8 (see Table , "Feature Actions," on page 258 for details). Thus the module 612 would look like the example shown in Figure , "Module 612, for AR usage".

#### Module 612, for AR usage

|          | SUPPRESS         | X       | X        | X      | X        |         | X      | X        |         | X     | X        |
|          | WML              | X       | X        | X      | X        | X       | X      | X        | X       | X     | X        |

a. "X" denotes a supported action. An empty block denotes an unsupported action.

b. Billing of 'admprog' for SCL pertains to the ability to change the size of the speed call list, not the contents of the list.

## Hardware Requirements or Dependencies

None

## Software Requirements or Dependencies

SN07 or ISN06 Activatable Patch for Telefonica

The NAOC feature billing portion of this feature requires the following feature to be activated by SOC:

- NSUP0023 - PCA SW Metering Support for Billing

This requires the following SOC features:

— NETK0019 - Network AOC

- NETK0024 - Network AOC Tariff
- NETK0028 - CGP Network AOC
- NSUP0017 - Payment Ceiling
- NSUP0020 - NAO/PCA Supp Svcs

### Limitations and restrictions

None

### Interactions

None

### Applicable customer facing sections

#### Fault Management

Logs \_\_n/a\_\_

a. This change applies to any XLA CODE table.

### Table/MIB/Remote Database Schema information

#### Name: NAOCFEAT

Network Advice of Charge Feature Charging Table

#### Functional description

Table NAOCFEAT contains Network Advice of Charge charging information for features when one or more of the following feature actions occur:

| Feature Action              | Description                                                                        |
|-----------------------------|------------------------------------------------------------------------------------|
| Administration Assignment   | Operating company personnel add a feature to a line.                               |
| Administration Deassignment | Operating company personnel remove a feature from a line.                          |
| Administration Activation   | Operating company personnel change the state of a feature from inactive to active. |
| Administration Deactivation | Operating company personnel change the state of a feature from active to inactive. |
| Administration Programming  | Operating company personnel change feature data.                                   |
| Subscriber Activation       | A subscriber causes the state of a feature to change from inactive to active.      |
| Subscriber Deactivation     | A subscriber causes the state of a feature to change from active to inactive.      |
| Subscriber Programming      | A subscriber causes a change to feature data.                                      |
| Subscriber Usage            | A subscriber uses a feature.                                                       |

| Feature Action           | Description                                                                                                               |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------|
| Subscriber Interrogation | A subscriber queries a feature, to determine whether it is active, and/or to display the data programmed for the feature. |

Table NAOCFEAT has a two-part key, containing

- a Carrier or Reseller Name (from tables CARNAME or RESNAME)
- an MMP line option name or an enquiry action

Current enquiry actions are:

- Register Recall (RR) - a subscriber flashes and switches between the parties involved in the call
- Register recall Target Number (RTN) - a subscriber flashes and dials a number for another subscriber

Associated with each key are an assigned feature code and a list of chargeable feature actions and their assigned charge.

**Note:** The presence of datafill in table NAOCFEAT for line options and/or enquiry actions does not necessarily mean that these features are being charged or should be charged. Table NAOCFEAT, like table MTRFEAT for World Metering, provides the flexibility for the telco to supply datafill for each subscriber feature with one or more chargeable activities, even though Network Advice of Charge is not currently active for the feature. The user must refer to the individual service documents to verify whether a particular feature is chargeable.

#### Usage sequence and implications (CM Only)

Tables must be datafilled in the following sequence:

- CARNAME
- RESNAME
- NAOCFEAT

#### Size

| Abbreviated table name | Minimum tuples | Maximum tuples | Information on memory                                           |
|------------------------|----------------|----------------|-----------------------------------------------------------------|
| NAOCFEAT               | 0              | 32766          | Memory is automatically allocated as the tuples are datafilled. |

#### Fields/OIDs

The following table lists the new fields for table NAOCFEAT

Table field descriptions

| Field    | New or Changed | Subfield or refinement | Entry                  | Explanation and action                                                                                                                                                                                        |
|----------|----------------|------------------------|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Key      | New            |                        | see subfields          | This field contains two subfields: CARRSNAM and FEATNAME                                                                                                                                                      |
|          | New            | CARRSNAM               | 8 character vector     | Carrier or Reseller name.<br><br>Enter a carrier or carrier reseller name as it was entered in either table CARNAME or table RESNAME.                                                                         |
|          | New            | FEATNAME               | <line option>, RR, RTN | Feature Name.<br><br>Enter a line option (as listed in the SERVORD Reference Manual) or an enquiry action.<br><br>Enquiry actions are:<br><br>RR - Register Recall<br><br>RTN - Register recall Target Number |
| FEATCODE | New            |                        | 00-99                  | Feature Code.<br><br>Enter a two-digit number to be used to identify the feature in a charge record.                                                                                                          |
| ACTIONS  | New            |                        | see subfields          | This field is a vector of up to 10 entries where each entry consists of two subfields, FEATACTN and CHARGE.                                                                                                   |

Table field descriptions

**Datafill example**

The following example shows sample datafill for table NAOCFEAT:

KEY    FEATCODE

ACTIONS

-----  
CAR01    ACRJ    01

( ASSIGN 4) (DEASSIGN 3) ( USAGE 5)\$

**Table release history update**

Added to WT20 by feature A00002654.

**Supplementary information**

None.

**Translation verification other tools**

NAOCFEAT does not use translation verification tools.

**Name: IBNFEAT**

IBN Features Table

**Functional description**

IBNFEAT displays data associated with various IBN features.

**Usage sequence and implications (CM Only)**

Current datafill order unchanged.

**Size**

The size of the table is not changed.

**Fields/OIDs**

This activity allows AR and ACRJ to appear in the FEATURES list of the SEC (Security Code option) as shown below:

| TYPE FEATURES_LIST_TYPE | STRING RANGE |
|-------------------------|--------------|
| 'DCPK'                  | 0            |
| 'AR'                    | 1            |
| 'ACRJ'                  | 2            |
| END STRING RANGE        |              |

(0, 4, 0, 4)

**Table field descriptions**

| Field | New or Changed | Subfield | Entry          | Explanation and action                                                               |
|-------|----------------|----------|----------------|--------------------------------------------------------------------------------------|
| DATA  | changed        | FEATURES | DCPK, AR, ACRJ | Enter DCPK, AR, and/or ACRJ. These are the line options associated with feature SEC. |

**Datafill example**

The following example shows sample datafill for table IBNFEAT.

HOST 00 1 10 05 0 SEC SEC (AR) \$ 0000

**Table release history update**

The SEC feature option is modified to include the AR and ACRJ options in its Features List.

**Supplementary information**

None

**Translation verification other tools**

None

**Name: ACCODE**

Access Code Table

**Functional description**

Access Code Table, and other code tables, work in conjunction with the universal translations head tables (for example, table ACHEAD) to provide the digit path through universal translations.

The access code table translates the access code digit segment of the incoming digit string. The access code is used for access to another networks, an attendant, or a feature.

**Usage sequence and implications (CM Only)**

Current datafill order unchanged.

**Size**

The size of the table is not changed.

### Fields/OIDs

The feature option selector (i.e. FTR) of the XLA feature selector (i.e. FEAT) of the XLA CODE table will be modified to add the additional features AR and ACRJ.

### Table field descriptions

### Datafill example

The following example shows sample datafill for table ACCODE.

```
starcept 921 921 FEAT (FTR AR) (PF 3) (MM 3 15) (FUNC ACT) $
starcept 934 934 FEAT (FTR ACRJ) (PF 3) (MM 3 15) (FUNC ACT) $
```

### Table release history update

The feature option selector (i.e., FTR) of the XLA feature selector (i.e., FEAT) of the XLA CODE table will be modified to add the additional features AR and ACRJ.

### Supplementary information

None.

**Translation verification other tools**

The example in the following figure shows the output from **traver** when it is used to verify Table ACCODE.

**Service Orders (SO) (CM & SESM)****Service order change details**

This feature will expand the existing SEC (Security Code) option to accept two more additional values (AR and ACRJ) when it is prompted for its feature list. The feature list contains a list of features for which the Security Code PIN applies.

**LCC and options**

The LCC compatibility of SEC is not being changed by this activity.

**Meridian digital centrex feature assignment requirements**

| Feature | 500<br>2500 | MDC<br>SET | ISDN<br>SET | MDC Set ISDN Set Relationship |                            |             |        |                            |                  |                  |                                 |

**New commands**

NA- No new Servord commands are being introduced by this activity.

**How service order options are presented****Description**

With this activity, the FEATURES prompt of the SEC option will allow two new values, AR and ACRJ. Previously, only DCPK was a valid option.

## Example

### Example of Servord sequence in prompt mode

```

SO:
>ado
SONUMBER:      NOW    3    6 16 PM
>
DN_OR_LEN:
>0 1 10 5
OPTION:
>sec
FEATURES:
>ar (or acrj)<----- The new features to which the SEC PIN applies
FEATURES:
>$
SEC_CODE:
>0000
OPTION:
>$
COMMAND AS ENTERED:
ADO NOW 3 6 16 PM HOST 00 1 10 05 ( SEC ( AR) $ 0000 ) $
ENTER Y TO CONFIRM,N TO REJECT OR E TO EDIT
>y

```

### Example of Servord sequence in no-prompt mode

```

SO:
ado $ 0 0 18 5 sec acrj $ 0000 $ y y

```

### Option prompts

The new SEC FEATURES values are shown in **bold** below.

#### Change to SEC FEATURES sub-option prompt

| Prompt   | Valid input                   | Description                                                      |
|----------|-------------------------------|------------------------------------------------------------------|
| FEATURES | DCPK, <b>AR</b> , <b>ACRJ</b> | The FEATURES field indicate the line features using the SEC PIN. |

### Line class code compatibility

The LCC compatibility of SEC is not being changed by this activity.

### Assignability

The SEC option is assignable to a line.

**Option prerequisites**

For the SEC PIN to apply to AR and ACRJ, the CEPT option needs to be present on the line. The SEC PIN will not apply to non-CEPT AR and ACRJ.

**Notes**

None.

**Feature identification**

Feature number: A00002654 (CEPT AR), A00002655 (CEPT ACRJ)

**SERVORD+ Exceptions**

None.

***Product = CS2000*****A00002655 -- CEPT ACRJ for Telefonica (Int'l IAW, Int'l UA-IP)*****Functional Description***

ACRJ is an administration assigned feature, but the subscriber as well as administration has the ability of activating, deactivating, and interrogating the status of the feature. When activated, this service causes the switch to reject incoming calls to the line when the call is anonymous, i.e. when the calling name or number is not presented/presentable to the user. The calling party receives an announcement that the call is being rejected because it is anonymous.

## CEPT ACRJ Feature Provisioning

CEPT ACRJ is essentially MMP ACRJ with the CEPT interface, PIN protection optionality, and CEPT billing. Accordingly, the feature is provisioned the same as MMP ACRJ except that the CEPT option is added to the line to give the service its CEPT character. In order to add CEPT to the line, CEPT must first be added to the applicable customer group in table CUSTSTN. CEPT ACRJ is available only for IBN lines.

Provisioning changes on the subscriber option can only be done via SO. For CEPT ACRJ both CEPT and ACRJ options should be assigned to the subscriber. There is no limitation or restriction to use together CEPT and ACRJ line options. Whenever CEPT line option is removed from the line ACRJ feature behaves as basic MMP feature instead of CEPT variant and so no CEPT subscriber interface and no CEPT billing will be available. Please refer to FN section of 59019274 CEPT Subscriber Control Functions Framework for CEPT line option.

### Sample Feature Provisioning for CEPT ACRJ

```
>servord
SO:
>ado
SONUMBER:      NOW    3    6 19 PM
>
DN_OR_LEN:
>8406101
OPTION:
>acrj
STATUS:
>inact
OPTION:
>cept
OPTION:
>$
COMMAND AS ENTERED:
ADO NOW 3 6 19 PM 8406101 ( ACRJ INACT ) ( CEPT ) $
ENTER Y TO CONFIRM,N TO REJECT OR E TO EDIT
>y
```

## CEPT Feature Control - Activation//Deactivation/Interrogation

For describing activation, deactivation, and interrogation (also known as status verification) sequences, it is useful to define several symbols:

- LH - lift handset
- DT - receive dialtone
- FC - the CEPT feature action code for ACRJ, specified as 934 by the CEPT specification.
- ACK - a positive acknowledgement announcement or tone

- NACK - a negative acknowledgement announcement or tone
- RH - replace handset

The ACK/NACK tone is always used for interrogation. For activation/deactivation, an ACRJ specific announcement exists and the tone is used only if announcement resources are not available. Incomplete activation sequences will result in NACK treatment. (However, an implied octothorpe will be assumed upon digit time-out.)

### Activation

To activate the CEPT ACRJ feature, the subscriber must execute the sequence depicted in the following figure.

#### CEPT ACRJ Subscriber Activation

|                      |                   |
|----------------------|-------------------|
| LH DT * FC # ACK RH  | - if successful   |
| LH DT * FC # NACK RH | - if unsuccessful |

The CEPT ACRJ becomes active immediately after execution of this sequence. The entry of a valid activation sequence when the feature is already active is treated as a success.

### Deactivation

Subscriber has the ability to deactivate CEPT ACRJ by using special dialling sequence. To deactivate the ACRJ feature, the subscriber must execute the sequence depicted in the following figure.

#### CEPT ACRJ Subscriber Deactivation

|                      |                   |
|----------------------|-------------------|
| LH DT # FC # ACK RH  | - if successful   |
| LH DT # FC # NACK RH | - if unsuccessful |

The CEPT ACRJ is deactivated immediately after the execution of this sequence. The entry of a valid deactivation sequence when the feature is already deactivated is treated as a success.

### Interrogation

Subscriber has the capability of interrogating the status of ACRJ by using special dialing sequence. To interrogate the status of ACRJ feature, subscriber must execute the sequence depicted in the following figure.

**CEPT ACRJ Subscriber Status Interrogation**

|                       |                            |
|-----------------------|----------------------------|
| LH DT *# FC # ACK RH  | - if CEPT ACRJ is active   |
| LH DT *# FC # NACK RH | - if CEPT ACRJ is inactive |

Subscriber gets re-order tone and a FTR138 log with FNAL is generated for the following cases

- CEPT and ACRJ options are not assigned on the line.
- Improper feature action is datafilled in table ACCODE for CEPT ACRJ.

**CEPT ACRJ Translations**

The CEPT ACRJ feature must be invoked by a feature translator in Universal Translations in any XLA xxCODE table, such as, ACCODE or PXC CODE. There are three tuples which translations will need datafilled, they are:

- Activation

These will be handled by the existing xxCODE feature selector using the option feature ACRJ (new FTR) and existing option function ACT. An example tuple in a xxCODE table would look like:

```
starcept 934 934 FEAT (FTR ACRJ) (PF 4) (MM 3 15) (FUNC ACT) $
```

- Deactivation

This will be handled by the existing xxCODE feature selector using the option feature ACRJ (new FTR) and existing option function DEACT. An example tuple in a xxCODE table would look like:

```
octcept 934 934 FEAT (FTR ACRJ) (PF 4) (MM 3 15) (FUNC DEACT) $
```

- Interrogation

This will be handled by the existing xxCODE feature selector using the option feature ACRJ (new FTR) and existing option function INTER. An example tuple in a xxCODE table would look like:

```
starcept C934 C934 FEAT (FTR ACRJ) (PF 5) (MM 4 15) (FUNC INTER) $
```

**PIN Protection Optionality**

PIN protection is optionally available to users of CEPT ACRJ. PIN protection is enabled via provisioning the SEC feature on the line -see AR FN for more information. If PIN protection is enabled for a line with ACRJ assigned, the activation and deactivation sequences are changed as follows ("PIN" represents the 4 digit PIN number).

**CEPT ACRJ sequences with PIN Protection****Activation**

```
LH DT * FC * PIN # ACK RH      - if successful
LH DT * FC * PIN # NACK RH     - if unsuccessful
```

**Deactivation**

```
LH DT # FC * PIN # ACK RH      - if successful
LH DT # FC * PIN # NACK RH     - if unsuccessful
```

**PIN Modification**

```
LH DT * FC * PIN * PIN # <voice prompting> RH
```

Details of the PIN protection option including its provisioning, impact on QLEN and QDN displays, and behavior during PIN modification are given in the PIN Protection Optionality section of the AR DSUM (A00002654). The material for AR applies in a straight-forward manner to the ACRJ feature as well.

**Accounting/Billing**

Billing records/meter pulses are generated for activation, deactivation, and interrogation. The FN for A00002654 documents the behavior of billing for both CEPT AR and CEPT ACRJ.

**Hardware Requirements or Dependencies**

N/A

**Software Requirements or Dependencies**

N/A

**Limitations and restrictions**

- This feature is only applicable on IBN lines with the CEPT option.
- If calling line information is unavailable (e.g. a trunk involved in the call does not propagate this information) then the call to the terminator will not be blocked due to action of this feature. An alternative mode of behavior - blocking all calls lacking calling line information (and called “Mode A” by CEPT specifications for rejection of unidentified calls) - is not supported.

**Interactions**

Same as MMP ACRJ

## Applicable customer facing sections

**Note:** The Configuration and Accounting sections of A00002654 include information applicable to both the CEPT AR feature and this feature.

## ***Product = CS2000***

### **A00002678 -- Telefonica IN Enhancements (Int'l UA-IP)**

#### ***Functional Description***

This activity enhances the IN platform to meet Telefonica requirements. Some of the components are only relevant to Telefonica, others are more generic and would be available for use in other CS1-R networks. The following enhancements are provided:

- TDP4 QoR triggering
- CPC Criteria triggering

- FCI handling
- ASF Enhancements
- Overdecadic digits in the CLI parm of the Connect message

For an overview of other IN functionality please refer to 1.

### **TDP4 Query on Release (QoR) Triggering**

TDP4 occurs when a release indication is received from the network or internally within the switch. The feature partially implements TDP4, it only allows IN to be trigger on receipt of an ISUP REL message (from ETSI ISUP and national variants). It does not support releases from other trunk type, nor internal failures to route.

**TDP-4 QoR triggering****Configuration**

The criteria for triggering TDP-4 is based on the cause value received in the ISUP message. The release cause value required to trigger TDP-4 is specified in a new criteria type CAUSE in table TRIGGRP. The CAUSE criteria can only be datafilled against NETBUSY triggers. Criteria matching will not be performed on digits at TDP-4, therefore an INFONAME must be datafilled in table TRIGINF before using the CAUSE criteria.

**Example datafill TRIGGRP**

| KEY                                             | TRIGDATA |
|-------------------------------------------------|----------|
| -----                                           |          |
| ETSIGRP NETBUSY                                 |          |
| (GENTRIG ( <b>CAUSE CSE_126</b> ) \$ MDCKEY1)\$ |          |

The following CAUSE value are supported (Note unsupported values may still be datafilled however they may not trigger.)

Supported Values : 1-5, 8,9, 17-22, 27-29, 34, 38, 41-44,  
46,47,50,53,55,57,58,62,63,65,69,70,79,87,88,90,91,95,97,99,102,103,110,111,126

Up to 16 CAUSE values may be specified for a particular trigger group using either the same or different infonames.

**Example datafill TRIGGRP**

| KEY                                     | TRIGDATA |
|-----------------------------------------|----------|
| -----                                   |          |
| TDP4 NETBUSY                            |          |
| (GENTRIG ( CAUSE CSE_126) \$ MDCKEY1)   |          |
| (GENTRIG ( CAUSE CSE_125) \$ MDCKEY2)   |          |
| (GENTRIG ( CAUSE CSE_124) \$ MDCKEY2)\$ |          |

The criteria ASSIGNED is also valid at TDP4, in this case all calls in which the originating trunk/line is subscribed to the TDP4 group, will trigger at TDP4 when released.

In addition to the criteria matching, TDP-4 triggering can be controlled on a per switch basis via a new office parm WTIN\_TDP4\_ACTIVE in table OFCENG. The default value for this parm is FALSE.

A new option CAUSE<sup>3</sup> has been added to the INITDP\_PARMS options in table SERVINFO. If this option is present the cause value used to trigger at TDP-4, will be sent to the SCP in the InitDP.

**Example datafill SERVINFO**

| SERVIDX | OPTION                                                                                                                                                                          |
|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -----   |                                                                                                                                                                                 |
| 4441    | (INITDP_PARMS ( SERVKEY) (CDPA) (CPC) (EVENT_TYPE) ( <b>CAUSE</b> ) \$)<br>(DIGIT_COLLECTION_INFO ( FULL_CDPA ) \$)<br>(EDPS_INFO ( EXPLICIT ) \$) (CS1R (CONTINUE) (CWA) \$)\$ |

---

3. The CAUSE option is available from SN07 onwards

**TRAVER support**

The TRAVER tool can be used to verify TDP-4 functionality. If a TDP4 trigger is detected the user is prompted to input a cause value, this is then checked against the datafilled criteria.

**Example TRAVER using CAUSE triggering at TDP-4**

```

### TDP-4 Usage example: Local Number Portability

TDP-4 QoR functionality can be used for a variety of services, this example demonstrates an LNP service using TDP-4 triggering.

Local Number Portability (LNP) enables customers to switch from one service provider to another service provider in the same geographical location, without having to change their telephone number.

This feature supports the IN based Local Number Portability by the Query on Release (QoR) method. QoR allows a call to be routed over Spanish ISUP trunks to the donor exchange. If the called directory number is ported, the donor exchange will release the call by sending REL 126 (QoR: NUMBER PORTED) to the QoR serving exchange. The QoR serving exchange (the originating, or in some case an intermediate exchange) upon receiving REL 126 will trigger the IN service and a query will be sent to the SCP. The SCP will reply with the new routing number and the QoR serving exchange will route the call to the recipient exchange based on the new routing number provided by the SCP.

For more information on non-IN LNP please refer to 4.

**Functional behaviour of IN LNP QoR Method****Configuring the CS2K for IN based QoR LNP**

The following steps are required to configure the CS2K for IN based QoR LNP

**1 Configure trunks to support QoR:**

QoR Release sending and receiving is controlled by the LNP option in table ISUP SVC. For more information about the LNP option in table ISUP SVC see 4. All outgoing trunks that need to support triggering at

TDP-4 need to have either the FULL or RX options specified. If the release should be propagated back to a previous exchange the originating trunk needs to have either the FULL or SEND options specified. If either of these options are datafilled on the originating trunk the call will not trigger at TDP-4 if a QoR specific cause value is used (e.g. 14 or 126), regardless of IN datafill.

To use the Spanish specific ported number release cause (126) rather than the default (14), the SPAIN NATL\_LNP\_QOR option must be specified in table ISUP SVC. For more information on the SPAIN ISUP SVC options please see 5.

#### Example datafill ISUP SVC

| KEY     | SERVICE                                          |
|---------|--------------------------------------------------|
| -----   |                                                  |
| LNPSEND | (LNP QOR (SEND) \$) (SPAIN (NATL_LNP_QOR) \$) \$ |
| LNPRX   | (LNP QOR (RX) \$) \$                             |

#### Example datafill TRKOPTS

| OPTKEY      | OPTINFO                   |
|-------------|---------------------------|
| -----       |                           |
| K1S5040SP2A | ISUP SVC ISUP SVC LNPSEND |
| K1S5040SP2B | ISUP SVC ISUP SVC LNPRX   |

## 2 Configure TDP-4 trigger criteria:

For trunk originations the TDP-4 trigger criteria needs to be specified in table TRIGGRP and the originating trunk(s) subscribed to the trigger group, either on a per trunk basis in table TRKAIN or on an office wide basis with the AIN\_OFFICE\_TRIGGRP office parameter in table OFCVAR. For line originations the AIN line option needs to be added via SERVORD

#### Example datafill TRIGGRP

| KEY             | TRIGDATA                                 |
|-----------------|------------------------------------------|
| -----           |                                          |
| TDP4GRP NETBUSY | (GENTRIG ( CAUSE CSE_126) \$ MDCKEY1) \$ |

#### Example datafill TRKAIN

| GRPKEY      | AINGRP  | AININFO |
|-------------|---------|---------|
| -----       |         |         |

```

**3 Configure translations to modify the NOA post TDP-4:**

If a specific NOA is required for Ported Calls (for Spain an NOA of 126 is required), translations needs to be set up to modify the NOA based on the new value specified by the SCP using the CDNRTE and SETCDN options. Example datafill for table CDNCHAR is shown in the following figure, and an example translations setup can be seen in figure . See reference 3 for more info on the CDNRTE and SETCDN options

**Example datafill CDNCHAR**

| CDNKEY  | PROTLIST                                                   |

### CPC Triggering (only available from SN07 onwards)

This activity allows calls to be triggered based on the Calling Party Category (CPC) for incoming calls from supported protocol.

The CPC is mapped to a generic, protocol independent Calling Party Category Name (CPCNAME) in table CPCCHAR. A new criteria type, CPC, in table TRIGGRP, is then used to trigger calls based on the CPCNAME. The CPC option can be datafilled against the INFOCOL (TDP-2) and INFOANAL (TDP-3) TDPs.

**Table CPCCHAR**

Table CPCCHAR is used to convert the protocol's CPC value, into a generic, protocol independent CPCNAME. This CPCNAME is then used for routing the call.

Each tuple in table CPCCHAR comprises of a CPCNAME, followed by between one and eight protocols, of which four protocols are currently valid. Each protocol has a list of between one and sixteen CPC values to match. The CPC value is specified in decimal.

For more information on table CPCCHAR and CPC routing please refer to 2.

**Example datafill for table CPCCHAR**

| TABLE: CPCCHAR |    | CPCKEY |         | PROTLIST |  |
|----------------|----|--------|---------|----------|--|
|                |    |        |         | -----    |  |
| PUBLPAYP       |    |        |         |          |  |
| (BTUP          | 3  | 8      | \$ )    |          |  |

## Telefonica FCI

The FCI option in table SERVINFO has been expanded to include a new FCI format of TELEFONICA. If the TELEFONICA FCI option is present, the SSP will accept the FCI in an OCTET STRING with boundaries of 0 to 200 bytes of billing data. For more information on Multivendor FCI please refer to 6.

### Example datafill SERVINFO

| SERVIDX | OPTION                                                                                                                                                                                                             |
|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 4441    | (INITDP_PARMS ( SERVKEY) (CDPA) (CPC) (EVENT_TYPE) \$)<br>(BILL_INFO (FCI_OPT <b>TELEFONICA 127</b> ) \$)<br>(DIGIT_COLLECTION_INFO ( FULL_CDPA ) \$)<br>(EDPS_INFO ( EXPLICIT ) \$) (CS1R (CONTINUE) (CWA) \$) \$ |

**ASN.1 encoding for Telefonica FCI**

```

    }
    [16] SET (SIZE (1-8) OF Item

```

The SSP will check the tag and length of the ASN.1 parameters received to ensure that they are contained in correct structure and then report the ASN.1 encoding in the module 199's appended to the AMA record.

The Parameters the fCIBillingChargingCharacteristics shall/may transport are:

## 1 First FCI Invocation

Scenario A - Before invoking a control connection operation: ETC, CONNECT and received after the opening of a AMA record on behalf of sending an InitialDP operation to the SCP. The following parameters are Mandatory:

fCIRegisterClass

fCIServiceKey

Scenario B - Before invoking a control connection operation ICA/Continue and received after the opening of a AMA record on behalf of sending an InitiateCallAttempt operation to the SCP. The following parameters are Mandatory:

fCIRegisterClass

fCIServiceKey

fCITariff

In both cases if this first FCI Operation does not contain all of these mandatory parameters, the SSF shall abort the TCAP dialogue with the SCF and will initiate the release of the call.

The remaining Parameters are optional.

## 2 Second and subsequent FCI Invocation, which may be sent during the same connection configuration, only the additional information:

fCIFeatures

fCISupplementaryServices

fCIItems

can be sent to the SSP. In the case where EDPS are armed if the FCI contains any other parameters different from the ones mentioned, the SSP shall discard them.

## NAOC support

If an fCITariff parameter is received, in addition to being it decoded and reported in the module 199's the charge information will be passed to the NAO framework which is done by a separate activity. (See 7, A00002637

Network AOC support for spanish trunk metering. The CS2K will not generate ISUP TAR messages based on the received fCITariff.

## ActivateService Filtering Enhancements

### Network specific duration

A new office parm has been created called INAP\_ASF\_FILTERING\_TIMEOUT\_DUR in table OFCENG to specify the network specific ASF duration. The office parameter accepts values in the range -1 to 86,400 seconds, -1 represents an infinite duration. The default value of the office parm is 0. If the SSP receives a ASF operation with a duration of -2, this indicates the value is network specific and the value of the office parameter is used for the ASF operation. Changes to the office parm will only affect new ASF operations and not any that may currently be processing.

### Multi-vendor ASF

This enables the SSP to accept sFBillingChargingCharacteristics that are not in the NortelFreeform format. This is similar to the way FCI can accept multi-vendor FCIBillingChargingCharachteristics.

#### ASN.1 encoding for Telefonica sFBillingChargingCharacteristics

```
SFBillingChargingCharacteristics ::= SEQUENCE {
    sFServiceKey [0] ServiceKey OPTIONAL
    generateChargingInfo [1] TESATariff OPTIONAL
    generateAccountRecord [2] BOOL DEFAULT FALSE
}
```

In order for the CS2K to accept Telefonica format sFBillingChargingCharacteristics the INAP\_VARIANT office parameter in table OFCENG must be set to TELEFONICA

#### Example datafill INAP\_VARIANT office parameter in table OFCENG

| PARMNAME     | PARMVAL           |
|--------------|-------------------|
| -----        | -----             |
| INAP_VARIANT | <b>TELEFONICA</b> |

### Overdecadic digits in the CLI parm of the Connect message

This activity adds supports for overdecadic (B-F) digits in the CLI parm of the Connect message. Although the CS2K supports the reception of overdecadic digits, the protocol used for any subsequent routing may not. Therefore care should be taken that if overdecadic digits are used in the CLI parm of a connect message, all signalling protocols used to onward route the call must also support overdecadic CLI digits.

## **Hardware Requirements or Dependencies**

None

## **Software Requirements or Dependencies**

A00002713 Spanish ISUP Enhancements for Telefonica is required by this functionality.

## **Limitations and restrictions**

### **General Limitations**

In SN06.2 the CS2K IN platform has the following limitations:

#### **Interactions with Explicit Call Transfer**

The CS2K does not support IN service interactions with the Explicit Call transfer feature.

#### **Call Forward denial per IN service**

It is possible to prevent forwarded calls triggering all services but not on a per service basis

#### **Call Waiting**

If a Call Waiting signal is received during a call to a ASF (TeleVote service), the IN dialog will be aborted (as expected) and the TeleVote announcement (if applicable) may be cut short.

#### **Telemetry**

The CS2K does not support the generation of ISUP TAR messages from Tariff information received in an FCI or sFBillingChargingCharacteristics.

#### **Three Way Call**

It is not be possible for services that arm EDPs or CIRP to use the conference capability of 3WC.

#### **Multiple Control Relationships per call**

Multiple IN services are not possible in a single call (e.g. using a Calling card to access a TeleVote number). If multiple services are required looparounds are needed.

#### **Omit missing ISUP parameters from InitDP**

ISUP Parameters missing from ISUP signalling are not omitted from the InitDP, instead an unknown value is used. For example if Redirection info is required in the InitDP and a Redirection Parameter is not received from the ISUP signalling, a redirection parameter with a value of unknown will be sent to the SCP.

**Filtering Criteria for callingAddressValue and location**

The CS2K is not able to filter ASF (TeleVote) calls based on callingAddressValue or location.

**ETC SCFId CorrelationID**

The SCFId and CorrelationID ISUP parameters are not supported by the CS2K. These should be appended to the end of the assistingSSPIPRoutingAddress address

**Telefonica Specific Extension Parameters**

Telefonica specific Extension Parameters are not supported by the CS2K.

**Cancel Operation**

The CS2K does not support the cancel operation.

**ASF (TeleVote) maximum counters = 20**

The CS2K can support a maximum of 20 counters per ASF operation. If more TeleVote numbers are required, several ASF operations are required e.g. one for nbrs 0800000001 to 0800000020, one for 0800000021 to 0800000030 etc.

**ICA in Begin Package**

The CS2K does not currently support the ICA operation in a TCAP begin package.

**TDP4 specific limitations**

Only the following interworkings are supported. Where ETSI ISUP is listed below this includes all national variants.

- ETSI ISUP -> ETSI ISUP
- Line -> ETSI ISUP
- 3WC-> ETSI ISUP
- CFW -> ETSI ISUP
- PRI -> ETSI ISUP

TDP4 as a trigger point is only detectable from the Routing + Alerting PIC. It should not be possible to detect it post answer. However it is a possible for early ACM and ANM messages to be received from the network, and that these are indistinguishable from the real ACM and ANM. Therefore the SSP will trigger TDP4 even if an ANM or ACM has been received.

The originating line/trunk must be an IN capable agent and be subscribed to the TDP4 group datafilled in TRIGGRP. In the case of Lines, 3WC and CFW the relevant OFCPARMS (e.g WTIN\_LINE\_TRIGGERING\_ACTIVE or INAP\_3WC\_INTERWORK) must also be datafilled.

## Parameter information

### WTIN\_TDP4\_ACTIVE

Intelligent Networks Trigger Detection Point 4 Active

#### Functional description

TDP4 Query on Release (QoR) Triggering is being introduced by this activity. TDP4 occurs when a release indication is received from the network or internally within the switch. The feature partially implements TDP4, it only allows IN to be triggered on receipt of an ISUP REL message (from ETSI ISUP). The criteria for triggering TDP-4 is based on the cause value received in the ISUP message. The release cause value required to trigger TDP-4 is specified in a new criteria type CAUSE in table TRIGGRP.

Checking for a matching CAUSE criteria introduces a real-time hit for during release message processing. To reduce this a new office parm, WTIN\_TDP4\_ACTIVE has been introduced. If TDP-4 triggering is required in the office this office parm can be set to TRUE. If the office parm is set to FALSE TDP-4 triggering will be disabled regardless of datafill in table TRIGGRP.

#### Provisioning rules

The value should be set to TRUE if TDP-4 triggering is required in this office, and FALSE if it is not required.

#### Range information

##### Range Information

| Minimum | Maximum | Default |
|---------|---------|---------|
| FALSE   | TRUE    | FALSE   |

#### Activation

Any changes are activated immediately

#### Dependencies

None

#### Consequences

If TDP-4 triggering is not required and this office parm is set to TRUE, there will be an unnecessary real time hit for all calls, during backward release.

#### Verification

Make a call which will trigger at TDP-4, if the office is parm is set to TRUE to call will result in the trigger being generated, if set to FALSE the trigger will not occur.

**Memory requirements**

No memory impact.

**Parameter release history update**

Created WTIN\_TDP4\_ACTIVE office parameter in table OFCENG.

**INAP\_ASF\_FILTERING\_TIMEOUT\_DUR**

Intelligent Network Application Part ActivateService Filtering Timeout Duration

**Functional description**

This activity provides the ability to specify a network default ASF duration. If the SSP receives an ASF operation with a duration of -2, this indicates the value is network specific and the network default duration should be used.

A new office parm has been created called INAP\_ASF\_FILTERING\_TIMEOUT\_DUR in table OFCENG to specify the network specific ASF duration.

**Provisioning rules**

This office parm is only applicable to networks which require a network specific ASF duration. The value of this office parm should match the network specific ASF duration or if not required should be entered as 0.

**Range information**

The range accepted by this office parm is -1 - 86,400 seconds. A value of -1 represents an infinite duration.

**Range Information**

| Minimum | Maximum | Default |
|---------|---------|---------|
| -1      | 86,400  | 0       |

**Activation**

Any changes are activated immediately but will only affect new ASF operations and not any that may currently be processing.

**Dependencies**

None

**Consequences**

If there is a network specific ASF duration and the value of this parameter does not match it, an incorrect duration will be used if the network specific duration is requested by the SCP. If there isn't a network specific ASF duration, and this office parm is not datafilled as 0, should an ASF operation be received with a duration of -2, it will not be treated as an error and instead the value of the office parm will be used for the duration of the ASF operation.

**Verification**

Send an ASF operation to the SSP with a duration of -2 and use the ASF MAP CI tool to display the ASF entries and check the duration parameter is set as expected.

**Memory requirements**

No memory impact.

**Parameter release history update**

Created INAP\_ASF\_FILTERING\_TIMEOUT\_DUR office parameter in table OFCENG.

**INAP\_VARIANT**

Intelligent Network Application Part Variant

**Functional description**

Unchanged

**Provisioning rules**

For the Spanish National Market this office parm should be set to TELEFONICA.

**Range information**

A new value of TELEFONICA has been added for the Spanish national market.

**Activation**

Unchanged

**Dependencies**

None

**Consequences**

If this office parameter is not set correctly INAP operations may be encoded/decoded incorrectly.

**Verification**

Unchanged

**Memory requirements**

Unchanged

**Parameter release history update**

Added a new variant TELEFONICA.

**Upgrade Impact**

N/A

## Data schema (DS) (CM)

### New/modified tables

#### New or modified tables

| Table name | NEW/CHANGED/ or DELETED/ | Table Control (NEW/OLD/UNCHANGED) |
|------------|--------------------------|-----------------------------------|
| TRIGGRP    | CHANGED                  | UNCHANGED                         |
| SERVINFO   | CHANGED                  | UNCHANGED                         |

### Table information

#### Name: TRIGGRP

Trigger Group

#### Functional description

Unchanged

#### Usage sequence and implications (CM Only)

Tables must be datafilled in the following sequence:

CPCCHAR  
TRIGGRP

#### Size

##### Table size

## Configuration Walkthrough

Please refer to the FN for ACT.00002678 for details on configuring this functionality.

## *Product = CS2000*

### **A00002680 -- CEPT/Telefonica Spain Changed Number Indication (Int'l UA-IP)**

#### ***Functional Description***

This feature is intended for the Telefonica market to provide intercept service using the UAS platform for telco subscribers who dial directory numbers that are no longer in service. The service is known as AIS (Automatic Intercept System) or CNI (Changed Number Intercept). Note that this feature is not CEPT specific, despite the title.

Currently, the DMS supports AIS via a trunk interface to an external machine that provides all the necessary announcements and functionality. This activity will provide the same type of functionality via an on-switch application utilizing the UAS as the announcement platform.

Callers reaching an intercepted number will receive a customized announcement from the UAS which includes the number that has been dialled (base DN) and the new directory number (reference DN) of the subscriber they

attempted to call. The reference DN will be associated with the base DN through datafill in the DMS.

Following is a description of how to provision and operate this service:

### Routing a Directory Number to Intercept Service

When a subscriber requests a directory number change, their old number will be assigned to OPRT treatment via SERVORD. The intercept treatment OPRT can be assigned via any of the following SERVORD commands: CDN, CHDN, DEL, CICP\_OUT, and EXBEST. In the case where only the generic notification is desired (number change notification without informing of the new number), the directory number should be routed to BLDN treatment instead of OPRT via SERVORD.

The OPRT tuples in TMTCNTL are modified to route to the CLI corresponding to the AIS announcement. This can be accomplished by changing the individual instances (i.e. OPRT in subtable LNT for line terminations) or deleting the OPRT tuple from each TMTCNTL subtable and modifying the entry in OFFTREAT [The entry in OFFTREAT applies to the entire office, but is over-ridden by entries in the other TMTCNTL tuples].

Following is an example of the TMTCNTL datafill necessary to route to OPRT treatment:

#### TMTCNTL Datafill to Route to AIS

```
TABLE: TMTCNTL

EXTTMTNM  TREAT
-----
OFFTREAT ( 234)

>SUB;POS OPRT

TREATMT LOG      FSTRTE
-----
OPRT  Y  S      AIS_ANN
```

For software or virtual directory numbers (numbers not associated with physical circuits), the intercept service can be specified by routing to OPRT treatment via table DNROUTE as shown below:

**DNROUTE Datafill to Route to AIS**

| AREACODE | OFCCODE | STNCODE | DNRESULT |
|----------|---------|---------|----------|
| 919      | 991     | 6100    | D OPRT   |

A list of all directory numbers routed to OPRT treatment can be obtained via the QDNSU command of SERVORD. This command can be used to generate either a numeric count of all numbers routed to OPRT or a listing of all individual directory numbers. Following is an example of the QDNSU command:

**Servord QDNSU Command Output**

```

>qdnsu
DIRECTORY_NUMBER_RANGE: ALL
>
TREATMENT: UNDT
>opr
SUMMARY OR DETAIL: S
>d
COMMAND AS ENTERED
QDNSU ALL OPRT D
ENTER Y TO CONFIRM, N TO REJECT OR E TO EDIT
>y
WARNING : Queries of all DNs or a large range of DNs
          may run for 30 minutes or more before producing any output
Please confirm ("YES", "Y", "NO", or "N"):
>y
REPORT ON UNASSIGNED DN
TREATMENT:OPRT
  9199911004 OPRT
  9199916100 OPRT
TOTAL COUNT OF UNASSIGNED DN:      2
TREATMENT:OPRT

```

A directory number that has been sent to OPRT treatment can be reused at any time by using the NEW command of SERVORD.

## Datafill for AIS Announcement

### Table CLLI

The Common Language Location Identifier (CLLI) or name for the AIS announcement must be defined in table CLLI. The value for field TRKGRSIZ must be set to specify how many individual members will exist for this announcement group.

### Table ANNS

The AIS announcement must be datafilled in table ANNS with ANTYP of AIS and only one entry is permitted. Field MAXCON must be set to one (1) and field CYTIME must be set to zero (0) as the length of each individual announcement is variable and will be determined internally. Field MAXCYC should be set to one (1) as the AIS announcement is a custom type announcement that ignores this field and is only played once.

The following figure depicts example datafill for the AIS announcement in table ANNS:

#### AIS Announcement Datafill for Table ANNS

| TABLE: ANNS |         |         |        |        |      |   |
|-------------|---------|---------|--------|--------|------|---|
| CLLI        | ANNARCH | TRAFSNO | CYTIME | MAXCYC | DATA |   |
| AIS_ANN     | NETWK   | 5       | 0      | 1      | AIS  | 1 |

### Table ANNMEMS

Table ANNMEMS must be datafilled to specify all members of the AIS announcement. The HDWTYPE field must be UAS and the CARD field must be AUD. Since it is desired to provide the AIS announcement simultaneously to more than one user, additional members must be datafilled in this table. The following figure depicts example datafill for the AIS announcement in table ANNMEMS with two members defined:

**AIS Announcement Datafill for Table ANNMEMS**

| TABLE: ANNMEMS |       |         |  |
|----------------|-------|---------|--|
| ANNMEM         |       |         |  |
| HDWTYPE        | CARD  | MEMINFO |  |
| -----          |       |         |  |
| AIS_ANN 0      |       |         |  |
| UAS            | AUD 1 | AUD 0   |  |
| AIS_ANN 1      |       |         |  |
| UAS            | AUD 1 | AUD 0   |  |

**Table ANNPHLST**

Table ANNPHLST is used to create the AIS announcement from individual phrases. Two new external phrase names are introduced by this activity as valid entries for field PHSLIST. These phrase names are AISBASEDN and AISREFDN. The phrase AISBASEDN represents the digits of the subscriber's old directory number or base DN. The phrase AISREFDN represents the digits of the subscriber's new directory number or reference DN. The following figure depicts example datafill for the AIS announcement in table ANNPHLST:

**AIS Announcement Datafill for Table ANNPHLST**

| TABLE: ANNPHLST |           |         |            |
|-----------------|-----------|---------|------------|
| ANNPHKEY        |           | PHSLIST |            |
| -----           |           |         |            |
| AIS_ANN         | 1         |         |            |
| (               | AUD_2014) | (       | AISBASEDN) |
|                 |           | (       | AUD_2015)  |
|                 |           | (       | AISREFDN)  |
|                 |           |         | \$         |

All the phrases present in the phraselist must be assigned or recorded on the UAS. Exceptions to this are the phrases AISBASEDN and AISREFDN, which are manipulated internally to produce a phraselist composed of digits. In the above example, AUD\_2014 and AUD\_2015 are simple text phrases recorded by the Telco. They would be similar to the following: *AUD\_2014-- "The number you have called"* and *AUD\_2015-- "has been changed. The new*

*number is*". The result of the entire tuple in ANNPHLST would be *"The number you have called, OLDNUMBER has been changed. The new number is NEWNUMBER"*.

If multiple cycles of this announcement are desired, repeat the ANNPHLST datafill [in the above example, the tuple would be (AUD\_2014) (AISBASEDN) (AUD\_2015) (AISREFDN) (AUD\_2014) (AISBASEDN) (AUD\_2015) (AISREFDN)].

Also, if a tone or treatment is desired after the AIS announcement completes, add the phrase associated with the desired treatment to the end of the phraselist. In the above example, assuming AUD\_2016 is T120 tone, a fifth phrase is added to the phraselist to provide T120 tone after the AIS announcement [(AUD\_2014) (AISBASEDN) (AUD\_2015) (AISREFDN) (AUD\_2016)].

### AIS Data Organization

There are three tables associated with AIS that were introduced previously via activity BV1522. These tables are also utilized by this activity, though some of the fields associated with them are not applicable to this design. These tables are presented below.

#### Table PAUSPATT

This table is intended to define the location of pauses during the speaking of the AIS base and reference directory numbers. This ability is required for the DRAM platform. Given that the Telefonica requirement is specific to the UAS, the functionality of this table is not relevant as the UAS has its own pause formatting scheme. However, the key of table PAUSPATT is a required field in table AISDBS, so it is necessary to add datafill as shown in the following figure:

**AIS Datafill for Table PAUSPATT**

| TABLE: PAUSPATT |       |       |       |       |
|-----------------|-------|-------|-------|-------|
| PAUSKEY         | PAUS1 | PAUS2 | PAUS3 | PAUS4 |
| UAS             | NP    | NP    | NP    | NP    |

#### Table ISCASSGN

This table introduces the Intercept Status Code (ISC), which is an organizational concept intended to simplify the association of an announcement and a number on intercept. [For example, a seven digit number may be routed to a different announcement than a ten digit number, so this

table would have two entries (i.e. c7 and c10) and the appropriate announcements would be associated here. This key (i.e. c7, c10) would then be referenced in table AISDBS as a quick way to route to the desired announcement.] The ISC concept is not utilized by this activity. The only field of interest in this table is AISMSG, which is used to define the announcement CLLI and index. The entry for field AISMSG must correspond to a valid entry in table ANNPHLST for the desired AIS announcement.

The following figure depicts example datafill for this table:

**AIS Datafill for Table ISCASSGN**

| TABLE: ISCASSGN |          |   |         |
|-----------------|----------|---|---------|
| ISCKEY          | AISMSG   |   | OVFLCHK |
| TMOUTCHK        |          |   |         |
| -----           |          |   |         |
| C7              | AIS_TEST | 1 | NONE    |
| NONE            |          |   |         |

Fields OVFLCHK and TMOUTCHK dictate routes for overflow and time-out conditions and are not utilized in this design. The overflow condition can be addressed by adding additional members for the AIS announcement or using a T-selector in TMTCNTL to specify a routelist. The time-out condition can be addressed by adding the desired treatment to the end of the announcement in table ANNPHLST, as discussed in section “Table ANNMEMS” on page 324.

### Table AISDBS

The main function of table AISDBS is to allow the Telco to associate a reference DN with the base DN. This table also utilizes the key fields from tables PAUSPATT and ISCASSGN. The following figure depicts example datafill for this table:

**AIS Datafill for Table AISDBS**

| TABLE: AISDBS |            |     |      |    |    |       |        |
|---------------|------------|-----|------|----|----|-------|--------|
| AISKEY        | AISPATT    | ISC | YR   | MT | DY | LOCAL | REFREQ |
| -----         |            |     |      |    |    |       |        |
| 9199911004    | UAS        | C7  | 2003 | 6  | 3  | Y     |        |
| DN            | 9199915555 | UAS |      |    |    |       |        |

The date field can be used as a reference by the Telco to identify how long the number has been or should be on intercept treatment; However, it is not used by this feature to provide any functionality. The pause information in fields AISPATT and PAUSREF is not needed by the UAS since it does its own audio formatting. The field ISC provides an association to the phraselist index in table ANNPHLST for the AIS announcement. Field LOCAL is not utilized by this activity and field REFREQ must be set to DN.

The index into table AISDBS is derived from the dialled digits of the originator. Any prefix digits dialled will be removed and the resulting digits will be used as the index into table AISDBS. This may result in the need to datafill multiple entries of a subscriber's old directory number in table AISDBS to address varied dialling plans of the originator (i.e. An example for the North American dialling plan might be to add a seven digit instance of the base DN for line terminations and a ten digit instance of the base DN for trunk terminations).

**Hardware Requirements or Dependencies**

This activity supports the AIS announcement on the UAS platform only. Therefore, AIS announcement members should not be defined on a MTM as this is not supported.

**Software Requirements or Dependencies**

None.

**Limitations and restrictions**

If the AIS announcement cannot be terminated upon during call processing (i.e. due to a problem in the UAS), the originator will be routed to GNCT treatment. If a problem is encountered providing the AIS announcement, the originator will be routed to BLDN treatment.

The index into table AISDBS is derived from the dialled digits of the originator. Any prefix digits dialled will be removed and the resulting digits will be used as the index into table AISDBS. This may result in the need to datafill multiple entries of a subscriber's old directory number in table AISDBS to address varied dialling plans of the originator (i.e. An example for the North American dialling plan might be to add a seven digit instance of the base DN for line terminations and a ten digit instance of the base DN for trunk terminations).

## Interactions

For ISUP and PRI terminations into the switch providing the AIS service, the OPRT treatment must be mapped as local via table TMTMAP for the AIS announcement to be provided. If OPRT is mapped remotely, the remote office will provide whatever treatment is datafilled there for OPRT treatment.

A flash attempt will be denied from a line connected to the AIS announcement. The flash capability and operation of a trunk terminating to the AIS announcement will be dictated by the switch associated with the trunk. Also, since flashing is denied, features that require flash for activation (such as CWT) will be denied when an agent is connected to an AIS announcement.

Call forwarding from a line to a number on AIS intercept is not supported. In the case of CFU, an attempt to forward to a number on AIS intercept will result in BLDN treatment given to the originator. In the case of CFB, the originator will receive BUSY treatment. In the case of CFD, the forward will not be attempted and the originator will continue to ring the base station. Call forwarding to a number on AIS intercept via trunk will function like a trunk termination to the AIS announcement. That is, the originator will receive the AIS announcement stating the old and new numbers associated with the forward-to number once the forwarding trigger is reached (i.e. busy condition for CFB or timer expiration for CFD).

No billing or AIS specific OM pegging is performed upon termination to the AIS announcement. The generic OMs associated with announcements are supported.

If the caller does not exit after the completion of the AIS announcement, the call will be routed to DISC (disconnect) treatment.

This feature supports the Primary and Secondary languages associated with the UAS through the assignment of the external phraseIDs LANGUAGE1 or LANGUAGE2 in table ANNPHLST. Specifying LANGUAGE1 will notify the UAS to play the announcement in its primary language and LANGUAGE2 will notify the UAS to play the announcement in its secondary language. The SL (Secondary Language) line option is not supported nor is the ability to specify a language directly via ANNPHLST datafill.

## ISN07 Feature Deltas

### ***Product = CS 2000***

#### **A00002713 -- Spanish ISUP enhancements for Telefonica (Intl UA-IP)**

##### ***Functional Description***

This feature extends the capabilities of the CS2000 Spanish ISUP V2 (PUSI 4/2) trunk interface to support additional capabilities used within the Telefonica España (TESA) network.

The existing CS2000 Spanish ISUP V2 (PUSI 4/2) interface is compliant to Telefonica specifications EG.S3.003 4th ed. and Appendices 1 and 2 with some minor limitations. It satisfies Spanish national network interconnect requirements.

This feature enhances the Spanish ISUP V2 (PUSI 4/2) interface to provide optional support for additional capabilities used within the Telefonica España (TESA) network, and specified in Telefonica specification Gt.EG.s3.403 Sections 5 and 6.

The main additional capabilities introduced by this feature are:

- A TESA defined “Call Stamp” in the IAM of all calls- comprising a Call Reference parameter to uniquely identify the call within the network.
- Support of Charge (#TAR) message enhanced at the call originating node.
- Number Portability support is enhanced to support use of Query on Release mode Local Network Portability within the Telefonica network.
- Transit Network Selection support.
- Barring of Reverse Charge Calls to certain (non-billable) lines.

Each capability will be individually controlled by datafill options and will only be supported on Spanish ISUP V2 trunks. Spanish ISUP V2 trunks are configured by the following set of field values in table TRKSGRP.

- External Protocol = ‘**Q767**’

ITU/ETSI ISUP variants in the CS2000 ISN load.

- Version='100\_WHITE'  
indicates that the variant is based on ITU White Book/ETSI ISUP V2 and
- Variant='SPAIN'  
marks the country specific variant as Spain

For example:

```
2W N N UNEQ NONE Q767 THRL 0 DMSNODE N N SPAIN 100_WHITE
$ ETSI CIC
```

Unless stated otherwise in the body of this document support for the features described in this document is limited to the scenario of PUSI 4/2 trunks interworking to Analog Lines - hosted on an MG9000 Gateway or connected via a PVG V5.2 Gateway as shown in the following figure.

### Supported configuration

## Telefonica defined PUSI requirements common to all Operating Companies as defined in GT.EG.S3.403 Section 5

This section describes the CS2000 implementation of Telefonica defined ISUP capabilities that are intended to be common across all Telefonica networks in all countries. These are specified in GT.EG.S3.403 Section 5.

### BACKWARD COMPATIBILITY (GT.EG.S3.403 Section 5.1)

The CS2000 implementation of PUSI 4/2 fully complies to this requirement for compatibility with the previous and future versions of PUSI, by compliance to Point 2.4. of Rec. Q.761 of the White Book.

### TIMERS (GT.EG.S3.403 Section 5.2)

The PUSI timer values agreed upon for all the Grupo Telefónica, are contained in the following table. The column on the left contains the timers; the 2nd column shows the values (0 range of values) allocated in Rec. Q.764 of the White Book ITU-T. The values that have been agreed upon by the Grupo Telefónica, can be seen in the 3rd column and the range configurable on the CS2000 in the 4th column.

Timers which are configurable on CS2000 are generally datafilled in table C7UPTMR. One or more tuples should be created in table C7UPTMR with the values required by the Telefonica network and associated to PUSI trunk groups.

**PUSI Timer Value**

| Timer           | Q.764 range | EG.S3.403 requirement | CS2000 range in C7UPTMR |
|-----------------|-------------|-----------------------|-------------------------|
| T1              | 15 - 60 s   | 30 s                  | 1 to 60                 |
| T2              | 3 m         | 3 m                   | 1 to 240                |
| T3              | 2 m         | 2 m                   | N/A                     |
| T4 <sup>a</sup> | 5 - 15 m    | 10 m                  | 1 to 326s               |
| T5              | 5 - 15 m    | 10 m                  | 1 to 900s               |
| T6              | Q.118       | 60 s                  | 1 to 240s               |
| T7              | 20 - 30 s   | 20 s                  | 1 to 60s                |
| T8              | 10 - 15 s   | 15 s                  | 1 to 60s                |
| T9              | Q.118       | 60 s                  | 1 to 300s               |
| T10             | 4 - 6 s     | 6 s                   | 1 to 30s                |
| T11             | 15 - 20 s   | 15 s                  | 1 to 60s                |
| T12             | 15 - 60 s   | 30 s                  | 1 to 60s                |

**PUSI Timer Value**

| <b>Timer</b> | <b>Q.764 range</b> | <b>EG.S3.403 requirement</b> | <b>CS2000 range in C7UPTMR</b> |
|--------------|--------------------|------------------------------|--------------------------------|
| T13          | 5 - 15 m           | 10 m                         | 1 to 900s                      |
| T14          | 15 - 60 s          | 30 s                         | 1 to 60s                       |
| T15          | 5 - 15 m           | 10 m                         | 1 to 900s                      |
| T16          | 15 - 60 s          | 30 s                         | 1 to 60s                       |
| T17          | 5 - 15 m           | 10 m                         | 1 to 900s                      |
| T18          | 15 - 60 s          | 30 s                         | 1 to 60s                       |
| T19          | 5 - 15 m           | 10 m                         | 1 to 900s                      |
| T20          | 15 - 60 s          | 30 s                         | 1 to 60s                       |
| T21          | 5 - 15 m           | 10 m                         | 1 to 900s                      |
| T22          | 15 - 60 s          | 30 s                         | 1 to 60s                       |
| T23          | 5 - 15 m           | 10 m                         | 1 to 900s                      |
| T24          | < 2 s              | 1.5 s                        | 100 to 2000ms                  |
| T25          | 1 - 10 s           | 10 s                         | 1 to 30s                       |
| T26          | 1 - 3 m            | 2 m                          | 1 to 240s                      |
| T27          | 4 m                | 4 m                          | 1 to 300s                      |
| T28          | 10 s               | 10 s                         | 1 to 30s                       |
| T29          | 300 - 600 ms       | 500 ms                       |                                |
| T30          | 5 - 10 s           | 8 s                          |                                |
| T31          | > 6 m              | ( * )                        |                                |
| T32          | 3 - 5 s            | ( * )                        |                                |
| T33          | 12 - 15 s          | 15 s                         |                                |
| T34          | 2 - 4 s            | 2 s                          |                                |
| T35          | 15 - 20 s          | 15 s                         |                                |
| T36          | 10 - 15 s          | 15 s                         |                                |
| T37          | 2 - 4 s            | ( * )                        |                                |
| T38          | Q.118              | ( * )                        |                                |
| T39          | Q.730              | ( * )                        |                                |

**PUSI Timer Value**

| Timer                                   | Q.764 range | EG.S3.403 requirement | CS2000 range in C7UPTMR |
|-----------------------------------------|-------------|-----------------------|-------------------------|
| NortelT35 = initial interdigit timer    | -           | -                     | 1 to 60                 |
| NortelT37 = subsequent interdigit timer | -           | -                     | 1 to 30                 |

a. Not required by Telefonica ISUP - Call Modification not supported

**Call Stamp (GT.EG.S3.403 Section 5.3.1)****Overview**

The aim is to identify all the calls that enter the network in an unequivocal way, whether this be at the originating local exchange or the frontier exchange with other operators (national or international). There are basically two applications: to be able to use this information when providing services (whether they be on the Intelligent Network or not), and to be able to relate the various records, for rating, statistics, or of another kind, that can be carried out at different nodes on the network.

This service is supported by the CS2000 for calls originating from and Terminating to Lines on the CS2000.

**Encoding**

“Call reference” and “Generic Digits” are the two parameters that carry this information.

- “Call reference”:

The “call reference” parameter is as specified in Q.763 [3]. The increasing send interpretation will be applied in both fields of this parameter, that is, the least significant bit in the “call identity” field, is bit 1 of octet 1, and the most significant one is bit 8 of octet 3, whereas bit 1 of octet 4 is the least significant one in the “point code” field and bit 6 of octet 5 is the most significant one.

- “Generic Digits”:

Generic digits implementation is backed out as it is not required by Telefonica.

**Procedure**

The procedure to be followed at the originating exchanges, will be the same for local exchanges and for frontier exchanges. The originating exchange will

carry out the following actions, whether the call is generated from the network itself, or whether it comes from another network:

It will generate the “call reference”.

It will make a note of all the parameters in the respective register: the rating register at the local exchanges and the accountancy register at the frontier exchanges.

It will include call reference in the PUSI initial address message

The pure transit exchanges that do not have to make any note, will pass this parameter without making any modification at all.

**Note:** CS2000 does not support this SSP related functionality at present.

The destination exchanges will discard and will carry on as if they had not received them, if they do not have any specific procedure enabled.

The network outlet exchanges will make a note of this information in the accountancy registers, and will remove the parameters, unless they have a specific agreement with the next network.

#### CS2000 Datafill Control of Call Stamp

##### a) Call Reference Parameter:

This feature meets the Telefonica requirements for the Call Reference parameter for calls originating and terminating to analog lines on the CS2000 and entering or leaving the Telefonica network on Spanish ISUP V1 & V2 or Base ETSI ISUP V2 trunks.

It extends the generic ETSI ISUP Call Reference capability implemented by A59023264.

Calls that enter the Telefonica Spanish ISUP V2 network on Spanish ISUP V1 or V2 or ETSI ISUP V2 will be handled as described in feature A59023264.

To control generation of the Call Reference parameter in the IAM for calls from Lines to Spanish ISUP V2 trunks a new service “CALLREF” is introduced to table ISUP SVC. The CALLREF service will have a vector of options to control which scenarios the trunks should add a Call Reference parameter for. In this release only one option value will be available

- “LINE” - to indicate that the call reference parameter is required to be generated for Line originated calls.

#### CALLREF LINE

This option will only take effect on trunk groups that also have the TRKOPTS option CALLREF datafilled with no suboptions.

The Call Reference parameter may be optionally captured in the AMA billing record as described in A59023264. This capability is extended to the Line origination and termination scenario by the CALLREF LINE option. This option needs to be datafilled for generating AMA records for Call reference in line origination and termination scenario.

### Functional Behavior Diagram

:

**Setting of TRKOPTS and ISUPSVC options for Telefonica network to generate Call Reference for all Line originations**

| <b>Trunk</b>                                                   | <b>TRKOPT CALLREF Datafill</b>       | <b>ISUPSVC CALLREF Datafill</b> |
|----------------------------------------------------------------|--------------------------------------|---------------------------------|
| Internal trunks within Telefonica network - T2, T3, T4, and T5 | CALLREF \$                           | CALLREF LINE                    |
| T1 and T6 if two-way trunks                                    | CALLREF (ADD_OVERWRITE )(DELETE ) \$ | don't care                      |
| T1 if it is a one-way incoming trunk                           | CALLREF (ADD_OVERWRITE ) \$          | don't care                      |
| T6 if it is a one-way outgoing trunk                           | CALLREF (DELETE ) \$                 | don't care                      |

Refer to A59023264 for full details of the Call Reference support on CS2000.

**SAMPLE DATAFILL FOR CALLSTAMP****1 . CALLREFERENCE PARAMETER****TABLE: TRKSGRP**

ETSIV2IC 0 DS1SIG C7UP 2W N N UNEQ NONE Q767 THRH 0  
DMSETSI N Y **SPAIN 100\_WHITE** \$ ETSI2W CIC

ETSIV2OG 0 DS1SIG C7UP 2W N N UNEQ NONE Q767 THRH 0  
DMSETSI N Y **SPAIN 100\_WHITE** \$ ETSI2W CIC

ETSIV2OG and ETSIV2IC, the outgoing and incoming trunks, are configured as Spain variants.

**TABLE: ISUPSVC**

EIV2\_SPAIN (SPAIN \$) (CALLREF LINE \$)

Define a key "EIV2\_SPAIN" in ISUPSVC with option SPAIN. This will be used to configure a trunk as a telefonica trunk when used in table TRKOPTS. Also add option CALLREF with suboption LINE. This option controls the CALL REFERENCE parameter generation for calls originated from line to TELEFONICA trunk. This option also controls AMA billing record generation for line origination and termination within telefonica network along with the existing option "STORE\_CALLREF" in table AMAOPTS.

**TABLE: TRKOPTS**

ETSIV2OG ISUP SVC ISUP SVC EIV2\_SPAIN

**TABLE: AMAOPTS**

STORE\_CALLREF ON

Call Reference parameter is captured in AMA record in module code.

e.g. “calldump full “command after the call, check for:

|                           |        |                              |
|---------------------------|--------|------------------------------|
| MODULE CODE:              | 611C   | GENERIC MOD: ONE DGT STR FMT |
| GENERIC CONTEXT ID:       |        |                              |
| PARSE RULES               | 80035  | CALL REFERENCE               |
| SIGNIFICANT DIGITS        | 00C    | NIL                          |
| GENERIC DIGIT STRING ONE: |        |                              |
| CALL ID                   | 590029 |                              |
| POINT CODE                | 0FA3   |                              |
| SPARE                     | 00000C |                              |

The non full version (i.e. just “calldump” command on CI), look for:

Subrecord data:

```

MODULE_CODE_ID 611C
GENERIC_CONTEXT_ID 8003500C
GENERIC_DIGIT_STRING DF007F958000000C

```

To control Call Reference for transit scenario follow the TRKOPTS datafill as mentioned in table 1 in page 161. An example is shown below, note that this is not the complete datafill in table TRKOPTS for call reference, derive the datafill required from the above mentioned table or refer to feature A59023264 in fmdoc for the exhaustive list.

**TABLE: TRKOPTS**

ETSIV2IC CALLREF CALLREF ADD\_OVERWRITE

**Services in IN (GT.EG.S3.403 Section 5.3.2)**

**The CS2000 does not support this service.** If the generic digits parameters related to this service are received by CS2000 they will be handled according to their corresponding PCI instructions.

The generic digits parameters related to this service are encoded:

*“correlationID” would be as follows: the “encoding scheme” must be 011 (binary) and code 11100 (correlationID) would be used as “type of digits”.*

*“SCFID” would be as follows: the “encoding scheme” must be 011 (binary) and code 11011 (SCFID) would be used as “type of digits”. The digits” field would be encoded as the parameter “call party address” of the SCCP.*

### **Authorization and account codes (GT.EG.S3.403 Section 5.3.3)**

**The CS2000 does not support this service.** If the generic digits parameters related to this service are received by CS2000 they will be handled according to their corresponding PCI instructions.

The generic digits parameters related to this service are encoded as follows:

*The encoding details depend on the specific application. For example, if the local originating exchange receives these codes and cryptographs, which increases the safety of these procedures, then the “encoding scheme” must be 011 (binary encoded). The relevant code would be used as “type of digits”, 00000 for the account code or 00001 for the authorization code.*

This service may be implemented on CS2000 by inband transmission over ISUP trunks of the Authorization and account codes as DTMF digits.

### **Corporate networks (GT.EG.S3.403 Section 5.3.4)**

**The CS2000 does not support this service.** It will not generate the format of generic digits parameter used by this service. If the generic digits parameter related to this service are received by CS2000 they will be handled according to their corresponding PCI instructions.

The generic digits parameters related to this service are encoded as follows:

*The “encoding scheme” must be 011 (binary), and code 00011 (company communications) would be used as “type of digits”. The corporate network code in “digits” would go in 2 octets (65536 possibilities).*

### **PARAMETERS CONFIGURABLE BY ROUTE (GT.EG.S3.403 Section 5.3.4)**

Telefonica requires that frontier exchanges must be able to restrict sending certain parameters out of the network on the basis of the incoming or outgoing route of the call. These parameters will only go to those other routes with which an agreement exists to that effect.

The list of parameters that have to be able to be configurable by route, is defined below.

- Calling number
- Connected number
- Generic number
- Generic digits
- User-to-user information

CS2000 supports this requirement for parameters in the IAM by use of existing table ISPARM. This table allows the network operator to specify one or more parameter(s) to be blocked/removed from an outgoing IAM on a set of trunk groups that are associated to a particular entry in table ISPARM. Any optional parameter can be removed using this table.

Certain parameters in the IAM and other messages may also be blocked by specific datafill that controls the use of messages and parameters on a per service basis.eg: Controls for the User-to-user Service and Call Reference capability.

## **NETWORK SPECIFIC REQUIREMENTS (GT.EG.S3.403 Section 6)**

### **(GT.EG.S3.403 Section 6.1) CTC REQUIREMENTS**

Not Applicable

### **(GT.EG.S3.403 Section 6.2) TASA REQUIREMENTS**

Not Applicable

### **(GT.EG.S3.403 Section 6.3) TDP and TESA REQUIREMENTS**

The following subsections follow the **GT.EG.S3.403** section numbering

#### **(GT.EG.S3.403 Section 6.3.1) Caller categories (TDP requirement)**

Not Applicable

#### **(GT.EG.S3.403 Section 6.3.2) Malicious call (TESA requirement)**

If the destination local exchange does not have the complete calling number. It will make use of the information request procedure to request it. Q.764 xxx2.1.6

The bits for the parameter “information request indicators” that are encoded to 1 are as follows: / “a calling party request indicator”) and H (“malicious call identification request indicator”). The rest will go to 0.

#### **(GT.EG.S3.403 Section 6.3.3) Rating (TESA requirement)**

The following subsections follow the GT.EG.S3.403 section numbering.

### 6.3.3.1 General

Telefónica de España requires the following rating procedure, which makes use of the rating information message #TAR and a parameter referred to as &TFA.

| Rating information message ( #TAR ) ( national use ) |      |        |  |
|------------------------------------------------------|------|--------|--|
| Parameter                                            | Type | Length |  |
| Type of message                                      | F    | 1      |  |
| &TFA                                                 | F    | 5      |  |

### 6.3.3.2 Encoding

The rating information message (#TAR) has only two parameters, both compulsory and of fixed length: message type and rate.

The code 1111 1000 has been allocated to the rate parameter (&TFA), but it is never used, given that it is only used in the message #TAR, where it is compulsory. It occupies 5 octets and is compulsory in the message #TAR. The least significant bit in octet 1, indicates whether octets 2 and 3, which contain rating information, are relevant or not; the following less significant bit, indicates whether octets 4 and 5, which contain charging information, are relevant or not; the rest of the bits in the octet are reserved. Octets 2 and 3, indicate the type of rate. Octets 4 and 5 indicate a number of monetary units to charge to the call.

The name and code of the parameter used is indicated in the following table.

| ACRONYM | NAME | REF | CODE      | notes |
|---------|------|-----|-----------|-------|
| &TFA    | Rate |     | 1111 1000 | @     |

@ = national use parameter.

The format ~TFA can be seen in the figure:

```

Reserve   InP   InT
Type of rate
Monetary units

```

The fields for this parameter are as follows:

InT (rate indicator): indicates whether the rating information (the type of rate) included in the parameter is relevant or not.

0: the rating information (octets 2 and 3) is not relevant

1: the rating information (octets 2 and 3) is relevant

InP (call price indicator): indicates whether the charging information (the monetary units) included in the parameter is relevant or not.

0: the charging information (octets 4 and 5) is not relevant

1: the charging information (octets 4 and 5) is relevant

The type of rate: a code that expresses the number for the type of rate that is to be applied (0-65535) in pure binary form (the most significant bit is 8 from octet 3, and the least significant bit is 1 from octet 2).

d) Monetary units: a code that indicates the number of units to be added to the call, expressed in pure binary form (the most significant bit is 8 from octet 5, and the least significant bit is 1 from octet 4).

### 6.3.3.3 Procedure

The rating procedure that determines the use of the rating message #TAR, together with the use of the various rating indicators (such as those that appear in the “backward call indicators”), is explained in the rating Specification that is in force. The procedures that are followed by default, are explained below.

Criterion for determining whether a call is subject to a rate being applied: all calls will be rated except in the following circumstances:

- If the rate to be applied is zero
- If the final value received for the “backward call indicators” in the “charge indicator”, is “no charge” (01), and none of the values received beforehand, if any had been received beforehand, came with the “charge” (10) meaning.

Call rate determination criterion: the originating local exchange will determine the rate to be applied to the call. If a #TAR is received with relevant rating information prior to the address complete message (#MDC) (or the connection message, #COX), then it will apply that rate, and not the one calculated previously. Furthermore, if a #TAR is received at any time, with relevant charging information, it will add to the caller's meter, the value concerned to the price of the call indicated in the message.

**The CS2000 will not generate the TAR message in this release.**

In transit, the #TAR message will pass without any modifications at all.

**(GT.EG.S3.403 Section 6.3.4) Number Portability (TESA requirement)**

**This requirement is replaced by that in Addendum A.**

This activity implements Numbering Portability by the method of Query on release. Number Portability by IN is covered by a separate activity A00002678

LNP QoR functionality is enabled by existing options in table ISUPSVC which was implemented by feature A59027497.

Additionally, a release cause indicator #126 is supported on spanish trunks for ported numbers. This is controlled by an option in table ISUPSVC in SPAIN service, "NATL\_LNP\_QOR". This is a symbolic option, if this option is datafilled along with LNP service datafill, then a cause value of #126 will be sent for ported numbers otherwise the default cause value 14 will be sent on ported number.

Additionally, accepting NOA value #126 is supported on Spanish ISUP variant having SPAIN service datafilled in table ISUPSVC.

**SAMPLE DATAFILL for LNP QoR**

Datafills as mentioned in Activity A59027497 is required in addition to the following datafills.

**TABLE: TRKSGRP**

**TABLE: TRKOPTS**

ETSIV2IC ISUPSVC ISUPSVC EIV2\_SPAIN

**(GT.EG.S3.403 Section 6.3.6) Selection of the Transit Network (TESA requirement)**

**This requirement is amended by that in Addendum A.**

It is necessary to prepare the network to allow the user to select the transit network that each call should use. The issue that concerns the PUSI is how to transport this information and - keeping in mind that in Spain we will soon have other basic telephony service local operators besides Telefónica - indicate

to the transit network if the call is offered by subscriber / user selection or through the choice of the operator that provides the access.

It is necessary to note that the existence of several local operators and several transit networks in a same country requires an agreed national network signaling (PUSI) that must be used between frontier exchanges of different networks.

The future anticipates the possibility of selecting a transit network by pre-assignment for all calls of a certain type; in this case, when a user uses the generic dialing (without explicit selection), the calls will be offered to the pre-assigned transit network. Otherwise, the local operator will choose the transit network to which to offer the call.

Whenever the call is offered to a transit network, it must be informed that this call has been offered by user selection (explicit selection or pre-subscription); keeping in mind the existence of local operators other than Telefónica, there will be calls established between subscribers of different local operators that, even without selecting the transit network, must cross the frontier exchanges of these operators and must be discriminated from the former for statistical and accounting purposes.

The origin local exchange will include the Transit Network Selection parameter in the Initial Address Message. This parameter will also be included in the Initial Address Message when the transit network selection is carried out by pre-assignment. This parameter will contain the digits that identify the selected transit network. The transit exchanges will analyze the content of the Transit Network Selection parameter received in the Initial Address Message to route the call to the frontier exchange with the Operator selected by the user. In the frontier exchanges, the initial address messages that do not contain the Transit Network Selection parameter will correspond to calls that do not require the transit network selection.

The following strategy will be used to introduce this parameter:

The update process will take some time during which the prefixes method will be used. In other words, the CSO (Operator Selection Code) will be used as prefix in the Called Party Number parameter. First, the transit network will be updated so that it supports the Transit Network Selection parameter; then, the entire access network will be updated, and when all the network exchanges support the Transit Network Selection parameter (even if they are not using it), it will be necessary to determine a point in time in which to carry out the change. The exchanges will have both logics implemented (prefix and use of the Transit Network Selection parameter), and at the time determined, the change will be made from one logic to another. At this time, the exchanges will begin to send the Transit Network Selection parameter, as well as the Called

Party Number parameter without the prefix. The Transit Network will already be prepared to handle it.

The coding of the transit network selection parameter will be made according to Recommendation Q.763, as shown in the figure:

Even /odd Type of network identifier Network identification plan. Network identifier

a) Odd / even indicator: 0 = even number of digits. 1 = odd number of digits.

a) Odd / even indicator: 0 = even number of digits. 1 = odd number of digits.

b) Type of network identifier: 010 = national code.

c) Network identification plan: 0000 = default value.

d) Network identifier: BCD coding of the digits that identify the selected transit network.

The possible user dialing that will allow the transit network selection for each call will be of the type indicated next:

### **CS200 Implementation**

TNS implemented by activity A59017057 will be reused for this feature.

This feature ensures CDPN format requirements for telefonica can be selected due to Spanish ISUP variant and existing Carrier Selection/Preselection datafill. Note that TNS parameter is not supported by this activity.

The carrier selection related information can be sent out either in the Transit Network Selection (TNS) parameter or to the called party number (CDPN) parameter. This is controlled by an option in on the outgoing trunk group or the route.

The Carrier Selection related information, the Carrier Access Code (CAC) and the Carrier Identification Code (CIC) can either be transported in the Transit Network Selection Parameter (TNS) or the Called Party Number plus (CDPN+). The Called Party Number plus consists of a prefix ('10xx', '10' = CAC and 'xx' = CIC) and the regular Called Party Number.

The decision which parameter will be used will be done by the CICOUT option in table PCIXLA or PCITRK. This option was implemented under "[2] A59012694.AA, Carrier Preselection and charge category based routing." This implementation adds the content of the field DIGSOUT in table PCIXLA as a prefix to the Called Party Number. Therefore this field has to be datafilled with the CAC and CIC information (e.g. '10xx').

In case the CICOUT option is not present in tables PCIXLA or PCITRK, the CIC information will be sent in the Transit Network Selection parameter (TNS). The mechanism for routing according to this information is covered in "[1] A19008748.AA, Austrian ISUP - TNS parameter invoked routing and CLI screening."

Decision either TNS or CDPN+ is used to transport CS information.

**(GT.EG.S3.403 Section 6.3.7) Vacant Lines (TESA requirements)**

CS2000 does not support this requirement. It is not possible to initiate a call from a vacant line on CS2000.

**(GT.EG.S3.403 Section 6.3.8) Compatibility Information (TESA requirement)**

CS2000 is compliant to the following requirements, with no datafill control required.

**6.3.8.1 Minimum value of message**

This edition does not use any message defined by Telefónica de España.

**6.3.8.2 Minimum value of a parameter**

The minimum value of the compatibility information value for a parameter, is the following encoding: “transit interpretation”, “do not release call”, “do not send notification”, “do not discard message (pass it on)” and in the “pass indicator not possible” field, “discard parameter”.

This is the one that will be used by default in the parameters defined by Telefónica de España.

**(GT.EG.S3.403 Section 6.3.9) Reverse charge tagging (TESA requirement)**

With respect to reverse charge calls through the operator, it is possible that the person who picks up the telephone and informs the operator that he or she is willing to pay for the call, will not necessarily be the person who eventually does pay for it. As a result, frauds could take place in public places, such as hospitals and hotels, which are provided with direct dialling from extensions.

If this situation is to be prevented, it is necessary to tag the reverse charge calls. With a view to this, bit N from the parameter “forward call indicators” will be used to mean “indicated: reverse charge call”, and will be encoded in the following way: if N = 0: ordinary call, if N = 1: reverse charge call. Certain exchanges will generate it, it will pass transparently through transit, and the relevant procedure will be applied at the destination (it will be ignored by default). The frontier exchanges will either set it at 0 or let it pass through transparently, depending on the route.

**Note: Cs2k does not set Bit N to 0 or 1 i.e. the frontier exchange capability is not supported. The functionality supported by this activity is just as described in the following paragraph.**

Reverse charge tagged calls indicated by the N bit set to 1 in “forward call indicators” will not be allowed to terminate on a line with ACCB (Automatic collect call blocking) option enabled. This will be controlled by an option **REV\_CHG** in table ISUP SVC on the incoming trunk. Calls will be checked for reverse charge (bit N) only if this option is datafilled on the incoming spanish ISUP trunk.

## Software Requirements or Dependencies

This feature is an increment to the Spanish ISUP V2 functionality in NSUP0001. Feature reference 59027768: SPANISH ISUP - V2 VARIANT'

## Limitations and restrictions

### Agent Interworking

This capabilities introduced by this feature are only supported for the agent interworkings given below. The feature should not be activated on Spanish ISUP v2 trunks that will have any other interworkings as the behavior in other scenarios is undefined.

#### Agent interworking for the current feature

| Platform | Originator                 | Terminating agents |                 |                            |                        |

## Interactions

The current activity interacts with the features listed below and their dependencies to support Line HW Metering and Software Metering and Billing when the charge determination point for the call is not the originating office and the call tariff and/or incremental charges are signalled across the ISUP network:

- i. NAOC for Spanish Trunk Metering Enhancements [7]
- ii. Software Metering Billing support [8]
- iii. Full Line HW Metering Billing compliance [9]

A brief overview of the feature interworkings is depicted in the following figure, “New NAOC features interworking”.

#### New NAOC features interworking

#### Hardware Requirements or Dependencies

No new hardware requirements or dependencies specifically for this feature.

### Parameter information

#### ORIGNETID

Originating Network Identification

#### Functional description

This parameter will be datafilled with a numeric value. This parameter determines the originating network identification number. This value is in the range (0 to 65535). This parameter will be the default value and is used for calls from line agents.

For Interconnect trunks, this value will be different and will be datafilled in the table TRKOPTS against the corresponding spanish ISUP V2 trunk.

#### Provisioning rules

***Product = CS 2000*****A00002754 -- China INAP Compliance Enhancement Part 1 (Succession on DMS)*****Functional Description***

This feature is to improve Nortel SSP's INAP functionality to comply with China INAP requirement.

**Functional Overview**

The enhancement is based on the China INAP specification and China INAP test specification (see reference 1, 2). Following enhancement is provided:

- CallGap(CG) parameter support enhancement: gapInterval.
- Multiple CallGaps support enhancement.
- ResetTimer parameter support enhancement: timerValue.
- CallInformationRequest/Report parameter support enhancement: legID, calledAddress & releaseCause.
- ActiveServiceFiltering parameter support enhancement: sfBillingRecordCharacteristics.
- ApplicationContextName negotiation support.
- ApplyChargingReport enhancement: conversation time measurement
- Support CS-1R ICA.

This feature is developed for both TDM and IP platform.

These functions are not agent specific, they are supported on the originating agents with the condition: the originating agent <-> INAP interworking is ALREADY supported. For example, China ISUP, IBN lines, SIP-T (no ISUP), China PRI.

The office parameter: INAP\_Variant is used for China INAP specific enhancement: only when INAP\_Variant = Chinese, the China INAP specific enhancement will take effect.

Following sections give detail of this feature:

### **CG parameter Support Enhancement: gapInterval**

This enhancement is general for all INAP market.

This enhancement is to enhance the processing for gapInterval value '0'.

The CG parameter gapInterval specifies the minimum time between calls being allowed through. A CG with gapInterval = 0 indicates that calls matching the CG's gapCriteria are not to be rejected. An InitialDP is sent to SCP, with cGEncountered set to the value of this CG's controlType.

**Note:** InitialDP will carry the cGEncountered when 'CGE' is datafilled in INITDP\_PARMS of table SERVINFORM.

### **Multiple CGs Support Enhancement**

This enhancement is to comply with China INAP specific rules for multiple CGs scenarios (please refer to reference 2):

Suppose: CG2 is received after CG1, within CG1's duration.

#### **1. Two CGs with same gapCriteria but different controlType**

This enhancement is China INAP specific.

In this scenario:

- CG1's data should be overwritten by CG2 EXCEPT the controlType: the gapIndicator in CG1 is replaced by CG2's gapIndicator, gapTreatment in CG1 is replaced(or appended) by CG2's gapTreatment if it exists in CG2.
- The controlType is set to manuallyInitiated because its priority is higher.

As a result, there won't be a new CG data saved for CG2 but CG1's parameters are updated. For example: Following two CGs are received,

#### **CG1 and CG2 with Same gapCriteria But Different controlType**

```
CG1{
  gapCriteria {gapOnService 200}
  gapIndicator {duration=30000sec, gapInterval=30sec}
  controlType=manuallyInitiated
}
```

**CG1 and CG2 with Same gapCriteria But Different controlType**

```
CG2{
  gapCriteria {gapOnService 200}
  gapIndicator {duration=60000sec, gapInterval=60sec}
  controlType= sCPOverloaded
  gapTreatment {toneID=1, duration=10}
}
```

Then CG1 will be updated to:

**Updated CG1**

```
CG1{
  gapCriteria {gapOnService 200}
  gapIndicator {duration=60000sec, gapInterval=60sec}
  controlType=manuallyInitiated
  gapTreatment {toneID=1, duration=10}
}
```

When next INAP calls comes in, the above CG data will be used.

In the above example, if CG1's controlType is sCPOverloaded and CG2's controlType is manuallyInitiated, the updated CG1 will be the same with that is shown in Table "Updated CG1" because manuallyInitiated has higher priority.

**1. Two CGs with different gapCriteria**

This enhancement is general for all INAP market.

In this scenario, these two CGs co-exist in SSP. If an IN service is to be triggered and it meets both of these two CG's criterias, then the CG to be activated should be the one whose criteria is more specific.

"More specific" means: first, gapCriteria has a higher priority. Following list shows gapCriteria from high priority to low priority:

- calledAddressValueAndService
- calledAddressValue
- callingAddressValueAndService
- gapOnService

Second, if two CGs have a gapCriteria with same priority, "More specific" means the gapCriteria is more detail. Following are examples:

- a. For gapCriteria calledAddressValueAndService, calledAddressValue and callingAddressValueAndService, if two CGs are found in both control types(manuallyInitiated and sCPOverloaded), the CG, whose gapCriteria has higher priority, takes effect.

For example: Following two CGs are received,

**CG1 and CG2 with gapCriteria: calledAddressValue**

|                                                                                                                                                 |
|-------------------------------------------------------------------------------------------------------------------------------------------------|
| <pre>CG1{   gapCriteria{calledAddressValue, 8765}   gapIndicator {duration=60000sec, gapInterval=60sec}   controlType=manuallyInitiated }</pre> |
| <pre>CG2{   gapCriteria{calledAddressValue, 87654}   gapIndicator {duration=60000sec, gapInterval=60sec}   controlType=sCPOverloaded }</pre>    |

when an IN service with calledAddressValue is 876543 is to be triggered, CG2 should be activated because its matched address value is longer, in another word, it's more specific.

- a. For gapCriteria gapOnService, the one has an exact match takes effect. For example: Following two CGs are received,

**CG1 and CG2 with gapCriteria: gapOnService**

|                                                                                                                                        |
|----------------------------------------------------------------------------------------------------------------------------------------|
| <pre>CG1{   gapCriteria{gapOnService, 1}   gapIndicator {duration=60000sec, gapInterval=60sec}   controlType=manuallyInitiated }</pre> |
| <pre>CG2{   gapCriteria{gapOnService, 10}   gapIndicator {duration=60000sec, gapInterval=60sec}   controlType=sCPOverloaded }</pre>    |

When an IN service is to be triggered and

- if the service key is 1, CG1 should be activated;
  - if the service key is 10, CG2 should be activated;
  - if the service key is 101, no CG should be activated.
- a. If the criteria is met in both control types and they are the same specific, the CG whose controlType is manuallyInitiated takes effect because its priority is higher. For example: the incoming call matches the criteria of two CGs (Table “CG1 and CG2 have the same

gapCriteria but different controlType”), in this case CG1 should take effect if both of them meet the gap criteria.

#### CG1 and CG2 have the same gapCriteria but different controlType

|                                                                                                                                                 |
|-------------------------------------------------------------------------------------------------------------------------------------------------|
| <pre>CG1{   gapCriteria{calledAddressValue, 8765}   gapIndicator {duration=60000sec, gapInterval=60sec}   controlType=manuallyInitiated }</pre> |
| <pre>CG2{   gapCriteria{calledAddressValue, 8765}   gapIndicator {duration=30000sec, gapInterval=60sec}   controlType=sCPOverloaded }</pre>     |

**Note:** This won't happen in China INAP because these two CGs can not coexist, see requirement (1).

#### RT Parameter Support Enhancement: timerValue

This enhancement is to extend the supported timerValue value.

In INAP call, timer Tssf is used to prevent the call from suspending too long, protect the dialogue between SSF and SCF. ResetTimer operation is sent from SCF to SSF, to restart Tssf timer using the timerValue, so that Tssf will not time out. It only takes effect in the following 3 states:

- waiting for instruction (WFI)
- waiting for end of user interaction (WFEOUI)
- waiting for end of temporary connection (WFEOTC)

This feature performs the following enhancement:

1. report UnexpectedDataValue error when the timerValue exceed 0-2047.

This enhancement is China INAP specific.

2. extend the supported timer values between 10 seconds & 60 seconds: 15, 20, 25, 30, 35, 40, 45, 50, 55 seconds support is added. For in-range value other than one of the above values, it is rounded up to the next supported value.

This enhancement is general for all INAP market.

3. extend the supported range for timerValue in WFI state to 1-60 seconds.

This enhancement is general for all INAP market.

## CIRQ/CIRP Parameter Support Enhancement: legID, calledAddress & releaseCause

This enhancement is general for all INAP market.

This enhancement is to:

1. support CS-1R CIRP: if CIRP is datafilled in the CS1R option of table SERVINFO, the outgoing CIRP will use the CS-1R format, the legID will not be included:

**Table 1 Table SERVINFO**

| SERVIDX | OPTION                                                                                                                                                                |
|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 200     | (INITDP_PARMS ( SERVKEY) (CDPA) (CLI) (CPC) (EVENT_TYPE) \$)<br>(TCAP_INFO ( INAP_OPT (AUTO_CONTINUE) \$) (TCAP_VERSION CCITT_V1) \$)<br>(CS1R ( <b>CIRP</b> ) \$) \$ |

2. add support for calledAddress and releaseCause parameters in CIRQ/CIRP:
  - calledAddress indicates the incoming called party address that was received by the SSF (i.e. before translation by the SCF) and is as available on the UNI or NNI and interpreted as per the numbering plan. The format is shown in Table “calledAddressValue Format (it uses the format of ISUP parameter: GenericNumber)”.
  - releaseCause is defined the same as Q.762, which is applied to the indicated or default party. The format is shown in Table “releaseCauseValue Format (same as ISUP parm: CauseIndicators)”. The diagnostics is not included in the releaseCauseValue of CIRP.

**Note:** for release cause, if the incoming release message is not in Q.762 format, then default value: ‘normal clearing’ is used.

**Table 2 calledAddressValue Format (it uses the format of ISUP parameter: GenericNumber)**

|                            |                             |   |   |                    |   |                |   |
|----------------------------|-----------------------------|---|---|--------------------|---|----------------|---|
| 8                          | 7                           | 6 | 5 | 4                  | 3 | 2              | 1 |
| Number qualifier indicator |                             |   |   |                    |   |                |   |
| Odd/even                   | Nature of address indicator |   |   |                    |   |                |   |
| NI Ind.                    | Numbering plan Ind.         |   |   | Presentation Ind.  |   | Screening Ind. |   |
| 2nd address signal         |                             |   |   | 1st address signal |   |                |   |
| .....                      |                             |   |   | .....              |   |                |   |
| Filler(if necessary)       |                             |   |   | nth address signal |   |                |   |

**Table 3 releaseCauseValue Format (same as ISUP parm: CauseIndicators)**

| 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 |
|---|---|---|---|---|---|---|---|
|---|---|---|---|---|---|---|---|

**Table 3 releaseCauseValue Format (same as ISUP parm: CauseIndicators)**

|                      |                 |       |              |
|----------------------|-----------------|-------|--------------|
| Ext.                 | Coding standard | spare | Location ... |
| Ext.                 | Cause Value     |       |              |
| Diagnostics (if any) |                 |       |              |
| .....                |                 |       |              |
| Diagnostics (if any) |                 |       |              |

**ASF Parameter Support Enhancement: sFBillingRecordCharacteristics**

This enhancement is general for all INAP market.

This enhancement is to provide support the sFBillingChargingCharacteristics. Whatever received, this parameter and sub-parameter is treated as: noINCharging.

The following functions are provided for sFBillingChargingCharacteristics subparameter:

- noINCharging
- iNCharging
- sendChargeInformation

**Note:** the decoding of sFBillingChargingCharacteristics is not supported. When received correct sFBillingChargingCharacteristics, no handling, no reject or return error. When received sFBillingChargingCharacteristics with problems, no handling, no reject or return error.

Following table gives the definition of SFBCC (highlighted in bold):

**China INAP ActiveServiceFiltering Definition:**

```
ActiveServiceFiltering ::= SEQUENCE {
    filteredCallTreatment [0] IMPLICIT SEQUENCE {
        sFBillingChargingCharacteristics [0] CHOICE {
            noINCharging [0] IMPLICIT NULL,
            iNCharging [1] IMPLICIT SEQUENCE {
                ..... } OPTIONAL },
            sendChargeInformation [2] IMPLICIT SEQUENCE {...} } OPTIONAL,
        informationToSend [1] CHOICE {
            maximumNumberOfCounters [2] IMPLICIT INTEGER (1..100) OPTIONAL,
            releaseCause [3] IMPLICIT OCTET STRING (SIZE (2..20)) OPTIONAL},
        .....
    }
```

**ACN Negotiation Support**

This enhancement is to provide the following functions:

1. Support China INAP ACNs

This enhancement is China INAP specific.

The ACN definition of China INAP is shown in the following table:

**China INAP Specific Application Context Name (Based on ISO/IEC DIS 8824-1)**

|                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| ACN coding: H'(03 a3 7d 01 01 01 xx 00)                                                                                                                                                                                                                                                                                                                                                                                           |

## 1. Support ACN negotiation

This enhancement is general for all INAP market.

Following ACN negotiation rules for SSP are supported:

- a. when SSP sends TC-BEGIN package:
  - encode the correct ACN into the package and store the ACN value.
- b. when SSP receives TC-BEGIN package:
  - if the ACN is supported, go on processing the TC component.
  - else, response SCP with TC-U-ABORT. Abort reason is 'application context name not supported'.
  - when processing component, if the component contains a China INAP operation, verify the application context according to the operation code (please refer to Table "China INAP Specific Application Context Name (Based on ISO/IEC DIS 8824-1)"). If fails, response SCP with TC-U-ABORT, abort reason is 'application context name not supported'. Else, go on processing the component.
- c. when SSP receives the first response from SCP in TC-CONTINUE/TC-END:

- if the ACN match the ACN value of previous TC-BEGIN, go on processing the TC component.
- else, response SCP with TC-U-ABORT. Abort reason is ‘application context name not supported’.
- d. when SSP receives the first response from SCP in TC-U-ABORT:
  - release the current dialogue.

### **ACR Enhancement: Conversation Time Measurement**

This enhancement is China INAP specific.

This enhancement is to fix the following problem: For INAP call being charged using AC operation, when the conversation is longer than 255 seconds, the duration value in ACR will go incorrect. This problem exists in max conversation time, duration, report interval measurement.

### **Support CS-1R ICA**

This enhancement is general for all INAP market.

This enhancement is to:

- support ICA in TC-BEGIN package
- support multiple components in TC-BEGIN package

The operation sequence must be: the first operation is ICA; the subsequence call processing operations could be RRBE, CONT, CWA, FCI, AC; the last operation must be CONT or CWA.

If the operations in the BEGIN package does not obey the rule, the package will be aborted.

If the package match the above rules but has logic conflict in the operations it carries, then it is out of this feature’s scope. The existing handling will be used. Also the imply and handling of each operation except ICA is out of this feature’s scope.

- support CS-1R ICA
- support virtual agent -> IBN line interworking  
No line features is supported in the interworking.
- enhance the AC, CONNECT handling for extended dialogue.

Following figure shows an example for ICA usage:

**China ICA Implementation Example**

As different markets may have different configuration on ICA in BEGIN package, some general rules is defined for what call related operation can be in BEGIN package:

- If the first operation is callp related, it must be ICA
- If the first operation is ICA, RRBE must be in the same package and the last operation must be CONT (CONTINUE) or CWA (ContinueWithArgument)
- The following callp operations are supported in BEGIN package if the first operation is ICA: RRBE, CWA, CONT, FCI, AC.

**Data Requirement**

Standard datafill for IN will be used.

**Hardware Requirements or Dependencies**

N/A.

**Software Requirements or Dependencies**

N/A.

## Limitations and restrictions

- This feature does not support the following ACN negotiation scenario: when SSP receives the first response from SCP in TC-U-ABORT, with abort reason is 'application context name not supported', then verify its ACN value, if it is valid, initiate a new dialogue using the new ACN, and release the current dialogue.
- This feature only accepts the Chinese ASF SfBillingChargeCharacteristics, does not handle it. In EINTRACE, this parms is displayed. There is no any handling on this parameter.
- For parameters not mentioned in this document, their implementation exceeds this feature's range.
- In the scenario that SCP originates a call to IBN lines, only the IBN lines use DGT are supported.

#### **Table/MIB/Remote Database Schema information**

##### **Name: OFCENG**

##### **Functional description**

The range of INAP\_TSSF\_WFI\_TIMER is changed from '1-10' to '1-60', and the datafillable value is changed from '1-10' to '1-10, 15, 20, 25, 30, 35, 40, 45, 50, 55, 60'.

Usage example: suppose the following datafill is supplied. The SSP will use

##### **Datafill Example:**

```
TABLE: OFCENG
PARMNAME PARMVAL
-----
INAP_TSSF_WFI_TIMER 15
```

value 15 as the default timer in the WFI state.

##### **Usage sequence and implications (CM Only)**

Current datafill order unchanged.

**Size**

| Abbreviated table name | Minimum tuples | Maximum tuples | Information on memory |
|------------------------|----------------|----------------|-----------------------|
| OFCENG                 | no change      | no change      | N/A                   |

**Fields/OIDs**

The following table lists fields/OIDs for OFCENG.

**Table field descriptions**

| Field               | New or Changed | Subfield or refinement | Entry             | Explanation and action                     |
|---------------------|----------------|------------------------|-------------------|--------------------------------------------|
| INAP_TSSF_WFI_TIMER | Changed        | refinement             | OFFICE_PARM_VALUE | value range and datafillable value changed |

**Datafill example****Datafill Example:**

```
TABLE: OFCENG
PARMNAME PARMVAL
-----
INAP_TSSF_WFI_TIMER 15
```

**Table release history update**

The range of INAP\_TSSF\_WFI\_TIMER is changed from '1-10' to '1-60', and the datafillable value is changed from '1-10' to '1-10, 15, 20, 25, 30, 35, 40, 45, 50, 55, 60'.

***Product = CS 2000*****A00002755 -- China Line Service Compliance (Succession on DMS)*****Functional Description***

This activity enhances IBN line services to comply with the China PSTN line service requirements in the China specification YDN065 and YDT1128 (partial) for DMS-Hybrid TDM solution and CS2Kc-IAD IP solution.

The following table shows the IBN line services which are chosen to achieve the corresponding China PSTN line service requirements.

**Line Services Required By China Market**

| <b>IBN Line Service</b> | <b>Requirement</b>                            |
|-------------------------|-----------------------------------------------|
| CEPT SC                 | YDN065: Abbreviated Dialling                  |
| CEPT WML                | YDN065: Hot Line Service with Time-Out        |
| CEPT ILR                | YDN065: Outgoing Call Barring                 |
| CEPT CDND               | YDN065: Don't Disturb Service                 |
| CLF                     | YDN065: Malicious Call Tracing                |
| CEPT IWUC               | YDN065: Alarm-Call Service                    |
| CEPT CFU                | YDN065: Call Forwarding Unconditional         |
| CEPT CFD                | YDN065: Call Forwarding on No Answer          |
| CEPT CFB                | YDN065: Call Forwarding on Busy               |
| CEPT CDTA               | YDN065: Absent-Subscriber Service             |
| CEPT ICWT, CEPT SCWID   | YDN065: Call Waiting                          |
| CEPT CCBS               | YDN065: Call Back                             |
| CEPT I3WC               | YDN065: Three Party Services                  |
| CEPT I6WC               | YDN065: Conference Service                    |
| CND                     | YDN065: Calling Identity Delivery             |
| CNDB, SUPPRESS          | YDN065: Calling Identity Delivery Restriction |
| AUL                     | YDT1128: Hot Line                             |
| CEPTPW                  | YDT1128: Password                             |
| CEPTRA                  | YDT1128: Call Forwarding Remote Access        |
|                         | YDT1128: Outgoing Call Barring Remote Access  |

This activity is divided into following components:

- Identification of China line service usage
- CEPT line service on the IBN line without CEPT option
- China line service's interaction compliance
- China line service's operation and administration compliance
- New downloadable China toneset CHINALGC

## Identification of China line service usage

In order to identify in which market the line services are working, this activity introduce a new field MARKET into the tuple CEPTONCENTREX. At present, two values are available for this field. One is DEFAULT and another is CHINA. For the chinese office, this field must be set to CHINA.

Refer to following datafill example of tuple CEPTONCENTREX:

### Datafill example of tuple CEPTONCENTREX

```
TABLE ISERVOPT
=====
CEPTONCENTREX CEPTONCENTREX CHINA (SC) (WML) (ILR) $
```

## CEPT line service on the IBN line without CEPT option

For the CEPT line services in Table , “Line Services Required By China Market,” on page 375, this activity allows them to work on the IBN line without CEPT option. In addition, this activity also allows the following CEPT line services to work on the IBN lines without CEPT option, which are not stated in the China Specification, but are used by China Market on DMS100I:

- CEPT CDTO
- CEPT CFF
- CEPT ICT

In order to allow all CEPT line services mentioned above on the IBN line without CEPT option, the corresponding service options must be present in tuple CEPTONCENTREX in table ISERVOPT. The following table shows the available options in tuple CEPTONCENTREX, and the associated CEPT line services:

***Note:** The CEPTONCENTREX options with **bold** font are introduced by this activity.*

### CEPTONCENTREX Options and CEPT Line Services

| CEPTONCENTREX<br>OPTION | Associated CEPT Line Service               |
|-------------------------|--------------------------------------------|
| SC                      | SCL, SCS                                   |
| WML                     | WML                                        |
| ILR                     | ILR                                        |
| CDIV                    | CDND, CFU, CFB, CFD, CFF, CDTA, CDTO, CFRA |
| ICT                     | ICT                                        |
| ICWT                    | ICWT                                       |

| <b>CEPTONCENTREX<br/>OPTION</b> | <b>Associated CEPT Line Service</b> |
|---------------------------------|-------------------------------------|
| IWUC                            | IWUC                                |
| ICWT                            | ICWT                                |
| CCBS                            | CCBS                                |
| I3WC                            | I3WC                                |
| I6WC                            | I6WC                                |
| CEPTPW                          | CEPTPW                              |
| CEPTRA                          | CEPTRA                              |

Refer to the following datafill example of tuple CEPTONCENTREX:

**Datafill example of tuple CEPTONCENTREX**

```
TABLE ISERVOPT
=====
CEPTONCENTREX CEPTONCENTREX CHINA (SC) (WML) (ILR) (IWUC) (CDIV)
(ICT) (ICWT) (CCBS) (I3WC) (I6WC) (CEPTPW) (CEPTRA) $
```

### China line service's interaction compliance

For the Chinese market, the line services in Table , “Line Services Required By China Market,” on page 375 have following interactions (Note: This activity does not cover the interaction with the line services from that table):

**IBN Line Services Interaction according to China requirement**

| <b>IBN Line Service</b> | <b>Interaction</b>                                                                                                                                                                                                                                                                                                            |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CEPT SC                 | The option SCS/SCL can not be assigned together with AUL. No precedence interactions with other line services.                                                                                                                                                                                                                |
| CEPT WML                | The option WML can not be assigned together with AUL. CEPT WML can not be activated when the ILR is registered to the class which restricts all calls.                                                                                                                                                                        |
| CEPT ILR                | The option ILR can not be assigned together with AUL. The ILR can not be registered to the class which restricts all calls when CEPT WML or CEPT I3WC is activated.                                                                                                                                                           |
| CEPT CDND               | The option CDND can not be assigned together with AUL, CDTA, CCBS or IWUC. The CEPT CDND takes precedence of CEPT CFU, CEPT CFD and CEPT CFB. The CEPT CDND takes precedence of the CEPT IWCT, no waiting calls can be established if the CEPT CDND is activated. The CLF can not be performed if the CEPT CDND is activated. |

| IBN Line Service | Interaction                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CLF              | The option CLF is compatible with other line options. The CLF functionality can not be invoked if the CEPT CDND or CEPT CDTA is activated. When the CLF functionality is invoked, the CLI must be provided if it is available, even the CLI delivery is restricted. For the diverted calls, the original calling party number should be traced if possible.                                                                                                                                                                                                                                 |
| CEPT IWUC        | The option IWUC can not be assigned together with AUL, CDND or CDTA. The CEPT IWUC can not be activated if CEPT CFU, CEPT CFD or CEPT CFB is activated.                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| CEPT CFU         | The option CFU can not be assigned together with AUL, CDTA or CCBS. The CEPT CFU can not be activated if CEPT IWUC is activated. The CEPT CDND takes precedence of CEPT CFU, no calls can be diverted to the destination number if the CEPT CDND is activated. The CEPT CFU takes precedence of CEPT ICWT, CEPT CFD and CEPT CFB. The party who has the CFU is not aware of the occurrence of the unconditional call diversion, and CND is not allowed to invoke on the party who diverting the CFU call. For the diverted call, the original calling party number is provided if possible. |
| CEPT CFD         | The option CFD can not be assigned together with AUL, CDTA or CCBS. The CEPT CDND takes precedence of CEPT CFD, no calls can be diverted to the destination number if the CEPT CDND is activated. The CEPT CFD can not be activated if CEPT IWUC is activated. When the call is diverted, the CND is allowed to invoke on the party who diverting the CFD call. For the diverted call, the original calling party number is provided if possible.                                                                                                                                           |
| CEPT CFB         | The option CFB can not be assigned together with AUL or CDTA. The CEPT CDND takes precedence of CEPT CFB, no calls can be diverted to the destination number if the CEPT CDND is activated. The CEPT CFB can not be activated if CEPT IWUC is activated. The CEPT CFB takes precedence of CEPT ICWT. The party who has the CFB is not aware of the occurrence of the call diversion on busy, and CND is not allowed to invoke on the party who diverting the CFB call. For the diverted call, the original calling party number is provided if possible.                                    |
| CEPT CDTA        | The option CDTA can not be assigned together with AUL, CCBS, CDND, IWUC, CFU, CFD or CFB. The CEPT CDTA takes precedence of the CEPT ICWT, no waiting calls can be established if the CEPT CDTA is activated. The CLF can not be performed if the CEPT CDTA is activated.                                                                                                                                                                                                                                                                                                                   |

| IBN Line Service      | Interaction                                                                                                                                                                                           |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CEPT ICWT, CEPT SCWID | The option ICWT can not be assigned together with AUL. The CEPT CFU and CEPT CFB take precedence of CEPT ICWT, and for the CFU or CFB calls, the SCWID is not allowed.                                |
| CEPT CCBS             | The option CCBS can not be assigned together with AUL, CDND, CDTA, CFU or CFD. No precedence interactions with other line services.                                                                   |
| CEPT I3WC             | The option I3WC can not be assigned together with AUL. The CEPT I3WC functionality can no be invoked when the ILR is registered to the class which restricts all calls.                               |
| CEPT I6WC             | As Nortel provision. There are not detailed requirement according to the China specification YDN065.                                                                                                  |
| CND                   | The option CND is compatible with other line options. The CND is not allowed to invoke on the party who diverting CFU or CFB calls.                                                                   |
| CNDB, SUPPRESS        | The option CNDB can not be assigned together with AUL. No precedence interactions with other line services.                                                                                           |
| AUL                   | The option AUL can not be assigned together with SCS, SCL, WML, ILR, CDND, IWUC, CFU, CFD, CFB, CDTA, ICWT, CCBS, I3WC, I6WC or CNDB. The AUL has the highest precedence against other line services. |
| CEPTPW                | The option CEPTPW is compatible with other line options. No precedence interactions with other line services.                                                                                         |

**Note:** Refer to Section , , Alarm-Call Service is incompatible with call diversion service (Call Forward Unconditional, Call Forward on No answer or Call Forward on Busy), however, refer to Section , Alarm-Call Service is compatible with call diversion service. After confirmed with the specification YDT1128 drafter, the interaction is that Alarm-Call Service can be assigned together with the call diversion service to the same subscriber, but both service can not be activated at the same time.

The customer can achieve the China specific line options compatibilities/incompatibilities by changing the table OPTOPT manually. Regarding the current release, the following changes are required to perform into table OPTOPT according to the China requirement:

- Remove ICWT, I3WC and I6WC options from the CLF tuple;
- Remove CLF option from the ICWT tuple;
- Remove CLF option from the I3WC tuple;

- Remove CLF option from the I6WC tuple;
- Add AUL, CCBS, CDTA and IWUC options to the CDND tuple;
- Add AUL, CDND and CDTA options to the IWUC tuple;
- Add CDTA and CCBS options to the CFU tuple;
- Add CDTA and CCBS options to the CFD tuple;
- Add CDTA option to the CFB tuple;
- Add CDND, IWUC, CFU, CFD, CFB and CCBS options to the CDTA tuple;
- Add CDND, CFU, CFD and CDTA options to the CCBS tuples,
- Add CDND and IWUC options to the AUL tuples.

The changes in table OPTOPT can be done by deleting the existing tuple, and adding a new tuple. Please note that, during the ONP, the table OPTOPT can not be transferred to the inactive side automatically, so the operator has to change the table OPTOPT according to the China requirement manually after the ONP.

The field MARKET of tuple CEPTONCENTREX in table ISERVOPT must set to CHINA to achieve the China line service's interaction compliance.

## **China line service's operation and administration compliance**

### **ILR Password: Display and Change**

Prior to this activity, the ILR password can not be displayed by using QDN command (it is masked with "NNNN"), and the password can not be changed by using CHF command. This activity introduces a new field SHOW\_CHG\_PSWD into the tuple ILRCLS in table ISERVOPT. If this field is set to Y, the ILR password allows to be displayed and changed.

Refer to following datafill example of tuple ILRCLS:

**Datafill example of tuple ILRCLS**

```
TABLE ISERVOPT

**IWUC: Abort wakeup request if line is in use**

The existing implementation of IWUC service, if the line is in use at the scheduled time, the wakeup request may retry after a given time delay. However, according to the China specification, the wakeup request should be aborted automatically if the line is in use.

This activity introduces a new field ABORT\_IF\_IN\_USE into the tuple IWUC in table ISERVOPT. If this field is set to Y, the wakeup request is aborted automatically when the line is in use at the scheduled time, and the IWUC102 log with the reason 'LINE IN USER' will be generated to indicate the abortion of the wakeup request.

Refer to following datafill example of tuple IWUC:

**Datafill example of tuple IWUC**

```

**ICWT: Datafillable Timer for “Called Party Ignores Waiting Call”**

In the existing implementation of ICWT service, the time-out of timer “Called Party Ignores Waiting Call” is hardcoded as 30 seconds, however, according to China Specification YDN065, this time-out should be set to 15 seconds.

This activity introduces a new field ICWT\_IGNORE\_WAITING\_TMO into tuple ICWT in table ISERVOPT. The operator can specify a value from 10 to 45 seconds for the timer “Called Party Ignores Waiting Call” of ICWT service. If the tuple ICWT is not present in table ISERVOPT, by default, the time-out of 30 seconds is used.

Refer to following datafill example of tuple ICWT:

**Datafill example of tuple ICWT**

```

TABLE ISERVOPT
=====
>add
MACHINES NOT IN SYNC - DMOS NOT ALLOWED

**CEPTRA: Collect DN and PIN in Different Stages**

According to China Specification YDN1128, the service CEPTRA is required to collect DN and PIN in different stages, that is, the subscriber should input DN firstly, and receive prompt, then input PIN.

This activity introduces a new field COLLECT\_DNPIN\_IN\_DIFF\_STAGES into tuple CEPTPW in table ISERVOPT, if this field is set to Y, the CEPTRA will collect DN and PIN in different stages.

Moreover, in order to support to play announcements to prompt the subscriber to input DN and PIN, two new announcements (COLLECT\_DN\_ONLY and COLLECT\_PIN\_ONLY) are introduced to the service CEPTRA, the operator can datafill tuple CEPTPW in table ISERVOPT to assign the corresponding announcement trunks which are connected for the new announcement names.

When provisioning the announcements for the service CEPTRA, if the field COLLECT\_DNPIN\_IN\_DIFF\_STAGES is set to Y, the announcement IDs COLLECT\_DN\_ONLY and COLLECT\_PIN\_ONLY are required to provision, and the announcement ID DNPIN is useless, and the datafill is not required. If the field COLLECT\_DNPIN\_IN\_DIFF\_STAGES is set to N, the announcement ID DNPIN is required to provision, and the announcement IDs COLLECT\_DN\_ONLY and COLLECT\_PIN\_ONLY are useless.

Refer to following datafill examples of tuple CEPTPW and announcement provision when the field COLLECT\_DNPIN\_IN\_DIFF\_STAGES is set to Y:

**Datafill example of tuple CEPTPW**

```

On the above announcements provisioning example, the announcements CEPTRA\_COLL\_DN and CEPTRA\_COLL\_PIN for the announcement IDs COLLECT\_DN\_ONLY and COLLECT\_PIN\_ONLY should be recorded as:

- **CEPTR\_A\_COLL\_DN:** “Please enter your telephone number”

This is an interruptible announcement and applied to the subscriber when he/she dials DISA DN in order to use CEPTRA. It is datafilled as CEPTRA\_COLL\_DN 0 in the datafill example in the figure .

- **CEPTR\_A\_COLL\_PIN:** “Please enter your password of the telephone number which you entered just now”

This is an interruptible announcement and applied to the subscriber when he/she dials a valid telephone number. It is datafilled as CEPTRA\_COLL\_PIN 0 in the datafill example in the figure .

For provisioning other announcements, please refer to the FN of activity A00001919.

### **New downloadable China toneset CHINALGC**

This activity introduces a downloadable China toneset CHINALGC, which can be specified for the PLGC in table LTCINV to support the ADSI CAS tone.

The toneset CHINALGC has the following tones definitions:

- Test and Diagnostic Tones
- DTMF Tones
- Simple Supervisory Tones
- Periodic Supervisory Tones

The operating company can change the field TONESET of the PLGC datafill in table LTCINV to specify the toneset CHINALGC. For the toneset change, the PLGC is requested to perform BSY and RTS manipulation in the MAPCI interface to take it effect, the toneset parameters can then be downloaded from the CM as part of XPM's static data upon RTS.

Please refer to section “ Tone Specifications” on page 413 for more information.

The following datafills are required for activating feature tones in the existing parameters and tables:

- For all feature tones, in OFCENG table,  
FEATURE\_TONE\_SET CHINALGC
- For CWT in OFCVAR table,  
CWT\_TONE\_LENGTH 4  
CWT\_TONE\_CYCLE\_TIME 5  
CWT\_NO\_OF\_ALERTS 3

### **Software Requirements or Dependencies**

N/A.

### **Limitations and restrictions**

- According to the existing handling, during the ONP, the table OPTOPT can not be transferred to the inactive side automatically, so the operator has to

change the table OPTOPT according to the China requirement manually after the ONP.

- For the line services that Centrex and CEPT are sharing the same line options (such as CFU, CFD and CFB), if the corresponding service options are present in tuple CEPTONCENTEX in table ISERVOPT, then only the CEPT line services can be available in the office.
- Regarding the China requirement of the service “Hot Line Service with Time-Out” in section , the CEPT WML service can not be activated by the subscriber when the CEPT ILR service has been activated as restriction class K=1 on the line. However, the CEPT WML service can be activated by the operator via SERVORD when the CEPT ILR service has been activated as restriction class K=1 on the line.
- Regarding the China requirement of the service “Outgoing Call Barring” in section , the CEPT ILR service can not be activated as restriction class K=1 by the subscriber when the CEPT WML service has been activated or the CEPT I3WC service has been assigned on the line. However, the CEPT ILR service can be activated as restriction class K=1 by the operator via SERVORD when the CEPT WML service has been activated or the CEPT I3WC service has been assigned on the line.
- Regarding the China requirements of the service “Call Forwarding Unconditional” in section , “Call Forwarding on No Answer” in section , and “Call Forwarding on Busy” in section , the CEPT CFU, CFD and CFB services can not be activated by the subscriber when the subscriber has activated a wake-up request. However, the CEPT CFU, CFD and CFB services can be activated by the operator via SERVORD when the subscriber has activated a wake-up request.
- Regarding the China requirement of the service “Three Party Service” in section , the line option I3WC can be assigned to the line by the operator via SERVOR even when the CEPT ILR service is activated as restriction class K=1 on the line.
- Regarding the China requirement of the service “Call Waiting” in section , the CEPT ICWT service can not support the permanent activation. The operator can activate the ICWT service when assigning it to the subscriber, however, the subscriber can deactivate the ICWT by dialing corresponding access code.
- For the subscriber assigned with the CEPT services such as ICWT, I3WC, I6WC and ICT, in order to invoke the corresponding functionalities (such as: toggle, disconnect talking party or establish conference) of these services, the subscriber must to dial the R-Code after flashing. The R-Code is one digit code of 1~9 or 0. This implicitly means only one digit is allowed to input when the subscriber goes flash, and the digit \* and # is illegal. It is not allowed to activate/deactivate/program/interrogate other services when these services require the subscriber to dial the R-Code.

- According to the feature A00001919, the R1 loopback trunks are required to perform digit collection for CEPTRA calls incoming from ISUP/TUP/FDCP R2 trunks. However, if UTR (Universal Tone Receiver) card exists on the XPM, the digit collection is supported on incoming ISUP/TUP/FDCP R2 trunks directly, no R1 loopback trunks are required. This feature is responsible to verify this functionality on the China variant trunks (CISUP/CTUP/FDCP C1) only. For the other markets request this functionality, the further verification is required accordingly.
- Refer to existing restrictions of the related line services.

## Interactions

Please refer to Section “China line service's interaction compliance” on page 377.

## **Appendix 1 for A00002755: China PSTN Line supplementary Services (YDN065)**

### **Abbreviated Dialling**

#### **Service Description**

Subscriber can specify a list of target numbers (local, national or international numbers), and assign a one- or two-digit code (abbreviated code) to each number.

When the subscriber dials the abbreviated code, the switch associates it with the assigned TN and attempts to complete the call.

#### **Service Registration**

This service can be registered through the following steps:

- Subscriber goes off-hook,
- Receives dial tone,
- Dials \*51\*MN\*TN#,
- Receives confirmation tone,
- Goes on-hook.

where the code MN stands for the abbreviated code, the code TN stands for the target number, which can be a local, national or international number.

#### **Service Usage**

The subscriber can use this service through the following steps:

- Subscriber goes off-hook,
- Receives dial tone
- Dials \*\*MN

where the code MN stands for abbreviated code.

#### **Service Cancellation**

This service can be cancelled on the subscriber through the following steps:

- Subscriber goes off-hook,
- Receives dial tone,
- Dials \*51\*MN#,
- Receives confirmation tone,
- Goes on-hook.

where the code MN stands for the abbreviated code.

### **Interaction with other services**

- a. No collision with other PSTN line services.

## **Hot Line Service with Time-Out**

### **Service Description**

If the subscriber lifts the handset and dials no digit during a given time, the switch will set up a call to a predetermined destination number after the timer expires. The subscriber can program the predetermined destination number.

### **Service Registration**

This service can be registered through the following steps:

- Subscriber goes off-hook,
- Receives dial tone,
- Dials \*52\*TN#,
- Receives confirmation tone,
- Goes on-hook.

where the code TN stands for the target number.

### **Service Usage**

If the subscriber wants to call a predetermined destination number, the call can be established automatically by switch if the subscriber lifts the handsets and dials no digit within 5 seconds.

If the subscriber wants to call the subscriber other than the predetermined destination number, the subscriber can start dialing within 5 seconds, and the call is processed as a regular call.

### **Service Cancellation**

This service can be cancelled by the subscriber through the following steps:

- Subscriber goes off-hook,
- Receives dial tone,
- Dials #52#,
- Receives confirmation tone,
- Goes on-hook.

### **Interaction with other services**

- a. Outgoing Call Barring

Hot Line Service with Time-Out can not be activated when Outgoing Call Barring Service is activated and its restriction class (K) is registered to 1. On the other hand, Outgoing Call Barring Service can not set its restriction Class (K) to 1 when Hot Line Service with Time-Out Service is activated.

- b. No collision with other PSTN line services.

## **Outgoing Call Barring**

### **Service Description**

This service restricts the outgoing calls according to the restriction class (K):

- Deny all outgoing calls (K=1), includes the local calls.
- Deny the national and international direct dial calls (K=2).
- Deny the international direct dial calls (K=3)

### **Service Registration**

This service can be registered through the following steps:

- Subscriber goes off-hook,
- Receives dial tone,
- Dials \*54\*KSSSS#,
- Receives confirmation tone,
- Goes on-hook.

where the code K stands for the restriction class (K=1/2/3), the code SSSS stands for 4 digits password, which is preassigned by the administrator when the user subscribes this service.

### **Service Usage**

If the restriction class is set, all restricted outgoing calls from the phone are routed to a busy tone.

### **Service Cancellation**

This service can be cancelled by the subscriber through the following steps:

- Subscriber goes off-hook,
- Receives dial tone,
- Dials #54\*KSSSS#,
- Receives confirmation tone,
- Goes on-hook.

where the code K stands for the restriction class, which must be identical with the registered restriction class; The code SSSS stands for 4-digits password, which is preassigned by the administrator when the subscriber applies this service.

### **Service Interrogation**

The subscriber can interrogate service status through the following steps:

- Subscriber goes off-hook,
- Receives dial tone,
- Dials \*#54#,
- Receives confirmation tone,
- Goes on-hook.

### **Interaction with other services**

- a. Hot Line Service with Time-Out

Refer to Section , item a.

- b. Three Party Services

The subscriber can not apply Three Party Service when Outgoing Call Barring Service is activated and its restriction class (K) is registered to 1, on the other hand, Outgoing Call Barring Service can not set its restriction Class (K) to 1 when Three Party Service is assigned to the subscriber.

- c. No collision with other PSTN line services.

## **Don't Disturb Service**

### **Service Description**

This service can be used when the subscriber does not want to receive any incoming calls in a period. The switch will route all incoming calls to an announcement. This service does not impact the outgoing calls of this subscriber.

### **Service Registration**

This service can be registered through the following steps:

- Subscriber goes off-hook,
- Receives dial tone,
- Dials \*56#,
- Receives confirmation tone,
- Goes on-hook.

**Service Usage**

If this service is activated, all incoming calls to the subscriber are routed to an announcement.

**Service Cancellation**

This service can be cancelled by the subscriber through the following steps:

- Subscriber goes off-hook,
- Receives dial tone,
- Dials #56#,
- Receives confirmation tone,
- Goes on-hook.

**Interaction with other services**

- a. Call Diversion (including: Call Forwarding Unconditional, Call Forwarding on No Answer and Call Forwarding on Busy)

When the subscriber has registered both Call Diversion and Don't Disturb Service at the same time, Don't Disturb Service takes precedence of Call Diversion.

- b. Absent-Subscriber Service

Absent-Subscriber Service and Don't Disturb Service are incompatible. The subscriber can not apply Absent-Subscriber Service and Don't Disturb Service at the same time.

- c. Call Back

Call Back and Don't Disturb Service are incompatible. The subscriber can not apply Call Back and Don't Disturb Service at the same time.

- d. Call Waiting

It is impossible that the subscriber has the waiting call when Don't Disturb Service is activated.

- e. Malicious Call Tracing

The malicious call can not be traced when Don't Disturb Service is activated.

- f. Alarm-Call Service

Alarm-Call Service and Don't Disturb Service are incompatible. The subscriber can not apply Alarm-Call Service and Don't Disturb Service at the same time.

- g. No collision with other PSTN line services.

## Malicious Call Tracing

### Service Description

The subscriber can apply this service to trace the calling number of the malicious call.

### Service Registration

This service is assigned by the operator per request from the subscriber.

### Service Usage

The subscriber can use this service through the following steps:

- Subscriber receives a malicious call,
- Goes flash and receives dial tone,
- Dials \*32#,
- Receives confirmation tone,
- Goes on-hook.

### Service Cancellation

This service is cancelled by the operator per request from the subscriber.

### Interaction with other services

- a. Call Diversion (including: Call Forwarding Unconditional, Call Forwarding on No Answer and Call Forwarding on Busy)

For the call scenario that subscriber A calls subscriber B, and this call is diverted to subscriber C (A->B->C), if the subscriber C requests Malicious Call Tracing service, the switch should provide the number of subscriber A if possible. For some reason or restriction, for example, subscriber A and B belong to the same local network, but subscriber B and C belong to different network, and subscriber B and C are connected via R2 MFC trunk (C1), then the subscriber C only can get the number of subscriber B.

- b. Calling Identity Delivery Restriction

Even when the calling party has Calling Identity Delivery Restricting Service (in this case, the calling number can not be allowed to be displayed on the called party), the operating company must provide the calling number to the subscriber.

- c. Don't Disturb Service  
Refer to Section , item e.
- d. Absent-Subscriber Service

The malicious call can not be traced if Absent-Subscriber Service is activated. The subscriber can not apply Absent-Subscriber Service and Malicious Call Tracing at the same time.

- e. No collision with other PSTN line services.

## **Alarm-Call Service**

### **Service Description**

The switch can ring the phone automatically at the subscriber specified time to remind the subscriber.

### **Service Registration**

This service can be registered through the following steps:

- Subscriber goes off-hook,
- Receives dial tone,
- Dials \*55\*H<sub>1</sub>H<sub>2</sub>M<sub>1</sub>M<sub>2</sub>#,
- Receives confirmation tone,
- Goes on-hook.

where the code H<sub>1</sub>H<sub>2</sub> stands for the hour (00-23), M<sub>1</sub>M<sub>2</sub> stands for the minute (00-59).

### **Service Usage**

At the subscriber specified time, the switch will ring the subscriber's phone. If the subscriber goes off-hook, he/she can receive the reminder announcement, and this service is cancelled automatically. If the call is not answered, the ring will last 1 minute. Five minutes later, the switch will ring the phone again. If the second attempt is also not answered, this service will be cancelled after 1 minute ring. Moreover, at the subscriber specified time, if the phone is in use, this Alarm-Call Service will be cancelled automatically.

### **Service Cancellation**

This service can be cancelled on the subscriber through the following steps:

- Subscriber goes off-hook,
- Receives dial tone,
- Dials #55#,
- Receives confirmation tone,
- Goes on-hook.

### **Interaction with other services**

- a. Don't Disturb Service

Refer to Section , item f.

b. Absent-Subscriber Service

Absent-Subscriber Service and Alarm-Call Service are incompatible. The subscriber can not apply Absent-Subscriber Service and Alarm-Call Service at the same time.

c. Call Diversion

Call Diversion and Alarm-Call Service are incompatible. The subscriber can not apply Call Diversion and Alarm-Call Service at the same time.

d. No collision with other PSTN line services.

### **Interception Calls**

The switch should have the capability to intercept the calls that can not be established successfully (for instance, vacant number or the blocked route), and route these calls to the announcement.

### **Registered Call**

This service is not used at present. Omitted here.

### **Call Forwarding Unconditional**

#### **Service Description**

This service allows the subscriber to divert all incoming calls to a predetermined destination number (including the voice mail box), regardless of the subscriber's state.

#### **Service Registration**

This service can be registered through the following steps:

- Subscriber goes off-hook,
- Receives dial tone,
- Dials \*57\*PQABCD#,
- Receives confirmation tone,
- Goes on-hook.

where the code PQABCD stands for the predetermined destination number (the number in this example is 6 digits).

#### **Service Usage**

After this service is activated, all incoming calls to the subscriber will be diverted to the predetermined destination number automatically.

**Service Cancellation**

This service can be cancelled by the subscriber through the following steps:

- Subscriber goes off-hook,
- Receives dial tone,
- Dials #57#,
- Receives confirmation tone,
- Goes on-hook.

**Service Interrogation**

The subscriber can interrogate service status through the following steps:

- Subscriber goes off-hook,
- Receives dial tone,
- Dials \*#57\*PQABCD#,
- Receives confirmation tone,
- Goes on-hook.

where the code PQABCD stands for predetermined destination number (the number in this example is 6 digits).

**Interaction with other services**

a. Absent-Subscriber Service

Absent-Subscriber Service and Call Forward Unconditional are incompatible. The subscriber can not apply Absent-Subscriber Service and Call Forward Unconditional at the same time.

b. Don't Disturb Service

Refer to Section , item a.

c. Call Waiting

Call Forwarding Unconditional takes precedence of Call Waiting if both services are activated.

d. Alarm-Call Service

Refer to Section , item b.

e. Malicious Call Tracing

Refer to Section , item a.

f. Call Back

Call Back and Call Forwarding Unconditional are incompatible. The subscriber can not apply Call Back and Call Forward Unconditional at the same time.

- g. Call Forwarding on Busy  
Call Forward Unconditional Service takes precedence of Call Forwarding on Busy Service if both services are activated.
- h. Call Forwarding on No Answer  
Call Forwarding Unconditional takes precedence of Call Forwarding on No Answer if both services are activated.
- i. Calling Identity Delivery  
If subscriber A makes call to subscriber B, and this call is diverted to subscriber C (that is, A->B->C), in case that both subscriber B and C have Calling Identity Delivery Services, only the subscriber C can display the subscriber A's number.
- j. No collision with other PSTN line services.

## **Call Forwarding on No Answer**

### **Service Description**

This service allows the subscriber to divert the incoming calls to a predetermined destination number if the called party does not answer within a prescribed time.

### **Service Registration**

This service can be registered through the following steps:

- Subscriber goes off-hook,
- Receives dial tone,
- Dials \*41\*PQABCD#,
- Receives confirmation tone,
- Goes on-hook.

where the code PQABCD stands for the predetermined destination number (the number in this example is 6 digits).

### **Service Usage**

After this service is activated, all incoming calls which are not answered within a prescribed time will be diverted to the predetermined destination number automatically.

### **Service Cancellation**

This service can be cancelled by the subscriber through the following steps:

- Subscriber goes off-hook,
- Receives dial tone,

- Dials #41#,
- Receives confirmation tone,
- Goes on-hook.

### **Service Interrogation**

The subscriber can interrogate service status through the following steps:

- Subscriber goes off-hook,
- Receives dial tone,
- Dials \*#41\*PQABCD#,
- Receives confirmation tone,
- Goes on-hook.

where the code PQABCD stands for predetermined destination number (the number in this example is 6 digits).

### **Interaction with other services**

#### **a. Absent-Subscriber Service**

Absent-Subscriber Service and Call Forward on No Answer are incompatible. The subscriber can not apply Absent-Subscriber Service and Call Forward on No Answer at the same time.

#### **b. Don't Disturb Service**

Refer to Section , item a.

#### **c. Alarm-Call Service**

Refer to Section , item b.

#### **d. Malicious Call Tracing**

Refer to Section , item a.

#### **e. Call Back**

Call Back and Call Forward on No Answer are incompatible. The subscriber can not apply Call Back and Call Forward on No Answer at the same time.

#### **f. Calling Identity Delivery**

If subscriber A makes call to subscriber B, and the unanswered call is diverted to subscriber C (that is, A->B->C), in case that both subscriber B and C have Calling Identity Delivery Service, the subscriber A's number can be displayed on both phones of subscriber B and C.

#### **g. No collision with other PSTN line services.**

## Call Forwarding on Busy

### Service Description

This service allows the subscriber to divert the incoming calls to a predetermined destination number if the called party is in busy state.

### Service Registration

This service can be registered through the following steps:

- Subscriber goes off-hook,
- Receives dial tone,
- Dials \*40\*PQABCD#,
- Receives confirmation tone,
- Goes on-hook.

where the code PQABCD stands for predetermined destination number (the number in this example is 6 digits).

### Service Usage

After this service is activated, if the called line is in use, all incoming calls to the subscriber will be diverted to the predetermined destination number automatically.

### Service Cancellation

This service can be cancelled by the subscriber through the following steps:

- Subscriber goes off-hook,
- Receives dial tone,
- Dials #40#,
- Receives confirmation tone,
- Goes on-hook.

### Service Interrogation

The subscriber can interrogate service status through the following steps:

- Subscriber goes off-hook,
- Receives dial tone,
- Dials \*#40\*PQABCD#,
- Receives confirmation tone,
- Goes on-hook.

where the code PQABCD stands for predetermined destination number (the number in this example is 6 digits).

### **Interaction with other services**

a. Absent-Subscriber Service

Absent-Subscriber Service and Call Forward on Busy are incompatible. The subscriber can not apply Absent-Subscriber Service and Call Forward on Busy at the same time.

b. Don't Disturb Service

Refer to Section , item a.

c. Call Waiting

Call Forward on Bust takes precedence of Call Waiting if both services are activated.

d. Alarm-Call Service

Refer to Section , item b.

e. Malicious Call Tracing

Refer to Section , item a.

f. Calling Identity Delivery

If subscriber A makes call to subscriber B in busy state, and the call is diverted to subscriber C (that is, A->B->C), in case that both subscriber B and C have Calling Identity Delivery Service, only the subscriber C can display the subscriber A's number.

g. No collision with other PSTN line services.

### **Absent-Subscriber Service**

#### **Service Description**

The subscriber can activate this service when he/she is absent. The operating company will respond to all incoming calls on behalf of the subscriber.

#### **Service Registration**

This service can be registered through following steps:

- Subscriber goes off-hook,
- Receives dial tone,
- Dials \*50#,
- Receives confirmation tone,
- Goes on-hook.

**Service Usage**

When this service is activated, all incoming calls are routed to an announcement to inform the calling party that the called party is absent at present.

**Service Cancellation**

This service can be cancelled by the subscriber through the following steps:

- Subscriber goes off-hook,
- Receives dial tone,
- Dials #50#,
- Receives confirmation tone,
- Goes on-hook.

**Interaction with other services**

a. Call Back

Call Back and Absent-Subscriber Service are incompatible. The subscriber can not apply Call Back and Absent-Subscriber Service at the same time.

b. Malicious Call Tracing

Refer to Section , item d.

c. Call Waiting

Absent-Subscriber Service takes precedence of Call Waiting. If Absent-Subscriber Service is activated, no waiting calls can be established.

d. Alarm-Call Service

Refer to Section , item b.

e. Call Diversion

Refer to Section , item a; Section , item a; Section , item a.

f. Don't Disturb Service

Refer to Section , item b.

g. No collision with other PSTN line services.

**Call Waiting****Service Description**

When the subscriber A is talking with subscriber B, if the subscriber C attempts to make a call to subscriber A, A will get a call waiting indication to know someone else is waiting for a call connection.

### Service Registration

For the permanent service of Call Waiting, it is assigned by the operator per the request from the subscriber. No special registration action is required when using this service.

If the subscriber only uses this service casually, this service can be registered through the following steps:

- Subscriber goes off-hook,
- Receives dial tone,
- Dials \*58#,
- Receives confirmation tone,
- Goes on-hook.

### Service Usage

When the subscriber A is talking with B, and the subscriber C calls subscriber A, the subscriber A will receive the waiting tone, and the subscriber C will receive ring back tone, the subscriber has three options:

- 1 Reject the connection request of the waiting subscriber  
Do nothing, the waiting call will be dropped after 15 seconds.
- 2 Hold the active connection and talk with the waiting subscriber
  - Subscriber goes flash,
  - Receives dial tone,
  - Dials 2
- 3 Terminate the active connection and talk with the waiting subscriber
  - Subscriber goes flash,
  - Receives dial tone,
  - Dials 1

### Service Cancellation (For casual using)

This service can be cancelled by the subscriber through the following steps:

- Subscriber goes off-hook,
- Receives dial tone,
- Dials #58#,
- Receives confirmation tone,
- Goes on-hook.

**Interaction with other services****a. Calling Identity Delivery**

When both services of Calling Identity Delivery and Call Waiting are activated, the calling number should be displayed on the phone when the subscriber receives the call waiting tone.

**b. Call Diversion**

Refer to Section , item c and Section , item c.

**c. No collision with other PSTN line services.****Call Back****Service Description**

This service provides the subscriber with ability to set up an automatic call back in the switch when he/she encounters a busy called party.

**Service Registration**

In case that the called party is busy, the calling party can register a call back request in switch through following steps:

- Subscriber goes flash,
- Receives dial tone,
- Dials \*59#,
- Receives confirmation tone,
- Goes on-hook.

**Service Usage**

If this service is registered, when both parties are idle, the calling party is given ring when the calling party answers, the call is set up and called party is given ring.

The call back request is cancelled if the calling party is not answered at the first call back attempt.

**Service Cancellation**

This service can be cancelled by the subscriber through the following steps:

- Subscriber goes off-hook,
- Receives dial tone,
- Dials #59#,
- Receives confirmation tone,
- Goes on-hook.

**Interaction with other services**

- a. Absent-Subscriber Service  
Refer to Section , item a.
- b. Don't Disturb Service  
Refer to Section , item c.
- c. Call Diversion  
Refer to Section , item f; Section , item e.
- d. No collision with other PSTN line services.

**Three Party Services****Service Description**

This service provides a subscriber with the ability to place an existing call on hold and set up a call to another subscriber. The controller can put three parties into a conference, or toggle and drop the active party when the three-way call is in progress.

**Service Registration**

This service is assigned by the operator per request from the subscriber. No special registration action is required when using this service.

**Service Usage**

- 1 When subscriber A is talking with subscriber B, if subscriber A wants to talk with subscriber C, A can go flash to hold the connection with B and dial the number of C after receiving dial tone, A can talk with C after the connection is created. In case that A can not connect C, A can go flash again to resume the conversation of B.
- 2 When A is talking with C, if A wants to talk with B again and remain the connection of C, A can go flash and dial digit 2 after receiving dial tone. If A doesn't want to remain the connection of C, A can go flash and dial digit 1 after receiving dial tone, the connection of C will be dropped and the connection is switched to B.
- 3 When A is talking with C, if A wants B to join in this conversation, A can go flash and dial digit 3 after receiving dial tone, then the three party conference can be established.
- 4 During the three party conference, if the controller A wants to talk with one party privately and hold another party, A can go flash and dial digit 2.

**Interaction with other services**

- a. Outgoing Calling Barring

Refer to Section , item b.

- b. No collision with other PSTN line services.

## **Conference Service**

### **Service Description**

This service provides more than three ports connection during a call. The conference must be established by the operator.

## **Calling Identity Delivery**

### **Service Description**

This service can deliver the calling number to the called party, and display the calling number on the called party's phone.

This service is applicable to the called subscriber only.

This service is assigned by the operator per request from the subscriber. No special registration action is required when the subscriber uses this service.

### **Interaction with other services**

- a. Call Diversion

Refer to Section , item i; Section , item f; Section , item f.

- b. Malicious Call Tracing

Refer to Section , item b.

- c. Call Waiting

Refer to Section , item a.

- d. Calling Identity Delivery Restriction

If the calling number is restricted to the called party, the calling number can not be displayed on the called party even though the called party applies Calling Identity Delivery Service.

- e. No collision with other PSTN line services.

## **Calling Identity Delivery Restriction**

### **Service Description**

The subscriber can use this service to restrict the display of the calling number on the called party's phone.

### **Service Registration**

The subscriber must specify which category he/she belongs to when applying this service from the operator:

- Category A subscriber, who can restrict the calling number delivery through the certain operation on an individual call basis. By default, the calling number is allowed to be displayed on the called party.
- Category B subscriber, who can allow the calling number delivery through the certain operation on an individual call basis. By default, the calling number is restricted to be displayed on the called party.
- Category C subscriber, who never allows the calling number delivery to the called party.

### **Service Usage**

- 1 For the category A subscriber, in this particular call, the calling number is allowed to be delivered to the called party through the following steps:
  - Subscriber goes off-hook,
  - Receives dial tone,
  - Dials \*62, following with the called number.
- 2 For the category B subscriber, the calling number is not allowed to be delivered to the called party through the following steps:
  - Subscriber goes off-hook,
  - Receives dial tone,
  - Dials \*68, following with the called number,

### **Interaction with other services**

- a. Malicious Call Trace  
Refer to Section , item b.
- b. No collision with other PSTN line services.

## **Appendix 2 for A00002755: Additional China PSTN Line supplementary Services (YDT1128, Partial)**

### **Enhanced Remote Access Services**

#### **Call Forwarding Remote Access**

##### **Service Registration**

This service is assigned by the operator per request from the subscriber.

##### **Service Activation**

The subscriber A can activate the call diversion from the remote location through following steps:

- a. Subscriber A goes off-hook and receives dial tone. A dials “0X<sub>1</sub>X<sub>2</sub>PQRYYYYY” if the remote phone and the subscriber A’s base station do not belong to the same local network, or dials “PQRYYYYY” if the remote phone and the subscriber A’s base station belong to the same local network.

In the above dialing, “0X<sub>1</sub>X<sub>2</sub>PQR” stands for the area code and the office code of the subscriber A’s base station, “YYYYY” stands for the access code of this service.

- b. Subscriber A receives the announcement which prompts to input the base station number. A dials “PQRABCD”, which is the number.
- c. Subscriber A receives the announcement which prompts to input the subscriber A’s password. A dials “S<sub>1</sub>S<sub>2</sub>S<sub>3</sub>S<sub>4</sub>”, which is the password.
- d. Subscriber A receives the prompt announcement. A dials \*SC\*FTN#, receives the announcement to inform that the operation is successful. A goes on-hook.

In the above dialing, “SC” stands for the access code of call diversion (Unconditional/Busy/No Answer, SC=57/40/41), “FTN” stands for the forwarded target number.

### Service Usage

If the corresponding call diversion of the subscriber A is activated, the call to subscriber A will be diverted to the target number according to the state of the line and the activated type of call diversion.

### Service Deactivation

The subscriber A can deactivate the call diversion from the remote location through the following steps:

- a. Subscriber A goes off-hook and receives dial tone. A dials “0X<sub>1</sub>X<sub>2</sub>PQRYYYYY” if the remote phone and the subscriber A’s base station do not belong to the same local network, or dials “PQRYYYYY” if the remote phone and the subscriber A’s base station belong to the same local network.

In the above dialing, “0X<sub>1</sub>X<sub>2</sub>PQR” stands for the area code and the office code of the subscriber A’s base station, “YYYYY” stands for the access code of this service.

- b. Subscriber A receives the announcement which prompts to input the base station number. A dials “PQRABCD”, which is the number.
- c. Subscriber A receives the announcement which prompts to input the remote subscriber A’s password. A dials “S<sub>1</sub>S<sub>2</sub>S<sub>3</sub>S<sub>4</sub>”, which is the password.

- d. Subscriber A receives the prompt announcement. A dial #SC#. A receives the announcement to inform that the operation is successful, goes on-hook.

In the above dialing, “SC” stands for the access code of call diversion (Unconditional/Busy/No Answer, SC=57/40/41).

### Signalling Flow

### Interaction with other services

- a. Alarm-Call Service

Both services can be used on the same subscriber.

- b. Refer to Section , and for the interaction with other services.

### Outgoing Call Barring Remote Access

#### Service Registration

This service is assigned by the operator per request from the subscriber.

#### Service Activation

The subscriber A can activate the Outgoing Call Barring service from the remote location through the following steps:

- a. Subscriber A goes off-hook and receives dial tone. A dials “0X<sub>1</sub>X<sub>2</sub>PQRYYYY” if the remote phone and the subscriber A’s base station do not belong to the same local network, or dials “PQRYYYY” if the remote phone and the subscriber A’s base station belong to the same local network.

In the above dialing, “0X<sub>1</sub>X<sub>2</sub>PQR” stands for the area code and the office code of the subscriber A’s base station, “YYYY” stands for the access code of this service.

- b. Subscriber A receives the announcement which prompts to input the base station number. A dials “PQRABCD”, which is the number.
- c. Subscriber A receives the announcement which prompts to input the subscriber A’s password. A dials “S<sub>1</sub>S<sub>2</sub>S<sub>3</sub>S<sub>4</sub>”, which is the password.
- d. Subscriber A receives the prompt announcement. A dials \*54\*KS<sub>1</sub>S<sub>2</sub>S<sub>3</sub>S<sub>4</sub>#. A receives the announcement to inform the subscriber the operation is successful. A goes on-hook.

In the above dialing, the code K stands for the restriction class:

K=1: Deny all outgoing calls, includes the local calls.

K=2: Deny the national and international direct dial calls.

K=3: Deny the international direct dial calls.

### Service Usage

If Outgoing Call Barring of the subscriber A is activated, all restricted outgoing calls from this phone is routed to a busy tone or an announcement.

### Service Deactivation

The subscriber A can deactivate the Outgoing Call Barring service from the remote location through following steps:

- a. Subscriber A goes off-hook and receives dial tone. A dials “0X<sub>1</sub>X<sub>2</sub>PQRYYYY” if the remote phone and the subscriber A’s base station do not belong to the same local network, or dials “PQRYYYY” if the remote phone and the subscriber A’s base station belong to the same local network.

In the above dialing, “0X<sub>1</sub>X<sub>2</sub>PQR” stands for the area code and the office code of the subscriber A’s base station, “YYYY” stands for the access code of this service.

- b. Subscriber A receives the announcement which prompts to input the base station number. A dials “PQRABCD”, which is the number.
- c. Subscriber A receives the announcement which prompts to input the remote subscriber A’s password. A dials “S<sub>1</sub>S<sub>2</sub>S<sub>3</sub>S<sub>4</sub>”, which is the password.

- d. Subscriber A receives the prompt announcement. A dials “#54\*KS<sub>1</sub>S<sub>2</sub>S<sub>3</sub>S<sub>4</sub>”. A receives the announcement to inform the subscriber the operation is successful. A goes on-hook.

**Signalling Flow**

Refer to Section .

**Interaction with other services**

- a. Refer to Section for the interaction with other services.

**Hot Line****Service Registration**

This service is assigned and programmed by the operator. The subscriber must predetermine the target number when applying this service.

**Service Usage**

When the subscriber goes off-hook, the switch immediately sets up the call to the predetermined terminating target number.

**Interaction with other services**

Hot line can not be compatible with the line services which require the operations via phone.

**Password****Service Registration**

The subscriber must apply this service and provide the password when applying the other line services require password (Such as: Outgoing Call Barring or Remote Access Services).

This service is assigned by the operator.

**Service Usage**

This service only can be used for other PSTN line services which require password.

**Password Modification**

The subscriber only can change the password at his/her own phone station via following steps:

- Subscriber goes off-hook,
- Receives dial tone,
- Dials \*77\*old\_pw\*S<sub>1</sub>S<sub>2</sub>S<sub>3</sub>S<sub>4</sub>\*S<sub>1</sub>S<sub>2</sub>S<sub>3</sub>S<sub>4</sub>#
- Receives confirmation tone,

— Goes on-hook.  
 where “old\_pw” stands for the old password, “S<sub>1</sub>S<sub>2</sub>S<sub>3</sub>S<sub>4</sub>” stands for the new password.

## Tone Specifications

### DTMF Tones

The DTMF tones specified for China market are contained in the table below:

| Tone         | Frequency (Hz)       | Level (dBm)  |
|--------------|----------------------|--------------|
| DTMF Digit 1 | 697 + 1209 (+/-2.0%) | -7/-9 (+/-3) |
| DTMF Digit 2 | 697 + 1336 (+/-2.0%) | -7/-9 (+/-3) |
| DTMF Digit 3 | 697 + 1477 (+/-2.0%) | -7/-9 (+/-3) |
| DTMF Digit 4 | 770 + 1209 (+/-2.0%) | -7/-9 (+/-3) |
| DTMF Digit 5 | 770 + 1336 (+/-2.0%) | -7/-9 (+/-3) |
| DTMF Digit 6 | 770 + 1477 (+/-2.0%) | -7/-9 (+/-3) |
| DTMF Digit 7 | 852 + 1209 (+/-2.0%) | -7/-9 (+/-3) |
| DTMF Digit 8 | 852 + 1336 (+/-2.0%) | -7/-9 (+/-3) |
| DTMF Digit 9 | 852 + 1477 (+/-2.0%) | -7/-9 (+/-3) |
| DTMF Digit 0 | 941 + 1336 (+/-2.0%) | -7/-9 (+/-3) |
| DTMF Digit * | 941 + 1209 (+/-2.0%) | -7/-9 (+/-3) |
| DTMF Digit # | 941 + 1477 (+/-2.0%) | -7/-9 (+/-3) |
| DTMF Digit A | 697 + 1633 (+/-2.0%) | -7/-9 (+/-3) |
| DTMF Digit B | 770 + 1633 (+/-2.0%) | -7/-9 (+/-3) |
| DTMF Digit C | 852 + 1633 (+/-2.0%) | -7/-9 (+/-3) |
| DTMF Digit D | 941 + 1633 (+/-2.0%) | -7/-9 (+/-3) |

Note, according to the China specification YDN065, section 8, for the DTMF tones, the allowed levels of low frequency and high frequency can be -4 ~ -23dBm, and the distinction of the levels of low frequency and high frequency can not exceed 6dBm. This activity sets -7dBm for the low frequency, and -9dBm for the high frequency.

### Audible Tones

The following sections provide the tables that describe the audible tones in the CHINALGC toneset specified for the China market. For each tone, a format is provided to include the meaning, frequency, level and cadence information.

### Idle Tone

|                       |            |
|-----------------------|------------|
| <b>Meaning</b>        | Silence    |
| <b>Frequency (Hz)</b> | 300        |
| <b>Level (dBm)</b>    | -          |
| <b>Cadence</b>        | Continuous |

Note: this tone is cloned from toneset CHINA100.

### Dial Tone

|                       |                                                                                                                                 |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------|
| <b>Meaning</b>        | A tone advising that the exchange is ready to receive call information and inviting the user to start sending call information. |
| <b>Frequency (Hz)</b> | 450 (+/-10%)                                                                                                                    |
| <b>Level (dBm)</b>    | -10 (+/-3)                                                                                                                      |
| <b>Cadence</b>        | Continuous                                                                                                                      |

### Special Dial Tone

|                       |                                                                                                                                                                                                                                            |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Meaning</b>        | A tone advising that the exchange is ready to receive call information and inviting the user to start sending call information, at the same time reminding the caller that special conditions (such as CFU is activated). are encountered. |
| <b>Frequency (Hz)</b> | 450 (+/-10%)                                                                                                                                                                                                                               |
| <b>Level (dBm)</b>    | -10 (+/-3)                                                                                                                                                                                                                                 |
| <b>Cadence</b>        | 400 ms ON<br>40 ms OFF<br>Repeated pattern                                                                                                                                                                                                 |

### Busy Tone

|                       |                                                           |
|-----------------------|-----------------------------------------------------------|
| <b>Meaning</b>        | A tone advising the caller that the called party is busy. |
| <b>Frequency (Hz)</b> | 450 (+/-10%)                                              |
| <b>Level (dBm)</b>    | -10 (+/-3)                                                |

|                |                                                           |
|----------------|-----------------------------------------------------------|
| <b>Meaning</b> | A tone advising the caller that the called party is busy. |
| Cadence        | 350 ms ON<br>350 ms OFF<br>Repeated pattern               |

### Congestion Tone

|                |                                                                                                                                                                                             |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Meaning</b> | A tone advising the caller that the groups of lines or switching equipment necessary for the setting up of the required call or for the user of a specific service are temporarily engaged. |
| Frequency (Hz) | 450 (+/-10%)                                                                                                                                                                                |
| Level (dBm)    | -10 (+/-3)                                                                                                                                                                                  |
| Cadence        | 700 ms ON<br>700 ms OFF<br>Repeated pattern                                                                                                                                                 |

### Ring Back Tone

|                |                                                                                                                                                   |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Meaning</b> | A tone advising the caller that the connection has been made and that a calling signal is being applied to the telephone number or service point. |
| Frequency (Hz) | 450 (+/-10%)                                                                                                                                      |
| Level (dBm)    | -10 (+/-3)                                                                                                                                        |
| Cadence        | 1000 ms ON<br>4000 ms OFF<br>Repeated pattern                                                                                                     |

### Vacant Number Tone

|                |                                                                     |
|----------------|---------------------------------------------------------------------|
| <b>Meaning</b> | A tone advising the party during a call that a toll call is waiting |
| Frequency (Hz) | 450 (+/-10%)                                                        |
| Level (dBm)    | -10 (+/-3)                                                          |

### Toll Break In

|                |                                                                                                              |
|----------------|--------------------------------------------------------------------------------------------------------------|
| <b>Meaning</b> | A tone advising the party during a local call that the operator wants to establish a toll call to the party. |
| Frequency (Hz) | 450 (+/-10%)                                                                                                 |
| Level (dBm)    | -20 (+/-3)                                                                                                   |
| Cadence        | 200 ms ON<br>200 ms OFF<br>200 ms ON<br>600 ms OFF<br>Repeated pattern                                       |

### Call Waiting Tone

|                |                                                                                                                                             |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Meaning</b> | A tone advising the user of the call waiting service who engaged on a talking call that another call is attempting to connect to this user. |
| Frequency (Hz) | 450 (+/-10%)                                                                                                                                |
| Level (dBm)    | -10 (+/-3)                                                                                                                                  |

|                |                                                                                                                                             |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Meaning</b> | A tone advising the user of the call waiting service who engaged on a talking call that another call is attempting to connect to this user. |
| <b>Cadence</b> | 400 ms ON<br>4000 ms OFF<br>Repeated pattern                                                                                                |

### Holding Tone (Reminder Tone)

|                       |                                                                                     |
|-----------------------|-------------------------------------------------------------------------------------|
| <b>Meaning</b>        | The subscriber on hold receives holding tone during the conference or enquiry call. |
| <b>Frequency (Hz)</b> | 950 (+/-10%)                                                                        |
| <b>Level (dBm)</b>    | -20 (+/-3)                                                                          |
| <b>Cadence</b>        | 400 ms ON<br>10000 ms OFF<br>Repeated pattern                                       |

### Howler Tone (Receiver Offhook Tone)

|                       |                                                       |
|-----------------------|-------------------------------------------------------|
| <b>Meaning</b>        | Prompts the subscriber to place the receiver on-hook. |
| <b>Frequency (Hz)</b> | 1400 / 2060 / 2460 / 2600 (+/-5%)                     |
| <b>Level (dBm)</b>    | -6                                                    |
| <b>Cadence</b>        | 100 ms ON<br>100 ms OFF<br>Repeated pattern           |

### Confirmation Tone

|                       |                                                                                                                                                                                         |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Meaning</b>        | Indication to a subscriber controlling a supplementary service that the control procedure for access to that service or a service feature has been successfully completed and accepted. |
| <b>Frequency (Hz)</b> | 450 (+/-10%)                                                                                                                                                                            |
| <b>Level (dBm)</b>    | -10 (+/-3)                                                                                                                                                                              |

|                |                                                                                                                                                                                         |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Meaning</b> | Indication to a subscriber controlling a supplementary service that the control procedure for access to that service or a service feature has been successfully completed and accepted. |
| <b>Cadence</b> | 160 ms OFF<br>160 ms ON<br>160 ms OFF<br>320 ms ON<br>640 ms OFF<br>Nonrepeated pattern                                                                                                 |

### ADSI CAS Tone

The ADSI CAS tone specified for China market is shown in the table below:

| <b>Tone</b>   | <b>Frequency (Hz)</b> | <b>Level (dBm)</b> |
|---------------|-----------------------|--------------------|
| ADSI CAS tone | 2130 + 2750 (+/-0.5%) | -15/-15 (+/-1)     |

### Test and Diagnostic Tones

The test and diagnostic tones are cloned from the toneset CHINA100:

| <b>Tone</b> | <b>Frequency (Hz)</b> | <b>Level (dBm)</b> |
|-------------|-----------------------|--------------------|
| Low Tone    | 450                   | -20                |
| 1004Hz Tone | 1004                  | 0                  |
| 950Hz Tone  | 950                   | -20                |
| Milliwatt   | 950                   | 0                  |

### Appendix 3 for A00002755 -- Q00869086 FN

This is the documentation for CR: Q00869086 - CI tool for line services auto update.

**Note:** In this document, both ‘option’ and ‘service’ are referring to the services that can be provided on lines through SERVORD tool.

### Function Description

The SN07 feature “A00002755 China Line Service Compliance” introduces line services that compliant to China line services spec (YDN065). While on SN06, some lines are using non China compliance services.

So the requirement rises: in an SN06 -> SN07 upgrade, update the non China compliance services to compliance services. The CI tool is designed to achieve this.

The CI tool is named “SERVUPD”, it does not require parameters.

The SERVUPD tool uses the datafill in CEPTONCENTREX to decide which services need update. Following table list the decision logic: if the option in ‘CEPTONCENTREX option’ column is datafilled, the service listed in ‘From Service’ column is updated to those listed in ‘To Service’ column. The “Update Description” column describes the update action.

### Service Update Decision Logic

| CEPTONCENTREX option | From Service | To Service         | Update Description                                                                                                                                                                                                                                                                   |
|----------------------|--------------|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IWUC                 | WUCR         | CEPT IWUC          | Wake up call.<br>- The wake up timer setting in WUCR will be transferred to IWUC.                                                                                                                                                                                                    |
| CDIV                 | MSB          | CEPT CDND          | Make set busy.<br>- The MSB state will be transferred to CDND.                                                                                                                                                                                                                       |
|                      | CFO          | CEPT CDTA/<br>CDTO | Call forward to operator.<br>- Since CFO can be mapped to CDTA or CDTO, according to the CFO route, it will not be updated by SERVUPD. The operator can update it manually. No update action.                                                                                        |
|                      | CFF          | CEPT CFF           | Call forward fix.<br>- No update action.                                                                                                                                                                                                                                             |
| ICT                  | CXR          | CEPT ICT           | Call transfer.                                                                                                                                                                                                                                                                       |
| ICWT                 | CWT          | CEPT ICWT          | Call waiting.<br>- Before updating, if the line has CWI, CCW, CWTACT & SCWID, they will be deleted first: the CWTACT state will be transferred to ICWT, the SCWID will be added back after ICWT added.<br>- The ICWT_ACTIVE field will be set to default 'Y' if there was no CWTACT. |
| CCBS                 | RAG          | CEPT CCBS          | Ring back (call complete to busy subscriber).<br>- If RAG is activated on a line, its setting will NOT be transferred to CCBS.                                                                                                                                                       |
| I3WC                 | 3WC          | CEPT I3WC          | Three way call.                                                                                                                                                                                                                                                                      |
| I6WC                 | CNF(C06)     | CEPT I6WC          | Six way call.<br>- Only CNF(C06) will be updated to I6WC.                                                                                                                                                                                                                            |

When the operator types ‘SERVUPD’, following actions will be taken:

1. Read the CEPTONCENTREX tuple of ISERVOPT, first check the MARKET field. If it is not China, prompt the error message and abort.

Following is the intended error message.

### ERROR Message

```
>ServUpd
Error:
ServUpd is for China market usage only.
If the market is China, please set the following field to CHINA, then retry:
table ISERVOPT, tuple CEPTONCENTREX, field MARKET
ServUpd not started.
```

2. If the MARKET is China, get the datafilled options in it.

Following is an example of CEPTONCENTREX.

### Datafill Example of CEPTONCENTREX in table ISERVOPT

```
SOPTSKEY SOPTSVAR
-----
CEPTONCENTREX CEPTONCENTREX China (SC) (WML) (ILR) (CCBS) (I3WC) (CDIV) $
```

3. Prompts to list the services that will be updated one by one, ask for the confirm from operator. (refer to on page 421)
4. Then list all services that will be updated, also list the services that can be updated but not datafilled in CEPTONCENTREX, and wait for the confirm from operator.

Following is the intended prompt.

### Prompt Example of ServUpd

```
>SERVUPD
Update: From 3WC to CEPT I3WC, agree?
Type 'y' or 'n'
>Y
Update: From CFO to CEPT CDTA/CDTO, agree?
Type 'y' or 'n'
>Y
Update: From MSB to CEPT CDND, agree?
Type 'y' or 'n'
>Y
Update: From RAG to CEPT CCBS, agree?
Type 'y' or 'n'
>Y
-----
Following line service update will be performed:
From 3WC TO CEPT I3WC
From MSB TO CEPT CDND
From RAG TO CEPT CCBS
-----
Warning:
Following line services can be updated but not required by user:
From 6WC TO CEPT 6WC
From CWT TO CEPT ICWT
From CXR TO CEPT ICT
From WUCR TO CEPT IWUC
They will not be updated.
-----
Type 'Y' to start, type 'N' to abort.
>Y
```

5. If the operator types 'N', just abort the command. If the operator types 'Y', perform the service update.

The SERVORD DEO/ADO utilities will be used to perform the update. The SERVORD requirement on line state applies, lines will not be updated if the state is invalid(eg: SB).

6. During update, the result will be printed to the screen. When update finishes, report the summary.

There are four kinds of result:

- success. It is counted in the 'number of success' in summary.
- error occurred. Some options may have been deleted before error occurs, the deleted option will be printed. It is counted in the 'number of not updated' in summary.
- line state not proper. It is counted in the 'number of not updated' in summary.

- partly success: the option is updated successfully, but the option setting before update lost. It is counted in the 'number of partly success' in summary.

Following is the result and summary example. Could use the existing CI tool 'RECORD' to record the logs into a file on disk.

### Logs/Report Example of ServUpd

```
Type 'Y' to confirm, type 'N' to abort.
>Y
Services being updated:
-----
LG 0 0 0 0: From 3WC TO CEPT I3WC ... success.
LG 0 0 0 1: From MSB TO CEPT CDND ... success.
.....
LG 0 1 0 0: From RAG TO CEPT CCBS ... Line state is not proper, no update. Please
retry later.
LG 0 1 0 1: From RAG TO CEPT CCBS ... success.
.....
LG 0 2 0 1: From MSB TO CEPT CDND ... Partly success, the service setting before
update lost.
LG 0 2 0 2: From MSB TO CEPT CDND ... Error occurred. Not updated.
Deleted Options:
MSB
.....

ServUpd completed,
Following line services are updated:
-----
3WC -> CEPT I3WC
Total number of success lines:      300
Total number of partly success lines:0
Total number of not updated lines:  3
-----
MSB -> CEPT CDND
Total number of success lines:      125
Total number of partly success lines:0
Total number of not updated lines:  0
-----
RAG -> CEPT CCBS
Total number of success lines:      200
Total number of partly success lines:0
Total number of not updated lines:  2
```

### Limitation

- The SERVUPD tool will be used for ONP only, it will be put in no context. The ONP team can bring it to site on tape for usage.
- Only one-way update is supported. This means, when an option is removed from the CEPTONCENTREX tuple in table ISERVOPT, the lines using this option can not be updated using 'ServUpd' command. For example:

ServUpd can change the RAG to CEPT CCBS, but can not change CEPT CCBS to RAG.

- The tool only uses SERVORD utilities to delete/add services on line. The service related translations, office parameters, etc. has to be deleted/added by the operator.
- When adding CEPT options to line, if the 'assign' action option is datafilled to be metered in table MTRFEAT, and the line has MOG option, the metering of 'Assign' will increase.
- When update RAG to CEPT CCBS, if the RAG is activated on the line, SERVUPD will only update RAG to CEPT CCBS, the RAG setting will NOT be transferred to CCBS to reduce the risk.

#### **Table/MIB/Remote Database Schema information**

##### **Name: ISERVOPT**

International Services options

##### **Functional description - Tuple CEPTONCNETREX**

A new field MARKET into the tuple CEPTONCENTREX in table ISERVOPT. The field MARKET is used to identify in which market the line services are working. Now, two value are available for this field. One is

DEFAULT and another is CHINA. For the chinese office, this field must be set to CHINA.

In order to allow all CEPT line services mentioned above on the IBN line without CEPT option, the corresponding service options must be present in tuple CEPTONCENTREX in table ISERVOPT. The following table shows the available options in tuple CEPTONCENTREX, and the associated CEPT line services:

**Note:** The CEPTONCENTREX options with **bold** font are introduced by this activity.

**CEPTONCENTREX Options and CEPT Line Services**

| <b>CEPTONCENTREX<br/>OPTION</b> | <b>Associated CEPT Line Service</b>        |
|---------------------------------|--------------------------------------------|
| SC                              | SCL, SCS                                   |
| WML                             | WML                                        |

**Functional description - Tuple CEPTPW**

A new field COLLECT\_DNPIN\_IN\_DIFF\_STAGES and two announcement IDs COLLECT\_DN\_ONLY and COLLECT\_PIN\_ONLY are introduced into tuple CEPTPW.

If the field COLLECT\_DNPIN\_IN\_DIFF\_STAGES is set to Y in tuple CEPTPW, a new DN and PIN dialing sequence is adopted by CEPTRA, that is, the subscriber should input DN firstly, and receive announcement, then input PIN.

When the subscriber dials the DISA DN in order to use CEPTRA service, if the field COLLECT\_DNPIN\_IN\_DIFF\_STAGES and ANNOUNCE are set to Y in tuple CEPTPW and the announcements are provisioned correctly, the subscriber will hear the announcement associated by announcement ID COLLECT\_DN\_ONLY to prompt to input DN, after the subscriber inputs the valid DN, he/she will hear the announcement associated by announcement ID COLLECT\_PIN\_ONLY to prompt to input password.

**Usage sequence and implications (CM Only)**

Current datafill order unchanged.

**Size**

Current table size unchanged.

**Fields/OIDs**

The following table lists fields for table ISERVOPT;

**Table field descriptions for tuple CEPTPW**

| Field                        | New or Changed | Subfield or refinement | Entry | Explanation and action                                                                                                                                                                                                                                                                                |
|------------------------------|----------------|------------------------|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COLLECT_DNPIN_IN_DIFF_STAGES | New            |                        | {N,Y} | This field indicates if the new DN and PIN dialing sequence is adopted for CEPTRA service. If this field is set to Y, the subscriber should input DN firstly, and receive announcement, then input PIN. If the field is set to N, the subscriber should input DN and PIN as "DN*PIN" at once dialing. |

***Product = CS 2000*****A00002756 -- Japan Trunk Services (Succession on DMS)*****Functional Description***

This activity migrates Japan trunk services “Notification of Time and Charge” (NTC), “Carrier Name Notification” (CNN) and “Account Code” (ACCT) from the legacy MMP product to CS2K Hybrid product IP side in ISN07. It transparently ports the functionality implemented under these MMP features onto the CS2K Hybrid IP side. “Hybrid” always means “CS2K Hybrid” within this document.

If these services are triggered by incoming IP side in hybrid, they are provided by IP side directly. On the contrary, if triggered by incoming TDM side, they are provided by legacy MMP features.

About the services provided by TDM side in hybrid, it is not the scope of this activity and please read the original MMP activities listed below.

The existing MMP NTC service was implemented by following activities:

- AR0480 Notification Of Time & Charge
- AR1344 NTC
- AR1599 Enhancement to NTC
- AR1816 Multilingual NTC
- A59017299 Japan Interconnect ISUP

The service of “Carrier Name Notification for Japan” has been provided on MMP under following activities:

- A59027517 Equal Access Carrier Name Notification
- A59034248 Carrier Name Notification for Carrier Designation Service

The “Account Code” service on MMP was originally done under following activities:

- AR2028 Account Code
- A59017299 Japan Interconnect ISUP

## **Notification of Time and Charge (NTC)**

### **Functional Overview**

Notification of Time and Charge is a service provided over JI-ISUP trunks to the Japanese domestic market.

The subscriber activates this service by using the NTC service code prior to the destination address digits. A call is registered as requesting NTC service when traversing a tuple in universal translation that has the NTC feature assigned to it. The NTC service contains two calls: original NTC call and NTC callback.

The original NTC call proceeds normally. After a successful call is answered, released and an AMA billing record is produced, NTC service calls the subscriber back using the Calling Line Identifier (CLID) and provides an announcement indicating such information as the destination address digits, the duration of the original call and the charge amount for this service. The NTC announcement is delivered from EDRAM hardware on Hybrid TDM side. As a Hybrid switch IP side is unlikely to use EDRAM hardware, this activity will rework the feature to use the newer UAS hardware in IP side.

The NTC announcement is a custom announcement that consists of a number of simple and compound phrases. Each simple phrase has a corresponding recording on UAS. Each compound phrase is composed of 1 or simpler phrases.

NTC service is not affected by the out going agent of the original NTC call. The service works providing the interworking from JI-ISUP to the outgoing agent is available and AMA record is used for the call.

Please refer to the following figure.

**NTC Functional Behavior Diagram**

### Linguistic Logic

In this feature, the linguistic logic supports all of the nine languages, Japanese, English, Tagalog, Portuguese, Chinese, Korean, Thai, Spanish and Malay, supported by legacy MMP features.

Following shows the English version NTC announcement.

*This is IDC. The international call you have just made to **A** the number **B** was **C** hours **D** minutes **E** seconds long and cost **F** yen. Repeat, **C** hours, **D** minutes, **E** seconds long and cost **F** yen. Thank you for using IDC. This is a recording.*

Here:

**A** = Area Name

**B** = the number recorded by hybrid during the original call.

**C** = Hours quantity, range is from 1 to 277.

**D** = Minutes quantity, range is from 0 to 59.

**E** = Seconds quantity, range is from 0 to 59.

**F** = Yen quantity, range is from 1 to 10 065 533 yen.

### Repeating/Skipping a Language during Cyclic Announcement

NTC service provides announcement in a cyclic fashion. In order to provide the subscriber with some control over NTC announcement playing, this feature supports '\*' key for repeating a language in the same cycle and '#' key for skipping to the next language.

- *skipping*: the received '#' keys are used for skipping.

Skipping does not change the playing sequence of the selected languages. This means that a '#' key stops the language currently being played immediately and starts the *next language* right after. The next language here may be the next one on the current cycle, or the first language of the next cycle if the stopped language is the last one of this cycle.

If a '#' key is received while the last language is being played during the last cycle, skipping is ignored. This is so for providing an explicit ending of the NTC service, i.e. either by a complete announcement in the last language or by subscriber disconnect.

- *repeating*: the received '\*' keys are used for repeating.

A received '\*' key stops the language currently being played immediately and starts to repeat the *same* language on the current cycle.

The maximal number of repeats allowed per cycle of NTC announcement is datafillable via an office parameter. If '\*' keys are received beyond the maximum datafilled, the '\*' keys are ignored.

Office parameter NTC\_ANNC\_CONTROL in table OFCVAR has two fields.

1. The first field sets the total number of cycles for NTC service. This field has a range from 1 to 8 with a default value of 2.
2. The second field sets the maximal number of repeats (i.e. '\*' keys) allowed per cycle of the announcement. This field has a range from 0 to 7 with a default value of 2.

Let's say there are three languages: A, B and C. One cycle is defined as (A B C) and NTC\_ANNC\_CONTROL is set to (4 2), i.e. four cycles and maximum of two repeats per cycle. The entire announcement without repeating (note, skipping may be happening) is:

(A B C) (A B C) (A B C) (A B C)

If skipping occurs during the above announcement, the language sequence would still be the same. The only difference is the skipped language would be stopped (except for C in the last cycle above) once the '#' key is received by

hybrid and the next language, which may be the next language on the current cycle or the first language on the next cycle, starts playing right after. Without skipping, each language would be played completely.

With repeating, the actual announcement may be:

(A A A B C) (A B B C C) (A B C) (A B B C)

Note that during the first cycle above, language B or C cannot be repeated any more since the only two repeats allowed per cycle is used up for language A. This means that all the '\*' keys received during the playing time of B and C in this cycle are ignored.

## Carrier Name Notification (CNN)

### Functional Overview

When a JI-ISUP IAM reaches hybrid IP side, the IAM is analyzed for a number of parameters as to whether the announcement is to be played. Once the hybrid decides to provide Carrier Name Notification announcement (for the conditions please refer to A59034248 FN section "Conditions for Feature activation"), an early ACM is sent to the calling party that serves to open a backward speech path and then the announcement is played.

Please refer to ["CNN Call Flow for Interworking with ISUP" on page 437](#) and ["CNN Call Flow for interworking with SIP-T" on page 438](#).

This service is supported in the following interworking scenarios by this activity:

- JI-ISUP -> JI-ISUP
- JI-ISUP -> IBN7 ISUP
- JI-ISUP -> ETSI ISUP V1
- JI-ISUP -> ETSI ISUP V2
- JI-ISUP -> SIP-T (JI-ISUP)
- JI-ISUP -> SIP-T (No ISUP to IMS)

**CNN Call Flow for Interworking with ISUP**

**CNN Call Flow for interworking with SIP-T****Announcement Handling**

If all conditions for feature activation are satisfied and the Network Identification Code in the TNS parameter matches with the CARRID datafill in table CARRNAME, then the announcement recorded corresponding to the announcement CLLI is played. Samples for CNN announcement datafill in ANNS & CARRNAME are shown in [“Example datafill in table ANNS” on page 438](#) and [“Example datafill in table CARRNAME” on page 439](#). In this sample, the announcement CLLI is “ANNCLLI1” and CARRID is “111111”.

**Example datafill in table ANNS**

|                                |
|--------------------------------|
| ANNCLLI1 NETWK 0 0 1 STND Y 10 |
|--------------------------------|

**Example datafill in table CARRNAME**

|                 |
|-----------------|
| 111111 ANNCLLI1 |
|-----------------|

If CNN announces fail, e.g. all ANNCLLI1 trunks are busy, the call is tandemed as a normal tandem call and the outgoing IAM doesn't contain TNS parameter. At the same time, CNN101 log is generated. For more information about CNN log, please refer to activity A59034248 FN section "Logs". The call process of this case please refer to ["CNN Announcement Fail Call Process"](#) on page 439.

**CNN Announcement Fail Call Process****Handling of Charge Indicator in BCI of CPG**

When CNN feature is triggered, the charge indicator in the CPG is modified according to the CHGIND datafill or the CPGCGIND datafill in table XXCODE / XXHEAD.

The rule of it is shown in the following figure.

**Handling of CPGCGIND in CPG**

| <b>CHGIND<br/>datafilled</b> | <b>Freedial<br/>(NOCHARGE)<br/>datafilled</b> | <b>CPGCGIND<br/>datafilled</b> | <b>Charge Indicator in CPG</b> |

**Handling of IAA parameters**

IAA is the abbreviation of Inter-Administration Accounting. For more information about IAA, please refer to AU2343 FN section APPENDIX A.

**Carrier Name Notification at CIEC****Carrier Name Notification at CIEC**

Please refer to Figure , on page 440 .

At hybrid that behaves as a CIEC, if an early ACM for the feature is generated, it will not contain the IAA parameters.

The IAA parameters in the incoming ACM are mapped to the CPG. The IAA parameters of the CIEC are appended to the CPG depending on the IAA logic.

The hybrid will append the CIEC info to the CPG only if all the following conditions are met: -

- the interworking is JI-ISUP to JI-ISUP,
- CIEC datafill in table IAACtrl is encountered during translation;
- all conditions for generating CIEC in IAM are met;
- the incoming ACM must contain the Carrier Info parm (#F1).
- the received TCIT indicator in the incoming IAM must be Backwards (10) or Bothways (11)

If all the above conditions are met, then the behavior depends on which of the following two conditions are met:

**(1)** if the last sub-block inside the received Carrier Info Parameter in the ACM is CIEC, and the received CIEC Carrier ID is the same as the datafill in ofcparm TELCO\_ID or the SUB\_TELCO\_ID datafill in table IAACtrl, then the behavior is like: -

|                    |                                                                                                                                                                                                     |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CarrierID sub-parm | no change                                                                                                                                                                                           |
| POI-CA sub-parm    | no change (even if EXIT_POI_CA is datafilled)                                                                                                                                                       |
| POI-CAT sub-parm   | if received, the ENTRY_POI_CAT, if datafilled, overwrites the received one; the received EXIT_POI_CAT is not changed;<br><br>if not received, this sub-parm is added if EXIT_POI_CAT is datafilled; |

**(2)** if the last sub-block inside the received Carrier Info parameter in the ACM is not CIEC, then the Carrier ID in it is not be the same as the datafill in ofcparm TELCO\_ID or the SUB\_TELCO\_ID datafill in table IAACtrl, then the behavior is like: -

|                    |                                                                       |
|--------------------|-----------------------------------------------------------------------|
| CarrierID sub-parm | taken from ofcparm TELCO_ID or SUB_TELCO_ID datafill in table IAACtrl |
| POI-CA sub-parm    | added only if EXIT_POI_CA is datafilled                               |

|                  |                                                                           |
|------------------|---------------------------------------------------------------------------|
| POI-CAT sub-parm | added if (EXIT_POI_CAT) OR (EXIT_POI_CAT and ENTRY_POI_CAT) is datafilled |
|------------------|---------------------------------------------------------------------------|

After the CPG with IAA is sent out, if there is an alerting CPG coming from outgoing JI-ISUP side, it is just tandemed out to incoming JI-ISUP side and no IAA is added. Please refer to the following figure.

### Second CPG mapping at CIEC

### Carrier Name Notification at INTL\_CALLED (Outbound International Calls)

Please refer to the following figure.

**Carrier Name Notification for INTL\_CALLED**

At hybrid that behaves as an **INTL\_CALLED** (for an international outbound call), if an early ACM for the feature is generated, it will not contain the IAA parameters. So the IAA parameters of the **INTL\_CALLED** will be added to the CPG, i.e. the Carrier Information Parameter containing the Carrier ID.

After the CPG with IAA is sent out, if there is an alerting CPG coming from outgoing IBN7 ISUP side, it is just tandemmed out to incoming JI-ISUP side and no IAA is added. Please refer to [“Second CPG mapping at INTL\\_CALLED”](#) on page 444.

**Second CPG mapping at INTL\_CALLED****Carrier Name Notification at IEC**

The activation of Carrier Name Notification announcement doesn't differentiate between IEC, CIEC or INTL\_CALLED.

If the announcement is played at an IEC, the early ACM generated will not contain the IAA parameters.

The IAA parameters in the incoming ACM are mapped to the CPG. The IAA parameters of the IEC are appended to the CPG depending on the IAA logic.

Please refer to the following figure.

**Carrier Name Notification at IEC**

The hybrid updates the IEC carrier info parm to the CPG only if all the following conditions are met:

- the interworking is JI-ISUP to JI-ISUP;
- IEC datafill in table IAACtrl is encountered during translation;
- all conditions for generating IEC in IAM, except the condition regarding the received TCIT value, are met;
- the incoming ACM must contain the Carrier Info parm (#F1);
- the received TCIT indicator in the incoming IAM must be Backward (10) or Bothways (11);

If all the above conditions are met, then the behavior depends on which of the following two conditions are met: -

- (1) if the last sub-block of the received #F1 parm is IEC, and this received IEC Carrier ID is the same as the datafill in ofcparm TELCO\_ID or the SUB\_TELCO\_ID datafill in table IAACtrl, then the behavior is like:

|                    |                                                                                                                                                                                                     |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CarrierID sub-parm | No Change                                                                                                                                                                                           |
| POI-CA sub-parm    | no change (even if EXIT_POI_CA is datafilled)                                                                                                                                                       |
| POI-CAT sub-parm   | if received, the ENTRY_POI_CAT, if datafilled, overwrites the received one; the received EXIT_POI_CAT is not changed;<br><br>if not received, this sub-parm is added if EXIT_POI_CAT is datafilled; |

(2) if the Carrier ID in the last sub-block of the received #F1 parm is not the same as the datafill in ofcparm TELCO\_ID or the SUB\_TELCO\_ID datafill in table IAACTRL, then the behavior is like:

|                    |                                                                           |
|--------------------|---------------------------------------------------------------------------|
| CarrierID sub-parm | taken from ofcparm TELCO_ID or SUB_TELCO_ID datafill in table IAACTRL     |
| POI-CA sub-parm    | added only if EXIT_POI_CA is datafilled                                   |
| POI-CAT sub-parm   | added if (EXIT_POI_CAT) OR (EXIT_POI_CAT and ENTRY_POI_CAT) is datafilled |

### Handling IBN7 ISUP Fast ANM

IBN7 ISUP fast ANM to JI-ISUP ACM/ANM mapping is enhanced to JI-ISUP CPG/ANM mapping. The call flow refers to [“CNN IBN7 ISUP Fast ANM to JI-ISUP CPG/ANM mapping” on page 447](#).

If the fast ANM with no charge and ANM (NOCHG) mapping feature is turned off, ANM is just mapped to CPG and no ANM is sent out. The IAA parameters of the INTL\_CALLED exchange will be added to CPG. Except this, the mapping is not impacted.

**CNN IBN7 ISUP Fast ANM to JI-ISUP CPG/ANM mapping****IBN7 ISUP to JI-ISUP BCI of CPG Mapping**

After the first CPG is sent back to JI-ISUP side, if there is a CPG with BCI is received from IBN7 ISUP side, it is mapped to CPG which has BCI in JI-ISUP side. The BCI mapping rule is the same as BCI of ACM to BCI of CPG mapping. The rule please refers to RS section of A59017299 table 52 "Parameter Mapping - ANSI7+ ISUP ACM to JI-ISUP ACM".

Please refer to the following figure.

**IBN7 ISUP to JI-ISUP BCI of CPG mapping****Account Code (ACCT)****Functional Overview**

“Account Code” service enables the subscriber to enter an account code during the call setup in order to classify the call on the customer’s bill.

The hybrid checks the customer group (CUSTGRP) and the network class of service (NCOS) to see if an account code is required on this call. If it is, the hybrid sends back second dial tone or announcement to prompt the subscriber to enter an account code. The hybrid receives the account code digits as DTMF tones over the voice path.

When entering the account code, the subscriber has the option to enter the reset digit (\*). This causes all account code digits entered by the subscriber during the present stage of dialing to be ignored. Accompanying the ‘\*’ is a reset tone,

to prompt the subscriber to begin re-entering the required digits where the first digit dialed breaks the reset tone.

Once the account code digits are entered, the hybrid checks to see if the required number of digits has been entered and the call continues. The entered account code digits will be contained in the AMA billing record.

If the subscriber enters the hash (#) during the dialing phase it is treated as end of dialing. At this point, if the minimum required number of digits has been collected, the call proceeds to the next phase of call processing.

ACCT is supported in following interworking scenarios on hybrid by this activity:

- JI-ISUP -> JI-ISUP
- JI-ISUP -> IBN7 ISUP
- JI-ISUP -> ETSI ISUP V1
- JI-ISUP -> ETSI ISUP V2
- JI-ISUP -> SIP-T (JI-ISUP)
- JI-ISUP -> SIP-T (No ISUP to IMS)

Please refer to “[ACCT Interworking with ISUP Functional Behavior Diagram](#)” on page 450 and “[ACCT Interworking with SIP-T Functional Behavior Diagram](#)” on page 451.

**ACCT Interworking with ISUP Functional Behavior Diagram**

ACCT Interworking with SIP-T Functional Behavior Diagram

### Reset Tone

When entering the account code, the subscriber has the option to enter the reset digit (\*). This causes all account code digits entered by the subscriber during the present stage of dialing to be ignored and "Reset tone" is played. This tone is stopped when first digit is received or reset tone duration is time out.

The specification of reset tone is shown in the following table.

**Specification of Reset tone**

| <b>Tone</b>                                       | <b>Single Frequency</b> | <b>Cadence</b> | <b>Duration</b> | <b>Level</b>          |
|---------------------------------------------------|-------------------------|----------------|-----------------|-----------------------|
| Reset Tone<br>(for reset of the digit collection) | 400 Hz                  | Constant       | (0.5 second)    | -16 dBmO<br>+/-0.5 dB |

**Tone/Announcement Handling**

The JI-ISUP agent, on receipt of the first digit, handles the tone/announcement in the following fashion:

- 0 - 9, '\*' - Tone/Announcement stopped
- '#' - Tone stopped/Announcement continues

**Effect On Permanent Signal Timer**

If digit 0 through 9 is entered as a first digit then the permanent signal timer is stopped, and the interdigit timer is used to collect the remaining digits.

If '\*' or '#' is entered as the first digit the handling of the permanent signal timer is shown in the following table.

**Account Code Handling of First Digit**

| <b>Digit Entered</b> | <b>Perm Signal Timer</b> |
|----------------------|--------------------------|
| * (asterisk)         | restarted                |
| #(octothorpe)        | restarted                |

**Interworking between JI-ISUP and ETSI ISUP V1**

Following interworkings are provided in this feature:

- JI-ISUP (NATL) to ETSI ISUP V1 (INTL)
- ETSI ISUP V1 (INTL) to JI-ISUP (NATL)

Because ETSI ISUP V1 trunk is an international trunk which is datafilled as INTL in table TRKGRP, and JI-ISUP trunk is a national trunk which is datafilled as NATL in table TRKGRP, the gateway supporting the interworking is regarded as an international gateway.

In this feature, the message and parameter mappings for above interworkings in the international gateway is handled based on the Q.767 specification (Application of CCITT ISUP for international ISDN interconnectios). All of

messages and parameters which are not supported in Q.767 are not supported in this feature.

Detail mappings are described in Appendix B.

| Access Transport             |                                                      |                                                                             | <=  | Access Transport                                                            |                                                      |                              |
| Discarded                    |                                                      |                                                                             | <=  | User to User Information                                                    |                                                      |                              |

***Product = CS 2000***

**A00002884 -- ETSI BRI Preset Conference Service Interactions (Succession on DMS)**

## ***Functional Description***

The activity “ETSI BRI Preset conference service interactions” allows the interworking for preset conference on BRI with the supplementary services indicated in “Preset Conference for BRI Supplementary Services” specification document.

Activity A00002884 is a continuation of activity A00002367 “BRI Preset conference base” which is based on the existing IBN Preset Conference and uses the same datafill requirements and restrictions for IBN Preset conference.

The implementation of this activity has no impact on the supplementary services current working behavior.

### **Provisioning of BRI Preset Conference**

BRI Preset Conference allows an ETSI BRI (point-to-multipoint) station or ETSI ISUP V2 trunk to set up a preset conference with up to 35 conferees by dialling a specific directory number. This invokes simultaneous ringing of preselected conference members. To be able to activate this activity, PRECONF, CUSTENG tables should be datafilled.

In table CUSTENG, the customer group of the originator should have ‘CONF6C’ option to allow the conference to be activatable. CUSTENG table datafill example is given in the following table.

#### **CUSTENG table datafill example**

| <b>CUSTNAME</b> | <b>ADNUM</b> | <b>NONCOS</b> | <b>NOIBNTMT</b> | <b>CONSOLES</b> | <b>DOMAIN</b>   | <b>GROUPID</b> |
|-----------------|--------------|---------------|-----------------|-----------------|-----------------|----------------|
| CUST783A        | 22           | 256           | 63              | Y PRIVATE       | 105 (CONF6C 12) | \$             |

Table PRECONF contains a predefined preset conference DN and the conferees for this DN.

Preset conference DN should be datafilled to be allowed for a customer group, it is possible to datafill up to 64 preset conference DNs in this table.

The conferees are specified in advance in this table. 35 conferee numbers can be assigned to each preset conference DN. This includes the originator, all preset conferees and all add on conferees. The preset conference originator is a member of the preset conference’s customer group. Conferees do not need to belong to the same customer group. The conferees can have an alternate address. The time outs interval is 15 seconds for both conferees and its alternate address.

PRECONF table datafill example with a predefined preset conference DN, a conferee with alternate address and another without alternate address is given in the following table:

**PRECONF Datafill example**

| <b>PCNFKEY CONFADDR PCNFVAR OPTIONS</b> |   |            |   |         |          |    |   |   |   |   |   |   |    |  |  |
|-----------------------------------------|---|------------|---|---------|----------|----|---|---|---|---|---|---|----|--|--|
| 0                                       | 0 | 1027835599 | D | IBN     | CUST783A | 0  | Y | N | Y | N | N | N | \$ |  |  |
| 0                                       | 1 | 7831016    | A | 7831003 | 15       | \$ |   |   |   |   |   |   |    |  |  |
| 0                                       | 2 | 7831002    | C | 15      | \$       |    |   |   |   |   |   |   |    |  |  |

A served user initiates one preset conference (PRECONF) by dialling a predefined DN, which is associated with conference. The directory number is recognized as a request for a preset conference. A check is made if required number of six-port conference bridges can be seized for the conference and the conference is not already in use. If call is valid and the conference ports are available, the originator will hear audible ringing (ring back tone). The status of conferees is not important at this moment for the originator to be able to hear ring back tone. If call is invalid (Translations checks for the originator's data against the data of preset conference and required number of six-port conference bridges can not be seized for the conference or the conference is already in use), the originator will be routed to treatment. Use of Notification for call valid scenarios is not required. No notification will be sent to served user even if some/all datafilled conferees are busy.

**Call Flows**

Conference originator initiates one preset conference by dialling a specific DN. Dialling the DN invokes simultaneous ringing of the preselected conference members. The directory number is recognized as a request for a preset conference. A check is made if the required number of six-port conference bridges can be seized for the conference and the conference is not already in use. An IMMSTART option can be set in table PRECONF so that the conference starts as soon as the first conferee answers.

The originator of a preset conference can add on conferees as local call, once the preset conference is established. In order to provide this functionality, the field ADDON of the table PRECONF should be set to 'yes' and line options AFC and HOLD. Once the maximum number of conferees is reached, no more conferees may be added. To add a new party, the connection to the conference bridge can be either in the (Active Idle) state or in the (Active Held) state and the connection to the party to be added can either be in (Active, Idle) state.

If ORIGCONT field set to "Yes" in table PRECONF, the originator is in control of conference. In this case when he goes on-hook, the conference is taken down, even if there are conferees are still on the bridge.

Basic call flow will be supported by "Preset Conference Base" feature (A00002367). For detailed information please refer to FN section of A00002367, available elsewhere in this document.

## Successful Case

### Preset Conference Initialization

**Add-on conferee, when preset conference is in held state**

**Add-on conferee, when preset conference is active-idle**

**Adding a party when the maximum conference size is reached**

Abbreviations used in section “Successful Case” on page 506 and section “Unsuccessful Case” on page 509 are described below:

CRx, CRy: Call Reference used

A-B: Call between user A and PRCONF

A-C: Call between user A and user C

FIE: Facility information element.

**Supplementary Services Interworkings****Interaction of Preset Conference with Advice Of Charge****General Information about AOC**

AOC on BRI is a feature which allows ISDN subscribers to get the number of charge units that the calls they originate consumes. AOC can provide the actual charge unit count on a regular basis during a call or only at the end of a call, or both. The AOC functionality can be controlled/provisioned in the following ways:

- BRI loop (customer) basis, through table KSETFEAT via SERVORD. BRI lines provisioned via SERVORD can have a new option called AOC.
- XPM basis, through table LTCINV for PLGCs, in this table option attribute METER has to be present for all the XPMs that need to provide the AOC functionality.
- The zone (MZONE) and logical network (LNET) options are taken from the xxCODE translation table and the MDI index (MDI) is taken from table LINEATTR. With these 3 values, call processing is able to access the tariff database and to determine the tariff to be used for this call.

**Test Considerations**

Current behavior.

AOC will be provided for basic call and for add-on phase of preset conference and no AOC information will be generated for the use of PRCONF equipment and for the calls to the remote users with no additional code changes. AOC interaction with ETSI BRI preset conference will be supported for ETSI BRI origination test cases.

**Interaction of Preset Conference with Call Waiting****General Information about CWT**

CWT is a feature, which gives subscriber X (talking to subscriber Y) attention to a call from subscriber A. Subscriber X gets a special Call Waiting Tone as sign of the waiting call. Subscriber A gets audible ringing. CWT functionality can be provisioned via Servord.

**Test Considerations**

Current behavior.

**Interaction of Preset Conference with Call Hold/Retrieve****General Information about HOLD**

HOLD is a feature, which enables subscriber A, talking to subscriber B, to hold B and make or receive a new call. HOLD functionality can be provisioned via Servord.

**Test Considerations**

Current behavior. Hold Indications including ISUP, hold announcement and silence will be supported.

**Interaction of Preset Conference with Connected Line Identification Presentation****General Information about COLP**

The COLP supplementary service provides the connected user's ISDN number to the calling user. COLP functionality can be provisioned via Servord.

**Test Considerations**

Current behavior.

COLP request is currently restricted in preset conference.

## **Interaction of Preset Conference with Completion of Call to Busy Subscriber**

### **General Information about CCBS**

The CCBS supplementary service enables user A, encountering a busy destination B to have the call completed without having to make a new call attempt when the destination B becomes not busy. When user A accepts the recall, the network will automatically generate a CCBS call to destination B. CCBS functionality can be provisioned via Servord.

### **Test Considerations**

Current behavior.

CCBS to busy preset conference is currently prevented.

## **Interaction of Preset Conference with Three Party Service**

### **General Information about 3PTY**

The 3PTY supplementary service enables the user to establish, participate in and control, a three-way conversation, i.e. a simultaneous communication involving the served user and two remote parties. This feature requires HOLD functionality, it can be provisioned via Servord and table CONF3PR should be datafilled to activate 3PTY.

### **Test Considerations**

Current behavior.

3PTY is not currently available for preset conference call.

## **Interaction of Preset Conference with Meet-me Conference**

### **General Information about MMC**

MMC provides a user with the ability to arrange for a call between more than two participants with all participants accessing a conference bridge. It is activated for a specified period booked in advance by the served user. MMC does not use SERVORD. In order for MMC to work properly, tables CUSTENG and MMCONF must be properly datafilled.

### **Test Considerations**

Current behavior.

A dialing to a local MMC if a local PRCONF is active on the loop, is currently prevented.

## **Interaction of Preset Conference with Conference Call, Add-on**

### **General Information about ECOF**

This feature enables a user A to simultaneously with more than three parties. add any member to a conference, split a conference to have private conversation, isolate a remote user, reattach an isolated user, drop a conferee or disconnect the conference. This service is supported only in point to multipoint configurations. ETSI HOLD must be present for the conference to function. Table CONF6PR should be datafilled to activate 3PTY.

### **Test Considerations**

Current behavior.

Preset conference activity is based on ETSI BRI Six party conference.

## **Interaction of Preset Conference with Direct Dialing In**

### **General Information about DDI**

DDI enables a user to directly call another user on ana integrated services private branch exchange or other private system without attendant intervention. The service shall be based on the use of the ISDN number and shall be provided after pre-arrangement with the service provider.

### **Test Considerations**

Current behavior.

## **Interaction of Preset Conference with Multiple Subscriber Number**

### **General Information about MSN**

MSN provides the possibility for assigning multiple integrated services digital network numbers to a single interface. This enables the selection of one or multiple distinct terminals attached to the same interface. The service provider shall fix the length of the numbers to be transmitted to the user's installation.

### **Test Considerations**

Current behavior.

## **Interaction of Preset Conference with Diversion Services**

### **General Information about Diversion Services**

CFF, CFFA, CFGD, CFGDA, CFI, CFIND, CFK, CFMDN, CFO, CFRA, CFS, CFTANN, CFTB, CFTD, CFU, CFW, CFWANN, CFX, CFXDNCT, CFXVAL are different kind of diversion services. These functionalities allows the called number to be diverted to an other number under different circumstances.

**Test Considerations**

Current behavior.

**Interaction of Preset Conference with Closed User Group****General Information about CUG**

CUG provides a mechanism for forming groups to and from which access is restricted. A specific user may be member of one or more Closed User Groups. Members of a specific CUG can communicate among each other but not, in general, with users outside of the group. CUG can be provisioned via Servord and table ETSIFEAT should be datafilled to activate this functionality.

**Test Considerations**

Current behavior.

It is required that CUG shall be assigned against the PRCONF DN which is in virtual DN type, and handle from the served user to the PRCONF DN according to CUG settings.

**Interaction of Preset Conference with Malicious Call Identification****General Information about MCID**

Malicious Call Identification is a supplementary service offered to the called party which enables the called party to request that the calling party be identified to the network and be registered in the network. The data to be registered will be the called party number, calling party number, local time and date of the invocation in the network serving the called user; and as a service provider option: calling party sub-address (if provided by the calling user). MCID can be provisioned via Servord.

**Test Considerations**

Current behavior.

**Interaction of Preset Conference with Subaddressing****General Information about SUB**

The sub-addressing supplementary service allows the called (served) user to expand his addressing capacity beyond the one given by the ISDN number. SUB allows one party in a call to provide a network address extension to supplement the party's own network address or that of the other party. SUB can be provisioned via Servord.

**Test Considerations**

Current behavior.

SUB information is currently restricted during preset conference.

## **Interaction of Preset Conference with Explicit Call Transfer**

### **General Information about ECT**

Explicit Call Transfer is an ISDN supplementary service which enables a user who has two calls, each of which can be an incoming or an outgoing call, to connect the other parties in the two calls. ECT can be provisioned via Servord.

### **Test Considerations**

Current behavior.

The served user can not currently transfer the call to the preset conference but remote users can currently use ECT. Use of ECT by the remote user is currently denied, if this would result in chaining of conferences. No addition to the existing code.

## **Interaction of Preset Conference with User to User Signalling**

### **General Information about UUS**

The UUS supplementary service allows the user to send/receive a limited amount of user-generated information to/from another user-network interface. UUS can be provisioned via Servord.

### **Test Considerations**

If the served user provides UUS information in the SETUP message to the PRCONF DN, the same UUS information shall be included into the call setup to the conferees. This part of feature interaction will be provided by “BRI Preset conference base” feature (A00002367).

If UUS explicit request exist in SETUP message and service request is Required, the call will be released. Any other UUS information shall be discarded.

## **Interaction of Preset Conference with Multi Level Precedence and Preemption**

### **General Information about MLPP**

The Multi-level Precedence and Preemption (MLPP) supplementary service provides prioritized call handling service. This supplementary service has two parts precedence and preemption. Precedence involves assigning a priority level to a call. Preemption involves the seizing of resources, which are in use by a call of a lower precedence, by a higher level precedence call in the absence of idle resources. MLPP can be provisioned via Servord.

### **Test Considerations**

If the served user provides MLPP information during call setup to the PRCONF DN, the same MLPP information shall be included into the call

setup to the conferees. This part of feature interaction will be provided by “BRI Preset conference base” feature (A00002367).

The PRCONF service shall ensure, that the call from the served users is established as MLPP call, if this was requested.

If a PRCONF has been initiated and is still active any other call to this PRCONF DN shall NOT result in the preemption of the existing PRCONF. The second call to the active PRCONF shall result in busy treatment for the caller. Current behavior for this part.

A PRCONF shall not be preempt able by an attempt to initiate the same PRCONF from a served user with higher precedence level, that the served user who initiated the existing PRCONF. The second call to the active PRCONF shall result in busy treatment for the caller.

If a PRCONF, established as MLPP call, has been initiated from subscriber A and if the conferee’s channels are occupied with MLPP calls with low precedence, preemption shall be prevented.

If a new MLPP call comes to a subscriber “A” whose both channels are occupied even one of them is involved in preset conference, (it is the case where subscriber “A” is a conferee of the preset conference) if the precedence of the new call is higher than preset conference call precedence, conference call shall be preempted by the new MLPP call. The figure below is a representation of this scenario.

**First scenario representation for MLPP - BRI preset conference interaction.**

It shall be supported that a PRCONF DN can be used as a valid Alternate Party for the MLPP service. This requirement will be supported if q955\_compliant bool in MLPP\_PARMS parameter in table OFCENG is set to “N”. If q955\_compliant bool is set to “Y”, connect message will be waiting before routing the call to alternate number, and this timer can erase preset conference route time-out value, to prevent this event, preset conference route timer will

be stopped and the call will be routed to MLPP alternate number. During an MLPP call if the conferee of preset conference has an alternate number, preset conference tries once to reach the conferee. If the conferee does not answer, the call is routed to MLPP alternate number.

If a new MLPP call comes to served user whose both channels are occupied even one of them is involved in ETSI BRI preset conference, established as MLPP call with low precedence, the new MLPP call shall preempt and drop ETSI BRI preset conference. The figure below is a representation of this scenario.

---

**Second scenario representation for MLPP - BRI preset conference interaction.**

---

After preemption, no notification indicator information element will be sent to served user or conferees.

If some of the calls making up the preset conference are non-MLPP (add-on functionality),

- Non-MLPP calls are assigned precedence level given by MLPP\_DEFAULT\_PRECEDENCE office parameter
- Highest precedence level of the legs is assigned as the precedence level of controller's conference leg. Conferees' legs are preserved their original precedence levels.

If all of the calls making up the conference are non-MLPP,

- Datafilled level on office parameter MLPP\_DEFAULT\_PRECEDENCE is assigned as the precedence level of both calls.

PRCONF shall ignore all other MLPP related signalling.

## **Interaction of Preset Conference with Calling Line Identification Presentation / Presentation Restriction**

### **General Information about CLIP/CLIR**

Calling Line Identification Presentation is a supplementary service offered to the called party which provides the calling party's ISDN-number, possibly with sub-address information, to the called party. When CLIP is applicable and activated, the network provides the called party with the number of the calling party at call set-up on all incoming calls. The calling party number may be accompanied by a sub-address.

Calling Line Identification Restriction is a supplementary service offered to the calling party to restrict presentation of the calling party's ISDN-number and sub-address to the called party. When CLIR is applicable and activated, the originating node provides the destination node with a notification that the calling party's ISDN number and any sub-address information are not allowed to be presented to the called party. In this case no calling party number is included in the call offering to the called party's installation.

### **Test Considerations**

The CLIP/CLIR information sent to the remote users during PRCONF establishing, shall be the same as being provided by the served user to the conference equipment. If the served user provides Generic Address Parameters and additional calling number identifications information in the SETUP message to the PRCONF DN, the same information shall be included into the call setup to the conferees (provided the respective protocol is supporting this). This part of feature interaction will be provided by "BRI Preset conference base" feature (A00002367).

For BRI-BRI, BRI-ISUP and ISUP-BRI interworkings, current working behavior of noscreening will be kept. For Ex. BRI terminal with special arrangement triggers PRCONF, the unscreened CLI should also be sent to the terminators).

## **Interaction of Preset Conference with Conference Chaining**

### **General Information about Conference Chaining**

Conference chaining shall be prohibited, if the conference equipment for both conferences resides on the same local exchange. But it is not possible to prevent conference chaining over remote connections since sent/received notifications are not permitted.

### **Test Considerations**

No Impact.

### **OM class for Preset Conference**

Since this activity is based on the existing IBN preset conference, the existing OM class PCNF is used.

OM class will be supported by “Preset Conference Base” feature (A00002367). For detailed information please refer to FN document of A00002367.

### **Billing**

No AMA/Billing changes for this activity.

### **Hardware Requirements or Dependencies**

The NT3X67 six-party conference card provides conference facilities on a single card for use with DMS-100 switches. This activity uses same hardware as IBN Preset Conference.

Since the feature is based on BRI Preset Conference Base, hardware requirements or dependencies of BRI Preset Conference are also valid for this activity.

### **Software Requirements or Dependencies**

The existing IBN preset Conference is used by this activity.

### **Limitations and restrictions**

1. Since the feature is based on the existing IBN Preset Conference, and a continuation of BRI Preset Conference Base, the restrictions of IBN preset conference and BRI Preset Conference are also valid for this activity.
2. Since section 4 of Preset Conference for BRI Supplementary Services” specification document which specifies the required interworking for PRCONF on BRI lines, does not contain any information about IBN lines CEPT and CENTREX features interactions, it is assumed in the development of this activity that any changes on the existing interworking which should be supported by the “IBN Preset Conference “feature.
3. If any of the conferees are connected to the DMS switch where the preset conference is being originated and has any of the diversion feature these feature will remain active for incoming preset conference call. If the primary address does not answer call forwarding will be attended if it is activated. On origination to a conference, diversion features will be deactivated. In other words, a direct access user cannot forward incoming calls to a preset conference.

## Interactions

### IBN Preset Conference

No Impact

### BRI Preset Conference Base

No Impact

### 10 AFC Keys for BRI Directory Number

“10 AFC Keys for BRI Directory Number” feature (A00002377) allows up to 10 AFC keys on one DN and allows also, 11 call HOLDS on one DN and 8 call waitings per loop if the customer is subscribed to these services. To be able to support more than one HOLD, it is permitted to make more than two calls on one TEI. This can cause a problem if there are two different preset conferences on one TEI and if this TEI tries to send ADDCONF FAC for a new call. Since there is no way to decide to which conference the new call will be added, one of the restrictions below will be followed:

- Two preset Conferences will not be allowed on one TEI.
- Add-on conference will be restricted if there are two preset Conferences on one TEI.
- The new call will be added on a random conference.

According to the information given above, please refer to A00002367 “BRI Preset Conference Base” and A00002377 “10 AFC Keys for BRI Directory Number” features.

## Appendix A for A00002884- IBN Preset Conference Interactions Background

“IBN Preset Conference (large)” feature (AF2014) enables the maximum number of conferees for a Meridian Digital Centrex (MDC) preset conference to be increased to 50.

The feature interactions required for this feature are described below:

1) If any of the conferees are connected to the DMS switch where the preset conference is being originated and has any of the following features:

- Call forwarding don't answer
- Call forwarding busy
- Call forwarding intragroup

These features will remain active for the incoming preset conference call (if the primary address does not answer call forwarding will be attempted if it is activated).

2) If the originator is active in any conference, flashes, or depresses a CONF key and dials a preset conference DN busy treatment is given. Two preset conferences can not be in conference together.

3) If the preset conference call has been originated in the switch, SMDR may apply to one or more legs. Each leg will be a separate record with conference identification in the SMDR report.

## ***Product = CS 2000***

### **A00002900 -- China INAP Compliance Enhancement Part 2 (Succession on DMS)**

#### ***Functional Description***

This feature will enhance the external IP capabilities and support multiple ApplyChargings on ISN07 TDM and CS2Kc platform for China market. The external IP supported in this feature has direct connection through China ISUP to SCP (as the following figure), SSP would not provide assisting SSP functionality.

**Network diagram**

This feature is based on feature A89008388: China IN SSP capabilities and feature AG5145: External IP.

Two main functionalities are implemented in this feature:

- External IP enhancement

For China INAP, several enhancements are made to fully support external IP:

- Enhance operation EstablishTemporaryConnection
- Enhance operation InitialDP

Parameter iPAvailable and iPSSPCapabilities are required in IDP operation. SSP is able to set these two parameters by datafill.

- Charging the temporary connection to external IP using ApplyCharging operation

According to China requirement, charging to the temporary connection to external IP is required. Charging per duration and time are both supported in this feature.

- Unsuccessful connection to external IP handling enhancement

Several scenarios of unsuccessful connection to external IP are enhanced to comply with China requirement.

- CISUP: Map the post answer ANM(CON) to CPG

- Multiple ApplyChargings support

- Support up to 3 ACs

Now up to 3 ACs can be accepted and handled simultaneously during an INAP call. For multiple ACs, corresponding ACRs can be sent to SCP if required.

Function 'CISUP: Map the post answer ANM(CON) to CPG' is for China ISUP originator only. The other functions are agent independent, i.e. they are supported on the originating agents with the condition: the originating agent <-> INAP interworking is ALREADY supported. For example, China ISUP, IBN lines, SIP-T (no ISUP), China PRI.

These functions are detailed in the sections that follow.

### Functional Requirements

The functions to enhance China IN SSP capabilities are based on the following specification:

- China INAP specification (See reference 1)
- China INAP test specification (See reference 2)
- Supplementary Specification of China IN CS-1 INAP (See reference 3)
- Test specification of Supplementary Specification of China IN CS-1 INAP (See reference 4)

### Data Requirement

The datafill is the same as that for normal IN call.

### External IP enhancement

#### EstablishTemporaryConnection enhancement

The ETC is defined as below in China INAP specification:

```
EstablishTemporaryConnection OPERATION
ARGUMENT
SEQUENCE {
    assistingSSIPRoutingaddress [0] IMPLICIT OCTET STRING;
    correlationID[1] IMPLICIT OCTET STRING OPTIONAL;
    legID [2] CHOICE{
        sendingSideID[0] IMPLICIT OCTET STRING( SIZE(1) )} OP-
        TIONAL;
    scfID [3] IMPLICIT OCTET STRING(SIZE (3)OPTIONAL;
    ....}
```

Parameters scfID and legID are supported in this feature. legID indicates which leg of a call is connected to the SRF for user interaction. Currently, external IP can only be connected to calling party. This feature will only support the decode of parameter legID.

Parameter correlationID has fixed length 3 bytes.

Parameter assistingSSIPRoutingAddress is checked according to China INAP requirement:

- the format is Generic number
- If scfID and correlationID are not contained in assistingSSPIPRoutingaddress, the NOA of assistingSSPIPRoutingaddress should be national number(0000011) or Subscriber number(0000001). For national number, it consists of the prefix 0, Area code and office code, the length of the number is 4~8. For Subscriber number, it consists of office code, the length of the number is 4~5.

For the outgoing IAM to external IP, the format of CDPN within IAM is different considering that the number of CDPN is even or odd. Examples are shown in table 1 and 2:

**CDPN with 8 digits assistingSSPIPRoutingAddress**

|    | 8                            | 7                        | 6 | 5 | 4                            | 3 | 2 | 1 |
|----|------------------------------|--------------------------|---|---|------------------------------|---|---|---|
| 1  | Even                         | Nature of Address        |   |   |                              |   |   |   |
| 2  | INN<br>indica-<br>tor        | Numbering Plan Indicator |   |   | Spare                        |   |   |   |
| 3  | 2nd Assisting Address Signal |                          |   |   | 1st Assisting Address Signal |   |   |   |
| 4  | 4th Assisting Address Signal |                          |   |   | 3rd Assisting Address Signal |   |   |   |
| 5  | 6th Assisting Address Signal |                          |   |   | 5th Assisting Address Signal |   |   |   |
| 6  | 8th Assisting Address Signal |                          |   |   | 7th Assisting Address Signal |   |   |   |
| 7  | 2nd SCF ID                   |                          |   |   | 1st SCF ID                   |   |   |   |
| 8  | 4th SCF ID                   |                          |   |   | 3rd SCF ID                   |   |   |   |
| 9  | 6th SCF ID                   |                          |   |   | 5th SCF ID                   |   |   |   |
| 10 | 2nd Correlation ID           |                          |   |   | 1st Correlation ID           |   |   |   |
| 11 | 4th Correlation ID           |                          |   |   | 3rd Correlation ID           |   |   |   |
| 12 | 6th Correlation ID           |                          |   |   | 5th Correlation ID           |   |   |   |

| 9  | 1st Correlation ID           | 6th SCF ID                   |
| 10 | 3rd Correlation ID           | 2nd Correlation ID           |
| 11 | 5th Correlation ID           | 4th Correlation ID           |
| 12 | Filler (0)                   | 6th Correlation ID           |

### InitialDP enhancement

According to China INAP, IPAvailable and IPSSPCapabilities should be supported in IDP operation, SSP should fill these two parameters according to its abilities.

In order to build iPAvailable and iPSSPCapabilities into IDP, option INITDP\_PARM of table SERVINFO is extended to add two new fields **IP\_AVA** and **IPSSP\_CAP** to indicate whether parameters IPAvailable and IPSSPCapabilities will be carried in IDP. These two fields should be datafilled at the same time. These two fields can also be datafilled for those variant other than China.

Meanwhile, option SRF\_INFO is extended to add new field **IP\_INFO** to provide detailed information of the IP capability within SSP.

For China market, if IP\_AVA and IPSSP\_CAP are datafilled and IP\_INFO is not datafilled, parameters iPAvailable and iPSSPCapabilities are set to default value according to China INAP, the default value of iPAvailable is '01'H (which indicates that the IP is available), the default value of iPSSPCapabilities is '#0C00' (which indicates that DTMF digit collection and tone & announcement is supported). If IP\_INFO is datafilled, then iPAvailable and iPSSPCapabilities are set according to this datafill. That means IP\_INFO will take effect only if IP\_AVA and IPSSP\_CAP are datafilled, otherwise, the information of this datafill will not be carried in IDP.

IP\_INFO contains two subfields: IP\_AVAILABLE and IPSSP\_CAPABILITIES, which contains values for parameter IPAvailable and IPSSPCapabilities respectively.

According to China INAP, there are 14 kinds of IP capabilities which are indicated by parameter iSSPCapabilities. These capabilities can be datafilled in IPSSP\_CAPABILITIES as shown in table 3:

#### IP Capabilities defined in China INAP

| IPSSPCapabilities parameter | Value          | Meaning                                                                | IPSSP_CAPABILITIES selections |
|-----------------------------|----------------|------------------------------------------------------------------------|-------------------------------|
| 1st byte, bit 0             | 0/1            | Not support/Support IPRoutingAddress                                   | IPRA                          |
| 1st byte, bit 1             | 0/1            | Not support/Support VoiceBack                                          | VOICE_BACK                    |
| 1st byte, bit 2             | 0/1            | Not support/Support VoiceInformation, recognize through voice, speech. | VOICE_INFO_SPEECH             |
| 1st byte, bit 3             | 0/1            | Not support/Support VoiceInformation, recognize through voice, voice.  | VOICE_INFO_VOICE              |
| 1st byte, bit 4             | 0/1            | Not support /SupportText to Voice conversion.                          | TEXT_TO_VOICE                 |
| 1st byte, bit 5             | 0/1            | Not support/Support fax.                                               | FAX                           |
| 1st byte, bit 6             | 0/1            | Not support/Support recorder.                                          | RECORDER                      |
| 1st byte, bit 7             | 0/1            | Not support/Support script.                                            | SCRIPT                        |
| 2nd byte, bit 0             | 0/1            | Not support/Support manual operator.                                   | MAN_OPERATOR                  |
| 2nd byte, bit 1             | 0/1            | Not support/Support conference.                                        | CONFERENCE                    |
| 2nd byte, bit 2             | 0/1            | Not support/Support tone & announcement.                               | TONE_ANNC                     |
| 2nd byte, bit 3             | 0/1            | Not support/Support DTMF digit collection.                             | DTMF_DIGCOL                   |
| 2nd byte, bit 4             | 0/1            | Not support/Support sending DTMF signal.                               | SEND_DTMF_SIG                 |
| 2nd byte, bit 5             | 0/1            | Not support/Support sending FSK signal.                                | SEND_FSK_SIG                  |
| 2nd byte, bit 6,7           | To be defined. |                                                                        |                               |
| 3rd, 4th bytes              | To be defined. |                                                                        |                               |

Below is an example of datafill:

**SERVINFO datafill example****Example of datafill:**

TABLE SERVINFO

```

200  (INITDP_PARMs (SERVKEY) (CDPA) (IP_AVA) (IPSSP_CAP) $)
      (SRF_INFO (EARLY_ANS ANS_ON_ANNS)
      (IP_INFO Y (IPRA) (VOICE_INFO_SPEECH)
      (TONE_ANNC)(DTMF_DIGCOL)$)$)$

```

**Charging the temporary connection to external IP using ApplyCharging operation**

Currently, DMS SSP does not charge the temporary connection to external IP. According to China INAP:

If the charging is based on duration:

- SCP should send AC before ETC, and the startChargePattern is 'AnswerReceived'
- When SSP receives AC and ETC, SSP begin to prepare for charging. SSP start charging after receiving answer message from external IP. When originator abandon, SSP releases the connection to external IP or SSP receives release message, the charging is stopped, and ACR is sent to SCP.
- The other requirement of processing AC parameters are not changed.

If the charging is based on time:

- SCP can send AC before ETC or during the speech phase. If AC is sent before ETC, then the startChargePattern can be 'Immediately' or 'AnswerReceived'. Otherwise, if AC is received during the speech phase, the startChargePattern should be 'Immediately'.
- The fee is carried in surCharge parameter of AC, meanwhile AC does not carry chargeClass parameter.
- SSP can send ACR immediately or after the connection to external IP is released.

**Unsuccessful connection to external IP handling enhancement**

If the ETC is received between PA and SRR, SSP should report unexpected component sequence error.

**CISUP: Map the post answer ANM(CON) to CPG**

There are two conditions under which the mapping will occur:

- Condition 1: SSP has received an answer message from external IP or called party and transmitted it to the originating office, when the SSP connect to the external IP or the called party (if the first connection is to external IP) again, SSP will receive another answer message.
- Condition 2: SSP has received CTR and PCUI, SSP sent ACM and ANM to the originating office, when the called party answer, SSP will receive another answer message.

This functionality will implement that: if the second or later answer message is CISUP ANM containing BCI or CISUP CON, then it will be mapped to CPG and transmitted to the originating office.

## **Multiple ApplyChargings support**

### **Support up to 3 ACs**

In this feature, up to 3 ACs can be accepted and handled simultaneously during an INAP call. The number 3 is the maximum number of in-effect ACs, it does not include the number of expired (that is, a final ACR has been sent) ACs.

The chargeRecordIdentifier parameter is used to identify the AC operation, different ACs should have unique chargeRecordIdentifier. If two ACs have an identical chargeRecordIdentifier, then the newly received one will be rejected with ReturnError (UnexpectedDataValue).

If an AC with chargeUserIndicator equaling 1 (calling party) or 2 (called party) had been received, then any subsequent ACs with the same chargeUserIndicator will be rejected with ReturnError (TaskRefused(generic)). In other words, on a call at most 1 AC is allowed for the calling/called party. However, this restriction does not apply to the specified charge number (chargeUserIndicator = 127).

If there are already 3 ACs in effect on the call, then all subsequent ACs will be rejected with ReturnError (TaskRefused(generic)).

For multiple ACs, corresponding ACR(s) can be sent respectively for each AC. ACR will be sent to SCP in three conditions:

1. If the calling/called party hangs up, the following actions are taken:
  - The call (or only the called party, depending on the on-hook party and armed EDPs) is taken down
  - ACR for each AC is sent respectively
2. If the cost/time limit for one of the ApplyChargings is reached, the following actions are taken:
  - The call (or only the called party, depending on armed EDPs) is taken down
  - The forceReleaseCause in the ApplyCharging whose charge/time limit is reached is stored in the backward release message
  - ACR for each AC is sent respectively. If the supervisionMethod in the AC for which we are sending ACR is costGranted, the reasonForReport parameter in the ACR is ChargeLimitReached; if the supervisionMethod is timeGranted, the reasonForReport is TimeLimitReached.
3. If the heartbeat timer for one of the ApplyChargings expires, the following action is taken:
  - An ACR for the AC is sent

Multiple treatments can be played if more than one ACs require warning tone/announcement to be played at a desired time before the charge/time limit is reached, provided the restrictions below:

- All tones/announcements are only played to the calling party
- If multiple treatments are required to play at almost the same time, DMS SSP will play the 1st started treatment and suppress other treatments which try to start at the time when the 1st treatment is playing.

### Table/MIB/Remote Database Schema information

**Name:** SERVINFO

#### Functional description

Option INITDP\_PARMs of table SERVINFO is extended to add two new fields **IP\_AVA** and **IPSSP\_CAP** to indicate whether parameters IPAvailable and IPSSPCapabilities will be carried in IDP. These two fields should be datafilled at the same time.

Meanwhile, option SRF\_INFO is extended to add new field **IP\_INFO** to provide detailed information of the IP capability within SSP.

If **IP\_AVA** and **IPSSP\_CAP** are datafilled and **IP\_INFO** is not datafilled, parameters **iPAvailable** and **iPSSPCapabilities** are set to default value according to China INAP, the default value of **iPAvailable** is '01'H (which indicates that the IP is available), the default value of **iPSSPCapabilities** is '#0C00' (which indicates that DTMF digit collection and tone & announcement is supported). If **IP\_INFO** is datafilled, then **iPAvailable** and **iPSSPCapabilities** are set according to this datafill. That means **IP\_INFO** will take effect only if **IP\_AVA** and **IPSSP\_CAP** are datafilled, otherwise, the information of this datafill will not be carried in IDP.

**IP\_INFO** contains two subfields: **IP\_AVA** and **IP\_SSP\_CAPABILITIES**, which are for parameter **iPAvailable** and **iPSSPCapabilities** respectively.

#### Usage sequence and implications (CM Only)

Current datafill order unchanged.

**Size**

| Abbreviated table name | Minimum tuples | Maximum tuples | Information on memory |
|------------------------|----------------|----------------|-----------------------|
| SERVINFO               | no change      | no change      | N/A                   |

**Fields/OIDs**

The following table lists fields/OIDs for SERVINFO.

**Table field descriptions**

| Field               | New or Changed | Subfield or refinement | Entry         | Explanation and action                                                         |
|---------------------|----------------|------------------------|---------------|--------------------------------------------------------------------------------|
| INITDP_PARAMETERS   | Changed        | refinement             | Boolean Value | Add new selections: IP_AVA and IPSSP_CAP.                                      |
| SRF_INFO            | Changed        | refinement             | Boolean Value | Add new sub-option: IP_INFO                                                    |
| IP_INFO             | New            | Subfield               | Boolean Value | Add new sub-options: IP_AVA and IP_SSP_CAPABILITIES                            |
| IP_AVA              | New            | Subfield               | Boolean Value | Indicate whether the IP is available.                                          |
| IP_SSP_CAPABILITIES | New            | Subfield               | Boolean       | Provide the detailed information of IP capabilities. (See table 4 for details) |

According to China INAP, there are 14 kinds of IP capabilities which are indicated by parameter iPSSPCapabilities. These capabilities can be datafilled in IP\_SSP\_CAPABILITIES as shown in table 4:

**IP Capabilities defined in China INAP**

| IPSSPCapabilities parameter | Value | Meaning                                                                | IPSSP_CAPABILITIES selections |
|-----------------------------|-------|------------------------------------------------------------------------|-------------------------------|
| 1st byte, bit 0             | 0/1   | Not support/Support IPRoutingAddress                                   | IPRA                          |
| 1st byte, bit 1             | 0/1   | Not support/Support VoiceBack                                          | VOICE_BACK                    |
| 1st byte, bit 2             | 0/1   | Not support/Support VoiceInformation, recognize through voice, speech. | VOICE_INFO_SPEECH             |
| 1st byte, bit 3             | 0/1   | Not support/Support VoiceInformation, recognize through voice, voice.  | VOICE_INFO_VOICE              |

|                   |                |                                               |               |
|-------------------|----------------|-----------------------------------------------|---------------|
| 1st byte, bit 4   | 0/1            | Not support /SupportText to Voice conversion. | TEXT_TO_VOICE |
| 1st byte, bit 5   | 0/1            | Not support/Support fax.                      | FAX           |
| 1st byte, bit 6   | 0/1            | Not support/Support recorder.                 | RECORDER      |
| 1st byte, bit 7   | 0/1            | Not support/Support script.                   | SCRIPT        |
| 2nd byte, bit 0   | 0/1            | Not support/Support manual operator.          | MAN_OPERATOR  |
| 2nd byte, bit 1   | 0/1            | Not support/Support conference.               | CONFERENCE    |
| 2nd byte, bit 2   | 0/1            | Not support/Support tone & announcement.      | TONE_ANNC     |
| 2nd byte, bit 3   | 0/1            | Not support/Support DTMF digit collection.    | DTMF_DIGCOL   |
| 2nd byte, bit 4   | 0/1            | Not support/Support sending DTMF signal.      | SEND_DTMF_SIG |
| 2nd byte, bit 5   | 0/1            | Not support/Support sending FSK signal.       | SEND_FSK_SIG  |
| 2nd byte, bit 6,7 | To be defined. |                                               |               |
| 3rd, 4th bytes    | To be defined. |                                               |               |

### Datafill example

The following example shows sample datafill for table SERVINFO:

#### Example of datafill:

```
TABLE SERVINFO
200 (INITDP_PARDS (SERVKEY) (CDPA)(IP_AVA) (IPSSP_CAP) $)
    (SRF_INFO (EARLY_ANS ANS_ON_ANNS)
    (IP_INFO Y (IPRA) (VOICE_INFO_SPEECH)
    (TONE_ANNC)(DTMF_DIGCOL)$)$)$
```

### Table release history update

New sub-option IP\_AVA, IPSSP\_CAP are added to option INITDP\_PARDS.  
New sub-option IP\_INFO is added to SRF\_INFO, and new option IP\_INFO has 2 sub-options: IP\_AVA and IP\_SSP\_CAPABILITIES.

***Product = CS 2000*****A00002904 -- CTI Toggle (Succession on DMS)****Description**

The Switch-Computer Applications Interface (SCAI) specifies an architecture and an Open Systems Interconnection (OSI) application layer protocol suite for peer-to-peer data communication between host computer applications and switch applications, thereby enabling the functional integration of computer systems and telephony switching systems.<sup>1</sup>

Remote Operation Service Element (ROSE) is used to support the interactive communication between the switch and host application.

Currently, ICM services exist for the use of four types of customers.

- Automatic Call Distribution (ACD) customers
- Meridian Digital Centrex (MDC) customers

---

1. Taken from the ANSI SCAI Standard document: ANSI TI.626-1993

- Residential (RES) customers
- SL-100 Private Branch Exchange (PBX) customers

ICM uses the following Operation Classes.

- Class 1: Synchronous, reporting success or failure
- Class 2: Asynchronous, reporting success or failure
- Class 5: Asynchronous, outcome not reported

This activity adds a Class 2 call control message, DV\_TOGGLE\_CALL, which is sent from the customer's host computer to the DMS to toggle between an agent's primary call leg and the consult call leg. The existing ICM messages DV\_CALL\_HELD\_U and DV\_CALL\_UNHELD\_U, will be changed to contain a new parameter that would indicate which leg of the call was held/unheld. The DV\_CALL\_HELD\_U and DV\_CALL\_UNHELD\_U messages will be sent out after a successful completion of the DV\_TOGGLE\_CALL message. The above two messages will also be sent out when the calls are toggled manually.

### **Application Logon SCAI Service Version**

The dv-Appl-Logon message contains a parameter, Service Version, which uniquely identifies the version of messages which will be sent during the session. A new Service Version value will be created to uniquely identify the stream of messages which are new or changed during this software release. The new Service Version will be SCAI18.

This new Service Version (SCAI18) must be specified in the dv-Appl-Logon message for the host application to send dv\_Toggle\_Call messages. If a Service Version lower than SCAI18 is specified, dv\_Toggle\_Call messages will not be available to the Host.

The Service Version is upward compatible. This means all of the functionality enabled and provided with any of the previous Service Versions will be provided in SCAI18. Future DMS-100 software releases will provide additional ICM functionality but will continue to allow the specification of the SCAI18 Service Version. Therefore, applications written to use SCAI18 will not require rewriting to continue to work properly.

### **Subscription to the new call control message and changed call held/unheld message**

The following changes in the table SCAISSRV are required to provide subscription to send the new ICM call control message DV\_TOGGLE\_CALL and the changed call event messages DV\_CALL\_HELD\_U and DV\_CALL\_UNHELD\_U.

### **Subscription for ACD**

- A new default tuple TPCC16\$ under category TPCC will be created with the new function TOGGCALL for the new message DV\_TOGGLE\_CALL.

TPCC16\$ will also contain the optional parameter HDUHDLEG of the function CALLHELD and CALLUNHELD set to Y.

### Subscription for Residential and Centrex lines

- A new default tuple SCAI3WC15\$ under the category SCAI3WC will be created with the new function TOGGCALL, for the new message DV\_TOGGLE\_CALL.
- A new default tuple SCAICC10\$ under the category SCAICC will be created with the optional parameter HDUHDLEG of the function CALLHELD and CALLUNHELD set to Y.

### Toggle Call Message and changed Held/Unheld message Setup and Validation

The following setup and conditions must be met in order for the host application to invoke the dv-Toggle-Call message.

1. The SCAI Service Version is at least SCAI18
2. An ICM switch-host session is established. A successful dv-Appl-Logon request was sent by the host computer.
3. The line which the host application is monitoring must be associated to the session via dv-DN-Associate.
4. For Centrex/Res lines the line option ECM with suboption CONF\_XFER set to 'Y' needs to be assigned to send DV\_TOGGLE\_CALL.
5. For Centrex/Res lines the line option ECM with suboption SCAICC set to 'Y' needs to be assigned to receive the changed DV\_CALL\_HELD\_U and DV\_CALL\_UNHELD\_U messages.
6. The switch-host session is subscribed to the new call control message, DV\_TOGGLE\_CALL and the changed messages DV\_CALL\_HELD\_U and DV\_CALL\_UNHELD\_U (SEE SECTION 2.2.2).

### Message Protocol

The ASN.1 notations for the new call control message provided by this activity, DV\_TOGGLE\_CALL is shown in this section. A sample X.209 hex encoding has been provided here. The length fields are variable because the length depends on the variable content. The tag values are taken from the ROSE protocols.

### Toggle Call ASN.1 Encoding

```

### Toggle Call Coded Example

As shown in “Toggle call between Customer and Advisor2” on page49, a host has requested the switch to toggle the call from Customer - Adviosor1 call to Customer-Advisor2 call. The following encoding has to be sent from the host to the DMS to cause the Customer-Advisor1 call to be put on hold and the Customer-Advisor2 call to become active. It is assumed that before the message is sent, the Customer-Advisor1 call was active and Customer-Advisor2 call was on hold.

**Message Protocol**

The ASN.1 notations for the changed call event message provided by this activity, DV\_CALL\_HELD\_U is shown in this section. A sample X.209 hex encoding has been provided here. The length fields are variable because the length depends on the variable content. The tag values are taken from the ROSE protocols.

### Call Held Coded Example

This example illustrates when the user has put the call on hold either using DV-HOLD-CALL or manually. The scenario is, B(DN 919-2463001) calls A(DN 919-4814210) and both of them are in talking state. The host application of A sends the call control message DV\_HOLD\_CALL to the switch. The call event message DV\_CALL\_HELD\_U, is sent back to the host application, indicating that the primary call on A has been put on hold.

**Call Unheld Coded Example**

This example illustrates when the user unholds either using DV-UNHOLD-CALL or manually. The scenario is, A(DN 919-7823640) consults B(DN 919-2463001) and both of them are in talking state. The host application of A sends the call control message DV\_HOLD\_CALL to the switch. Then the agent manually unholds the held call. The call event message DV\_CALL\_UNHELD\_U, is sent back to the host application, indicating that the held consult leg on A has been unheld.

## Operational Measurements (OM)

### New/Modified OM groups

When a new ICM message is created it is necessary to create new registers in the associated OM group to peg any application-specific outgoing SCAI messages. Two new registers are being added to the SCAISRV4 OM group. These registers are pegged on a SCAIGRP basis.

The following new registers are created by this feature:

- TOGCLLRR - pegged when the switch sends out a RR in response to a valid DV\_TOGGLE\_CALL message request being received and processed.
- TOGCLLRE - pegged when the switch sends out a RE in response to an invalid DV\_TOGGLE\_CALL message request being received.

### Toggle Call invoke message flow examples

This message is used when an agent has two calls with one being active and the other on hold, and wants to go back and forth between the two calls. When an agent is active on call one and call two is on hold, the host sends the DV\_TOGGLE\_CALL message, now call one will be put on hold and call two will become active.

SCAI 3WC/call transfer toggle and set based 3WC/call transfer toggle are not interchangeable on a per call basis. When a call is extended by dv\_add\_party message, it cannot be controlled by the 3WC/call transfer set feature. Similarly if a call is extended via the 3WC/call transfer set feature, it cannot be controlled by the SCAI 3WC/call transfer.

Some message flow scenarios are considered in this section to get a better understanding of the feature functionality.

The proposed call control message and the additional dv\_call\_held\_u and dv\_call\_unheld\_u messages are highlighted in the figures.

## Toggle call between Customer and Advisor2

## Toggle with Transfer

**Toggle call with cancel transfer****Note:**

- Manual toggle cannot be done when a call is in an ACD queue.
- When an ACD queue is reached over a trunk, Toggling is allowed using ICM only when the Audio option is datafilled for that ACD group.

## Toggle and connect call to queue

### Note:

- Manual toggle cannot be done when a call is in an ACD queue.
- When an ACD queue is reached over a trunk, Toggling is allowed using ICM only when the Audio option is datafilled for that ACD group.

## Toggle and release call

### Note:

- Manual toggle cannot be done when a call is in an ACD queue.
- When an ACD queue is reached over a trunk, Toggling is allowed using ICM only when the Audio option is datafilled for that ACD group.

## Manual toggle call between Customer and Advisor2

**Manual consult party with CTI toggle**

## Manual toggle with CTI toggle

**CTI toggle with manual hold**

## Two Party call with Hold

## Consult and release Advisor2

The following scenario does not require the new message.

1. Customer calls ACD group and is connected to Advisor1.
2. Advisor1 puts customer on hold and connects to Advisor2, using the `dv_Add_Party` message.
3. Advisor1 ends call with Advisor2 by using the `dv_Drop_Party` message.
4. Advisor1 is now connected to customer.

## Hardware Requirements or Dependencies

Not Applicable.

## Software Requirements or Dependencies

Not Applicable

## Limitations and restrictions

- The limitations and restrictions that apply to the functionalities of the 3WC flip flop apply to this feature as well. An exception is made by this feature when a call is queued in an ACD queue. Before this feature with 3WC, one could not toggle when the second leg is connected to an ACD queue. With this feature, this restriction has been removed only for ICM initiated toggle. Manual toggle will not be changed or affected.
- When the second call leg is connected to an ACD queue, toggling is ONLY allowed using ICM. Manual toggle is not allowed. The exception to this is when the queued ACD call is over a trunk and when that ACD group has the Audio option datafilled on it.
- Toggling is also not allowed when the call gets presented to an ACD agent..(i.e Call is ringing on the agent) The exception to this is when the ACD agent is reached over a trunk after being given queued audio.
- When the second call leg is connected to an ACD queue which is located in a different switch than the originator of the second call leg, (i.e termination to ACD queue is using a trunk) toggling is not possible unless the Audio option is datafilled in that ACD group.
- When the second call leg is a trunk ACDcall and it gets requeued due to the ACD agent not answering the call, the requeued call cannot be toggled either using ICM or by manual toggle.
- This feature is not supported on IBN (2500) sets.
- The existing restriction for Add\_Party, Transfer\_Party, Conference\_Party and Drop\_Party applies to this feature as well. When a consult leg is originated using dv\_Add\_Party, toggling must also be originated using ICM. When a consult leg is originated manually, toggling must also be done manually.

## Interactions

None of the existing interactions will be affected or changed by this activity.  
No new interactions will be introduced by this activity.

**A00003147 -- DP Digit Reception Control (Succession on DMS)**

### Description

## Purpose

The goal of the work covered by this activity is to provide a mechanism that eliminates the problem about generation of fake emergency service calls and unwanted billing records by line faults, which is a serious nuisance.

## Background information

Insulation breakdown due to moisture or chafing of the cable pair due to wind causes the line to appear to be outpulsing digits. With the dial plan for the DMS switches, a pulse of 1 represents digit 1. Since digit "1" is only one pulse, for example, if there are three of these occurring within the interdigit pause, then the DMS routes the call as "111" which is an emergency service number in some countries.

## Functional description

By disabling DP digit collection on lines assigned DGT option, the impacts of these fake calls can be eliminated.

The functionality thus provided eliminates the possible generation of these phantom calls by completely disabling DP digit collection with the use of an office parameter; scanning for only offhook, flashes and DTMF tones are permitted.

The change has the following operational impacts/effects:

- Prevents the generation of phantom calls on lines assigned DGT option.
- Dial pulse equipment is not supported on lines assigned DGT option.

## Feature Operation

This activity provides control of DP Digit Collection on lines assigned DGT option by introducing a new office parameter `DISABLE_DP_RECEPTION_ON_DGT` in table `OFCENG`.

When office parameter `DISABLE_DP_RECEPTION_ON_DGT` in table `OFCENG` is assigned to Y, DP digit collection is disabled on lines assigned DGT option, only offhook, flashes and DTMF tones are permitted.

When office parameter `DISABLE_DP_RECEPTION_ON_DGT` in table `OFCENG` is set to N, DP digit collection functionality remains unchanged.

The diagram below shows the desired behaviour.

**Functional Behavior Diagram**

| <b>'Disable DP Reception on DGT' office parameter</b>       | <b>DIGITONE PHONE ON DGT LINE</b>                                                                            | <b>DIAL PULSE PHONE ON DGT LINE</b>                            | <b>DIAL PULSE PHONE ON DP LINE</b> |
|-------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------|------------------------------------|
| office parameter set to N<br>(dp digit collection allowed)  | possible generation of fake calls, DP digit reception allowed.                                               | possible generation of fake calls, DP digit reception allowed. | possible generation of fake calls  |
| office parameter set to Y<br>(dp digit collection disabled) | possible generation of offhook, flashes and DTMF tones only, not fake calls, DP digit reception not allowed. | not supported, DP digit reception not allowed.                 | possible generation of fake calls. |

The new office parameter `DISABLE_DP_RECEPTION_ON_DGT` is not directly related to the `OFCVAR` parameter `DEFAULT_SIGNALLING_TYPE`. `DEFAULT_SIGNALLING_TYPE` parameter decides which option to be assigned to the line by default when no option is added to the line. If the `DEFAULT_SIGNALLING_TYPE=DP` and no option is assigned to the line, DP option is assigned automatically and the line is not affected by the new parameter `DISABLE_DP_RECEPTION_ON_DGT`. If the `DEFAULT_SIGNALLING_TYPE=DT` and no option is assigned to the line, DGT option is assigned automatically and the line is affected from the new parameter according to Table 1. If the `DEFAULT_SIGNALLING_TYPE=DT` and DP option is assigned to a line, the line is not affected from the new parameter, DP digit collection is allowed.

The new office parameter is downloaded to the targetted XPMs under following conditions:

- Static data download after XPM loading.
- Static data download during RTS of XPM.
- Change in the value of `DISABLE_DP_RECEPTION_ON_DGT` in table `OFCENG`.

One of the available locations of protected global data area in the XPM is reserved to store the new office parameter value.

Whenever a change occurs in the office parameter value, a msg is sent to all the targetted peripherals immediately, with the updated value.

Also, the XPMs are updated with the existing office parameter value whenever a loading or RTS of supported peripherals occur.

This does not cause any outage or static data mismatch in the peripherals.

There is no need for a reload, swact, etc on the peripherals for the parameter value update.

### **Supported Peripherals**

The definitive line/XPM types that need to be covered under this activity are:

- GPP V5.2 IBN Lines.
- GPP MelCAS IBN Lines.
- IBN Lines on PLGC.
- IBN Lines in RCO2.

All DMS-100 customers that deploy line services are able to use this functionality.

### **Error Detection**

A PM181 informational log is generated whenever a failure in updating the pre-defined global data location in the XPM is detected.

Refer to the Fault Management section for more details.

### **Activation**

Feature activation is done by setting the office parameter `DISABLE_DP_RECEPTION_ON_DGT` to Y.

Changes to `DISABLE_DP_RECEPTION_ON_DGT` are immediately effective.

The targetted PM's are immediately updated with the new value, without causing any outage in the XPM, no action is needed in the peripherals for the parameter value update.

By default, the office parameter value is set to N.

### **Hardware Requirements or Dependencies**

No changes due to this feature.

### **Software Requirements or Dependencies**

The new functionality provided by this activity is being implemented using the existing interfaces. As such, no new software dependencies are being introduced.

This functionality requires release SN07 or higher loads.

## Limitations and restrictions

The functionality that is provided by this feature restricts the use of Dial Pulse phones on lines assigned DGT option.

When the office parameter DISABLE\_DP\_RECEPTION\_ON\_DGT is set to Y, Dial Pulse phones on lines assigned DGT option are not supported.

## Patch Availability

The activity is implemented in SN07 and patched back to SN04.

## Interactions

There are no interactions with other features.

This feature has no effect on flash functionality and on features using flash functionality.

## ISN07 Feature Deltas

***Product = CS 2000***

### **A00003410 -- New ETSI ISUP variant for Honduras (Succession on DMS)**

#### ***Functional Description***

The purpose of this feature is to introduce a new ETSI ISUP variant for Honduras market in MMP20. This variant should be defined under ETSI ISUP Version 2 (White Book).

The reason to use the new variant is that Honduras market requirements may not be provided neither by the BASE ETSI ISUP nor by one of existing variants. The detailed description of Honduras market requirements may be found in the Product Spec “ETSI ISUP for Honduras (HONDUTEL)”, module **P008287PS.AA05** in FMDOC library.

The brief description of Honduras market requirements:

- Honduras ISUP variant should be supported in QDT and QCI loads.
- Prohibit specific ISUP messages and parameters.
- Support of INR/INF ISUP messages.
- Support of national Calling Party Categories (CPC) in interworking between Honduras ETSI ISUP and FDCP protocols.
- Support of Trunk Offering (TKO) feature.
- Support of Malicious Call Trace feature.

The detailed description of Honduras market requirements is below.

## New Honduras variant

The type CCITT\_ISUP\_VARIANT\_TYPE should be extended with HONDURAS variant (new decimal value 43 will be used), see Figure . Trunk definition in the TRKSGRP table is shown in the Figure .

### Extension of CCITT\_ISUP\_VARIANT\_TYPE

```
type CCITT_ISUP_VARIANT_TYPE
{BASE, GERMANY, FRANCE, SPAIN, BELGIUM, ITALY, ISRAEL, PNG, SPARE, UK,
CHILE, COSTA_RICA, NORWAY, NEW_ZEALAND, ETHIOPIA, GEORGIA, MYANAMAR,
VIETNAM, ISDEFO, SAUDI, ACIF_AUSTRALIA, BRAZIL, MEXICO, TURKEY, PORTUG
AL, DENMARK, SPIROU, SWEDEN, AUSTRIA, EGYPT, JPN_INTERCONN, PERU,
ARGENTINA, POLAND, CZECH, HUNGARY, CA30_AUSTRALIA, HONGKONG, TAIWAN,
SINGAPORE, CHINA, BANGLADESH, RUSSIA, HONDURAS}
```

### HONDURAS variant in TRKSGRP

```

pos orisup2 0

>orisup2 0 ORISUP2 0 DS1SIG C7UP 2W N N UNEQ NONE Q767 THRH 0
TMX100 N N HONDURAS 100_WHITE (ALL_NOA ) $ NIL CIC
```

The Honduras ETSI ISUP variant should be supported in the following crosses.

### Supported crosses

| port2<br>port1 | ISUP | FDCP | IBN |
|----------------|------|------|-----|
| ISUP           | Y    | Y    | Y   |
| FDCP           | Y    |      |     |
| IBN            | Y    |      |     |

## Allowed ISUP Messages and Optional Parameters

Messages that should be **supported** in Honduras market are shown in the Table , “Supported messages,” on page 566. If any other message will be received in the trunk it should be responded with ISUP\_CNF (confusion).

### Supported messages

| Message          | Code            |
|------------------|-----------------|
| Address complete | 0 0 0 0 0 1 1 0 |

**Supported messages**

| Message                                  | Code            |
|------------------------------------------|-----------------|
| Answer                                   | 0 0 0 0 1 0 0 1 |
| Blocking                                 | 0 0 0 1 0 0 1 1 |
| Blocking acknowledgement                 | 0 0 0 1 0 1 0 1 |

| Continuity                               | 0 0 0 0 0 1 0 1 |
| Continuity check request                 | 0 0 0 1 0 0 0 1 |
| Information (national use)               | 0 0 0 0 0 1 0 0 |
| Information request (national use)       | 0 0 0 0 0 0 1 1 |
| Initial address                          | 0 0 0 0 0 0 0 1 |
| Operator (for TKO)                       | 1 1 1 1 1 0 0 1 |
| Release                                  | 0 0 0 0 1 1 0 0 |
| Release complete                         | 0 0 0 1 0 0 0 0 |
| Reset circuit                            | 0 0 0 1 0 0 1 0 |
| Resume                                   | 0 0 0 0 1 1 1 0 |
| Subsequent address                       | 0 0 0 0 0 0 1 0 |
| Suspend                                  | 0 0 0 0 1 1 0 1 |
| Unblocking                               | 0 0 0 1 0 1 0 0 |
| Unblocking acknowledgement               | 0 0 0 1 0 1 1 0 |

Parameters that should be **supported** for Honduras variant are shown in the Table , “Supported parameters.”. Parameters that are not supported should not

be included in the ISUP messages that are built in the switch, and being received from another switch should be discarded.

#### Supported parameters

| Parameter                              | Code            |
|----------------------------------------|-----------------|
| Access transport                       | 0 0 0 0 0 0 1 1 |
| Automatic congestion level             | 0 0 1 0 0 1 1 1 |
| Backward call indicators               | 0 0 0 1 0 0 0 1 |
| Called party number                    | 0 0 0 0 0 1 0 0 |
| Calling party number                   | 0 0 0 0 1 0 1 0 |
| Calling party's category               | 0 0 0 0 1 0 0 1 |
| Cause indicators                       | 0 0 0 1 0 0 1 0 |
| Circuit group supervision message type | 0 0 0 1 0 1 0 1 |
| Closed user group interlock code       | 0 0 0 1 1 0 1 0 |
| Connected number                       | 0 0 1 0 0 0 0 1 |
| Continuity indicators                  | 0 0 0 1 0 0 0 0 |
| End of optional parameters             | 0 0 0 0 0 0 0 0 |
| Event information                      | 0 0 1 0 0 1 0 0 |
| Forward call indicators                | 0 0 0 0 0 1 1 1 |
| Information indicators                 | 0 0 0 0 1 1 1 1 |
| Information request indicators         | 0 0 0 0 1 1 1 0 |
| Nature of connection indicators        | 0 0 0 0 0 1 1 0 |
| Optional backward call indicators      | 0 0 1 0 1 0 0 1 |
| Optional forward call indicators       | 0 0 0 0 1 0 0 0 |
| Range and status                       | 0 0 0 1 0 1 1 0 |
| Subsequent number                      | 0 0 0 0 0 1 0 1 |
| Suspend/Resume indicators              | 0 0 1 0 0 0 1 0 |
| Transmission medium requirement        | 0 0 0 0 0 0 1 0 |
| User service information               | 0 0 0 1 1 1 0 1 |
| User-to-user indicators                | 0 0 1 0 1 0 1 0 |
| User-to-user information               | 0 0 1 0 0 0 0 0 |

**Note:** Parameters and indicators supported in INR/INF messages are described below in the section .

## Support of INR/INF

Information request indicators under the INformation Request (INR) message and Information indicators under the INformation (INF) message should support only calling party address.

Supported information indicators are shown in the following table.

### INR / INF - Indicators support

| Message | Indicators                      | Bits | Value |
|---------|---------------------------------|------|-------|
| INR     | calling party address request   | A    | Y     |
|         | holding indicator               | B    | N     |
|         | calling party category request  | D    | N     |
|         | charge information request      | E    | N     |
|         | malicious call identification   | H    | N     |
| INF     | calling party address response  | BA   | Y     |
|         | hold provided                   | C    | N     |
|         | calling party category response | F    | N     |
|         | charge information response     | G    | N     |
|         | solicited information           | H    | N     |

### INR/INF Indicators supported

| Message | Indicator supported                         | Not supported          |
|---------|---------------------------------------------|------------------------|
| INR     | calling party address (bit A)               | Bits B - P should be 0 |
| INF     | calling party address response (bits A - B) | Bits C - P should be 0 |

Optional parameters supported in INR/INF are shown in the Table , “INR / INF - Optional Parameters support,” on page 570.

**INR / INF - Optional Parameters support**

| Message | Indicators                          | Supported |
|---------|-------------------------------------|-----------|
| INR     | call reference                      | N         |
|         | network specific facility           | N         |
|         | parameter compatibility information | N         |
| INF     | calling party category              | N         |
|         | <b>calling party number</b>         | <b>Y</b>  |
|         | call reference                      | N         |
|         | connection request                  | N         |
|         | parameter compatibility information | N         |
|         | network specific facility           | N         |

**Message Type: INR and INF messages.**

| Message | Parameter                      | Type | Length |
|---------|--------------------------------|------|--------|
| INR     | Message Type                   | F    | 1      |
|         | Information request indicators | F    | 2      |
|         | End of optional parameters     | O    | 1      |
| INF     | Message Type                   | F    | 1      |
|         | Information indicators         | F    | 2      |
|         | calling party number           | O    | 5-12   |
|         | End of optional parameters     | O    | 1      |

**INR / INF in Tandem switch****INR / INF for regular CPC****INR / INF for test CPC**

## INR / INF in Originating switch

### INR / INF for regular CPC

### INR / INF for test CPC

## INR / INF in Terminating switch

**INR / INF for regular CPC****Calling Party Categories: Values and Mapping.**

The following calling party categories should be supported for Honduras variant (see table below).

**Calling Party Categories**

| CPC               | Value |
|-------------------|-------|
| Regular           | #0A   |
| Priority          | #0B   |
| Public phone      | #0F   |
| National Operator | #E1   |
| Test              | #0D   |

In the ISUP - FDCP and FDCP - ISUP crosses that should be supported by Honduras ETSI ISUP variant the mapping between ISUP CPC categories and MFC activities is following:

**CPC Mapping**

| ISUP CPC              | Value | MFC Activity | Signal |
|-----------------------|-------|--------------|--------|
| ISUP_CPC_SUBSCRIBER_1 | #0A   | REG_SUB      | 1      |
| ISUP_CPC_TOF_OPER     | #E1   | OPER         | 5      |
| ISUP_CPC_PRIORITY     | #0B   | PR_SUB       | 2      |
| ISUP_CPC_PAYPHONE     | #0F   | LOCAL_COIN   | 4      |
| ISUP_CPC_TEST_CALL    | #0D   | MTC_EQ       | 3      |

In the mapping for ISUP to FDCP - Convert all ISUP\_CPC categories except the above mentioned to REG\_SUB MFC Activity.

In the mapping for FDCP to ISUP - Convert all MFC Activities categories except the above mentioned to ISUP\_CPC\_Subscriber\_1.

### Trunk Offering

The Honduras requirements for trunk offering are the same that for Costa-Rica market, detailed information on it may be found in the feature **A00002291.AA15** “Trunk Offering Expansion”, FMDOC library.

- The ISUP Operator signal should be #F9.
- The operator calling party category should be #E1 (see section “Calling Party Categories” on page 573).

### Malicious Call Trace

MCT support means that the field **Reverse\_Holding\_Ind** in the ACM message (that is set according to the will of MCT terminator) should be transferred via net.

In the FDCP to ISUP tandem ACM with Reverse\_Holding\_Ind = REQUIRED should be transferred into activity TERM\_CTRL\_CHG, and into activity CONNECT\_CALL\_CHG otherwise.

#### Reverse holding indicator transfer

### Hardware Requirements or Dependencies

N/A

### Software Requirements or Dependencies

N/A

## Limitations and restrictions

**A.** Messages that should be **supported** in Honduras market are shown in Table , “Supported messages,” on page 566. If any other message will be received in the trunk, it should be responded with ISUP\_CNF (confusion) message.

**B.** Parameters that should be **supported** for Honduras variant are shown in Table , “Supported parameters,” on page 568. Parameters that are not supported should not be included in the ISUP messages that are built in the switch, and being received from another switch should be discarded.

**C.** The definition of Honduras variant will be only for SX05 release.

## Interactions

### Data schema (DS) (CM, MIBS, RDB)

#### New/modified tables, MIBs, or Database Schema

| Table/MIB name | NEW/CHANGED/ or DELETED/ | Table Control (NEW/ OLD/UNCHANGED) |
|----------------|--------------------------|------------------------------------|
| TRKSGRP        | CHANGED                  | UNCHANGED                          |

#### Table/MIB/Remote Database Schema information

##### Table Name: TRKSGRP

##### Functional description

DMS100 switches are all based on ETSI V2 White book specification. Each market which its requirements are different from the base, can implement it by using the ability to declare its own VARIANT. Each market can use the VARIANT that already has been declared by the ISUP Platform.

*For example:* The Honduras national variant is identified by datafilling of the VARIANT field as ‘HONDURAS’ in table TRKSGRP for the Honduras ETSI ISUP trunks.

The VERSION field in table TRKSGRP is datafilled when the PROTOCOL field in table TRKSGRP indicates Q767 (ETSI ISUP). The 100\_WHITE is available whenever the PROTOCOL is datafilled as Q767. The datafilled Version 100\_WHITE together with the Variants define whether ETSI ISUP V2 or another market of ETSI ISUP V2 is used for that particular trunk group.

### Usage sequence and implications (CM Only)

Current datafill order unchanged.

### Size

| Abbreviated table name | Minimum tuples | Maximum tuples | Information on memory |
|------------------------|----------------|----------------|-----------------------|
| TRKSGRP                | 0              |                |                       |

### Fields/OIDs

#### Table field descriptions

***Product = CS 2000*****A00003411 -- New Toneset for Honduras (Succession on DMS)*****Functional Description***

This feature provides new loadable tones for the Honduras market on the base of existing NTMX76AB and NTMX76CA tone cards for the GPP and DTCO2 peripherals in the MMP20 stream.

The tone set includes:

- DTMF (Dual-Tone Multi-Frequency) tones
  - The DTMF tones are added to support EBS (Electronic Business Set) and signalling to PABXs (Private Automatic Branch Exchanges). The following is the list the DTMF tones that should be defined for

Honduras market: dtmf digit 1, dtmf digit 2, dtmf digit 3, dtmf digit 4, dtmf digit 5, dtmf digit 6, dtmf digit 7, dtmf digit 8, dtmf digit 9, dtmf digit 0, dtmf tone \*, dtmf tone #, dtmf tone A, dtmf tone B, dtmf tone C, dtmf tone D.

- MFC (Forward Multi-Frequency Compelled) tones
  - The MFC tones are added to support R2 protocol signalling. The following is the list the MFC tones that should be defined for Honduras market: MFC 1, MFC 2, MFC 3, MFC 4, MFC 5, MFC 6, MFC 7, MFC 8, MFC 9, MFC 10, MFC 11, MFC 12, MFC 13, MFC 14, MFC 15.
- B MFC (Backward Multi-Frequency Compelled) tones
  - The following is the list the B MFC tones that should be defined for Honduras market: MFC B1, MFC B2, MFC B3, MFC B4, MFC B5, MFC B6, MFC B7, MFC B8, MFC B9, MFC B10, MFC B11, MFC B12, MFC B13, MFC B14, MFC B15.
- Supervisory Tones
  - The supervisory tones consist of standard voice band supervisory tones generated by equipment connected to public exchanges. The following is the list the supervisory tones that should be defined for Honduras market: Dial Tone, Silent Tone, Milliwait Tone, Low Tone, High Tone, SF Loud tone, Audible Ringing Tone, Busy Tone, Congestion (Reorder), ROH (Howler), Call Waiting Tone, Confirmation Tone (PIT), Special Dial Tone, Vacant.

By specifying the appropriate TONESET field in table LTCINV, the tone-making process generates the tone samples required by Honduras market. The TONESET field should be set to 'HONTONES'. These tone samples are sent to the tone memory (RAM).

## Continuous tones

### Continuous Tones definition

| Tone          | Description                                                                                                                                                       |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DIAL TONE     | Is sent to the call originator after off-hook until the first digit is received by the exchange.                                                                  |
| SILENT TONE   | Is sent as a quiet termination for the tone-off periods to prevent noise.                                                                                         |
| MILLIWAT TONE | Is sent through an O/G or an I/C trunk at 0 dBm level (1 mW) so that the far end can measure losses of the trunk. The tone is used for trunk tests T902 and T904. |
| LOW TONE      | The LOW Tone is for future use.                                                                                                                                   |
| HIGH TONE     | The HIGH Tone is for future use.                                                                                                                                  |
| SF LOUD TONE  | The SF LOUD tone is used for XPM tests.                                                                                                                           |

### Continuous Tones description

#### SILENT TONE

Is sent as a quiet termination for the tone-off periods to prevent noise.

#### DIAL TONE

**MILLIWAT TONE****LOW TONE****HIGH TONE**

**SF LOUD TONE****Simple Tones allocation**

The list of the simple Honduras tones is shown below in Figure , "Honduras, Simple Tones".

|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| VACANT TONE              | Is sent due to one of the following treatment conditions:<br>FNAL - Feature Not Allowed.<br>HNPI - Home NPA Intercept.<br>VACT - Vacant Code.                                                                                                                                                                                                                                                                                                     |
| ROH (HOWLER)             | The Receiver Off Hook tone (ROH) is sent to the subscriber as a loud tone after it was left off-hook for more than a predefined time and no digits dialed. It is also sent when the terminator remains off-hook for more than a predefined time after originator disconnect. The ROH tone consists of 4 frequencies, 470Hz, 940Hz, 1410Hz and 1880Hz mixed together. Each frequency has a -2dBm level so that the total bursts ROH level is 4dBm. |
| SPECIAL DIAL TONE (SPDT) | Is given to a subscriber in various features to allow him continue with the dialling.                                                                                                                                                                                                                                                                                                                                                             |
| CALL WAITING TONE        | Is given to a terminator (who subscribed to the CWT feature) as a warning signal that another call has entered and is waiting for an answer.                                                                                                                                                                                                                                                                                                      |
| CONFIRMATION TONE        | Is given to a subscriber that has activated a feature as a positive acknowledge that the feature has been received by the switch.                                                                                                                                                                                                                                                                                                                 |
| INTRUSION TONE           | This Tone is used to provide the warning for a subscriber that is occupied in a call that an operator has just established a TPS/ENQ as part of the Trunk Offering feature. We shall probably provide the intrusion tone for the operator trunk offering feature, directly from the CTM card. In which case the pattern will remain as it is provided in the CTM and will not be changed.                                                         |

**Note:** The meaning of (+) is that it is in use, the meaning of (-) is that it is not currently in use.

| New term | Definition                        |
| DTCO2    | Digital Trunk Controller Overseas |
| GPP      | Global Peripheral Platform        |
| Hz       | Hertz                             |
| MFC      | Multi-Frequency Compelled         |
| PIT      | Positive Indication Tone          |
| RAM      | Random Access Memory              |
| DTMF     | Dual-Tone Multi-Frequency         |

## *Configuration for A00003411*

### Hardware and Software Requirements

The NTMX76AB card must be equipped on GPP line peripherals with SX05 processor.

The NTMX76CA card must be equipped on DTCO2 trunk peripherals SX05 processor.

The QPO20xx or QCI20xx load files should be supported for SX05 processor.

### Initial Configuration

GPP should be loaded with QPO20xx load file.

DTCO2 should be loaded with QCI20xx load file.

NTMX76AB tone cards must be equipped on GPP peripherals.

NTMX76CA tone cards must be equipped on DTCO2 peripherals.

The LTCINV table should be datafilled with the new 'HONTONES' toneset.

The GPP/DTCO2 static data should be downloaded

**Office/Subnet parameters (OP/SP) (CM & SESM)**

FEATURE\_TONE\_SET office parameter.

**New/modified office/subnet parameters**

| Parm table | Parameter name   | NEW/<br>CHANGED/<br>DELETED/<br>RELOCATED | Domain (CM or<br>Subnet<br>Management |
|------------|------------------|-------------------------------------------|---------------------------------------|
| OFCENG     | FEATURE_TONE_SET | CHANGED                                   | CM                                    |

**Parameter information****Functional description**

The FEATURE\_TONE\_SET office parameter is responsible for providing market specific feature treatment definitions instead of default hardcoded definitions.

This office parameter will be expanded so as to include the new HONTONES toneset that is required for the Honduras market.

**Provisioning rules**

For the Honduras market the FEATURE\_TONE\_SET office parameter must be set to HONTONES value.

**Activation**

For activation of the office parameter the Restart Reload must be performed.

**Dependencies**

None

**Consequences**

If this office parameter is not set to HONTONES, the CWT tone will not be connected during CWT feature usage for Honduras market.

**Memory requirements**

No memory impact.

**Upgrade Impact**

N/A

**Data schema (DS) (CM, MIBS, RDB)****New/modified tables, MIBs, or Database Schema**

The LTCINV table will be modified. The TONESET field will be enhanced with HONTONES tones set.

**Configuration Walkthrough**

- Verify that the TL6K69LB tone card exists on the peripheral.
- Verify that this card is datafilled in the LTCINV tuple.
- Verify that the 'HONTONES' toneset is defined for the peripheral with the TL6K69LB tone card.
- Load Static Data to the peripheral

***Product = CS 2000*****A00003465 -- ETSI BRI Channel Reservation Override (Succession on DMS)*****Functional Description***

This feature provides the user to override the channel reservations for the calls on a loop. This enables the user to steal channel reserved for any other non-CW incoming alerting call for another call. Incoming alerting call is a call which ALERT is sent by the set to the switch.

Channel steal request is sent by SETUP, CONNECT or RETRIEVE messages with a proprietary facility information element.

This feature is required to enable subscribers to be able to freely answer incoming calls.

For DBArt, Stationary Train dispatchers use specially developed terminals for telecommunication purposes, called GeFo. The telecommunication I/F to the fixed network is based on ETSI BRI point to multipoint connections. When a call is presented to the user, the network always reserves a free B-channel. The

user is not allowed to answer a waiting call, if both B-channels are reserved. To overcome this operational restriction, the terminal will be allowed to request allocation override on a reserved B-channel.

### Requesting channel steal

To override the B-channel allocation for incoming alerting non-CW calls in case of incoming CW calls and outgoing calls, the mechanism for a user control of network-side channel reservation provided in ETS 300196-1 "Generic functional protocol for the support of supplementary services" in chapter 10.1.2 is used.

In order to minimize potential future implementations, the optional argument `controlOption` is extended by the proprietary value "reservationRequiredOverrideAllocations" with the value 128 (#80). The extended ASN.1 definition from table D.7 is outlined below.

```
ExplicitReservationCreationControl ::= OPERATION
  ARGUMENT controlOption ENUMERATED {
    noReservationRequired (0),
    reservationRequiredWithReservationIndicator (1),
    reservationRequiredWithoutReservationIndicator (2),
    reservationRequiredOverrideAllocations (128)} -- optional
  RESULT ReservationIndicator -- optional
  ERRORS { maximumNumberOfReservationsReached,
    notAvailable,
    notSubscribed,
    unwantedReservationCreated}
```

The reservation FAC IE can be sent in outgoing SETUP messages (to free up an allocated B-channel for an outgoing call) and in outgoing CONNECT or RETRIEVE messages (to free up an allocated B-channel for an incoming CW call).

**Channel stealing with CONN message****Channel stealing with SETUP message**

**Channel stealing with RETR message**

The terminal can pass the channel ID (CID) which it wants to reserve, but in case this preferred CID cannot be reserved (e.g. already stolen) the other b-channel will be returned in the next call control message.

During an attempt to setup an outgoing call while both B-channels are busy, the terminal is responsible to automatically hold or release one of its calls to free up a B-channel.

**ExplicitReservationCreationControl.Invoke**

| Hex Value              | Description                 |
|------------------------|-----------------------------|
| 1C                     | Facility                    |
| 0C                     | Facility Length             |
| 91                     | Supplementary Service Spare |
| A1                     | Invoke Operation            |
| 09                     | Invoke Length               |
| 02 - Universal Integer | Invoke ID Tag               |

|                                             |                      |
|---------------------------------------------|----------------------|
| 01                                          | Invoke ID Length     |
| A unique invoke Identifier                  | Invoke Identifier    |
| 02 - Universal Integer                      | Operation Tag        |
| 01                                          | Operation Length     |
| 14 - ExplicitReservationCreationControl     | Operation Identifier |
| 02 - Universal Integer                      | controlOption Tag    |
| 01                                          | controlOption Length |
| 80 - reservationRequiredOverrideAllocations | controlOption        |

If an allocated B-channel will be provided (an allocated B-channel from another incoming alerting non-CW call) or if a B-channel is available the response from the XPM in the next call control message is a FAC Return Result.

#### **ExplicitReservationCreationControl.ReturnResult**

| Hex Value                                  | Description                 |
|--------------------------------------------|-----------------------------|
| 1C                                         | Facility                    |
| 06                                         | Facility Length             |
| 91                                         | Supplementary Service Spare |
| A2                                         | ReturnResult Operation      |
| 03                                         | ReturnResult Length         |
| 02 - Universal Integer                     | Invoke ID Tag               |
| 01                                         | Invoke ID Length            |
| InvokeID of the Invoke component, set sent | Invoke Identifier           |

In case the request can not be fulfilled (e.g. both B-channels are busy), the response from the XPM is a FAC return error component with the error "maximumNumberOfReservationsReached".

If the optional parameter in Invoke component is different than #80, the request can not be fulfilled. If no parameter is included, or the parameter has the value 0, 1 or 2 the request is valid and a FAC RE component with error code "notAvailable" will be sent (valid request, not supported).

If the value is between 2 and #80 or greater than #80 the request is invalid (coding error) and a FAC reject with the problem code "mistyped-argument" will be sent.

**ExplicitReservationCreationControl.ReturnError**

| Hex Value                                  | Description                 |
|--------------------------------------------|-----------------------------|
| 1C                                         | Facility                    |
| 09                                         | Facility Length             |
| 91                                         | Supplementary Service Spare |
| A3                                         | ReturnError Operation       |
| 06                                         | ReturnError Length          |
| 02 - Universal Integer                     | Invoke ID Tag               |
| 01                                         | Invoke ID Length            |
| InvokeID of the Invoke component, set sent | Invoke Identifier           |
| 02 - Universal Integer                     | Error Tag                   |
| 01                                         | Error Length                |
| 00 - maximumNumberOfReservationsReached    | Error Code                  |

**Software optionality control (SOC) option**

The soc option SULN0028 “SULN BRI Call Queuing” which is created by the activity A00002377 “10 AFC Keys for BRI Directory Number” is also used for this activity. The functionality of this activity is depend on the SOC option SULN0028. When the SOC option is changed, static data of PLGCs and GPPs should be updated. A warning is printed when SOC is changed in CI level;

*“Static data update is required for related PLGCs and GPPs. Please BSY/RTS the inactive unit and perform swact” .*

**Hardware Requirements or Dependencies**

N/A

**Software Requirements or Dependencies**

N/A

**Limitations and restrictions**

1. Pre-emption services (MLPP): If a call selected to be pre-empted has had its b-channel stolen, the pre-emption does not successfully free up a b-channel and the pre-empting call will not complete. Therefore, the operator must disable MLPP network pre-emption in datafill by setting NONPREEMPT=YES, if B-channel stealing is to be used. Please note that, precedence calls are still allowed.

2. Busy determination services (CW, CF, CCBS, MLPP): A channel that has been made available after b-channel stealing is not available to CW, CF and CCBS. Specifically, if there is an alerting call that has had its b-channel stolen and there is also a free b-channel, CW, CF and CCBS consider that free channel as reserved against the call that had its b-channel stolen. A basic scenario could be as follows:
  - Consider, b1 and b2 are reserved for two different alerting calls and there is an additional waiting call on loop.
  - Assume b1 is stolen for the waiting call.
  - Let call holding b2 to terminate.
  - We have a free b-channel available on XPM and the set can originate a new call. However CM thinks that both channels are in use and no normal calls are terminated to the loop. Therefore CW, CF, CCBS, MLPP pre-emption or MLPP alternate party diversion may be tried.
3. Terminal Impact (1): A call that has had its b-channel stolen cannot be answered unless there is another channel available for stealing or one has been freed by the terminal. Therefore, the terminals used must be specially designed to first verify that a call can be answered under this new algorithm if b-channel stealing is to be used. A terminal can always send the stealing request, even there is no need for stealing since there are available b-channels.
4. Terminal Impact (2): Since the terminals used must have complete knowledge of all calls on the loop to make the determination of which calls can be answered (see previous point), the operator must ensure only one terminal may be active on the loop if b-channel stealing is used.
5. Terminal Impact (3): Since b-channel stealing may cause the b-channel specified in the next call control message (RETR ACK, CONN ACK, CALL PROC) to the channel stealing request to be different than previous messages, the terminals must always use the b-channel specified in the CONNECT ACK and ignore b-channels specified in earlier messages.

## Interactions

### Pre-emption services (MLPP):

Pre-emption services (MLPP): If a call selected to be pre-empted has had its b-channel stolen, the pre-emption does not successfully free up a b-channel and the pre-empting call will not complete. Therefore, the operator must disable MLPP network pre-emption in datafill by setting NONPREEMPT=YES, if B-channel stealing is to be used. Please note that, precedence calls are still allowed.

**Busy determination services (CW, CF, CCBS):**

Busy determination services (CW, CF, CCBS, MLPP): A channel that has been made available after b-channel stealing is not available to CW, CF and CCBS. Specifically, if there is an alerting call that has had its b-channel stolen and there is also a free b-channel, CW, CF and CCBS consider that free channel as reserved against the call that had its b-channel stolen. A basic scenario could be as follows:

- Consider, b1 and b2 are reserved for two different alerting calls and there is an additional waiting call on loop.
- Assume b1 is stolen for the waiting call.
- Let call holding b2 to terminate.
- We have a free b-channel available on XPM and the set can originate a new call. However CM thinks that both channels are in use and no normal calls are terminated to the loop. Therefore CW, CF, CCBS, MLPP pre-emption or MLPP alternate party diversion may be tried.

### **A00003467 -- Reverse Translations Enhancements via CUSTMOD Option (Succession on DMS)**

#### **Description**

##### **Background Information**

The purpose of this feature is to enhance Reverse Translations to co-exist with CS1R.

The current DMS100 MMP product has requirements to alter the default dialling on a per CLI basis, which is originally determined by the incoming trunk group (Customer Group and NCOS). This is done by assignment of the CUSTMOD option against the given CLI(s) (Calling Line Identity) and assigning a new customer group. In order to make use of the new customer group, in the routing phase (IBNRTxx), the routing option invoked is IBNRX. This allows a form of re-translations to occur, which is not exactly re-entering Universal Translations at the top of the digit analysis phase. The digits then are re-examined using the new Customer Group info and when entering Universal Translations, the call will then re-route according to this data.

The limitation is that CS1R and IBNRX are not integrated to be supported in the same call. This is due to the fact that the CS1R functions are ONLY designed to work within the digit translations phase of the call and IBNRX is invoked in the routing phase. Thus, the call will fail.

The primary enhancement is to allow Reverse Translations to be invoked within the digit analysis phase of the call. The preferred place to provide the enhancement is within the "Featinfo Validate".

##### **Introduction**

The functional diagram of this feature is shown in the [“Functional Behavior Diagram” on page 607](#).

CUSTMOD, which is an option in refinement VALDATOP for XLASEL FEATINFO in universal translation tables, is enhanced by this feature; and the new field REV\_XLA (Reverse\_Translations\_Trigger) and its refinement DELDIGS (Delete Prefix Digits) are added to the CUSTMOD option.

The entry in new field REV\_XLA can be either Y or N.

When the CUSTMOD option is encountered in one of the translation tables (for ex in table PXCODE), and when these conditions are satisfied

- i. The entry in field REV\_XLA is “Y”

- ii. The customer group or NCOS is changed in table DNSCRNx

the Reverse Translation starts within the "Featinfo Validate" option in Universal Translation tables, i.e. within the digit analysis phase of the call, and digit analysis stops and re-enters at the standard IBN translations block with the new Customer Group and NCOS.

So, based on the Access Code used to invoke CLI Screening, the customer can decide on a per CLI basis if they want to change the default Customer Group/NCOS from the Trunk Group assigned or override the default with the one defined against the CLI. The new Customer Group/NCOS is used immediately during digit analysis without having to wait for the routing phase of call as per current implementation of IBNRX (an example for previous implementation of reverse translation is shown in [“Traver output of the previous implementation - Part 1 / 2”](#) on page 608 and in [“Traver output of the previous implementation - Part 2 / 2”](#) on page 609).

The new refinement DELDIGS allows the removal of prefix digits before retranslation (re-enter of IBNXLA) begins. DELDIGS is a mandatory field only if the entry in field REV\_XLA is “Y”. The entry in new refinement DELDIGS can be an integer from 0 to 18, inclusive.

Sample datafill is shown in the following figure.

#### Sample Datafill

```

REV\_XLA option starts the reverse translation once per call.

Activation of the functionality is controlled by the SOC option XLAS0054 “XLAS Rev Trans Custmod”. If the SOC is turned OFF or ON, it is possible to datafill the new field REV\_XLA but this option is ignored when the SOC is turned OFF.

Also,

- No changes are done in Table DNSCRN and the other DNSCRNx tables. This is to ensure integrity of the provisioning systems.

- If the entry in new field REV\_XLA is Y or N, then if IBNRX is encountered in the routing phase, then IBNRX still functions as it always did. So, there is full transparency to this feature with existing capabilities.
- If the entry in 'new' field REV\_XLA is Y, and the CLI does not have defined any Customer Group info, then any options in Featinfo selector will be completed and translation continues on universal translations.

If the call hits an AMAGRPID option in lineattr tables after the reverse translation starts, then this second AMAGRPID over-writes the previous one. And, the last AMAXLAID option (which can be datafilled in universal translation tables) over-writes the previous AMAXLAID option, too. An example for these options is shown in “New traver output - Part 1 / 2” on page 610 and “New traver output - Part 2 / 2” on page 611.

The translations verification (traver) tool is enhanced by this feature. It is now possible to trace the reverse translation via traver; after REV\_XLA is hit, the traver shows the translation tables, the CS1R trigger points, the terminator, the outpulsed digits, and so on. Please refer to “New traver output - Part 1 / 2” on page 610, and “New traver output - Part 2 / 2” on page 611.

## IN Interaction

The new functionality enables to support CS1R and the CUSTMOD option to be supported in the same call, as explained in the following paragraph.

The new functionality is to be able to trigger IN system after execution of the CUSTMOD option when the reverse translation is triggered; functional Behavior Diagram is shown in “Functional Behavior Diagram” on page 607; and an example is shown in “New traver output - Part 1 / 2” on page 615 and “New traver output - Part 2 / 2” on page 616.

Also, the traver output shows the outpulsed digit result and the route choice(s) for both standard and CS1R triggered calls. Traver outputs of the previous implementation of CUSTMOD option is shown in “Traver output of the previous implementation - Part 1 / 2” on page 613 and “Traver output of the previous implementation - Part 2 / 2” on page 614; the new outputs are shown in “New traver output - Part 1 / 2” on page 615 and “New traver output - Part 2 / 2” on page 616.

Both TDP2 and TDP3 are supported by this feature. TDP2 occurs at the Info Collected point in the call (This can be seen in the traver - INAP Info Collected TDP). The reverse XLA occurs after this so we will do a TDP2 check, then reverse XLA. When this happens, the call will go back through the INFOCOL point in call. (Normally this occurs between DGCOL and IBNXLA. Reverse XLA does go back through these table so we will go back through another TDP2 trigger point. As shown in “New traver output - Part 1 / 2” on page 615 and “New traver output - Part 2 / 2” on page 616.

Other traver examples are shown in the three figures that start with [“Traver example - Part 1 / 3” on page 617](#).

The working principle of CS1R is not effected.

AIN (Advanced Intelligent Networks; the North American standard of IN) and GIN (GSP IN) are not supported. Only EIN (ETSI INAP V8) is supported.

After the CONNECT message is received by the SSP, the original customer group and ncos of the originator trunk is used by the IN translation system. For ex: When the call triggers at TDP-3 on the SSP to provide an IN number translation service, after the IBNRX option, the translation system uses the customer group of the originating trunk, not the customer group and the ncos values defined in DNSCRN table.

## Hardware Requirements or Dependencies

N/A

## Software Requirements or Dependencies

Activation of the functionality is controlled by the SOC option XLAS0054 “XLAS Rev Trans Custmod”.

This feature is patched backed to SW000004. The patch ID is NAP43. NAP43 is a password activatable patch. For an ONP from (ISN04 - ISN06) to (ISN07 and beyond), the state of the SOC option XLAS0054 will automatically be set to ‘ON’, if NAP43 was activated before the ONP, and also all of the functionalities of this feature will be ON after the ONP, too. But for this ONP, a password for SOC option is still required to change the RTU field of the SOC option XLAS0054 in loads SW000007 and beyond. “SOC states and RTU values of the SOC option XLAS0054 after ONPs” is described in the following table.

**SOC states and RTU values of the SOC option XLAS0054 after ONPs**

| ONP                                                                                          | State of SOC option after ONP                                        |                                                                    | RTU of SOC option after ONP                                     |                                                                 |

## Limitations and restrictions

REV\_XLA option starts the reverse translation once per call.

AIN (Advanced Intelligent Networks; the North American standard of IN) and GIN (GSP IN) are not supported. Only EIN (ETSI INAP V8) is supported.

Only TDM trunks are supported by the REV\_XLA option.

REV\_XLA is functional for only the trunk originated calls. Supported Trunk types are:

- ETSI ISUP V1, V2, V3
- All National variants of ETSI ISUP (can be V1 or V2 based)
- BTUP V2, V2+
- SSUTR2
- SPIROU
- National variants of ETSI PRI
- QSIG
- Numeris VN4 PRI
- Numeris VN6 PRI
- DPNSS

## Interactions

When a call is initiated by a feature, REV\_XLA does not start the reverse translation after the featinfo selector; i.e. feature initiated calls are not supported by this activity. Some examples for the unsupported features are:

- Call diversion favors
- CFRA
- Attendant Console's night service
- CCBS
- MONA
- IBN Auth code and Acct code features
- RSA
- DISA

Supported feature interworkings are:

- Calling Party Category Screening and Routing
- CDN

- BC, as exists plus Universal MMP15 feature.
- PN screen
- IN CS-1, CS-2, CS-3, CS-4
- All existing AMA functionality
- Forced overlap outgoing - Eire
- NETINFO
- All existing Validate CLI functionality
- IN Billing - all current IN billing to be supported (including FCI)
- French NAOC (AU3283) base feature support required along with the new NAOC features in ISN07

REV\_XLA is supported only in the translation phase of the call. Therefore REV\_XLA option is not supported after the other re-translation options in routing tables. But those other re-translation options in routing tables are supported by the REV\_XLA option when the call hits the REV\_XLA option before these options. For ex: REV\_XLA option is not supported after

- RT, GBL options in universal routing tables
- RT, RX, GBL options in OVRx and OFRx tables
- RX, IBNRX, GBL options in IBNRTx tables
- VFGs

### **Applicable customer facing sections**

#### **Fault Management**

|        |     |
|--------|-----|
| Logs   | N/A |
| Alarms | N/A |

#### **Configuration**

## ***Product = CS2000***

### **A00003627 -- T.38 FAX Support for H.323 (Intl IAW)**

#### ***Functional Description***

This activity provides “Call Server controlled switchover to T.38 (or G.711)” for Call Server routed H.323 calls. Fax interworking is supported on calls

between H.323 GWs (e.g. Meridian, Cisco, BCM) and H.248 GWs (e.g. PVG) or MGCP GWs (e.g. Mediatrix). At least one involved agent must be H.323.

Fax interworking is provided over Session Initiation Protocol (SIP-T). All involved Call Servers must support the prerequisites given in section “SIP-T Support for T.38 fax” on page 659.

This feature provides “Call Server controlled switchover to T.38 (or G.711)” depending on T.38 network option:

- If **Netopt is set to “T.38”** and both GW support T.38, then upon fax detection, switchover is done from G.729 (or G.711) to T.38 codec.
- If **Netopt is not set to “T.38”**, or a GW does not support T.38, then switchover to T.38 does not apply. If the call was set up with G.729 codec, switching is done from G.729 to G.711 codec. If the call was set up with G.711, no switchover occurs.

This activity builds on top of the SN06.1 activity A00001895 “H.323 Base Application” that included development to support basic call capabilities for H.323 GWs connected to the CS2K.

This feature does not impact the capability of a GW to do autonomous switchover to T.38 in a call that does not involve an H.323 GW (e.g. PVG to PVG call).

Digital call control signaling (ISUP, ISDN, H.323) may request a Group 3 fax call within the first setup message (IAM, SETUP) by BC IE = “3.1 kHz audio” and HLC IE = “Facsimile Group 3”. Checking this teleservice “Fax Group 3” and opening a T.38 channel from beginning is not considered by this feature.

Testing is done on the international CS2K load only.

### ISN06 restrictions

The ISN06 CS2K solution does not provide interworking to Group 3 facsimile equipment (G3FE) connected to H.323 GW.

There are three different methods to do Group 3 fax over IP signalling:

1. Autonomous GW switching to fax transport mode via inband indication.
2. Call Server control of GW switching to fax transport mode.
3. GW switching to fax transport mode - peer-to-peer out of band indication.

The ISN06 CS2K solution provides autonomous switching to fax transport mode (G.711 codec or T.38 mode) if a fax tone (e.g. CNG, V.21 header) was received. The H.248 GW does not notify the H.248 GWC or far end GWC/GW about fax tone event or about autonomous switchover to T.38 mode.

H.323 generally supports method #2 for gatekeeper (GK) routed calls and method #3 for peer-to-peer calls. SIP GWs tend to support method #2 and #3.

To support fax interworking to H.323 GW, method #2 “Call Server controlled switchover to T.38 mode” is implemented on CS2K.

**Note:** The peer-to-peer approach (#3) does not work for GK controlled calls and is therefore out of scope for this CS2K implementation.

## VoIP Network Model

[“Configuration example for facsimile transmission over IP networks” on page 655](#) shows an example for T.38 fax data transmission over IP networks.

The H.323 GW is connected via H.323 protocol to the CS2K, which consist of H.225 protocol (Call control signaling) and H.245 protocol (Multimedia communication control). The G3FE devices are connected directly to the GW.

The H.248 GW supports voice trunking for public PSTN and private ISDN network. The GW is controlled via Media gateway control protocol H.248 from Call Server 2000 (CS2K). Call control signaling is relayed via IUA for ETSI PRI and via V5UA for V5.2 access between GW and CS2K.

The MGCP GW supports analog lines and is controlled by MGCP protocol only.

Media stream is transported via Real Time Protocol (RTP/UDP/IP) for voice calls and via Internet Facsimile Protocol (T.38/UDP/IP) for Group 3 fax calls.

**Configuration example for facsimile transmission over IP networks****Applicable Standards**

The ITU-T recommendations T.30 [1], T.38 [2] + [3], H.323 [4], T.225.0 [5], T.245 [6], H.248.1 [7], H.248.2 [8] applies for this feature. They are listed in the References section of this document with title and issue date.

**H.323 Support for T.38 fax**

Implementation of “Call Server controlled switchover to T.38 mode” is based on T.38 [2] Annex B, D and E, Draft Amendment to T.38 [3] Annex E and H.323 [4] Annex D.

The H.323 GWC requests the remote H.248 or MGCP side to detect fax tone and to notify the H.323 GWC about a fax event.

Upon receipt of fax event notification from remote H.248 or MGCP side, the H.323 GWC controls switching to T.38 mode. The logical voice channel is cleared and a T.38 fax channel is opened. The SDP(T.38) data is sent to the remote side, which is invited to switch over to T.38.

A remote H.248 or MGCP GW may send a SDP indicating simultaneous support of voice media stream via “m=audio ..” and T.38 media stream via “m=image ..” line. The “m=image 1 udptl t38” line in SDP means that T.38 codec is supported and “autonomous switchover to T.38” might be used lateron - see [3] Annex E.2.2.

**Note:** A SDP coding sample for simultaneous voice and T.38 support is given in [“SDP sample for H.248 -> H.323 \(FS\) interworking over SIP-T” on page 661.](#)

A H.323 GW which does not support voice media stream and T.38 media stream at the same time, removes/rejects the “m=image 1 udptl t38” line. This means that “autonomous switchover to T.38” is not used for this call.

**Note:** To switch successfully to T.38, each side should know the T.38 capability of the other side. A GW indicates T.38 capability, by including a “a=cdsc: 1 image udptl t38” line in SDP. This means that “Call Server controlled switchover to T.38” is supported and might be used lateron.

## H.248 Support for T.38 fax

**Note:** Implementation of “Call Server controlled switchover to T.38 mode”, makes use of “Call Type Discriminator package” (ctyp) with event “Discriminating Tone detected” (dtone). See H.248.2 [8], chapter 7.

The GWC checks the GW capability to support T.38 via H.248 AuditValue command. If the H.248 GW replies with H.248 package “ctyp-1”, then “Call Server controlled switchover to T.38 mode” is supported - see [“Coding example: Check supported H.248 packages” on page 657.](#)

**Note:** If Netopt = “T.38”, the H.248 GWC add the ephemeral termination with voice and T.38 codec - see [“Coding example: Add ephemeral with G.729 and T.38 codec” on page 658.](#)

The H.248 GW does not switch over to T.38, before the remote SDP is received.

- If the remote SDP contains T.38 codec (m=image 1 udptl t38), then “autonomous switchover to T.38” applies.
- If the remote SDP indicates T.38 capability (a=cdsc: 1 image udptl t38), then “Call Server controlled switchover to T.38 mode” applies.

The H.248 coding examples below display H.248 message as used in the call flow examples in section “Call Flows” on page 664.

**Coding example: Check supported H.248 packages**

| Transaction (GWC -> MG)                                                                                       | Reply (GWC <- MG)                                                                                                          |

| <p>Note 1: The ephemeral termination is added with T.38 codec, to support “autonomous switchover to T.38” for e.g. PVG to PVG calls. At this point the remote GW type is unknown. If the remote side is H.323, then the T.38 codec is removed by the H.323 GW (codec negotiation).</p> <p>Note 2: This example shows 2 media lines in one session descriptor, as implemented in ISN06.2. This example will be updated at end of this feature to display real used SDP syntax.</p> |                                                                                                                                                                                                                             |

## MGCP Support for T.38 fax

Implementation of “Call Server controlled switchover to T.38 mode”, makes use of Fax tone (ft) defined in the Generic Media Package (G). See Basic MGCP Packages [9] in the References section

The MGCP GW does not switch over to T.38, before the remote SDP is received.

- If the remote SDP contains T.38 codec (m=image 1 udptl t38), then “autonomous switchover to T.38” applies.
- If the remote SDP indicates T.38 capability (a=cdsc: 1 image udptl t38), then “Call Server controlled switchover to T.38 mode” applies.

**Note:** According to Reference [9], the MGCP GW detect a fax call by detecting the V.21 fax preamble. The fax tone event SHOULD also be generated when the T.30 CNG tone is detected

## SIP-T Support for T.38 fax

SIP-T/SDP support for T.38 fax call is implemented according ITU T.38 [2] Annex D, Draft Amendment to T.38 [3] Annex E and IETF SIP Support for Real-time Fax [13].

T.38 fax interworking is supported over SIP-T. Support via native SIP is not covered by this activity.

### Fax call CS2K to CS2K

This feature provides and verifies T.38 fax calls for H.323 GW interworking to H.323 GWs, H.248 GWs and MGCP GWs over SIP-T (ETSI ISUP V2+).

The SIP messages SUBSCRIBE and NOTIFY are used, which are defined in IETF RFC 3265 [11].

- With SUBSCRIBE(reqFaxDet), the H.323 GWC requests the remote side to detect fax event and to notify the H.323 side about a fax event.
- With NOTIFY(FaxDet), the H.248 or MGCP GWC notifies the event “fax call detected” to the remote H.323 side.

The content of both messages is proprietary and is needed on interworking between H.323 GWs with H.248 or MGCP GWs. The coding is specified in section “Coding of SIP-T messages SUBSCRIBE and NOTIFY” on page 660.

### Fax call CS2K to other Call Server

**Prerequisite:** The other Call Server with connected GW must support the functionality section “Coding of Session Description Protocol (SDP)” on page 660. Additionally option 1 or option 2 below must be supported:

**Option 1:** The SIP SUBSCRIBE(reqFaxDet) and SIP NOTIFY(FaxDet) message are supported and processed as defined in .

**Option 2:** The SIP SUBSCRIBE(reqFaxDet) and SIP NOTIFY(FaxDet) message are not supported. In this case the other Call Server must support:

- Autonomous fax event detection.
- Upon detection of fax, a Re-INVITE (T.38) message is sent to the far end.
- Receipt of SUBSCRIBE(reqFaxDet) message is ignored or rejected.

No design work is planned to support T.38 interworking with other Call Servers.

G.729 and G.711 capability is indicated to the remote GW with “a=cdsc: 2 audio RTP/AVP 18 8” line in SDP data.

### T.38 parameter in capability description

```
v=0
c=IN IP4 128.96.41.1
a=sgn: 0
  a=cdsc: 1 image udptl t38 - indicates T.38 capability
a=cpar: a=T38FaxVersion: 1
a=cpar: a=T38FaxMaxBuffer:3341
a=cpar: a=T38FaxMaxDatagram:333
a=cpar: a=T38FaxMaxBitRate: 10000
  m=audio 1111 RTP/AVP 18
a=ptime:20
  a=cdsc: 2 audio RTP/AVP 18 8 - indicates G.729 and G.711 capability
a=cpar: a=ptime:20
```

**Note:** For clarity, T.38 parameters are omitted in the subsequent figures.

“SDP sample for H.248 -> H.323 (FS) interworking over SIP-T” on page 661 to “SDP sample for H.248 -> H.323 (FS) interworking over SIP-T” on page 663 show SDP coding examples for interworking H.248 to H.323.

**Note:** SDP coding for H.248 side applies also for non-H.323 e.g. MGCP.

“SDP sample for H.248 -> H.323 (FS) interworking over SIP-T” on page 661 and “SDP sample for H.323 (FS) -> H.248 interworking over SIP-T” on page 662 show SDP coding examples for interworking H.248 GW supporting “autonomous switching to T.38” and H.323 GW supporting “Call Server controlled T.38 switching”. Fast start (FS) applies on H.323 side.

**Interworking**

This feature supports “Call Server controlled switchover to T.38 (or to G.711)” for **nodal calls** and for **inter-Call Server calls** over SIP-T (ETSI ISUP V2+) when the originating or terminating agent is H.323.

This feature provides Call Server controlled switchover to T.38 (or G.711) codec depending on T.38 network option:

- If **Netopt** is set to “**T.38**” and both GW support T.38, then upon fax detection, switchover is done from G.729 (or G.711) to T.38 codec.
- If **Netopt** is not set to “**T.38**”, or a GW does not support T.38, then switchover to T.38 does not apply. If the call was set up with G.729 codec, switching is done from G.729 to G.711 codec. If the call was set up with G.711, no switchover occurs.

**Supported fax interworkings for nodal calls and for inter-Call Server calls via SIP-T**

| Terminating side: | H.323 | H.248                                       | MGCP | SIP-T                                |
|-------------------|-------|---------------------------------------------|------|--------------------------------------|
| Originating side: |       |                                             |      |                                      |
| H.323             | 3     | 3                                           | 3    | 3                                    |
| H.248             | 3     | Out of scope<br>for this activity<br>Note 3 |      | 3<br>Note 2                          |
| MGCP              | 3     |                                             |      |                                      |
| SIP-T             | 3     | 3<br>Note 1                                 |      | Out of scope<br>for this<br>activity |

**Note 1:** Provided, if the originating side sends SUBSCRIBE(reqFaxDet) and processes NOTIFY(FaxDet) as defined in section “SIP-T Support for T.38 fax” on page 659.

**Note 2:** Provided, if the terminating side sends SUBSCRIBE(reqFaxDet) and processes NOTIFY(FaxDet) as defined in section “SIP-T Support for T.38 fax” on page 659.

**Note 3:** Calls where only H.248 GWs or MGCP GWs are involved, are out of scope for this feature. “Autonomous switching to T.38 (or to G.711)” may apply for these calls.

T.38 fax interworking to H.323 is provided for currently available protocol agents on H.248 GW: ETSI ISUP, ETSI PRI and ETSI V5.2.

In case of CS2K Hybrid, the interworking between TDM platform and IP platform is provided via ISUP-looparound.

## Call Flows

Description of T.38 functionality is provided via annotated call flows. The description of the first call flow is given in detail and may be applied to other subsequent call flows.

**Note:** Focus of the call flows is to show “Call Server controlled switchover to T.38 mode”. Call control messages (e.g. H.225, IUA, SIP) and Media control messages (e.g. H.245, H.248, MGCP) are not complete. Furtheron TCS-Ack messages have been omitted for clarity.

Mapping between H.248 or H.323 messages and SIP-T messages can be obtained from the call flows. Coding of SIP-T messages SUBSCRIBE and NOTIFY is specified in section “Coding of SIP-T messages SUBSCRIBE and NOTIFY” on page 660. Coding of SDP content is specified in section “Coding of Session Description Protocol (SDP)” on page 660.

In the case that the originating and terminating GW are located on the same Call Server, the SIP-T part is not applicable and shall be neglected.

T.38 fax call flows are presented for:

- fast start: H.248(FS) -> H.323(FS) - see Section .
- fast start: H.323(FS) -> H.248 (FS) - see section “Call flow for H.323 to H.248 interworking (fast start)” on page 668.
- fast start: H.323(FS) -> H.323(FS) - see section “Call flow for H.323 to H.323 interworking (fast start)” on page 670.
- slow start: H.248(FS) -> H.323(SS) - see section “Call flow for H.248 to H.323 interworking (slow start)” on page 671.
- slow start: H.323(SS) -> H.248(FS) - see section “Call flow for H.323 to H.248 interworking (slow start)” on page 672.

#### **Call flow for H.248 to H.323 interworking (fast start)**

“[Sample flow for H.248 to H.323 interworking](#)” on page 666 displays a sample messaging of a successful fax call between PRI (H.248 controlled) and H.323. First a voice call is established. After a fax call was detected, “Call Server controlled switchover to T.38” occurs.

Selection: Fast start applies - the H.248 side is “slave”, the H.323 side is “master”. Both sides support “Call Server controlled switchover to T.38” and Netopt is set to “T.38”

## Sample flow for H.248 to H.323 interworking

**Note 1:** The H.248 GWC checks GW T.38 capability via H.248 AuditValue command at GW registration. If GW replies to the AuditValue request with H.248.2 fax package “ctyp-1”, then “Call Server controlled switchover to T.38 mode” is supported by the H.248 GW.

Coding sample of H.248 AuditValue is shown in Figure , on page 657 .

**Note 2:** After adding the physical TDM termination (Add tp), the ephemeral termination (te) is added for a voice call (e.g. G.711 or G.729 codec).

If the Network Option is set to “T.38”, the GWC request “T.38 mode”, by including T.38 codec in Add te request command.

**Note 3:** The H.248 GW replies with local Session Description Protocol (SDP) containing the preferred voice codec and optional with T.38 codec.

Coding sample of H.248 Add te is shown in [“Coding example: Add ephemeral with G.729 and T.38 codec”](#) on page 658.

**Note 4:** The H.323 GWC sends a Terminal Capability Set (TCS) message to the H.323 GW, to indicate that “CS controlled switchover to T.38” is supported by the remote side.

**Note 5:** The H.323 GW supporting “CS controlled switchover to T.38” responds with the preferred audio codec and indicates T.38 capability.

SDP coding samples are available in section “ Coding of Session Description Protocol (SDP)” on page 660.

**Note 6:** The H.323 GWC checks “CS controlled switchover to T.38” capability via H.323 GW profile. If supported, the remote H.248 side is requested to detect fax call.

**Note 7:** If H.248 GW supports “CS controlled switchover to T.38” i.e. AuditValue Reply included “ctyp-1” package, fax event detection (CNG tone, V.21 Preamble) is requested on the physical termination.

Coding sample of H.248 Modify tp event=ctyp/dtone is shown in [“Coding example: Request fax event detection”](#) on page 657.

**Note 8:** The ephemeral termination is modified with the remote SDP. If the remote SDP indicates T.38 capability via “a=cdsc: 1 image udptl t38”, then “CS controlled switchover to T.38” applies for this call. The H.248 GW does not switch over autonomously to T.38 or G.711.

**Note 9:** Upon detection of “fax call”, the H.248 GW notifies the H.248 GWC. The Notification is transferred to the remote H.323 GWC/GW side.

Coding sample of H.248 Notify tp fax call is shown in [“Coding example: Notify fax event V.21 flag” on page 657](#).

**Note 10:** Upon receipt of Notify fax detection, the H.323 GWC sends RequestMode (T.38) to the H.323 GW. The H.323 GWC handles the H.323 CLC and OLC messaging locally. Switchover to T.38 mode is always invoked by the H.323 GWC. The remote side is requested to switch over to T.38 by exchanging SDP(T.38) data.

**Note 11:** Upon receipt of SDP(T.38) data, a H.248 Modify command is sent, which request the ephemeral termination to switch over to T.38.

**Note 12:** The content of SDP uses following abbreviation:

- SDP(audio) for processing of audio media stream.
- SDP(t38) for processing of t38 media stream.
- SDP(audio, t38) for simultaneous processing of audio and t38 media streams.
- SDP(audio, t38-cap) for processing of audio media stream and for t38 capability indication.

**Note 13:** To reduce H.248 messaging, the “H.248 request detect fax tone” shall be sent within other available H.248 messages, if possible:

- combination of “Modify event = ctyp/dtone” and “Modify signal cg/rt” is possible, if ALERTING and SUBSCRIBE messages are sent coincidentally.
- combination of “Add tp” and “Modify event = ctyp/dtone” is possible, if the H.248 GW is the terminator and runs in “master mode”.

The “event = ctyp/dtone” is only requested, if the remote side is H.323, which request fax detection. On H.248 to H.248 interworking or H.248 to MGCP interworking, fax detection event is not requested.

#### **Call flow for H.323 to H.248 interworking (fast start)**

[“Sample flow for H.323 to H.248 interworking” on page 669](#) displays a sample messaging of a successful fax call between H.323 and PRI (H.248 controlled). First a voice call is established. Upon detection of fax call by originating H.323 side, “Call Server controlled switchover to T.38” applies.

Selection: Fast start applies - the H.323 side is “slave”, the H.248 side is “master”. Both sides supports “Call Server controlled switchover to T.38” and Netopt is set to “T.38”.

#### Sample flow for H.323 to H.248 interworking

**Call flow for H.323 to H.323 interworking (fast start)**

“Sample flow for H.323 to H.323 interworking” on page 670 displays a sample messaging for “Call Server controlled switchover to G.711” between two H.323 GWs. First a voice call with G.729 codec is established. Upon detection of CED tone, switching to G.711 codec is requested by the terminating side in this example. Upon detection of CNG or V.21 preamble a further switching to T.38 codec may take place as displayed in “Sample flow for H.323 to H.248 interworking” on page 669.

**Sample flow for H.323 to H.323 interworking**

### Call flow for H.248 to H.323 interworking (slow start)

Figure displays a sample messaging of a voice call establishment between PRI (H.248 controlled) and H.323. In case of a fax event, the same sequence applies as displayed in “Sample flow for H.248 to H.323 interworking” on page 666 or “Sample flow for H.323 to H.248 interworking” on page 669.

Selection: Originating side (H.248) starts with fast connect, the terminating side (H.323) rejects fast connect. The H.323 side is “master”, the H.248 side is “slave”. Netopt is set to “T.38”

### Sample flow for H.248 (FS) to H.323 (SS) interworking

## G3FE operation modes

This feature supports fax operation modes specified in ITU-T T.30 [1]. The originating side can invoke a fax call manually or automatically. Same happens on terminating side, call acceptance can be manually or automatically.

Detection of a fax call and subsequent “Call Server controlled switchover to T.38 mode” is complicated by the following facts:

- Sending Calling tone (CNG tone) is mandatory for calling fax devices. However manual calling terminals conforming to 1993 or previous T.30 versions may not transmit this signal.
- Called terminal identification answer tone (CED tone) is mandatory for called fax devices using automatic mode. For manual operation mode the sending of CED is optional.
- Upon receipt of CED tone, it is not clear whether a fax call or a modem call will be established. Because of the time-critical nature of a modem call, it is recommended to switch from G.729 codec to G.711 codec. If a fax call is determined by detection of CNG tone or V.21 preamble, an additional switch to T.38 may occur.
- V.21 Preamble is sent by all G3FE devices except fax devices which use V.8 or V.34 operation mode. These devices may send CNG tone.
- Upon receipt of V.21 Preamble flag, the switchover to T.38 must occur quickly (within ca. 2 sec), otherwise the fax call will fail.

**Note 1:** A GW may identify a fax call by monitoring the physical termination (TDM bearer channel) for CNG tone and V.21 Preamble flags.

**Note 2:** Fax calls, without CNG tone and V.21 Preamble, will not be recognized by the GW.

**Note 3:** H.323 GWs seem to detect a fax call with CED and V.21 Preamble.

[“Establishment of T.30 Fax call \(automatic operation example\)” on page 674](#) display an example of a T.30 fax call establishment. If switchover to T.38 mode is triggered by V.21 Preamble, the switchover must occur before Digital Command Signal (DCS) is transmitted. To prevent the exchange of DIS/DCS during switchover phase, the voice path should be blocked. If no DCS is received on terminating side, V.21/CSI/DIS is sent again after 3 sec.

## Establishment of T.30 Fax call (automatic operation example)

## Hardware Requirements or Dependencies

New hardware is not required.

## Software Requirements or Dependencies

- CM/GWC: ISN07 load
- H.248 GW - supporting H.248.1, H.248.2 ctyp package, T.38 mode.
- H.323 GW - supporting H.323, H.225, H.245 protocol, T.38 mode
- MGCP GW - supporting Generic media package/fax tone (G/ft), T.38 mode

## Limitations and restrictions

- T.38 fax interworking to non-Nortel Call Servers are out of scope for this feature and will not be tested. (**Note 1**)

**Note 1:** Interworking to non-Nortel Call Servers may work, if the non-Nortel Call Server supports the prerequisites as defined in section “Fax call CS2K to other Call Server” on page 659.

- T.38 fax interworking is supported over SIP-T (ETSI ISUP V2+). Native SIP support for T.38 fax interworking is not covered by this feature.
- T.38 fax interworking with MCS 5200 (IMS) is not tested by this feature.
- This feature verifies T.38 fax interworking for H.323 GW on one call leg and H.323 GW or H.248 GW or MGCP GW on the other call leg. Feature verification is done for:
  - H.323 GW: Succession1000M
  - H.323 GW: BCM
  - H.323 GW: Cisco IOS gateway 2600 (**Note 2**)
  - H.248 GW: PVG Passport 15k with VSP3 cards
  - MGCP GW: Mediatrix

**Note 2:** This should also cover support for Cisco IOS gateway 36xx, although it isn't explicitly tested by this feature.

T.38 interworking with other GWs are out of scope and will not be tested within this feature.

- Testing Westell and SBC interoperability is tested by feature ... tbd.
- Interworking to Group 4 fax, Modem and Data Transmissions are out of scope for this feature.
- “Facsimile-only over IP environment” (T.38 Annex D.2.2.3) is out of scope for this feature. This feature addresses “Facsimile and voice over IP

environment” (T.38 Annex D.2.2.4) in which first a voice call is established and then switchover to T.38 mode occurs.

- This feature does not support switching back to voice codec, when a fax call has ended.
- This feature uses the transport layer UDP/IP for T.38 packets (T.38 Annex D.2.3.2). Transport of T.38 packets via TCP/IP is not used by this feature.
- The optional transport of T.38 packets via one bidirectional reliable channel is not used. Instead two logical channels are used. (T.38 Annex B.3.3, D.2.3.2)
- Testing is done on the international CS2K load only.
- Testing T.38 fax interworking to MCS 5200 is not part of this feature.
- T.38 fax interworking to Cable MTAs is out of scope for this feature.
- *Due to the DSP implementation on the BCM, currently BCM calls are not supported over a Media Portal (MP). BCM calls are only supported in the same network segment. A solution is currently estimated for the BCM 3.7 load which is post SN07 content which involves changes to the BCM software implementation.*  
*The deployment of the T.38 functionality is currently only possible with the S1KM/S1K, if used behind a NAT / Firewall.*
- *BCM and S1KM will not request G.711, if the codec is G.729 and a fax is detected, but T.38 is unavailable. Therefore no support for G.729 to G.711 switchover is possible between two H.323 GWs. Solution planned for post SN07 GW loads.*
- *Currently the only supported H.323 GWs are BCM and S1KM. Westell, Cisco and Mediatrix are not included in the IT content and will be tested in the ICAF A00005122 which is currently post SN07 content.*
- *The FN will be updated upon completion of A00005122 including the final restrictions for SN07.*

### **A00003695 -- ANSI ISUP FGD on CS2K (Int'l PT-IP)**

#### ***Functional Description***

This activity provides ANSI ISUP FGD functionality on CS2K international load. This is done by porting the functionality of existing TDM MMP 17 feature with actid AT.59036475 into the ISN load.

The purpose is to enable CS2K with ISN load to directly interconnect to Inter Exchange Carriers (IEC) in North America.

This activity verifies the following agents interworkings only:

- ANSI ISUP FGD to/from ANSI ISUP FGD
- ANSI ISUP FGD to/from ETSI ISUP V1

#### **Hardware Requirements or Dependencies**

None

#### **Software Requirements or Dependencies**

None

#### **Limitations and restrictions**

Following interworkings are not verified with this activity:

ISUP V2 - ANSI ISUP FGD

ANSI ISUP FGD - ISUP V2

ANSI ISUP+ - ANSI ISUP FGD

ANSI ISUP FGD - ANSI ISUP+

ANSI ISUP FGD - ITU-R2

ITU-R2 - ANSI ISUP FGD

#### **Interactions**

Following interactions will be verified with this activity:

- ANSI ISUP FGD - ANSI ISUP FGD
- ANSI ISUP FGD - ETSI ISUP V1
- ETSI ISUP V1 - ANSI ISUP FGD

## Applicable customer facing sections

The reader is referred to the FN of the original MMP feature (Ref a).

## A59036475 -- ISUP FGD (ISDN User Part Feature Group “D”) - Phase 1 (Int’l UA-IP)

### *Functional Description*

This feature implements ISUP FGD (ISDN User Part Feature Group “D”) on the DMS MMP switch. ISUP FGD will be used in the North American market to access the domestic network. Phase I of this feature includes the protocol, interworking to existing MMP agents, limited specific supplementary services, and limited SS7/ISDNUP services.

This feature will implement the IXC exchange end of the ISUP FGD interface.

This feature will allow service providers to connect into the local network in North America and allow access into their network.

### **Network diagram**

The following figure illustrates the network in which this feature will be utilized.

**Network Overview****Functional Description**

The ISUP FGD protocol will be used to interface the DMS MMP with Local Exchange Carriers (LECs) and other Inter-exchange Carriers (IECs) in North America. This interface provides not only an SS7 transport between such nodes but also includes a set of Equal Access features to allow subscribers to selectively choose a service provider for national and international traffic.

ISUP FGD allows end-users in the North American public network to remotely access the DMS MMP and its services. It also provides the ability for subscribers outside of North America to terminate calls directly into this network.

This feature will allow service providers to connect into the local network in North America and allow access into their network.

**Bearer Services**

ISUP FGD supports the following bearer services:

- Speech
- 3.1 kHz audio
- 64 Kbit/s unrestricted

## Supplementary Services

The supplementary services supported by this implementation in Phase I are as follows:

- **Calling Line Identification Presentation (CLIP):** When this service is subscribed to, information about an incoming call can be presented to the subscriber at the destination. Please refer to a59023300 - CLI Delivery control.
- **Calling Line Identification Restriction (CLIR):** When this service is subscribed to, the ISDN number will not be available to the called user. This will prevent CLIP subscribers from knowing the origin of incoming calls. CLIR can be used permanently or on a per-call basis. The CLIR service can be overridden by privileged users, e.g. police. Please refer to a59023300 - CLI Delivery control
- **Direct Dialling Inward (DDI):** It allows the calling user to call directly, via the public ISDN, a user on a private ISDN by using the public ISDN numbering plan. This will allow a connection to the called user without having to go through the private ISDN's operator.
- **Multiple Subscriber Number (MSN):** This service allows each individual terminal on one access to have one or more DNs. For example, this would allow a calling user to select, via the public network, one distinct terminal out of a multiple choice and to identify the terminal to the public network for other services, such as CLIP. MSN allows the user to select which ISDN terminal they wish to use.
- **Sub addressing (SUB):** The SUB service allows the called (served) user to expand their addressing capacity beyond the one given by the ISDN number. With this sub-address the called user could, for example, route the incoming call to a specific terminal.
- **Terminal Portability (TP) (Suspend/Resume):** Suspend/Resume initiated by the called party is supported. This service allows a user to move terminal from one socket to another within one given basic access during the active state of call. It also allows a user to move a call from one terminal to another within one given basic access during active phase of call. The DMS will transit the suspend and resume message from the originating or terminating network after the ACM has been received from the terminating network.

## Additional SS7 procedures

Additional SS7 procedures for ISUP FGD

- **Phase I:**
  - **Continuity Testing (both manual and per call basis):** ISUP FGD supports continuity testing both manual and per call basis. Continuity Check, validates the speech path on a trunk that has CCS7 signaling. Continuity Check on incoming trunks is facilitated by

applying a loop between the transmit and receive paths of the incoming trunk circuit when the continuity check field in the nature of connection indicator requires continuity check on the circuit concerned. Outgoing continuity check is initiated when the COTREQ field in table TRKSGRP of the terminating trunk group is datafilled to greater than zero. This number represents the percentage of calls on each trunk in that subgroup that should request for a continuity check during call setup.

- **Forward Call Indicator National/International Bit Override:** A new option FCI is provided in table TRKOPTS by this feature ISUP FGD. This option provides the ability to override the FCI-National/International bit in the incoming IAM message and set it to either NATL or INTL regardless of the call type in the outgoing IAM. DMS will first check if the FCI option is on the outgoing trunk, if present this shall be considered, else a check is made if the FCI option is on the incoming trunk and this shall be considered if present.

#### Sample datafill for FCI\_NATL\_INTL\_BIT option in table TRKOPTS

|                              |
|------------------------------|
| TABLE: TRKOPTS               |
| OPTKEY OPTINFO               |
| -----                        |
| ANSI7LPA <b>FCI FCI NATL</b> |
| ANSI7LPB <b>FCI FCI INTL</b> |

## SS7 Parameters

ISUP FGD protocol is based upon the ANSI T1.113 ISUP Specification but also includes additional IAM parameters which are either not included in ANSI specification or are viewed by ANSI to be optional. ISUP FGD is defined by GR-317-CORE, Telcordia and GR-394-CORE Telcordia.

### Parameter Blocking in outgoing IAM

Almost all IAMs sent across an ISUP network contain optional parameters which supply additional information to the subsequent exchange. In some cases, the presence of an optional parameter may cause a different type of switch to reject the message. Additionally, the presence of an optional parameter can invoke processing which is not desired at the next exchange. In both cases it can be necessary to suppress one or more specific parameters. Parameter Blocking provides the capabilities to block any or all of the following parameters from being transmitted to the next switch in the outgoing IAM message, on a per trunk group basis.

The following parameters are required for the ISUP FGD implementation on the DMS MMP. ISUP FGD will optionally block the following parameters from being transmitted to the next switch in the outgoing IAM on a per-trunk group basis.

- Access Transport parameter

- Calling Party Number
- Charge Number
- Carrier Identification Code Parameter
- Carrier Selection Parameter
- Generic Address Parameter
- Generic Name Parameter
- Service Code Parameter
- Jurisdiction Information Parameter
- Hop Counter
- Original Called Party Number
- Originating Line Information
- Redirecting Number
- Redirecting Information
- Transit Network Selection

### Provisioning

The handling of optional IAM parameters will be controlled via datafill in table TRKOPTS and table ISPARM. Table TRKOPTS is the common table to house various options for all kinds of trunks. Table ISPARM supports parameter blocking for optional parameters of IAM messages. The option ISPARM in table TRKOPTS only applies to outgoing trunks and will hold the index into table ISPARM. If the parameters listed above are datafilled to be blocked in table ISPARM, the parameters will be blocked from the outgoing IAM.

The options Access Transport Parameter, Calling Party Number, Hop Counter, Original Called party number, Transit Network Selection, Generic Address, Generic Name, Redirecting Information and redirecting number are currently available in MMP and can be used to block these parameters for ISUP FGD. The parameters like Charge Number (#EB), Carrier Identification Code Parameter (#C5), Carrier Selection Parameter (#EE), Originating Line Information (#EA), Service Code Parameter (#EC) and Jurisdiction Parameter (#C4) can be blocked by using the VALUE\_OF\_PARM option in table ISPARM.

#### Logical tuple layout for option *ISPARM* in table TRKOPTS:

| Key                  | Service | Option     |
|----------------------|---------|------------|
| <trunk_group> ISPARM | ISPARM  | <char_key> |

**Logical tuple layout for table ISPARM:**

| Key        | action  | optparm          | value              |
|------------|---------|------------------|--------------------|
| <char_key> | {BLOCK} | {ATP}            |                    |
|            |         | {OFCI}           |                    |
|            |         | {CGN}            |                    |
|            |         | ...              |                    |
|            |         | {NTWRK_SPEC_FAC} |                    |
|            |         | {DEL_PARM}       |                    |
|            |         | {VALUE_OF_PARM}  | {<parameter code>} |

**Datafill sequence**

First of all it is necessary to enter one or more tuples in table ISPARM. These tuples will define actions for specific profiles of optional IAM parameters.

Afterwards it is possible to add an ISPARM option in table TRKOPTS indexing a specific entry in table ISPARM.

**Datafill example****Sample Datafill for option ISPARM in Table TRKOPTS:**

```
TABLE: TRKOPTS
OPTKEY OPTINFO
-----
KNGA210ISBWE ISPARM ISPARM NO_OFCI
KNGA210ISBWE ISPARM ISPARM NO_JIP
```

**Sample Datafill in Table ISPARM:**

```
TABLE: ISPARM
KEY ACTION
-----
NO_OFCI (BLOCK (ATP) $) $
NO_JIP (BLOCK ( VALUE_OF_PARM 196) $) $
```

Please refer to A59028040: “SS7ATTR equivalence” for more details.

**ISDNUP services****Hop Counter**

ISUP FGD supports Hop Counter. To avoid infinite routing loops, the Hop Counter maintains a “count” of link traversals. If a Hop Counter parameter is received in the incoming IAM, and its value is 1 or greater, the DMS MMP decrements the count by 1. If the decremented (or received) value equals 0, the call is released.

If no Hop Counter is received, the DMS MMP will create a Hop Counter with a starting value 20.

Only the basic functionality of hop counter will be supported.

Hop Counter may be restricted by datafill in table TRKSGRP with the option “NO\_HOP” for outgoing ISUP FGD trunk.

#### Sample Datafill in Table TRKSGRP:

```
TABLE: TRKSGRP
SGRPKEY CARDCODE SGRPVAR SGRPVAR
-----
KNGA210ISBWE 0 DS1SIG C7UP 2W N N UNEQ NONE Q764 THRL 0 DMSNODE
(NO_HOP) $ ISUP2W CIC
```

The Hop Counter Parameter can also be blocked from the outgoing IAM by datafill in table ISPARM for outgoing trunk.

#### Sample Datafill for option ISPARM in Table TRKOPTS:

```
TABLE: TRKOPTS
OPTKEY OPTINFO
-----
KNGA210ISBWE ISPARM ISPARM 1234
```

#### Sample Datafill in Table ISPARM:

```
TABLE: ISPARM
KEY ACTION
-----
1234 (BLOCK (OPT_HOP_COUNTER_PARM) $) $
```

### Equal Access Services

The following ISDNUP services are supported for ISUP FGD:

#### Phase I:

**Calling/Charge Number Handling:** ISUP FGD supports Calling/Charge Number Handling. Because of the interaction between Calling Numbers and Charge Numbers, the DMS-MMP will allow the service provider to specify which of these two parameters will be used for CLI screening, while the “BILLING\_OPTION” field allows the user to specify which address to capture in the AMA billing record, and which will be outpulsed in the outgoing IAM. A mapping function is required when ISUP FGD originations terminate to protocols which do not support both Calling Number and Charge Number parameters. Please refer to a59023556 for more details.

### Inswitch Services

**Phase I:** The following inswitch services are supported by ISUP FGD on DMS MMP in Phase I

**30-Digit Called Party Number Support**

The DMS MMP currently support 30-digit called-party number lengths.

For ISUP originations, if more that 30 digits are received in the incoming IAM message, the call will be released.

**Time Of Day (TOD) Routing**

Time-of-Day Routing allows cost-effective use of facilities available by allowing or denying route choices based on the time of day. The routes can also be varied based on the day of the week or the day of the year, to account for weekends and holidays.

**Called Party Number Digit Manipulation**

Digit manipulation is provided by the DMS MMP in various ways through translations and routing. (For e.g., Table DIGMAN, Table IBNRTE)

**Class of Service Screening**

Class Of Service Screening will allow operators to restrict trunk to trunk calls based on the datafills. The COS value of the originating and terminating trunks are used to determine whether the call is to be allowed/restricted. Class of Service is a value between 0 -1023, that an operator can assign to a trunk group.

The Class of Service Screening is extended to support ISUP FGD.

**Note:** Please refer to activity, a59023338-Class Of Service Screening for more details.

**CLI Screening****CLI Screening, Billing, and Outpulsing**

DMS MMP CLI screening provides the ability to screen International and National addresses, and expands the capacity of the CLI Screening database. Screening of calls is enhanced to allow configurable selection of the address to screen. A configurable selection of the address to bill is also provided.

The CLI Screening functionality is extended to support ISUP FGD.

**Note:** Please refer to MMP15 activity, 59023556 and 59023300 for more details.

**Account Code Collection and Screening**

Account Code Collection provides the ability to collect optional Account code (Acctcode) information on indirect access calling line identification (CLI) or authorization code (Authcode) screened calls, respectively. In addition, functionality is provided to allow such Account codes to be validated (if required) against a table of predetermined codes. Please Refer to A59023153 for more details.

**NOA/TON Mapping**

The NOA in the outgoing IAM shall be set based on the CDN option in the UXLA xxHEAD/xxCODE tables. Office parameter NOA\_UXLA\_CDN\_OPT to be turned ON for CDN option. It can also be set based on SETCDN option which is based on CDNCHAR functionality. The CDNCHAR for ISUP FGD uses IBN7 protocol. For more details refer ANSI ISUP/ IBN7 sections in E164UTIL (Activity 59007530).

If the outgoing trunk is ANSI ISUP or ISUP FGD, and the incoming Called Party Number NOA is National then the outgoing NOA will map to Subscriber number if the Called party digits is less than or equal to 7.

If the outgoing trunk is ANSI ISUP or ISUP FGD and the incoming Called Party Number NOA is National Number Operator Requested, then the outgoing NOA will map to subscriber number operator requested if the Called party number digits is less than or equal to 7.

If the outgoing trunk is ANSI ISUP or ISUP FGD and the incoming Called Party Number NOA is Subscriber number, then the outgoing NOA will map to National number if the called party digits is greater than or equal to 10.

If the outgoing trunk is ANSI ISUP or ISUP FGD and the incoming Called party number NOA is Subscriber Number Operator Requested, then the outgoing NOA will map to National number Operator Requested if the called party digits is greater than or equal to 10.

The NOA set based on SETCDN option has precedence upon the above behaviour.

**Destination OMs**

The OM group TERMDEST provides peg counts and usage measurements for calls which are translated using the xxCODE and xxHEAD tables and terminated to a particular destination.

OM group TERM RTE provides peg counts and usage measurements for calls terminating to a specific route choice for a particular terminating destination.

Please Refer to A59026196-Destination & Route Based OMs for more details.

**Serving Country Code**

Serving Country Code (SCC) denotes the code associated with a trunk, indicating the country which the trunk serves.

The DMS-MMP can convert the incoming Calling Party Number (CgPN) into international format by prefixing it with Serving Country Code (SCC) when a call is between subscribers in two different countries (International call). Also

depending upon the value of the SCC, the country code can be stripped off from the outgoing Called Party Number (CdPN) and Calling Party Number.

Please refer to A59023331 Serving Country Code for details.

### **Q118 Timers**

The SUS/RES timers of the Q.118 are provided in MMP through office parameter LONG\_TIMED\_RELEASE\_DISC\_TIME. For a tandem exchange the time out value for SUS is the maximum of:

- (a)  $\lceil (\text{LONG\_TIMED\_RELEASE\_DISC\_TIME}/10) + 100 \rceil$  seconds
- (b) 254 seconds

The Long Ring Disconnect timer of the Q.118 is not provided in this release.

### **Remote Access**

Remote access is designed for roaming VPN users. It allows them to access the VPN while away from their workplace, e.g. by calling from a hotel or mobile telephone. The user accesses the VPN by dialling a Freephone number or a VPN access code, then entering an authorization code and PIN when prompted to do so. ISUP FGD is supported for MONA and DISA which enables to provide these services.

### **Registered Site Access**

Registered Site Access (RSA) provides users without a dedicated private network connection the ability to dial into the private network via a PSTN connection, with the Calling Line Identity (CLI) of the user being screened to verify validity.

Advantages of RSA are

- The site is able to get connected to the corporate communications network.
- Calls made from sites can be managed more effectively.

A calling subscriber is provided with a Freephone code or NAC to make RSA calls. PSTN routes the call to VPN access node (DMS). Upon receiving the IAM, DMS validates the attempt by verifying the CLI against the table DNSCRN entries. If screening is successful then call will be allowed to continue. ISUP FGD is supported for CLI screening which enables to provide these services.

### **Multiple Announcements for Failure**

This provides a mapping function to allow a single announcement to map to many announcements based upon the Class of Service (COS) assigned to the originating trunk. Thus it provides failure announcements to the end-users/subscribers branded to their particular service provider and in their native language. Please refer to the FN document of 59028846 for more details.

**Default Number**

The default number can be used in many scenarios.

- It is used for overriding the incoming CLI or Charge number regardless of whether CLI or Charge number has been received in the incoming message or not.
- It is also used when the CLI or Charge number parameter has not been received in the incoming trunk.
- It is used when the CLI or Charge number parameter has been received without any digits in the incoming trunk

Table DEFNUM defines the default number CLI or Charge number. The table has fields to set default NPI, NOA, PI and SI. The DEFNUM functionality is extended to cover ISUP FGD originations and terminations.

Please refer to A59028834-CLI Default Number for more details.

**Satellite Override**

The satellite indicator in the Nature of Connection of IAM is overridden based on the datafill in table SATOVER. If the incoming NOC in the ISUP IAM says that one or more satellite hops has occurred then that is used. Otherwise the SAT field is checked to indicate that one previous hop has occurred. The default behaviour is overridden by SATOVER. SATOVER is checked with the incoming and terminating trunk and if OVERRIDE=Y then we can exceed the normal limit. If no then we can't and the route is skipped as normal.

**REL Generation and Mapping**

For an interworking call which is successful, the REL mapping depends on the datafill in table FAILMSG. (Note: Table FAILMSG will not be referenced if the protocol of the incoming and outgoing trunk is the same. ISUP FGD and ANSI ISUP will not be treated as different protocols, since ISUP FGD also uses the Q764 protocol.)

For an unsuccessful call that routes to treatment, DMS will either generate treatment or a Release with values (from table TMTMAP) based on the datafill in table TMTMAP.

**Nature of Connection Mapping for IAM**

The fields in the Nature of Connection in the IAM are mapped based on the incoming data and the table datafill for the outgoing trunk.

Satellite Indicator: - This value is encoded based on incoming information and the datafill in TRKSGRP field SAT for the outgoing trunk.

Continuity Check Indicator: - This value is encoded based on incoming information and datafill in TRKSGRP field CONTCHK and field COT for the outgoing trunk.

Echo Control Device Indicator:- This value is encoded on incoming information and datafill in table TRKSGRP field ESUPR and ECSTAT for the outgoing trunk.

### National / International Agency for ETSI ISUP V2 trunks

ETSI ISUP V2 trunks are referred to as “National Agency” if the COFFTYP in TRKGRP is NATL and “International Agency” if COFFTYP is INTL.

Examples of both is given below:

```
TABLE: TRKGRP
GRPKEY GRPINFO
-----
KNGA280EIBWE IBNT2 0 NPDGP NCRT KINGSA 0 MIDL 10 N ANSDISC 0 Y N N N N N N 0
0 N 0 1 0 1 N N N N N N N N NATL $

KNGA1042E2BWE IBNT2 0 NPDGP NCRT KINGSA 0 MIDL 10 N ANSDISC 0 Y N N N N N N
0 0 N 0 1 0 1 N N N N N N N N INTL $
```

### Redirection Behaviour if outgoing leg is ANSI ISUP or ISUP FGD

Redirecting Number will not be sent out unless the incoming IAM message contains a redirection information parameter with the redirection counter greater than one.

### Agent Interworking

ISUP FGD feature supports the following interworkings:

- Phase I:
  - ISUP FGD
  - ANSI ISUP +
  - ETSI ISUP V1
  - ETSI ISUP V2
  - ITU R2 (ISUP FGD will support FDCP R2)

[ Note: Sample datafill for FDCP R2

| UCIC             | Unequipped Circuit Identification Code Message | 3                                          |                                 |

a. CPG message is tandemed only if received in the backward direction.

b. CRA - Acknowledgement for CRM.

c. CRM generated when EAEO to AT uses inband signalling and outgoing circuit to IXC uses SS7 signalling. DMS does not generate this message.

d. RES message is only supported in the backward direction in DMS MMP.

e. SUS message is only supported in the backward direction in DMS MMP.

### ISUP FGD Supported Parameters

The supported parameters are listed in the table below. Any ISUP parameters not listed in the table are not supported by ISUP FGD on DMS MMP.

#### ISUP FGD Supported Parameters

| Parameter                                        | Code           | Supported in Messages <sup>a</sup> | Supported by ISUP FGD             |                     |
|--------------------------------------------------|----------------|------------------------------------|-----------------------------------|---------------------|
|                                                  |                |                                    | Processed or generated by DMS MMP | Tandemed by DMS MMP |

a. A message marked with (M) indicates its parameter is mandatory. Otherwise, the parameter is optional.

b. ACL if received will be blocked by DMS.

c. Event Information parameter is tandemed if received in a CPG message.

- d. Multirate connections are not supported. Only USI representations of speech, 3.1 kHz audio and 64 kbit/s data supported.

### Agency Provisioning - Table TRKOPTS

Table TRKOPTS is datafilled to provision ISUP FGD trunk.

A sample datafill on DMS MMP to make an ANSI ISUP IBN trunk as ISUP FGD is shown below:

```
TABLE: TRKOPTS
OPTKEY OPTINFO
-----
ANSI7LP1 FGD FGD IXC
ANSI7LP2 FGD FGD IXC
```

The datafill in Table TRKGRP and TRKSGRP is same as IBN trunks for ANSI ISUP. A sample example is shown below:

```
TABLE: TRKGRP
GRPKEY GRPINFO
-----
ANSI7LP1 IBNT2 0 STDTK NCRT IDCGRP 0 MIDL 511 N ANSDISC 0 Y N N N N
Y N 0 0 N 0 0 0 0 N N N N N N N N NATL $

TABLE: TRKSGRP
SGRPKEY CARDCODE SGRPVAR SGRPVAR
-----
ANSI7LP1 0 DS1SIG C7UP 2W N N UNEQ NONE Q764 THRH 0 DMS (MBG NONE)
$ ANSI72W CIC
```

ISUP FGD will use the same TMRKEY in table C7UPTMR and hence the same timers as that of ANSI ISUP. A sample datafill is shown below:

```
TABLE: C7UPTMR
TMRKEY C7UPDIR TMRS OPTIONS
-----
ANSI72W 2W Q764 13 2 25 6 60 10 180 20 200 13 60 2 32 3 600 $
```

## Message Flow Description

The following section provide detail message and parameter mappings of some common interworking issues.

- ISUP FGD <=> ANSI ISUP+
- ISUP FGD <=> ETSI ISUP V1
- ISUP FGD <=> ETSI ISUP V2
- ISUP FGD <=> ITU-R2
- ISUP FGD <=> ISUP FGD

## ISUP FGD To ANSI ISUP+

### Normal Call Setup

#### Normal Call Setup

#### Message Mappings ISUP FGD -> ANSI ISUP+

## Overlap Call Setup

ANSI ISUP+ and ISUP FGD do not support overlap

## ISUP FGD -> ETSI ISUP V1 Interworking

### Normal Call Setup

The following tables show the ISUP FGD to ETSI ISUP V1 detailed message mapping. They include all the possible ISUP FGD parameters, and details how they are mapped to their corresponding ETSI ISUP V1 counterparts.

#### ISUP FGD to ETSI ISUP V1: Normal Call Setup

#### Message Mappings

| ISUP FGD Message | Trigger Direction | ETSI ISUP V1 Message |
|------------------|-------------------|----------------------|
| IAM              | ⇒                 | IAM                  |

*a. REL triggered by Time-out of Suspend timer.*

*b. REL triggered by Time-out of Suspend timer.*

## Overlap Call Setup

## ETSI ISUP V1 to ISUP FGD - Overlap Call Setup

**Overlap Call Setup Message Mapping**

| ETSI ISUP V1 Message | Trigger | ISUP FGD Message |
|----------------------|---------|------------------|
| IAM                  | ⇒       | IAM              |
| SAM(s)               | ⇒       |                  |
| ACM                  | ⇐       | ACM              |
| ANM                  | ⇐       | ANM              |

Parameter and field mappings are identical to the normal call setup scenario except for the Called Party Number Address Signals. This field will be a concatenation of the digits received in the incoming IAM message and SAM message(s).

**ISUP FGD -> ETSI ISUP V2 Interworking****Normal Call Setup**

The following tables show the ISUP FGD to ETSI ISUP V2 detailed message mapping. They include all the possible ISUP FGD parameters, and details how they are mapped to their corresponding ETSI ISUP V2 counterparts

**ISUP FGD to ETSI ISUP V2: Normal Call Setup**

**Message Mappings**

| ISUP FGD Message | Trigger Direction | ETSI ISUP V2 Message |
|------------------|-------------------|----------------------|
| IAM              | ⇒                 | IAM                  |
| ACM              | ⇐                 | ACM                  |
| ANM              | ⇐                 | ANM                  |

## ETSI ISUP V2 -> ISUP FGD Interworking

### Normal Call Setup

The following tables show the ETSI ISUP V2 to ISUP FGD detailed message mapping. They include all the possible ETSI ISUP V2 and details how they are mapped to their corresponding ISUP FGD counterparts.

### ETSI ISUP V2 to ISUP FGD: Normal Call Setup

### Message Mappings

| ETSI ISUP V2 Message | Trigger Direction | ISUP FGD Message |
|----------------------|-------------------|------------------|
| IAM                  | ⇒                 | IAM              |
| ACM                  | ⇐                 | ACM              |
| ANM                  | ⇐                 | ANM              |

**No Mapping-** There is no appropriate mapping of an ETSI ISUP V2 protocol element to an equivalent ISUP FGD protocol element (or vice versa). This element is discarded when interworked

**Parameter Mapping - ETSI ISUP V2 IAM to ISUP FGD IAM**

| ETSI ISUP V2 IAM       |       |                                             | Dir | ISUP FGD IAM                                |       |                        |
|------------------------|-------|---------------------------------------------|-----|---------------------------------------------|-------|------------------------|

a. Please refer to Section "Nature of Connection Mapping for IAM" on page 691.

b. - Called and Calling Party Number parameters are encoded based on incoming values and inswitch manipulation; therefore, SCC, INAP, and standard translation processes may result in values other than those shown.

c. Please refer to Section "Additional SS7 procedures" on page 683.

d. Field is set according to the length of the calling party number

## Parameter Mapping - ISUP FGD ACM to ETSI ISUP V2 ACM

**ISUP FGD -> ETSI ISUP V2: Suspend Timer Time-out**

**Suspend Timer Time-out Message Mapping**

| ETSI ISUP V2 Message    | Trigger | ISUP FGD Message        |
|-------------------------|---------|-------------------------|
| SUS                     | ←       | SUS                     |
| No Trigger <sup>a</sup> | ⇒       | REL                     |
| REL                     | ←       | No Trigger <sup>b</sup> |
| No Mapping              | ←       | RLC                     |
| RLC                     | ⇒       | No Mapping              |

*a. REL triggered by Time-out of Suspend timer.*

*b. REL triggered by Time-out of Suspend timer.*

**ISUP FGD -> ITU R2 Interworking****Normal Call Setup**

The following tables show the ISUP FGD to ITU R2 detailed message mapping. They include all the possible ISUP FGD parameters, and details how they are mapped to their corresponding ITU R2 counterparts.

## ISUP FGD -&gt; ITU R2: Normal Call Setup

**Normal Call Setup Message Mapping**

| ISUP FGD Message | Trigger Direction | ITU R2 Line Signal                 |
|------------------|-------------------|------------------------------------|
| IAM              | ⇒                 | SZG                                |
|                  |                   | SZA                                |
|                  |                   | GRP I-A<br>NEXT_DIGIT <sup>a</sup> |

| ACM              | ⇐                 | GRP B-6<br>CONNECT_CALL<br>_CHG    |
| ANM              | ⇐                 | Answer                             |

a. Multiple NEXT\_DIGIT signals will be sent until all Called Party Digits have been collected.

b. One Called Party Digit will be sent in response to each NEXT\_DIGIT signal received.

c. See the following table for the specific Calling Party Category signal generated from each IAM Calling Party Category value.

**Parameter Mapping - ISUP FGD IAM -> ITU R2 SZG/SZA**

*a. REL triggered by Time-out of Suspend timer.*

*b. REL triggered by Time-out of Suspend timer.*

### Overlap Call Setup

ISUP FGD ->ISUP FGD Interworking do not support Overlap Call Setup

### Hardware Requirements or Dependencies

No special hardware required. The ISUP FGD is supported on DTC peripheral for a T1 carrier.

### Software Requirements or Dependencies

The Functionality Order Code for this feature is NETK0073.

### Limitations and restrictions

- Automatic Congestion Level Parameter in the REL message is blocked. If received, DMS will remove it from the outgoing message.
- Non Compliancy: The messages which are supported on ANSI (e.g., FAA, FAR, etc.) but not on ISUP FGD will be passed by ISUP FGD as in the case of ANSI ISUP.
- No Line Interactions are supported by this feature.
- ISUP FGD will not be supported on SPM.
- IN Services will not be supported in Phase I of ISUP FGD
- This feature is supported only on SX05 XPM loads.

Further limitations are mentioned along with the description of each functionality.

## Interactions

The Interactions are mentioned along with the description of each functionality.

***Product = CS 2000*****A00003696 -- G-ISUP Routing enhancements (Int'l PT-IP)*****Functional Description***

This feature focuses on the routing enhancement for Deutsche Telecom G-ISUP, using the new national parameter UKK (#F5).

Additionally it also covers the

- Identification procedures for T-ISUP.
- Capturing of Originating ISC point Code.
- Blocking of Connected Number and Calling Party Number based on presentation indicator

These are described in the subsection below

## Routing Enhancement for DTAG GISUP

DTAG Specifications introduces a new field Kundenkennung (KK) i.e Customer ID for the special routing.

KK is field in the national Parameter UKK, received in the IAM, from DTAG network.

The special routing is based on the following Criteria.

- Customer ID
- Destination
- IPI
- TMR

### Routing based on Kundenkennung

To provide the ability to allow a different routing depending on the special routing criteria, the call control and universal screen framework is used (A59028780, A59033687). This frame work already provides the ability to route depending on BC and IPI.

Since TMR and BC are correlated, we use the BC screening, in place of the TMR screening,

#### TMR - BC correlation

| TMR                       | BC                                                                     |
|---------------------------|------------------------------------------------------------------------|
| TMR_SPEECH                | BC_SPEECH                                                              |
| TMR_64KB_UNRES            | BC_64K_DATA                                                            |
|                           | BC_7_KHZ: ITC -<br>GEN_ITC_DIG_TONES_ANNOUNC or<br>GEN_ITC_7_KHZ_AUDIO |
| TMR_3_1KHZ_AUDIO          | BC_3_1_KHZ                                                             |
| TMR_ALT_SPEECH_64KB_UNRES | BC_64K_DATA                                                            |
| TMR_ALT_64KB_UNRES_SPEECH | BC_64K_DATA                                                            |
| TMR_64KB_PREFERRED        | BC_64K_RES                                                             |

Table , “TMR - BC correlation.” captures the correlation of TMR and BC. The value TMR\_64KB\_UNRES, has different BC values based on ITC, hence TELCO will have to provision both these BC values for handling TMR\_64KB\_UNRES.

A new Table KKSCRN is created to store the KK values and the framework is extended to also allow routing dependent on KK. Please refer to Figure , on page 869 .

#### Call control and Universal screening Tables

The screening framework provides a flexible structure for modifying translations. For the purpose of DTAG, the recommended usage is as follows:

An entry screen index is datafilled against the trunk group and the table to screen against first (KKSCRN). The format of the table is as shown in the following table:

**Format of Table KKSCRN**

| Field            | Range of Values                                                            | Description                                                                             |
|------------------|----------------------------------------------------------------------------|-----------------------------------------------------------------------------------------|
| SCRN_KEY         | Any valid index from table CALLCNTL                                        | Key Field: Index from table CALLCNTL                                                    |
| KK               | KK value {0-16383}                                                         | Key Field: Kundenkennung.                                                               |
| NEWSCRN_KEY      | Any valid index in table CALLCNTL                                          | Updated CALLCNTL Index                                                                  |
| CALLCNTL_OPTIONS | Call Control Options:<br>CUSTGRP, TREAT,<br>POECNAME, DIGEDIT,<br>CLICNTL. | Allows setting of call processing variables or treatment as performed in table CALLCNTL |

1. The KK for the call is used along with this screen index to look up the entry in table KKSCRN. This entry can specify a customer group to use for translations (if no other BC or IPI specific routing is required), or a new screen index and the next screening table (IPISCRN).
2. The IPI for the call is used along with the current screen index to look up the entry in table IPISCRN. This entry can specify a customer group to use for translations (if no other IPI specific routing is required), or a new screen index and the next screening table (BCSCRN).
3. The BC for the call is used along with the current screen index to look up the entry in BCSCRN. This entry specifies the customer group to use for translations.

The datafill is as shown in the following figure:

**Sample datafill for KK/IPI/BC routing**

```
TABLE TRKOPTS
STEP27ISUPV2 CCNTLIDX CCNTLIDX INDEX

TABLE CALLCNTL
INDEX (SCRN (KK) (IPI) (BC) $)$

TABLE KKSCRN
INDEX 5 KK5 $

TABLE IPISCRN
KK5 PREFERRED KK5_PREF $

TABLE BCSCRN
KK5_PREF          SPEECH          KK5_PREF_SP          (CUSTGRP
KK5_PREFERRED_SPEECH_CUSTGRP1) $
```

The end result is that the customer group for the call can be specified uniquely for each KK/IPI/BC combination. These customer groups can each have their own translations defined.

The special routing will be invoked based if either Bit A = 1 or Bit C = 1 is set in the message, else it proceeds for Normal routing.

The flow diagram shown in “[Flow Diagram for KK screening](#)” on page 872 captures the screening (routing) done based on the sample datafill for KK/IPI/BC combination.

The flow captures only a part of the screening framework, concentrating on the KK screening.

In cases where special routing is not required, the flow would proceed to normal routing. If the normal routing requires the IPI and BC to be screened, then IPISCRN tables and BCSCRN table should have provisioning to handle the index provisioned in Call Control table.

The translation for updated custgrp are set to route the call based on the called party number to a restricted routelist, as needed by the special routing KK/IPI/BC combination.

*Interworking of Customer Id screening with other possible screening options may lead to incorrect result, if the index are not handled properly. This may even lead to have no KK screening done in spite of the UKK parameter available in the IAM.*

### **Handling of failures for special routing**

The routelist obtained after screening of KK/IPI/BC, restricts the available routes as compared to the default routes.

In cases where this special routing fails, the decision to fall back to the default routing is based on capabilities provided.

This is handled by adding all the default routes to routelist for the customer groups where the customer ID demands to fall back to the default Routing.

The example below details the handling.

### **Scenario**

- The default routelist for all customers with calls coming on Trunk CLLI1 for Called party number DN1 is {RR1, RR2, RR3, RR4, RR5}
- For the customers with Kundenkennung KK1 and KK2 the routes are restricted to {RR2,RR3,RR4}.
- But customer with KK1 have the facility to fallback back to the default routing when special routing to the restricted routelist fails.

### **Provisioning**

The provisioning for the above scenario is as explained in the Figure , on page 874 .

**Provisioning for special routing****Capacity for provisioning of Kundenkennung**

The Feature approach suggested derives the Customer group, based on the KK/IPI/BC combinations. The Translations system completes the further routing based on the called number using Customer Group as index.

With the current provisioning capacity, total number of customer groups allowed is 4094.

In a completely unoptimized system, the resulting combinations can lead to  $64000 \text{ KKs} \times 3 \text{ IPIs} \times 11 \text{ BCs} = 2,112,000$  different routing systems. This far exceeds the abilities of the CS2K XLA system.

But the realistic requirement specifies the International Gateway should support an average of 1000 Customer ID (KK), 80 destinations per customer

group and an average of 2 IPI/BC combinations per destination. Since the screening of destination is done in translations, we do the IPI/BC screening before the destination. Thus the system will provide support for all 9 combinations of IPI/TMR. This results to 9000 customer group, which is beyond the current capacity of 4086.

But it is expected that there will be a significant number of combinations of KK/IPI/BC that result in the same routing. For example, two KK may share the same routing or one KK may have one routing for all IPI/BC combinations. Refer to the Appendix section “Example Datafill Setup” on page 892 for examples of how this can be done.

### Handling of the Bit E

In addition to special routing, the UKK parameter also provides information regarding bypassing the Black List numbers using Bit E (Blocking Indicator). If bit E = 1, then the black list will be ignored.

Screening for Bit E is handled by providing an additional screen option UKKCDPN in the table CALLCNTL. This option will use the existing CDPNSCRN table in conjunction with bit i.e it will not perform CDPN screening if the bit E is set to 1.

**Table CALLCNTL(UKKCDPN option)**

```
TABLE: CALLCNTL

TABLE KKSCRN
INDEX 5 KK5 $

Proceed as described in sample datafill for KKSCRN
```

The flowchart for the above datafill is as shown in the following figure.

#### Handling of Bit E

#### Setup of UKK

The UKK parameter needs to be setup trunk based, for incoming International calls coming on GISUP/V1 trunks.

This capability is provided by providing a new option in table TRKOPTS.

The Option will allow the complete parameter to be provisioned, as per its specification. Please refer to the following figure:

#### NP.UKK parameter layout

|       |   |   |   |   |   |   |   |
|-------|---|---|---|---|---|---|---|
| 8     | 7 | 6 | 5 | 4 | 3 | 2 | 1 |
| Ext.i | G | F | E | D | C | B | A |

|       |                                          |                                                     |
|-------|------------------------------------------|-----------------------------------------------------|
| Ext.i | Kundenkennung (customer ID)              | Kundenindikator<br>(customer indicator)             |
| Ext.i | Dienst-Typenkennung (type of service ID) | Registrierungsindikator<br>(registration indicator) |

The OPTINFO will contain fields, representing from A to G, the Customer ID (Kundenkennung) and the Service ID.

Please refer to section 3.118 of TISUP Q.763 for:

- **parameter NP.UKK and its fields.**
- **coding of Kundenkennung (customer ID)**

**Table TRKOPTS (UKK option)**

| TABLE: TRKOPTS |     |  |         |   |   |   |   |   |   |   |     |   |
|----------------|-----|--|---------|---|---|---|---|---|---|---|-----|---|
| OPTKEY         |     |  | OPTINFO |   |   |   |   |   |   |   |     |   |
| -----          |     |  |         |   |   |   |   |   |   |   |     |   |
| STEP27ISUPV2   | UKK |  | UKK     | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 100 | 0 |

The provisioned parameter will only be used to transit it in outgoing IAM on TISUP (National trunks) or GISUP (supt) and not for routing.

The provisioning of the NPUKK on the trkopts is allowed on all ISUP trunk AGent. But interworking are currently supported only for GISUP,TISUP, ETSI V2 and ETSI V1 trunks.

**Note: Bit A to E can take values '0' or '1'. Bit F and Bit G are spare bits and hence accept value '0' ONLY**

The format of trunk option NPUKK is given below:

**Format of trunk option NPUKK**

| Field                    | Range of Values | Description                |
|--------------------------|-----------------|----------------------------|
| UKK_SPECIAL_ROUT_IND     | { 0 to 1}       | Bit A of octate 1 (NP.UKK) |
| UKK_SPECIAL_ZONE_IND     | { 0 to 1}       | Bit B of octate 1 (NP.UKK) |
| UKK_SPECIAL_INTL_CAR_IND | { 0 to 1}       | Bit C of octate 1 (NP.UKK) |
| UKK_SPECIAL_NTL_CAR_IND  | { 0 to 1}       | Bit D of octate 1 (NP.UKK) |
| UKK_SPECIAL_BLOCK_IND    | { 0 to 1}       | Bit E of octate 1 (NP.UKK) |
| BIT_F_SPARE              | { 0 to 1}       | Bit F of octate 1 (NP.UKK) |

**Format of trunk option NPUKK**

| Field                    | Range of Values | Description                |
|--------------------------|-----------------|----------------------------|
| BIT_G_SPARE              | { 0 to 1}       | Bit F of octate 1 (NP.UKK) |
| KUNDENKENNUNG            | {0 to 16383}    | Octate 2 & 2a (NP.UKK)     |
| REGISTRIERUNGS_INDICATOR | {0 to 127}      | Octate 3 (NP.UKK)          |

**Interworking for NP.UKK**

The table below captures the Interworking for the NPUKK parameter.

Since the NPUKK parameter is only built for TISUP and GISUP-T. The interworking having these trunks as outgoing are considered.

**Interworking For NPUKK**

|                            |                                                                                                  |
|----------------------------|--------------------------------------------------------------------------------------------------|
| Interworking               | NPUKK on the outgoing end.                                                                       |
| GISUP->TISUP               | Built if provisioned on the GISUP                                                                |
| ETSI V1->TISUP             | Built if provisioned on the ETSI V1                                                              |
| ETSI V2->TISUP             | Built if provisioned on the ETSI V2                                                              |
| GISUP(sipt)->TISUP         | If NPUKK is received in IAM, then it is transited, otherwise built if provisioned on GISUP(sipt) |
| TISUP -> TISUP             | If NPUKK is received in IAM, then it is transited, otherwise built if provisioned on TISUP       |
| TISUP -> GISUP(sipt)       | If NPUKK is received in IAM, then it is transited, otherwise built if provisioned on TISUP       |
| ETSI V1 -> GISUP(sipt)     | Built if provisioned on the ETSI V1                                                              |
| ETSI V2 -> GISUP(sipt)     | Built if provisioned on the ETSI V2                                                              |
| GISUP(sipt) -> GISUP(sipt) | If NPUKK is received in IAM, then it is transited, otherwise built if provisioned on GISUP(sipt) |
| GISUP->GISUP(sipt)         | Built if provisioned on the GISUP                                                                |

**Translation Verification Tool Support**

The TRAVER tool is updated to support the new screening options, KK and UKKCDPN.

Figure , on page 879 and Figure , on page 880 show the travers output involving KK and UKKCDPN screening, where Bit E is set to 1, hence the CDPN table is skipped.

**Example Traver for UKKCDPN, KK screen**

**Identification procedures for T-ISUP**

DTAG specifications enhances the current IDR-IRS functionality for Gateway switch by

- Introducing additional timer T39A
- Additional Identification procedures.

The Timer T39A functionality is covered by the feature A00002908.

This feature covers the additional Identification procedures. DTAG enhances the Identification procedure by adding two new messages.

- NANA (#FF)
- EHZA (#FC)

The procedures are described below.

## Procedures for Incoming international Call, terminating on DTAG network (for G -> T and V1 -> T).

### Activation

The enhanced identification procedures are activated by receiving the IDR with Holding bit set to 1. DTAG requires the flexibility that the IDR can be received before or after ACM. The Outgoing IDR on the International gateway will always have the holding Indicator set to zero.

The IRS received from the International network, will be transited to the National network, with Holding Indicator as received in the in IDR. Please refer to the following figure.

**Note:** The Timer T39A and the procedures associated with it are not shown in the Figure, to make it simple.

### Transit of IDR-IRS on International Gateway

If the received IDR has MCID indicator set to zero, i.e **MCID not requested** and Holding Indicator set to zero i.e. **Holding not requested**, then the IDR is **discarded and is NOT responded with a IRS**.

If the received IDR has MCID indicator set to zero, i.e **MCID not requested** and Holding Indicator set to one i.e. **Holding requested**, then the IDR is not transited to the International network. **Also the CS2K responds with a IRS message ( MCID response Indicator bit set to zero and Holding Bit set to one) and holding procedures are activated on the Avst. Figure captures this behavior.**

#### IDR-IRS behavior for MCID Indicator to 1

In cases where the incoming International call is from ETSI ISUP V1. The IDR received will be responded with IRS, by TISUP and the holding procedures will be activated based on the holding indicator bit.

#### Behavior for Identification

Once the procedure is activated, the NANA message is handled as below.

When a NANA message is received with Message Indicator field in NP.FF set to IDF, the identification data will be printed. The the content of the printout is analogous to the printout of the ETSI MCID service”. Hence a new report MCID 600 is added to the MCID log. This log will be generated will be generated on the receipt of the NANA message. The content of the log is as shown in Figure , on page 885 .

**MCID Log capturing printout for Identification**

```

AVST1_LOG  MCID600 DEC09 18:12:57 5700 INFO IDENTIFICATION DATA
Calling_Agent : CKT  STEP36ISUPV2 628
Called_Agent  : CKT  STEP39ISUPV2 632
Calling_Number : 7848810036
Called_Number  : 003349777799
Date : 09.12.2003
Time : 18:12:57

```

**Behavior for Identification**

When Release is received from international side, it is not transmitted to national end. The new EHZA message is sent. The international call leg is disconnected while national leg remains active till NANA(IDE) is received. Any NANA(IDF) is received a printout will be generated as mentioned above. On receipt of NANA(IDE), a release message is sent if an EHZA message is already sent. Please refer to “Behavior for Identification” on page 885.

**Deactivation**

The enhanced identification procedures are deactivated on the receipt of NANA message with the Message Indicator field in NP.FF set to IDE (Identification Ende). Any additional NANA (IDF) and NANA(IDE) message received is ignored.

### Deactivation of Identification procedures

### Procedures for Outgoing International Call from a DTAG network

For outgoing international calls from a DTAG network, the existing IDR-IRS functionality will be used for identification. no additional capability is being provided.

The holding indicator will be set to set zero when the IDR is transited to the national network and the response IRS will also have the holding bit set to zero, when it is sent on the International network. This is as shown in Figure .

### Procedures on outgoing International Gateway

### Procedures for TISUP - TISUP interworking.

For the procedures for the TISUP-TISUP scenario, please refer to Figure .

**Note:** The TISUP to TISUP interworking on the AVST is only possible, where the AVST acts as an SSP. Since MCID services are not directly related to the IN queries. Also the early ANM is currently not supported. The procedures described here are considering a normal TISUP -TISUP interworking.

All the messages NANA(IDE), NANA(IDF), EHZA will be transited. Identification procedures are also activated on the switch, NANA(IDF) will cause printout, NANA(IDE) will end the Holding. But these message will be transmitted. There is no release for EHZA.

#### Behavior of TISUP-TISUP interworking

## Origination ISC Point Code

DTAG specifies that the origination ISC point code, for an international incoming call, to be captured for statistics purpose. This feature implements the capability to capture the point code and print in a log ISC600

The log is generally generated every 3hrs. It will print the first 480 point code and the count of calls received from that point code respectively.

Additionally, it will also provide a count of all the calls received on the point code. The output of the log based on the point code captured is as below.

- For no Calls coming on GISUP to a national trunk:

### Log for ISC PC for no Calls

```
AVST1_LOG ISC600 NOV28 11:55:28 8900 INFO ISC log report
Originating ISC point Code captured from NOV-28 11:54 to NOV-28 11:55
-----
                No data captured
-----
```

- For calls received with number of distinct point codes less than 480:

### Log for ISC PC for few calls

```
AVST1_LOG ISC600 NOV28 11:55:28 8900 INFO ISC log report
Originating ISC point Code captured from NOV-28 11:58 to NOV-28 12:25
-----
ISCPC Count  ISCPC  Count  ISCPC  Count  ISCPC Count  ISCPC Count
-----
100    5    150    1    230    1    250    1    16000 1
16350 1    16400 1
-----
```

- For calls received from distinct PC more than 480:

**Log for ISC PC with received point codes more than 480**

| -----                                                                 |       |       |       |       |       |       |       |       |       |
| PC not captured : 10                                                  |       |       |       |       |       |       |       |       |       |
| -----                                                                 |       |       |       |       |       |       |       |       |       |

**Note:** The preceding Log figures show the point codes and the their count to be left justified in their respective formatting space. In actual log these numbers are right justified.

This functionality is controlled via and Office parameter CAPTURE\_ISC\_OM, in table OFCENG.

### Blocking of Connected Number and Calling Party Number

DTAG requires blocking of connected number and calling party number if the Address Presentation Restricted Indicator is set to "Presentation Restricted". DTAG also requires the above functionality to be enabled / disabled via a trunk option.

This feature implements the above functionality by creating a new trunk option "BLK\_CGPN\_CONN" in table TRKOPTS. The option has to be set to "Y" for the functionality to be enabled.

An example of datafill for the option "BLK\_CGPN\_CONN" in table TRKOPTS is shown below:

#### datafill in table TRKOPTS

|                |               |               |   |
|----------------|---------------|---------------|---|
| TABLE: TRKOPTS |               |               |   |
| STEP25ISUPV2   | BLK_CGPN_CONN | BLK_CGPN_CONN | Y |

## **Hardware Requirements or Dependencies**

None

## **Software Requirements or Dependencies**

None

## **Limitations and restrictions**

### **Kundenkennung range**

The screening frameworks allows up to 8191 indices.

- This implies that there can for each KK, there can be 8191 different routing paths specified. Similarly, for each BC or IPI, there can also be 8191 different routing paths specified.

The total number of customer groups allowed on a switch is 4094.

- This implies that there can only be a total of 4094 different routing systems to be shared between all KK/BC/IPI combinations.

This is not a limitation considering the current scope of the requirement, but would limit the system if the complete range of Kundenkennung is to be provisioned.

### **Holding Indicator Bit**

The Holding indicator bit for IRS from GISUP (SIPT) to TISUP, should be transmitted unchanged. This functionality would set it to the received value in IDR message, similar to GISUP (nonsipt) to TSIUP interworking.

### **SSP procedures**

Procedures for Early ANM scenario are not covered.

### **Holding procedures for Network initiated SUSPEND timeout.**

Currently the holding procedure for Network initiated SUSPEND timeout is not supported.

### **Calling party DN in IRS**

The current design sends the Billing DN in the IRS, when we do not have a valid calling number available. This is noncompliant with the MCID requirements of the Detusche Telecom.

To satisfy the requirement “It is recommended that the Billing DN is datafilled as \$ and Table DEFNUM is NOT datafilled and trunk option DEFNUM is NOT used”.

## Interactions

This feature interacts with the screening of Number blocking features, where by the blocked numbers can be overridden with Bit E set to 1.

## Appendix for A00003696

### Example Datafill Setup

The first table shows the No sharing of customer group (unoptimized) usage of the screening framework. The following tables provide some examples of the re-use that may occur because of common routing attributes for various IPI/KK/BC combinations. The final table shows the resulting datafill that would satisfy this example. Note that the in the worst-case scenario of this example, 18 customer groups would be required to specify the necessary translations. In the example optimization, only 3 are required because of re-use. Also note that only 2 screening indices were required for the optimized example, while in the unoptimized example, 9 would be required.

**No sharing of Customer Group**

| KK      | IPI       | BC       | Resulting Customer Group |
|---------|-----------|----------|--------------------------|

|                        |         | SCRN0 B<br>SCRN1 | SCRN1          | Not Req          | No Entry                    | SCRN1          |               |                     |                                |
|                        |         |                  |                |                  |                             |                |               |                     |                                |

1. KK Sharing: 2 or more KK share the same routing
2. IPI Sharing: 2 or more IPI values share the same routing
3. BC Sharing: 2 or more BC values share the same routing
4. Customer Group Sharing: The same customer group (translations) are used for 2 or more KK/IPI/BC combinations

## ***Fault Management for A00003696***

### **Fault management strategy**

No change

### **Fault management tools and utilities**

No change

### **Logs: ISC600**

#### **Explanation**

Log Title: ISC600

Name: ISC log Report

Description: Displays the Point Codes and their respective counts for all the calls received on a GISUP trunk, routing to a National variant. It displays up to 480 distinct point Codes with the respective counts. In case the received point codes are more than 480, then these are counted and captured as PC not counted.

Event type: Once in 3 Hours

#### **Format**

Below is the format for the ISC log:

```
TCB2_LOG      ISC600 <mmmmdd hh:mm:dd>INFO ISC log report
Originating ISC point Code captured from <from_time> to <to_time>
-----
ISCPC Count   ISCPC Count   ISCPC Count   ISCPC Count   ISCPC Count
-----
<pc> <count>  <pc> <count>  <pc> <count>  <pc> <count>  <pc> <count>
<pc> <count>  <pc> <count>  <pc> <count>  <pc> <count>  <pc> <count>
.....
<pc> <count>  <pc> <count>  <pc> <count>  <pc> <count>  <pc> <count>
<pc> <count>  <pc> <count>  <pc> <count>  <pc> <count>  <pc> <count>

-----
PC not captured : <overflow>
-----
```

### Examples

- Example 1: No calls on INTL (GISUP)TRK which logs the point Code.

```
TCB2_LOG      ISC600 NOV28 11:55:28 8900 INFO ISC log report
Originating ISC point Code captured from NOV-28 11:54 to NOV-28 11:55
-----
                        No data captured
-----
```

- Example 2: Few calls received on the INTL (GISUP TRK)

```
TCB2_LOG      ISC600 NOV28 11:55:28 8900 INFO ISC log report
Originating ISC point Code captured from NOV-28 11:54 to NOV-28 11:55
-----

```

## Field descriptions

The Fields in the log format are displayed as per format below.

### Field descriptions

| Field     | Value         | Description                                                                                      |
|-----------|---------------|--------------------------------------------------------------------------------------------------|
| from_time | Date and time | The time when the ISC point Code where captured for the current Log                              |
| to_time   | Date and time | The time till the ISC point Code were captured for the give log.                                 |
| pc        | 0 -16383      | Originating ISC point Code received.                                                             |
| count     | Integer range | Counter displaying the count of the respective point Code                                        |
| overflow  | Integer range | Counts the number point codes from which the calls were received but are not printed in the log. |

## Action

Nil

## Associated Operational Measurements or Performance Measurements

Nil

## Additional information

This data collected form this log will be used for Statistical purpose. The printing of the log is controlled via office parameter CAPTUE\_ISC\_PC.

## Logs: MCID600

### Explanation

Log Title: MCID600

Name: Identification Data

Description: This log is an extension of the MCID logs, introduced for DTAG holding service. It provides information about the Called agent, calling number, called number and the date and time of the call.

Event type: When Holding is activated on the Telco and NANA message is received.

## Format

Below is the format for the MCID log.

```
AVST1_LOG MCID600 DEC04 <mmdd hh:mm:ss> INFO IDENTIFICATION DATA
```

```
Calling_Agent : <originating agent>
```

```
Called_Agent : <terminating agent>
```

```
Calling_Number : <calling number>
```

```
Called_Number : <called number>
```

```
Date : <date>
```

```
Time : <time>
```

## Examples

```
AVST1_LOG MCID600 DEC04 22:23:01 0800 INFO IDENTIFICATION DATA

**Table/MIB/Remote Database Schema information****Name: KKSCRN**

KundenKennung Screening

**Functional description**

A mechanism to facilitate KK, IPI and TMR based screening and routing has to be provided as a part of this activity. To organize the data required to fulfill the above requirement, a new table KKSCRN has been created.

Access to this table from call processing and TRAVER starts with table TRKOPTS which then moves to CALLCNTL. After this, all other tables would be accessed depending on the particular datafill in CALLCNTL.

A screening index is datafilled against the trunk group (TRKOPTS) and the same screening index is also datafilled in the table (KKSCRN) which will be screened first.

The KK for the call is used along with this screen index to look up the entry in table KKSCRN. This entry can specify a customer group to use for translations

(if no other BC or IPI specific routing is required), or a new screen index and the next screening table (IPISCRN)

The IPI for the call is used along with the current screen index to look up the entry in table IPISCRN. This entry can specify a customer group to use for translations (if no other IPI specific routing is required), or a new screen index and the next screening table (BCSCRN).

The BC for the call is used along with the current screen index to loop up the entry in BCSCRN. This entry specifies the customer group to use for translations.

The end result is that the customer group for the call can be specified uniquely for each KK/IPI/BC combination.

The special routing will be invoked based Bit A and Bit C of national parameter NP.UKK. if either Bit A = 1 or Bit C = 1 is set in the message, else it proceeds for Normal routing.

Flow Diagram for KK screening

**Usage sequence and implications (CM Only)**

Tables must be datafilled in the following sequence:

TABLE TRKOPTS

TABLE CALLCNTL

TABLE CDPNSCRN

SUBTABLE CDPNDATA

TABLE KKSCRN

TABLE IPISCRN

TABLE BCSCRN

**Size****Table size**

| Abbreviated table name | Minimum tuples | Maximum tuples | Information on memory                                 |
|------------------------|----------------|----------------|-------------------------------------------------------|
|                        |                |                |                                                       |
| KKSCRN                 | 0              | 8191           | Memory is automatically allocated for 16 DPC devices. |

**Fields/OIDs**

The following table lists fields/OIDs for KKSCRN.

**Table field descriptions**

| Field | New or Changed | Subfield or refinement | Entry                             | Explanation and action                                                                                                                                         |

***Product = CS 2000*****A00003951 -- CICM i2001 Support (Int'l IAC)****Description**

The i2001 is a reduced functionality sibling of the i2002 to reduce cost of manufacture it has a smaller screen, fewer buttons and a cheaper build

The i2001 is also a Phase II Unistim Terminal. Currently the CICM supports Phase I Terminals, as part of the scope of this feature, existing support for the i2002 and i2004 Phase I Terminals will be updated to support the new range of Phase II i2002 and i2004's.

Phase 1 terminals will be MD when the Phase II terminals become available so support for the whole range of Phase II terminals (i2001, i2002 and i2004) on the CICM will be required

**Table 1** Table 1 i200x Configuration/menu matrix

## Display

The following details apply to the i2001.

- i2001 will have a 32x143 pixel, fully bit-mapped, monochrome, non-grayscale display. This will display 2 lines of 24 5x9 characters.
- The number of Soft labelled feature keys on the i2001 is zero
- Dedicated icon area in the main display area has been removed.
- Dedicated Clock / Calendar area present.
- Dedicated number and context label are present.
- Dedicated down arrow removed.

**Display layout of i2001**

## Generic Display Rules

The following rules have been devised for the i200x terminals. These rules have been introduced to allow one common interface across both terminal types and to help avoid issues with Language Translations on soft key strings.

- All strings for menu options should be created with the following rules in mind
  - a. Recommended length 12 characters – strings meeting this condition will always be shown in full (both on the information lines and in the context field)
  - b. Maximum length 20 character – strings above 12 characters in length and equal to or below 20 characters will be fully displayable in the information line but not in the context field. Long strings in the context field will be cropped off to 11 characters and terminated with an ellipsis to indicate they have been cropped.
  - c. Strings above 20 characters to be shown:
    - In the information lines will be cropped off to 19 characters and terminated with an ellipsis to indicate they have been cropped.
    - In the context field will be cropped off to 11 characters and terminated with an ellipsis to indicate they have been cropped.
- The Login Screen echoes entered digits to information line 0 rather than line 1 (see the following figure). The username and passwords entered may be up to a maximum of 15 digits. If the username/password entered is longer than the field space left on the screen (i.e. if the “Username” string

is 14 characters and 12 username digits are to be entered), the digits will be scrolled to the left and an ellipsis will be inserted to the left of the username to indicate this (please see example below).

|   |   |   |   |   |   |   |   |  |  |   |   |   |   |   |   |   |   |   |   |   |   |   |   |
|---|---|---|---|---|---|---|---|--|--|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| U | S | E | R | N | A | M | E |  |  | T | H | S | : | . | . | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 0 |
|---|---|---|---|---|---|---|---|--|--|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

- Bottom Soft key labels are set to a maximum of 5 characters with the exception of the last soft key on the screen which may use up to a maximum of 6 characters (see the following figure). This is due to a limitation of screen space on the i2001.

#### i2001 - Login Display

- Soft key labels are limited to a small generic subsection of the previously used soft keys (“Ok”, “Cancel”, “Clear”, “Bkspc”, “Menu”, “Help”, “Yes” and “No”).
- Menu options are selected via a scrollable list (instead of being assigned to a soft key). Scrolling may be carried out using the up and down navigation. This allows menu options to be displayed in strings which may be up to a maximum of 20 displayable characters (see rule 1). This is advantageous for the following reasons:
  - A greater area makes language translations easier.
  - A more informative string may be displayed.
- The position within a scrollable list is displayed to the far right hand side of the display. 1 character space is reserved to show scroll position.

- All Menu Options in the scrollable list are numerically indexed with the shortcut key number assigned to that option. The numerical indexes will go from 1 – 9. Options above 9 will have no shortcut assigned/displayed next to the menu option
- A menu option may be selected by either highlighting the option (i2004) or viewing the option (i2002, i2001) and selecting “Ok”. Alternatively the appropriate shortcut key assigned to an option may be selected using the key pad. This will cause the user to jump straight into the menu option required without scrolling.
- All Menu Options are set to a recommended length of 12 characters (so they may be displayed in the context field on the i2004). Please see rule number 1) for further details.
- The Logout option is presented as the first option in the Menu Options List. This will avoid language translation issues on when using a soft key for the same operation.
- All user prompts will be presented on Information line 0 on the display. The maximum length of a prompt is 23 characters. Prompts beyond 23 characters will be cropped down to 22 characters and an ellipsis will be presented as the 23<sup>rd</sup> character to indicate cropping has taken place. Further text to describe the prompt is viewable on a help screen which is accessed by selecting a “Help” soft key (See the following figure).

**i2001- Override prompt**

User permissions disabled.

The help screen presents text to the user by using scrolling pages (See the following figure). The help screen has a maximum number of 255 characters (due to the scrolling functionality). The recommended word size is 24 characters (words exceeding this limit will be word wrapped onto the next line of the display).

**i2001 - Override Help screen**

The Menu system is accessible by either selecting the “Menu” softkey or by selecting the “service” physical key (please see at any time (idle or non-idle)).

**i2001 - Service key position (used to launch Menu system)**

### **i2001 Display Rules**

To show the information required to the user on such a restricted display, the following list of rules have been devised specifically for the i2001. The context-sensitive display that these rules entail are not as intuitive to use as that of the i2004, however there is no choice but to change the position and visibility of information on the display depending upon context if that information is to be displayed at all.

- The Menu options are selected via a scrollable list.
- The relative position within the list is shown to the far right of information line 0 via up and down arrows.

#### **Example of navigation arrows**

- Information line 1 is dedicated for the Soft keys.
- Time / Date displayed on context line.

### **i2001 Menu Map**

The following screen representations show what will be presented to the user when logging on to a gateway, and navigating the menu options of the i2001.

## Login Screens

Screen 1 – Only shown if an upgrade is available / required.

Screen 2 – Selective Gateway Login feature

Screen 2 – A user can either hit “Ok” to accept a gateway to login to, they will then be presented with Screen 3 to login. Alternatively the user may start entering their username digits and this will also accept the currently selected gateway, go to Screen 3 and insert the digit(s) already entered.

Screen 3 – If the username is too long for the display the digits entered will scroll to the left and an ellipsis will be shown to the left of the username to indicate this to the user.

### Menu Option/Idle Screens

## Administration - Element Manager

The screenshot shows a web browser window titled "Centrex IP Client Manager - Microsoft Internet Explorer provided by Nortel Networks". The browser's address bar is empty. The page has a blue header with the "Nortel Networks" logo on the right. On the left, there is a vertical navigation menu with yellow buttons for "CICM", "status", "configuration", "terminals", "users", "maintenance", "CICM-EM", "status", "synchronization", "profiles", "audio", "enterprise", "language", "network", "user", "feature", "diagnostics", and "diagnostics". The main content area is titled "i2001 terminal firmware configuration (cxip180)". It contains several sections: "File Transfer Options" with a dropdown for "File Transfer Protocol" set to "TFTP (Please see help file)" and an "Apply changes" button; "Firmware Details For Phase 2 Terminals" with fields for "Recommended firmware load name (and optionally, path) on TFTP server" (c304d22.img), "Recommended supported firmware level" (3.99), and "Min Supported firmware level" (3.05); "TFTP Server Configuration (for TFTP only)" with fields for "IP address of TFTP server" (47.165.168.75) and "TFTP server port number" (radio buttons for "use default (port 69)" and "specify a port:"); and "UFTP Server Configuration (for UFTP only)" with a field for "Binary file import directories (specify semi-colon separated fully qualified UNC paths)" (\\47.165.168.75\\firmware) and a checkbox for "set to defaults". At the bottom left, it says "CICM-EM Version 7.10.118". At the bottom right, there are navigation links: "home", "terminal home", and "terminals on cxip180".

### Screen capture of terminal firmware upgrade page

The administration and configuration of the i2001 terminals will use the same pages which are already provided for the i2004 and i2002 terminals. (See the following figure.)

The screenshot shows the Centrex IP Client Manager web interface in Microsoft Internet Explorer. The browser title is "Centrex IP Client Manager - Microsoft Internet Explorer provided by Nortel Networks". The address bar is empty. The page has a blue header with the "Centrex IP Client Manager" logo and the "NORTEL NETWORKS" logo. A left sidebar contains a navigation menu with categories: CICM (status, configuration, terminals, users, maintenance), CICM-EM (status, synchronization), profiles (audio, enterprise, language, network, user, feature), and diagnostics. The main content area is titled "i2002 terminal firmware configuration (cxip180)". It contains several sections: "File Transfer Options" with a dropdown for "File Transfer Protocol" set to "UFTP" and an "Apply changes" button; "Firmware Details for Phase 1 Terminals" with fields for "Recommended firmware load name (and optionally, path) on TFTP server" (i2002\_rel\_1\_63.BIN), "Recommended supported firmware level" (1.63), and "Min Supported firmware level" (1.10); "Firmware Details For Phase 2 Terminals" with fields for "Recommended firmware load name (and optionally, path) on TFTP server" (Phase2\_rel\_3\_20.BIN), "Recommended supported firmware level" (3.20), and "Min Supported firmware level" (0.05); "TFTP Server Configuration (for TFTP only)" with fields for "IP address of TFTP server" (0.0.0.0) and "TFTP server port number" (radio buttons for "use default (port 69)" and "specify a port:"); and "UFTP Server Configuration (for UFTP only)" with a field for "Binary file import directories (specify semi-colon separated fully qualified UNC paths)" (\\47.165.168.75\\firmware) and a checkbox for "set to defaults". At the bottom of the main content area are links: "home", "terminal home", and "terminals on cxip180". The footer shows "CICM-EM Version 7.10.118" and a status bar with "Done" and "Internet".

### Screen capture of phase 2 terminal firmware upgrade page

User permissions will be editable via the user/user profile pages.

## Interactions

### Joint Sessions

The i2001 will only be able to have a joint session with the m6350 Softclient. In this scenario it will always adopt the master position in their master/slave relationship. In this case, the i2001 will function in the same manner as the i2004.

There will be no support for the i2001 to have a joint session with another i200x.

### Software Requirements or Dependencies

Firmware load \*.bin will be used for the development of this feature on the i2001.

### Interactions

This feature will change the existing menu system employed by the i2004 and i2002. Menu options previously displayed on the soft keys will be displayed in the main screen as a scrollable list (using the up and down navigation keys). The Soft keys will only be used for a small sub section of set functions.

The change is beneficial on the i2004 for the support of different languages as longer strings may be used for menu options. Problems had previously been encountered upon translating soft key options which were limited to only 7 characters i.e. a 7 character soft key in English may translate into a 9 character soft key in French which is not easily abbreviated.

### **A00004205 -- Japan PRI Backward Voice Path Solution (Succession on DMS)**

#### *Functional Description*

Some PBXs, upon receiving a PROGRESS or an ALERT message with PI#2 (Destination address is non-ISDN) on their Japan PRI interfaces do not open backward direction voice paths. As a result of this, although ring-back tone from destination side is available, PBX subscribers can not hear it. Currently, a PROGRESS message with PI#2 is sent back to the PBX when an ACM message with the pattern described in section “Background” on page 936 is received in Japan PRI to Japan Interconnect ISUP(JI-ISUP)/ANSI7+

interworkings. Also currently, an ALERT message with PI#2 is sent back to the PBX when an ALERT message with PI#2 is received in Japan PRI to Japan PRI interworking (see the following figure).

#### Call scenario

The activity “Japan PRI Backward Voice Path Solution (A00004205)” implements in ISN07 the optional addition of a second progress indicator (PI#8: inband info available) to the PROGRESS/ALERT messages sent back to the call originating side like PBX.

Upon receiving the PI#8, the PBXs are expected to open their backward voice paths and resolve the ring-back tone problem described above.

The second PI is only added for the agents given in Table , “Supported Agents and Directions.” in the specified direction and it is added only if the switch-based option, that is introduced with activity, is enabled as described in section “ Activation of the PI#8 addition” on page 937.

#### Supported Agents and Directions

| From: \ To:  | Japan PRIv1 | Japan PRIv2 |
|--------------|-------------|-------------|
| Japan PRIv1  | YES         | YES         |
| Japan PRIv2  | YES         | YES         |
| JI-ISUP      | YES         | YES         |
| ANSI7+(Q764) | YES         | YES         |

Important datafills corresponding to the above interfaces are as follows:

**Japan PRIv1**

DMS (MBG NONE) \$ ANSI2W CIC

In the rest of this document, Japan PRI will refer to both Japan PRIv1 and Japan PRIv2, unless otherwise specified.

**Background**

A PROGRESS message with PI#2 is sent back to a JapanPRI trunk upon receiving an ACM message from Japan Interconnect ISUP (JI-ISUP) or ANSI7+ trunk with the following Backward Call Indicators (BCI):

**Current Backward Call Indicator to Progress Indicator mapping**

| <b>JI-ISUP</b>                         | <b>Japan PRI</b>                       |
|----------------------------------------|----------------------------------------|
| Bit I=0 No interworking encountered    | PI#2 (Destination address is non-ISDN) |
| Bit M=0 Terminating access is non-ISDN |                                        |
| Bit DC=00 No indication                |                                        |
| <b>ANSI7+ ISUP</b>                     | <b>Japan PRI</b>                       |
| Bit I=0 No interworking encountered    | PI#2 (Destination address is non-ISDN) |
| Bit M=0 Terminating access is non-ISDN |                                        |
| Bit DC=00 No indication                |                                        |

**Current ACM to PROGRESS mapping**

An ALERT message with PI#2 is sent back to a JapanPRI trunk upon receiving an ALERT message with PI#2 from JapanPRI trunk.

**Current ALERT to ALERT mapping****Activation of the PI#8 addition**

Activation and deactivation of this feature is only available per one DMS100 switch basis.

In order to activate the addition of the PI#8 back to the originating PBXs, ISERVOPT table should be datafilled as follows:

**ISERVOPT datafill example for JapanPRI option**

| SOPTSKEY | SOPTSVAR   |
|----------|------------|
| JAPANPRI | JAPANPRI Y |

The following table displays how datafilling the JapanPRI option will actually take place:

**Datafilling JapanPRI option in ISERVOPT table**

```

>table iservopt
>add
JOURNAL FILE UNAVAILABLE - DMOS NOT ALLOWED
ENTER Y TO CONTINUE PROCESSING OR N TO QUIT
>y
SOPTSKEY:
>japanpri
OPTION:
>japanpri
ALLOW_BACKWARD_VOICE_PATH:
>y
TUPLE TO BE ADDED:
JAPANPRI JAPANPRI Y
ENTER Y TO CONFIRM, N TO REJECT OR E TO EDIT.
>y
TUPLE ADDED
JOURNAL FILE INACTIVE

```

**Scenarios when PI#8 is not added**

When JAPANPRI option in ISERVOPT table is not datafilled or when it is datafilled but ALLOW\_BACKWARD\_VOICE\_PATH is set to 'N', the PI#8 will not be added to the PROGRESS/ALERT messages. Therefore in these conditions, ACM to PROGRESS mapping in Japan PRI to JI-ISUP/ANSI7+ interworkings and ALERT to ALERT mapping in Japan PRI to Japan PRI interworkings will be as described in section “ Background” on page 936.

This will be the default behavior of this feature, in order to prevent changing the existing behavior after upgrades.

**Scenarios when PI#8 is added**

If the JAPANPRI option in ISERVOPT table is datafilled and ALLOW\_BACKWARD\_VOICE\_PATH option is set to 'Y', then a PROGRESS message with a second PI#8 will be sent back to a JapanPRI trunk upon receiving an ACM message from JI-ISUP or ANSI7+ trunk with the following Backward Call Indicators (BCI):

**Desired Backward Call Indicator to Progress Indicator mapping****JI-ISUP****Japan PRI**

Bit I=0 No interworking encountered  
 Bit M=0 Terminating access is non-ISDN  
 Bit DC=00 No indication

PI#2 (Destination address is non-ISDN)  
 PI#8 (Inband Info Available)

**ANSI7+ ISUP****Japan PRI**

**Desired Backward Call Indicator to Progress Indicator mapping****JI-ISUP**

Bit I=0 No interworking encountered  
 Bit M=0 Terminating access is non-ISDN  
 Bit DC=00 No indication

**Japan PRI**

PI#2 (Destination address is non-ISDN)  
 PI#8 (Inband Info Available)

**Desired ACM to PROGRESS mapping**

If the JAPANPRI option in ISERVOPT table is datafilled and ALLOW\_BACKWARD\_VOICE\_PATH option is set to 'Y' then an ALERT message with a second PI#8 will be sent back to a JapanPRI trunk upon receiving an ALERT message from JapanPRI trunk.

### Table/MIB/Remote Database Schema information

**Name:** ISERVOPT

#### Functional description

The new tuple JAPANPRI will be introduced by this activity in table ISERVOPT. This tuple holds entries for every Japan PRI related enhancement which is intended to be switched on and off by datafill. At the moment table ISERVOPT will allow an entry for opening backward voice path on the Japan PRI PBXs by sending a second PI#8 in the PROGRESS/ALERT messages.

Value Yes 'Y' implies that this service should be supported, value No 'N' or absence of JAPANPRI tuple in the ISERVOPT table means the service is not supported.

#### Usage sequence and implications (CM Only)

There is no requirement to datafill tables in a specific order.

#### Size

Unchanged.

#### Fields/OIDs

The following table lists fields/OIDs for ISERVOPT.

#### Table field descriptions

| Field    | New or Changed | Subfield or refinement    | Entry    | Explanation and action                                                     |
|----------|----------------|---------------------------|----------|----------------------------------------------------------------------------|
| SOPTSKEY | Changed        | -                         | JAPANPRI | New entry JAPANPRI defined.                                                |
| SOPTSVAR | Changed        | option                    | JAPANPRI | New entry JAPANPRI defined.                                                |
| SOPTSVAR | New            | allow_backward_voice_path | {Y, N}   | Whether second PI#8 should be added or not to the PROGRESS/ALERT messages. |

**Datafill example**

The following examples shows sample datafill for table ISERVOPT.

- Addition of the second PI#8 should be turned on:  
*JAPANPRI JAPANPRI Y*
- Addition of the second PI#8 should be turned off:  
*JAPANPRI JAPANPRI N*

**Table release history update**

The following information was added:

New entry JAPANPRI added to fields SOPTSKEY and SOPTSVAR.

New option ALLOW\_BACKWARD\_VOICE\_PATH added to the JAPANPRI.

**Supplementary information**

None.

**Translation verification other tools**

ISERVOPT does not use translation verification tools.

## A00004931 -- Indian ISUP (Int'l PT-IP)

### *Functional Description*

This activity addresses the ability to support Indian ISUP. Indian ISUP is on the CS2K IP solution. It is available on the International Succession Product.

The Indian ISUP is based on following international standards:

- ETSI standard ETS 300 356-1 to -12 and -14 to -19 (February 1995): ISDN User Part (ISUP) Version 2 for the international interface
- ETSI standard ES 201 296, V1.1.2 (1998-09) (ISUP Signalling aspects of charging)

The primary difference between Indian ISUP and ETSI ISUP V2 baseline is the modification of some of the existing additional parameters within the supported message set of ETSI ISUP base and additional parameters with Indian ISUP specific format.

Following interworkings will be covered by this activity:

to ETSI ISUP V2

to ANSI ISUP

to Indian ISUP

The following table indicates which protocols will be tested using SIP-T:

#### **SIP-T Usage**

| <b>Protocol</b> | <b>SIP-T</b> | <b>non-SIP-T</b> |
|-----------------|--------------|------------------|
| ISUP V2         | X            | X                |
| Indian ISUP     | X            | X                |

The following figure illustrates the planned CS2K configuration for Indian ISUP.

**CS2K Configuration for Indian ISUP**

The following additional timers shall be provided as detailed by the specification for Indian ISUP, rest of timers shall be used as defined for ETSI ISUP V2.

**UI SUS Control timer** - Initiated when controlling exchange receives SUS (user) message and terminated upon receipt of resume message. At expiry the release procedure is initiated.

**Congestion handling short** - Initiated when congestion indication is received. At expiry the new congestion indication will be taken into account.

**Congestion handling long** - Initiated when congestion indication is received. At expiry the traffic is restored by one step.

**Response to Call Reference release** - Initiated when response to request of end to end connection establishment is sent and terminated at the receipt of the first end to end message from remote end. At expiry end to end message is allowed to be sent.

## Indian ISUP datafill

This activity provides the ability to datafill Indian ISUP variant in table TRKSGRP. An example of this datafill in TABLE TRKSGRP is as shown below:

Table TRKSGRP

```
99ATMC42IT2 0 DS1SIG C7UP 2W N N EXTERNAL NONE Q767 THRH
0 DMSETSI N Y INDIA 100_WHITE $ ETSI2W CIC
```

‘100\_WHITE’ indicates that the variant is based on ETSI ISUP V2. ‘INDIA’ marks the specific variant based on 100\_WHITE.

## Indian ISUP signalling

### General

This section describes the supported messages and parameters. The description within this section is based on ETSI ISUP V2 specification and Indian ISUP specification.

### Messages

The following set of tables describes the messages and the parameters that these messages will/will not supported in Indian ISUP.

#### ISUP Address Complete Message

| Message | Parameter                           | Supported on Indian ISUP | Optional/Mandatory |
|---------|-------------------------------------|--------------------------|--------------------|
| ACM     | Message type                        | Y                        | Mandatory          |
|         | Backward call indicators            | Y                        | Mandatory          |
|         | Optional backward call Indicators   | Y                        | Optional           |
|         | Cause indicators                    | Y                        | Optional           |
|         | User-to-user indicators             | Y                        | Optional           |
|         | User-to-user information            | Y                        | Optional           |
|         | Generic notification indicator      | N                        | -                  |
|         | Transmission medium used            | N                        | -                  |
|         | Access transport                    | Y                        | Optional           |
|         | Access delivery information         | Y                        | Optional           |
|         | Redirection number                  | Y                        | Optional           |
|         | Parameter compatibility information | Y                        | Optional           |

**ISUP Address Complete Message**

| Message | Parameter                                | Supported on Indian ISUP | Optional/Mandatory |
|---------|------------------------------------------|--------------------------|--------------------|
|         | Call diversion information               | Y                        | Optional           |
|         | Service Activation                       | N                        | -                  |
|         | Redirection number restriction indicator | Y                        | Optional           |
|         | Echo control information                 | Y                        | Optional           |
|         | End of optional parameters               | Y                        | Optional           |

**ISUP Answer Message**

| Message | Parameter                           | Supported on Indian ISUP | Optional/Mandatory |
|---------|-------------------------------------|--------------------------|--------------------|
| ANM     | Message type                        | Y                        | Mandatory          |
|         | Backward call indicators            | Y                        | Optional           |
|         | Optional backward call indicators   | Y                        | Optional           |
|         | User-to-user indicators             | Y                        | Optional           |
|         | User-to-user information            | Y                        | Optional           |
|         | Connected number                    | Y                        | Optional           |
|         | Access transport                    | Y                        | Optional           |
|         | Access delivery information         | Y                        | Optional           |
|         | Generic notification indicator      | N                        | -                  |
|         | Parameter compatibility information | Y                        | Optional           |
|         | Backward GVNS                       | N                        | -                  |
|         | Call history information            | N                        | -                  |
|         | Generic number                      | N                        | -                  |
|         | Remote operations                   | N                        | -                  |
|         | Transmission medium used            | N                        | -                  |
|         | Redirection number                  | Y                        | Optional           |
|         | Service activation                  | N                        | -                  |
|         | Echo control information            | Y                        | Optional           |

**ISUP Answer Message**

| Message | Parameter                                | Supported on Indian ISUP | Optional/Mandatory |
|---------|------------------------------------------|--------------------------|--------------------|
|         | Display information                      | N                        | -                  |
|         | Redirection Number Restriction Indicator | Y                        | Optional           |
|         | End of optional parameters               | Y                        | Optional           |

**Blocking/Unblocking message**

| Message    | Parameter    | Supported on Indian ISUP | Optional/Mandatory |
|------------|--------------|--------------------------|--------------------|
| BLO<br>UBL | Message type | Y                        | Mandatory          |

**Blocking/Unblocking acknowledgment message**

| Message    | Parameter    | Supported on Indian ISUP | Optional/Mandatory |
|------------|--------------|--------------------------|--------------------|
| BLA<br>UBA | Message type | Y                        | Mandatory          |

**Call progress message**

| Message | Parameter                   | Support on Indian ISUP | Optional/Mandatory |
|---------|-----------------------------|------------------------|--------------------|
| CPG     | Message type                | Y                      | Mandatory          |
|         | Cause indicators            | Y                      | Optional           |
|         | Call reference              | N                      | -                  |
|         | Backward call indicators    | Y                      | Optional           |
|         | Optional backward call Ind. | Y                      | Optional           |
|         | Access transport            | Y                      | Optional           |
|         | User-to-user indicators     | Y                      | Optional           |

**Call progress message**

| Message | Parameter                                | Support on Indian ISUP | Optional/ Mandatory |
|---------|------------------------------------------|------------------------|---------------------|
|         | Redirection number                       | Y                      | Optional            |
|         | User-to-user information                 | Y                      | Optional            |
|         | Generic notification indicator           | N                      | -                   |
|         | Transmission medium used                 | N                      | -                   |
|         | Access delivery information              | Y                      | Optional            |
|         | Parameter compatibility information      | Y                      | Optional            |
|         | Call diversion information               | Y                      | Optional            |
|         | Service activation                       | N                      | -                   |
|         | Call transfer number                     | N                      | -                   |
|         | Echo control information                 | Y                      | Optional            |
|         | Connected number                         | Y                      | Optional            |
|         | Backward GVNS                            | N                      | -                   |
|         | Generic Number                           | N                      | -                   |
|         | Call history information                 | N                      | -                   |
|         | Redirection number restriction indicator | Y                      | Optional            |
|         | End of optional parameters               | Y                      | Optional            |

**Charge Information Message**

| Message | Parameters                        | Supported in Indian ISUP | Optional/ Mandatory |
|---------|-----------------------------------|--------------------------|---------------------|
| CRG     | Message type                      | Y                        | Mandatory           |
|         | Charge Band                       | Y                        | Mandatory           |
|         | Message compatibility information | Y                        | Mandatory           |
|         | End of optional parameters        | Y                        | Mandatory           |

**Circuit Group Blocking Message**

| Message | Parameters                                        | Supported in Indian ISUP | Optional/Mandatory |
|---------|---------------------------------------------------|--------------------------|--------------------|
| CGB     | Message type                                      | Y                        | Mandatory          |
|         | Circuit group supervision message type indicators | Y                        | Mandatory          |
|         | Range and status                                  | Y                        | Mandatory          |

**Circuit Group Blocking Acknowledgement Message**

| Message | Parameters                                        | Supported in Indian ISUP | Optional/Mandatory |
|---------|---------------------------------------------------|--------------------------|--------------------|
| CGBA    | Message type                                      | Y                        | Mandatory          |
|         | Circuit group supervision message type indicators | Y                        | Mandatory          |
|         | Range and status                                  | Y                        | Mandatory          |

**Circuit Group Reset Message**

| Message | Parameters       | Supported in Indian ISUP | Optional/Mandatory |
|---------|------------------|--------------------------|--------------------|
| GRS     | Message type     | Y                        | Mandatory          |
|         | Range and status | Y                        | Mandatory          |

**Circuit Group Reset Acknowledgement Message(status subfield not present)**

| Message | Parameters       | Supported in Indian ISUP | Optional/Mandatory |
|---------|------------------|--------------------------|--------------------|
| GRA     | Message type     | Y                        | Mandatory          |
|         | Range and Status | Y                        | Mandatory          |

**Circuit Group Unblocking Message**

| Message | Parameters                                        | Supported in Indian ISUP | Optional/Mandatory |
|---------|---------------------------------------------------|--------------------------|--------------------|
| CGU     | Message type                                      | Y                        | Mandatory          |
|         | Circuit group supervision message type indicators | Y                        | Mandatory          |
|         | Range and status                                  | Y                        | Mandatory          |

**Circuit Group Unblocking Acknowledgement Message**

| Message | Parameters                                        | Supported in Indian ISUP | Optional/Mandatory |
|---------|---------------------------------------------------|--------------------------|--------------------|
| CGUA    | Message type                                      | Y                        | Mandatory          |
|         | Circuit group supervision message type indicators | Y                        | Mandatory          |
|         | Range and status                                  | Y                        | Mandatory          |

**Confusion Message**

| Message | Parameters                | Supported in Indian ISUP | Optional/Mandatory |
|---------|---------------------------|--------------------------|--------------------|
| CFN     | Message type              | Y                        | Mandatory          |
|         | Cause Indicator           | Y                        | Mandatory          |
|         | End of optional parameter | Y                        | Optional           |

**Connect Message**

| Message | Parameters                        | Supported in Indian ISUP | Optional/Mandatory |
|---------|-----------------------------------|--------------------------|--------------------|
| CON     | Message type                      | Y                        | Mandatory          |
|         | Backward call indicators          | Y                        | Mandatory          |
|         | Optional backward call indicators | Y                        | Optional           |
|         | Backward GVNS                     | N                        | -                  |
|         | Connected number                  | Y                        | Optional           |

|  |                                     |   |          |
|--|-------------------------------------|---|----------|
|  | User-to-user indicators             | Y | Optional |
