

# Krups quick mix bar repair slip-out shaft

The locking ring of the shaft can rust and thereby the shaft slides out of the rod. The replacement of the shaft retaining ring helps.

Written By: Matt

## Step 1 — Replacing the circlip

- For the knife, loosen the three small screws (size 5 in the nut box).
- Wave from behind (back = where the quick-mix stick comes in the mixer) from the bar (here may be some strength required, do not be surprised).
- Buy retaining ring (DIN 6799, size 4, stainless !!!)
- Remove old circlip, attach new one. The circlip must be the last part from the end of the shaft. I've uploaded a photo of both the circlip and the inside, which can be found in the user pictures of this article.
- Close again. I would recommend new screws, the old ones have very flat heads and are quickly turned off.

Finished!
