

MacPro fan removal

Disassembling Mac Pro Front fan assembly of an old Mac Pro

Written By: Dirk Winning

INTRODUCTION

It seems hard to get the fans out in the real world, so I would like to explain

TOOLS:

- [Pro Tech Toolkit](#) (1)
-

Step 1 — MacPro fan removal

- You want to pull off the grey fan-assembly on the left (already gone in the pic), for that you have to unscrew 4 Screws in the memory-compartment on the right, slide that to the right and take out the middle cover for the processors

Step 2

- The problem often is, that the slide-holder of the fan-assembly is quite stuck in the black plastic on the bottom of the case; it helps a lot to use a flat metal stick to push it up and out
- The card-retaining blade that has two hand-driven screwheads is quite ideal for this purpose

To reassemble your device, follow these instructions in reverse order.
