# Patch your Patagonia Nano Puff ® Jacket with Repair Tape

This guide will show you how to repair a rip or tear in your Nano Puff Jacket with a temporary patch.

Written By: Brittany McCrigler

INTRODUCTION

Patagonia Nano Puff ® Jackets have a wonderfully soft feel and a pampering warmth which means we want to wear them for everything we do. Unfortunately, sometimes they get ripped or torn by a sharp object like snowboard edges or gnarly brush. While patching your jacket with repair tape will hold for a while, and is a great way to repair when you're on-the-fly, eventually you'll want to put a real patch on the jacket. For details on patching a Patagonia down jacket check out our Baffle Repair Guide.

For replacement parts or further assistance, contact Patagonia Customer Service.

🔧 TOOLS:

- Tenacious Tape ™ (1)
- Utility Scissors (1)

## Step 1 — Patch your Patagonia Nano Puff ® Jacket with Repair Tape

- Inspect the damage on your jacket. Clip any dangling threads or fabric using small scissors.
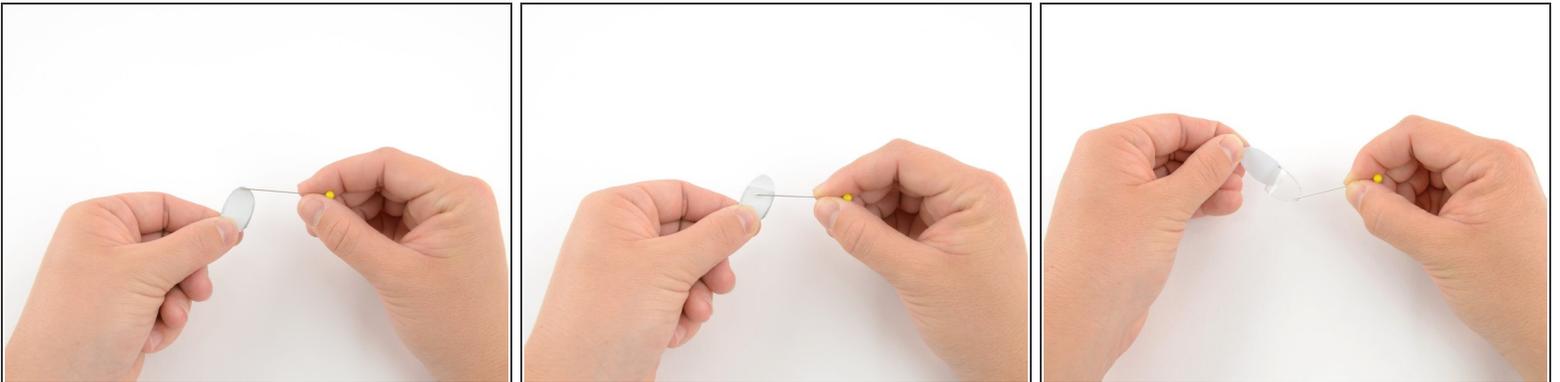

Step 2

- Grab your repair tape.

- Flip the repair tape to the back side.

- Using a permanent marker, draw an oval slightly larger than the hole.

  - (i) If you have a wide hole, you can use a rectangle, but be sure to round the edges. Rounding the edges prevents the corners from getting caught and peeling up.

Step 3

- Cut out your shape using scissors.

Step 4

- Using your fingernail, or a pin, peel the backing off the tenacious tape, so that you only have the clear sticky layer.

⚠️ Be sure not to touch the sticky side of the tape as this will gum up the tape and it won't stick well.

Step 5

- Lay the tape over the hole and press the tape down with your finger.

Step 6

- Use a fingernail or spudger to work out all of the air bubbles under the tape. Continue rubbing the tape until it is well-adhered.
